3. MA. Bui Duc Dung, Head, Department of Administration, NEU, Vietnam
4. Dr. Dao Thanh Tung, Head, Department of International Cooperation, NEU, Vietnam
5. Dr. Vu Trong Nghia, Head, Department of Communication, NEU, Vietnam
6. Dr. Le Viet Thuy, Director, Center for Applied Information Technology, NEU, Vietnam
7. Dr. Nguyen Dinh Trung, Department of Device Administration, NEU, Vietnam
8. Dr. Nguyen Thi Thanh Huyen, Vice Dean, Faculty of Environmental, Climate Change and Urban Studies, NEU, Vietnam
9. Assoc. Prof. Dr. Le Thu Hoa, Faculty of Environmental, Climate Change and Urban Studies, NEU, Vietnam
10. Dr. Nguyen Cong Thanh, Faculty of Environmental, Climate Change and Urban Studies, NEU, Vietnam
11. BSc. Bui Huy Hoan, Department of Science Management, NEU, Vietnam
12. Assoc. Prof. Dr. Orathai Piayura, Dean, Faculty of Humanities and Social Sciences, Khon Kaen University, Thailand
13. Assoc. Prof. Dr. Sutida Ngonkum, Faculty of Humanities and Social Sciences, Khon Kaen University, Thailand
14. Assistant Prof. Dr. Ratana Chanthao, Faculty of Humanities and Social Sciences, Khon Kaen University, Thailand

Proceeding Editorial Board and Peer Reviewers

1. Assoc. Prof. Dr. Dinh Duc Truong, Dean, Faculty of Environmental, Climate Change and Urban Studies, NEU, Vietnam
2. Assoc. Prof. Dr. To Trung Thanh, Head, Department of Science Management, NEU, Vietnam
3. Dr. Nguyen Thi Thanh Huyen, Vice Dean, Faculty of Environmental, Climate Change and Urban Studies, NEU, Vietnam
4. Assoc. Prof. Dr. Nguyen Ngoc Son, Dean, Faculty of Planning and Development, NEU, Vietnam
5. Assoc. Prof. Dr. Ngo Thi Phuong Thao, Dean, Faculty of Realestate and Resources Economics, NEU, Vietnam
6. Assoc. Prof. Dr. Tran Van Nam, Dean, Faculty of Law, NEU, Vietnam
7. Assoc. Prof. Dr. Pham Thi Thanh Thuy, Dean, Faculty of Foreign Languages Economics, NEU, Vietnam
8. Assoc. Prof. Dr. Nguyen Cong Thanh, Faculty of Environmental, Climate Change and Urban Studies, NEU, Vietnam
9. Assoc. Prof. Dr. Vu Thi Hoai Thu, Faculty of Environmental, Climate Change and Urban Studies, NEU, Vietnam
10. Dr. Nguyen Kim Hoang, Faculty of Environmental, Climate Change and Urban Studies, NEU, Vietnam
11. Dr. Le Huy Huan, Faculty of Environmental, Climate Change and Urban Studies, NEU, Vietnam
12. Dr. Nguyen Dieu Hang, Faculty of Environmental, Climate Change and Urban Studies, NEU, Vietnam
13. MA. Nguyen Thuy Linh, Faculty of Environmental, Climate Change and Urban Studies, NEU, Vietnam
14. Dr. Doan Quang Tri, General Administration of Hydro-Meteorology, MONRE, Vietnam
15. Assoc. Prof. Dr. Orathai Piayura, Dean, Faculty of Humanities and Social Sciences, Khon Kaen University, Thailand
16. Assoc. Prof. Dr. Sutida Ngonkum, Faculty of Humanities and Social Sciences, Khon Kaen University, Thailand
17. Assistant Prof. Dr. Ratana Chanthao, Faculty of Humanities and Social Sciences, Khon Kaen University, Thailand

LIST OF PAPERS DIVIDED BY TOPIC

SESSION 1: ECONOMIC DEVELOPMENT AND INTEGRATION

1. **ENTREPRENEURIAL FARMERS IN THE CHANGING WORLD: ARE THEY DISAPPEARING? EVIDENCE FROM VIETNAM** 1
Dr. Trinh Anh Khoa
2. **AN ANALYSIS OF IMPACTS OF THE MONETARY POLICY IN VIETNAM** 17
Assoc. Prof. Dr. Nguyen Van Cong
3. **THE RELATIONSHIP BETWEEN FOREIGN DIRECT INVESTMENT, ECONOMIC GROWTH, TRADE OPENNESS AND ENVIRONMENT IN VIETNAM** 29
Pham Minh Duc, Mai Ngoc Anh
Tran Thi Khanh Linh, Pham Thanh Long
4. **THE IMPACT OF INFORMATION SHARING, INTERNATIONAL SUPPLY CHAIN COOPERATION AND SUPPLY CHAIN PERFORMANCE ON EXPORT PERFORMANCE IN DIGITAL TRANSFORMATION: A CASE STUDY OF VIETNAMESE SEAFOOD ENTERPRISES**..... 45
Assoc. Prof. Dr. Nguyen Xuan Hung, Nguyen Hoang Duong
Tran Ngoc Duong, Mai Thi Xuan Lan
Nguyen Duc Manh, Bui Thi Tuoi
Assoc. Prof. Dr. Nguyen Thi Minh Phuong
5. **IMPACT OF MACROECONOMIC VOLATILITY ON SHORT- AND LONG-TERM VOLATILITY OF THE DEVELOPING STOCK MARKET: A STUDY AT THE VIETNAM STOCK MARKET** 61
M.Econ. Nguyen Thi Lien, MSc. Hoang Thanh Tam
6. **MEASURING PERFORMANCE WITH DATA ENVELOPMENT ANALYSIS (DEA) INTEGRATED UNDESIRABLE VARIABLES - SOME POTENTIAL RESEARCH DIRECTIONS** 75
Dr. Phung Manh Trung
7. **INVESTIGATING THE MOTIVATIONS OF VIETNAM'S OUTWARD FDI: DOES RESOURCE SEEKING MATTER?** 83
Dr. Phung Thanh Quang
8. **A STUDY ON THE RELATIONSHIP BETWEEN CAPITAL STRUCTURE AND PERFORMANCE** 94
Nguyen Thi Xuan, Tran Manh Dung

9. **IMPACT OF FINANCIAL DEVELOPMENT ON ECONOMIC GROWTH: EVIDENCE FROM VIETNAM109**
 Assoc. Prof. Dr. Nguyen Thi Dieu Chi
10. **APPROACHING THE GRAVITY MODEL TO INVESTIGATE FACTOR AFFECTING VIETNAM'S SEAFOOD EXPORT119**
 Assoc. Prof. Dr. Nguyen Xuan Hung, MA. Le Tuan Anh
 Do Huu Quan, Nguyen Hai Yen
 Hoang Thi Ha Phuong, Nguyen Thi Hong Tham
11. **IMPACT OF CAPITAL STRUCTURE ON PROFITABILITY IN THE BANKING SYSTEM142**
 Huynh Thi Thanh Truc
12. **FACTORS AFFECTING THE QUALITY OF FINANCIAL REPORTING INFORMATION OF LISTED ENTERPRISES IN VIETNAM153**
 Dr. Nguyen Thi Mai Anh, Nguyen Huyen Trang
 Nguyen Thu Phuong, Than Thi Lan Huong
 Hoang Thi Que, Le Thi Thao
13. **FACTORS AFFECTING ORGANIC AGRICULTURAL PRODUCE EXPORT READINESS OF ENTERPRISES IN VIETNAM165**
 To Xuan Cuong, Ta Thi Duyen
 Vu Van Thanh, Phan Le Ngoc Anh
 Tran Thi Thanh Thao, Nguyen Huyen Trang
14. **FACTORS INFLUENCING NON-INTEREST INCOME OF COMMERCIAL BANK IN VIETNAM185**
 Dr. Khuc The Anh, Pham Thi Thuy Trang
 Nguyen Dinh Dung, Bui Duc Manh
 Ngo Thi Ngoc Anh
15. **IMPACTS OF THE VIETNAM - UK FREE TRADE AGREEMENT (UKVFTA) ON THE EXPORT OF VIETNAM'S AGRICULTURAL197**
 Le Nguyen Quynh Trang, Lam Minh Khanh
 Dinh Dieu Linh, Nguyen Huong Thao, Nguyen Anh Thu
16. **FACTORS INFLUENCING PERSONAL BEHAVIORAL ATTITUDE IN USING FINANCIAL LEVERAGE IN REAL ESTATE TRANSACTIONS - EMPIRICAL EVIDENCE FROM CB-SEM211**
 Khuc The Anh, Nguyen Manh Cuong, Le Thu Ha
 Nguyen Ha Anh, Vu Hoang Anh, Nguyen Quoc Tien
17. **ANNOUNCEMENT EFFECT OF CORPORATE BOND ISSUANCE ON VIETNAMESE LISTED COMPANIES' STOCK PRICE..... 227**
 Dr. Ha Hong Hanh

18.	THE IMPACT OF CAPITAL STRUCTURE ON FIRM VALUE OF LISTED LOGISTICS COMPANIES	241
	Assoc. Prof. Dr. Le Thanh Tam, Dr. Dinh Le Hai Ha Ha Thi Giang, Do Ha Xuyen, Pham Ha Duc Le Ngoc Yen Chi, Nguyen Quynh Chi	
19.	FACTORS AFFECTING TRANSFER PRICING OF FDI ENTERPRISES IN VIETNAM	253
	Doan Thanh Nga, Vu Chau Anh, Ha Viet Nga Duong Thu Hong, Nguyen Ha Giang	
20.	FACTORS AFFECTING CHALLENGES IN APPLICATION OF ACCOUNTING SOFTWARE: A STUDY OF SMALL AND MEDIUM ENTERPRISES IN VIETNAM	267
	Dr. Ta Thu Trang	
21.	ARE BIG GAPS OF CORPORATE INCOME TAX IN DIFFERENT CONTEXTS?.....	277
	Nguyen Thi Quynh Nga, Luong Thi Giang Nguyen Thu Thuy, Tran Manh Dung	
22.	FACTORS AFFECTING THE SUSTAINABILITY DISCLOSURE IN CONSTRUCTION ENTERPRISES LISTED ON THE VIETNAM STOCK MARKET: A BINARY LOGISTIC REGRESSION ANALYSIS	293
	Dr. Dang Thu Hang, Dr. Do Thi Huyen	
23.	THE IMPACT OF FINANCIAL STRESS ON INFLATION IN VIETNAM ..	303
	MA. Pham Thi Lam Anh	
24.	STOCK MARKET REACTION TO ANNOUNCEMENT CHANGE IN BOARD OF DIRECTORS AT VIETNAMESE LISTED SEAPORT ENTERPRISES	314
	Do Thi Bich Ngoc, Nguyen Thi Phuong Mai	
25.	THE IMPACT OF TRADE OPENNESS ON VIETNAM'S ECONOMIC GROWTH	320
	MA. Phạm Ngọc Minh, Dr. Dong Thi Ha MA. Vu Thi Thanh Huyen	
26.	IMPROVE TAX ADMINISTRATION FOR CAPITAL TRANSFER ACTIVITIES IN VIETNAM	331
	Assoc. Prof. Dr. Nguyen Thi Thuy Duong	
27.	OPPORTUNITIES AND CHALLENGES IN THE GROWTH OF VIETNAM'S EXPORT TURNOVER WHEN TAKING ADVANTAGE OF THE EFFECTIVENESS OF FREE TRADE AGREEMENTS	342
	MA. Nguyen Nguyen Zen Student DMB01-002-2022. Bui Duc Hieu	

28.	INCLUSIVE INSURANCE: A FINANCING TOOL TO NATURAL DISASTER RISKS IN VIETNAM	351
	Dr. Nguyen Thi Hai Duong Nguyen Nhu Minh Ngoc	
29.	ATTRACTION OF HIGH-QUALITY FOREIGN DIRECT INVESTMENT FLOWS INTO VIETNAM	362
	Bui Huy Nhuong, Ha Dieu Linh	
30.	ENHANCING MEKONG FLOW MANAGEMENT: EXAMINING THE PRESENT SCENARIO AND CHALLENGES FACED BY MAINLAND SOUTHEAST ASIAN NATIONS	372
	PhD student. Nguyen Minh Hong	
31.	THE ROLE OF MYANMAR FOREIGN TRADE WITH GMS COUNTRIES	386
	Dr. Ah Mar	
32.	GLOBAL VALUE CHAIN AND THE PARTICIPATION OF TEXTILE ENTERPRISES IN VIET NAM	395
	Dinh Thuy Dung	

SESSION 2: BUSINESS ADMINISTRATION

33.	WHY DO SMALL FARM HOUSEHOLDS HESITATE TO PURCHASE INSURANCE TO COPE WITH SHOCKS? EMPIRICAL EVIDENCE FROM VIETNAM USING A SIMULTANEOUS APPROACH	405
	Dr. Trinh Anh Khoa	
34.	FACTORS AFFECTING PURCHASE BEHAVIOUR TOWARDS PRODUCTS OF CIRCULAR BUSINESS MODELS OF HANOI CONSUMERS: EXAMINING IN TEXTILE INDUSTRY	418
	Assoc. Prof. Dr. Truong Dinh Chien, Nguyen Thi Thuy Hien Tran Khanh Linh, Tran Huong Tam	
35.	INFLUENCE OF ACCOUNTING CONSERVATISM ON FIRM PERFORMANCE: EVIDENCE FROM LISTED COMPANIES ON HANOI STOCK EXCHANGE (HNX)	430
	Assoc. Prof. Dr. Dinh The Hung, Nguyen Le Thuy Nguyen Khanh Linh, Mai To Quyen Le Yen Nhi, Vu Dieu Linh	
36.	STUDY OF FACTORS AFFECTING THE QUALITY OF FINANCIAL REPORTING INFORMATION OF SMALL AND MEDIUM ENTERPRISES IN HANOI CITY	446
	Pham Huy Hung	

37. **THE INDEPENDENCE OF BOARD OF DIRECTORS AND FINANCIAL PERFORMANCE: AN EMPIRICAL EVIDENCE OF PHARMACEUTICAL ENTERPRISES IN VIETNAM 465**
 Nguyen Van Chien
38. **THE FINTECH WAVES AND ITS IMPACT ON THE OPERATIONAL EFFICIENCY OF COMMERCIAL BANKS IN VIETNAM 475**
 Nguyen Trang My, Nguyen Phuong Thao
 Dang Thi Hai Ha, Do Phuong Giang, Vu Le Du
39. **AWARENESS OF ACCOUNTANTS AND AUDITORS ON THE APPLICATION OF BLOCKCHAIN TECHNOLOGY IN VIETNAM 486**
 Dr. Nguyen Thi Mai Anh, Nguyen Thuy Nguyen
 Nguyen Thi Hong Minh, Dao Thi Thanh Tam
 Dang Thuy Quynh, Le Yen Nhi
40. **IMPACT OF IDENTITY THEFT ON ONLINE PURCHASE INTENTION IN VIETNAM 498**
 Dr. Nguyen Thi Phuong Linh, Phung Tue Tam
 Vu Thi Thu Hien, Bui Le Dan Tam, Pham Thao Anh
41. **EFFECT OF THE RISK GOVERNANCE STRUCTURES ON BANK RISK-TAKING IN VIETNAM 509**
 Dr. Khuc The Anh, Le Phuong Thao
 Le Thi Phuong Huyen, Pham Thi Ngoc Minh
 Nguyen Phuong Thao, Thai Phuong Thao
42. **EFFECTS OF ESG PRACTICES ON THE OPERATIONAL EFFICIENCY OF TEXTILE ENTERPRISES IN THE PERIOD OF 2017 - 2022 522**
 Do Thi Ngoc, Nguyen Thi Ngoc Huyen
 Tran Thu Huong, Tong Thi Thuy Tien
 Nguyen Thi Thuy Hong
43. **THE IMPACT OF FINANCIAL LITERACY ON THE INTENTION TO ADOPT FINTECH SERVICES IN HANOI, VIETNAM 537**
 Dr. Khuc The Anh, Dong My Hang
 Nguyen Thi Viet Thu, Nguyen Tran Ngan Ha
 Nguyen Quynh Anh
44. **THE IMPACT OF GREEN SKEPTICISM ON GREEN CONSUMER GOODS' PURCHASE INTENTION AMONG GENERATION Z IN HANOI..... 550**
 Dr. Nguyen Thu Lan, Nguyen Mai Huong
 Dinh Xuan Anh, Nguyen Thi Tuyet Mai
 Vu Hoang Minh, Vu Thi Mai Phuong

45. **RESEARCH ON THE INFLUENCE OF ASYMMETRIC INFORMATION ON STUDENTS' INTENTION TO PARTICIPATE IN THE STOCK MARKET IN HANOI559**
 Assoc. Prof. Dr. Phan Huu Nghi, Tran Lan Anh
 Nguyen Hong Phuc, Nguyen Thi Bich Ha
 Vu Ngoc Bich, Tran Duc Anh
46. **FACTORS AFFECTING BUSINESS PERFORMANCE OF BUILDING MATERIAL FIRMS LISTED ON VIETNAM STOCK MARKET.....569**
 Dr. Hoang Thi Hong Le, Dr. Phan Thuy Duong
 Dr. Hoang Thi Thanh
47. **THE ATTITUDE OF TOP MANAGEMENT, PRESSURE OF STAKEHOLDERS TOWARD IMPLEMENTING AND DISCLOSURE OF ENVIRONMENTAL ACCOUNTING INFORMATION583**
 Dr. Lam Thi Truc Linh, MBA. Nguyen Hong Nga
 MBA. Tran Thi Anh Hong, Nguyen Ngoc Tho
48. **THE IMPACT OF SOCIAL MARKETING ON CUSTOMER INTENTION AND PURCHASE DECISIONS: A RESEARCH OF THE FMCG INDUSTRY IN VIETNAM597**
 MBA. Nguyen Thanh An
49. **FACTORS IMPACTING PRODUCT COMPETITIVENESS: A SYSTEMATIC LITERATURE REVIEW AND SOME FUTURE RESEARCH DIRECTIONS612**
 Nguyen Hoang Duong, Assoc. Prof. Dr. Nguyen Thuong Lang
 Bui Thi Tuoi, Nguyen Trung Kien
50. **EXPECTATIONS AND EXPERIENCE IMPACT ON VALUE CO-CREATION INTENTION OF USERS WHEN PLAYING GAMES.....627**
 Le Thi Hong Minh, Huynh Le Bao Quynh
 Nguyen Thi Cam Ha, Le Thien Phat
 Nguyen Van Nhat Quy, Vu Thi Thuy Dung
51. **FACTORS AFFECTING THE APPLICATION OF MANAGEMENT ACCOUNTING: AN ACTUAL SURVEY OF SMALL AND MEDIUM-SIZED ENTERPRISES IN NGHE AN PROVINCE, VIETNAM640**
 MSc. Le Thi Huong Tram, Dr. Doan Thi Quynh Anh
52. **INTERNATIONAL FINANCIAL REPORTING STANDARDS 17 - INSURANCE CONTRACT AND ISSUES WITH VIETNAM INSURANCE ENTERPRISES..652**
 MAcc. Nguyen Thi Thao Anh
53. **FACTORS AFFECTING VIETNAMESE CONSUMERS' KOREAN COSMETIC CONSUMPTION BEHAVIOR: AN EXTENDED THEORY OF PLANNED BEHAVIOR APPROACH661**
 Assoc. Prof. Dr. Nguyen Xuan Hung, Tran Thi Ngoc Mai

54. **DETERMINANTS OF DIGITAL FINANCIAL COMPETENCY AMONG EMPLOYEES IN VIETNAM BANKING SECTOR 679**
 MSc. PhD students. Le Van Hinh, Assoc. Prof. Dr. Dang Thi Le Xuan
 PhD students. Ngo Anh Nguyet
55. **THE INFLUENCE OF AUTHENTIC LEADERSHIP ON INNOVATIVE WORK BEHAVIOR OF EMPLOYEES IN THE BANKING SECTOR IN VIETNAM: A LITERATURE REVIEW AND A PROPOSED MODEL..... 699**
 Thanh Kim Hue
56. **A STAKEHOLDER PERSPECTIVE ON THE ADOPTION OF INTERNATIONALLY RECOGNIZED QUALITY CERTIFICATES OF SMES IN VIETNAM 711**
 Dr. Tran Ngoc Mai
57. **DISCLOSURE OF CUSTOMER PROTECTION IN COMMERCIAL BANKS IN VIETNAM 721**
 Hoang Thi Thu Hien, Nguyen Minh Phuong
58. **DETERMINANTS OF HIGH-PERFORMANCE WORK SYSTEM AND ITS IMPACTS ON ORGANIZATIONAL PERFORMANCE: EMPIRICAL STUDY OF LISTED COMPANIES IN VIETNAM 733**
 PhD student, MA. Vy Vu Hong Thao

SESSION 3: INFORMATION TECHNOLOGY AND DIGITAL ECONOMY

59. **THE ROLE OF DIGITAL TRANSFORMATION IN THE COMPETITIVE CAPACITY OF VIETNAMESE ENTERPRISES 751**
 Dr. Le Thi Anh, Thieu Ngoc Mai
60. **FACTORS AFFECTING ENTERPRISE’S DIGITAL TRANSFORMATION.... 763**
 Truong Doan The, Cao Thuy Xiem
61. **FACTORS AFFECTING ORGANIZATIONAL ENGAGEMENT OF EMPLOYEES IN THE CONTEXT OF THE DIGITAL TRANSFORMATION: AN EMPIRICAL EVIDENCE 778**
 Nguyen Van Chien
62. **STUDYING CREDIT SCORING MODELLING BY MACHINE LEARNING APPROACHES 789**
 Dr. Pham Minh Hoan, Tran Thi Hoa
63. **INVESTIGATING INFLUENTIAL FACTORS OF BLOCKCHAIN INTEGRATION IN THE LOGISTICS INDUSTRY: A CASE STUDY OF VIETNAM 803**
 Hoang Hong Hanh, Do Kim Chi, Phan Hoang Duy
 Nguyen Huu Son, Pham Truong Phuc

64. **FACTORS AFFECTING DECISION TO USE MOBILE PAYMENT OF NORTHERN VIETNAMESE UNDERGRADUATE STUDENTS818**
 Assoc. Prof. Dr. Nguyen Xuan Hung, Nguyen Hoang Duong
 Le Bui Thanh Hang, Tran Thi Tra My, Dr. Pham Van Hieu
65. **DETERMINANTS OF DECISION TO USE FINTECH FOR MANAGING PERSONAL FINANCE IN VIETNAM.....839**
 Ngo Thanh Xuan, Ha Bao An
 Le My Linh, Ha Duong Huong Linh
 Tran Hai Linh, Mai Thu Trang
66. **THE IMPACT OF COMMUNICATING WITH CONSUMERS THROUGH INSTANT MESSAGING ON POSITIVE WORD-OF-MOUTH: RESEARCH IN VIETNAM.....851**
 Phung Duy Quang, Vu Thi Lam
 Nguyen Thuong Lang, Do Huu Quan
 Do Trung Ha, Vu Thi Thu Huyen
67. **THE IMPACT OF AI MARKETING ON BRAND LOVE AMONG HANOI UNIVERSITY STUDENTS: THE CASE OF E-WALLETS863**
 MSc. Tran Viet An, Le Thuy Hien
 Do Thuy Duong, Hoang Mai Khanh
 Nguyen Thi Thuy Hang, Trinh Hoang Giang Huong
68. **ONLINE COMPULSIVE BUYING AMONG YOUNG PEOPLE UNDER THE DEVELOPMENT OF E-COMMERCE877**
 Dr. Nguyen Thi Thu Trang, Le Yen Nhung
 Phan Trinh Tra My, Tran Thi Ngoc Anh
 Tran Quoc Hai, Pham Nguyen Dieu Minh
69. **IMPACT OF DIGITAL FINANCES ON THE STABILITY OF THE COMMERCIAL BANKING SYSTEM IN VIETNAM893**
 Ngo Thanh Xuan, Le Quynh Mai
 Nguyen Minh Hang, Ngo Thi Thuy Ngan
 Nguyen Thuy Trang, Nguyen Minh Ngoc
70. **FINANCIAL LITERACY OF VIETNAMESE STUDENTS IN THE CONTEXT OF DIGITAL TRANSFORMATION: EVIDENCE FROM STUDENTS IN HANOI CITY905**
 Dr. Phan Hong Mai, Bui Phuong Linh, Nguyen Ngoc Anh
 Nguyen Vu Phuong Anh, Nguyen Thi Mai Anh
71. **STUDENT’S INTENTION TO USE E-LEARNING: CASE STUDY AT NATIONAL ECONOMICS UNIVERSITY.....920**
 Dr. Ngo Quynh An, Giap Van Khoa
 Ho Hoang Anh, Ngo Truc Anh, Nguyen Huong Mai

72. **THE IMPACT OF DIGITAL TRANSFORMATION ON USING ELECTRICAL PAYMENTS IN DAILY LIFE OF PEOPLE IN VIETNAM 933**
 Assoc. Prof. Dr. Nguyen Xuan Hung, Ngo Thi Kieu Trang
 Hoang Thi Xuan Mai, Nguyen Thi Duong Lam
 Nguyen Hoang Manh
73. **IMPACT OF FINANCIAL LITERACY ON THE MIDDLE-AGED ACCESSIBILITY TO DIGITAL FINANCIAL SERVICES..... 953**
 Phung Thanh Quang, Khuc The Anh
 Huynh Anh Thu, Nguyen Thi Bich Ngoc
74. **THE IMPACT OF DIGITAL TRANSFORMATION ON CUSTOMER SATISFACTION TO DIGITAL BANKING SERVICE OF COMMERCIAL BANKS IN VIETNAM 965**
 Khuc The Anh, Quan Trung Duc
 Tran Thi Ngoc Anh, Nguyen Tuan Dat
 Nguyen Hong Ha, Nguyen Trung Kien
75. **THE EFFECT OF ONLINE ADVERTISING PLACEMENT AND THE NUMBER OF IDENTICAL ONLINE ADVERTISEMENTS ON BRAND AWARENESS: AN EXPERIMENTAL RESEARCH ON UNIVERSITY STUDENTS IN HANOI..... 978**
 MSc. Hoang Tuan Dung, Le Thi Thu
 Le Duc Hanh, Hoang Tien Dat
 Le Thi Tram Anh, Nguyen Da Thu Huong
76. **FACTORS AFFECTING INNOVATIVE WORK BEHAVIOR OF EMPLOYEES: A STUDY OF STARTUPS AT VIETNAM NATIONAL INNOVATION CENTER..... 989**
 Assoc. Prof. Dr. Le Thi My Linh, Dao Dang Phuong Anh
77. **THE EMPLOYEE’S READINESS TO CHANGE IN DIGITAL TRANSFORMATION: THE CASE OF SMES IN HANOI..... 1005**
 Nguyen Thi Thu Thuy, Nguyen My Tam
 Pham Thu Ha, Nguyen Thu Hien, Nguyen Van Kien
78. **APPLICATIONS INFORMATION AND COMMUNICATIONS TECHNOGY IN WAREHOUSE OPERATION: A CASE STUDY IN VIETNAMESE LOGISTICS COMPANIES 1022**
 Bui Thi To Loan, To Thi Hang
79. **CASHLESS PAYMENTS IN VIETNAM: BEFORE AND DURING THE COVID-19 PANDEMIC 1030**
 Dr. Nguyen Thi Vu Khuyen
80. **CREDIT RISK MANAGEMENT ENABLING BY MACHINE LEARNING ... 1042**
 Truong Thi Hoai Linh

81. **EXPLORING FARMERS' CURRENT ACCESS AND INTENTION TO USE DIGITAL SEASONAL FORECAST AND ADVISORY SERVICE IN THE MEKONG RIVER DELTA, VIETNAM.....1052**
 Luong Van Lam
 Assoc. Prof. Dr. Nguyen Cong Thanh
82. **EVALUATIONS OF E-WALLETS IN VIETNAM FOR SUSTAINABLE DEVELOPMENT TARGET1064**
 Dr. Nguyen Minh Phuong
83. **USING INFLUENCER MARKETING TO PROMOTE VIETNAM TOURISM..1072**
 Tran Thi Tuan Anh
84. **DUAL PANEL MODEL OF CORPORATE GOVERNANCE AND FIRM PERFORMANCE IN PUBLICLY HELD ENTERPRISES.....1079**
 Dao Anh Tuan, Dao Thanh Tung

SESSION 4: RESOURCES, ENVIRONMENT AND CLIMATE CHANGE

85. **FACTORS AFFECTING THE CLASSIFICATION OF DOMESTIC WASTE IN THE HANOI CITY1095**
 Nguyen Thi Minh Phuong, Hoang Tuan Minh
 Tran Ba Vuong, Nguyen Thi Phuong Tram
 Nguyen Thi Minh Chau, Hua Pham Tien Dat
 Nguyen Minh Chau
86. **CARBON TAXES AND OIL PRICES: DRIVING INFLATION UP OR DOWN?1111**
 Tran Ngoc Lan Anh, Nguyen Phuong Thuy An
 Tran Dinh Hanh Giang, Cao Kim Cuong
 To Cong Nguyen Bao
87. **FACTORS AFFECTING THE IMPLEMENTATION OF ENVIRONMENTAL MANAGEMENT ACCOUNTING: A CASE STUDY OF MANUFACTURING ENTERPRISES IN HANOI1124**
 Dr. Chu Thi Bich Hanh, Dr. Dang Thu Hang
88. **THE IMPACT OF GREEN SUPPLY CHAIN MANAGEMENT ON BUSINESS PERFORMANCE: THE CASE OF TEXTILE ENTERPRISES IN VIETNAM...1137**
 Du Duc Tu, Tran Thanh An, Trinh Thi Linh
 Vu Nguyen Thao Nguyen, Ta Phuong Quynh
 Assoc. Prof. Dr. Nguyen Xuan Hung, Tran Thi Phuong
89. **THE ROLE OF GREEN INNOVATION IN PROMOTING THE CIRCULARITY PERFORMANCE IN EUROPE.....1155**
 MSc. Nguyen Thi Nhung, MSc. Tran Thi Ngoc Phuong

90. **ASSESSMENT OF AGRICULTURAL LAND QUALITY IN THE BUFFER ZONE OF TAM DAO NATIONAL PARK..... 1178**
PhD Student. Ta Ngoc Long, Prof. Dr. Nguyen The Dang
91. **THE IMPACT OF THE SOCIAL RESPONSIBILITY OF THE DESTINATION ON THE ENVIRONMENTALLY RESPONSIBLE BEHAVIOR OF THE COMMUNITY: A CASE STUDY IN NHA TRANG CITY, KHANH HOA, VIETNAM 1189**
BBA Nguyen Hung Vi, MA. Huynh Phuong Duyen
92. **THE POWER OF POSITIVE CHANGE: ESG AND CORPORATE DIVIDEND POLICY 1203**
Nguyen Hong Hanh, Tran Dinh Hoang
Dinh Thi Lan Huong, Nguyen Le Thu Tra
Truong Hoang Bao Tran, To Cong Nguyen Bao
93. **ENVIRONMENTAL BARRIERS FOR VIETNAM'S SEAFOOD EXPORTS TO EU MARKET: STATUS AND IMPLICATIONS..... 1218**
Assoc. Prof. Dr. Dinh Duc Truong
94. **DETERMINANTS OF PERCEIVED EFFICACY OF SLUICE GATES IN KIEN GIANG PROVINCE..... 1233**
Dr. Nguyen Dieu Hang, Assoc. Prof. Dr. Nguyen Cong Thanh
Dr. Nguyen Hoang Nam
95. **OPPORTUNITIES FOR CIRCULAR ECONOMY IN NATURAL ESSENTIAL OIL PRODUCTION IN VIETNAM..... 1246**
Le Thu Hoa, Nguyen Quang Huy
Vu Tuong Vi, Nguyen Dinh Hung
Lam Thi Bich Ngoc
96. **MEASURING CARBON FOOTPRINT BASED ON LIFE-CYCLE ASSESSMENT OF SUSTAINABLE FOOD VALUE CHAINS: PRELIMINARY RESULTS OF THE PIZZA 4P'S CASE STUDY..... 1261**
Assoc. Prof. Dr. Nguyen Cong Thanh
Dr. Nguyen Hoang Nam, Dr. Nguyen Dieu Hang
97. **COMMUNITY-BASED FOREST MANAGEMENT IN XUAN LIEN NATURE RESERVE 1276**
Nguyen Quang Hong, Do Mai Linh
98. **FACTORS INFLUENCING THE DESIGN AND IMPLEMENTATION OF A CARBON PRICING POLICY: A SYSTEMATIC LITERATURE REVIEW 1289**
Le Huy Huan, Doan Thi Ngoc Ha
Nguyen Ha My, Dang Khanh Linh

99. **APPROPRIATE WASTE-TO-ENERGY TECHNOLOGY FOR VIETNAM TOWARDS A CIRCULAR ECONOMY IN WASTE MANAGEMENT1299**
MSc. Nguyen The Thong
100. **ENERGY TRANSITION FOR 2050 NET ZERO IN VIETNAM: OPPORTUNITIES, CHALLENGES AND POLICY IMPLICATIONS1310**
Assoc. Prof. Dr. Vu Thi Hoai Thu
101. **GREEN CREDIT SOLUTIONS TO MITIGATE CLIMATE CHANGE IN VIETNAM.....1323**
MBA. Dang Thuy Linh
102. **ENVIRONMENTAL COMMUNICATION THROUGH THE CASE STUDY OF PLASTIC WASTE COMMUNICATION PRODUCTS IN VIETNAM ..1333**
Assoc. Prof. Dr. Dinh Kieu Chau
103. **DEVELOPING GREEN BANKS IN THE CONTEXT OF DIGITAL TRANSFORMATION IN VIETNAM COMMERCIAL BANKS TODAY ...1344**
MA. Vu Thanh Tung
104. **IMPACT OF CLIMATE CHANGE ON SOCIO-ECONOMIC ACTIVITIES IN VIETNAM.....1358**
Nguyen Vu Tram Anh, Vo Thanh Truc
105. **THE CRITERIA FOR THE DEVELOPMENT OF A ZERO-EMISSION PORT - GREEN PORT.....1372**
Dang Manh Ha, Nguyen Thi Thuy Hong
106. **THE IMPACT OF NATURAL DISASTERS AND CLIMATE CHANGE ON GLOBAL AND VIETNAM INSURANCE INDUSTRIES.....1386**
MSc. Dang Thi Minh Thuy, Dr. Phan Anh Tuan
107. **EVALUATE THE POTENTIAL FOR THE DEVELOPMENT OF SOME CIRCULAR BUSINESS MODELS FOR PLASTIC PACKAGING IN URBAN AREAS IN DEVELOPING ECONOMIES.....1394**
MA. Trinh Thi Tuyet Dung, Dr. Vu Kim Chi
108. **UTILIZATION OF NATURAL CAPITAL IN CIRCULAR ECONOMY: SOLUTIONS FOR SUSTAINABLE ECONOMIC DEVELOPMENT1404**
Dr. Nguyen Thi Hien Oanh
109. **PROMOTING THE GREEN ECONOMY TOGETHER ENVIRONMENTALLY SUSTAINABLE DEVELOPMENT IN VIETNAM: SOME THEORETICAL AND PRACTICAL ISSUES1418**
MA. Trinh Thi Kim Thoa
110. **FACTORS INFLUENCING BEHAVIOUR OF HOUSEHOLD SOLID WASTE SEPARATION IN THANH XUAN DISTRICT, HANOI CAPITAL.....1429**
Dr. Ngo Thanh Mai, Do Duc Duy

SESSION 5: URBAN AND REGIONAL DEVELOPMENT

111. **FACTORS AFFECTING PROFITABILITY OF REAL ESTATE ENTERPRISE LISTED ON THE STOCK MARKET 1439**
Assoc. Prof. Dr. Phan Huu Nghi, Nguyen Hong Phuc
Tran Lan Anh, Nguyen Thi Bich Ha
Vu Ngoc Bich, Tran Duc Anh
112. **FACTORS AFFECTING VIETNAMESE CUSTOMERS' INTENTION TO PURCHASE RECYCLED PRODUCTS 1447**
Dr. Nguyen Thi Phuong Linh
113. **COMMUNITY-BASED TOURISM DEVELOPMENT IN PHONG NHA - KE BANG NATIONAL PARK 1457**
MBA. Nguyen Tuyet Khanh, MSc. Le Khac Hoai Thanh
114. **MIGRATION IN ASIAN COUNTRIES: EXPLORING THE EVIDENCE FOR THE INFLUENCE OF CLIMATE CHANGE AND SOCIO-ECONOMIC FACTORS..... 1468**
MA. Huynh Hien Hai
115. **LIVELIHOOD DIVERSIFICATION AND POVERTY IN THE SALTWATER INTRUSION AREA OF THE MEKONG DELTA, VIETNAM..... 1476**
MA. Le Thi Kim Loan, Dr. Ngo Thi Thanh Truc
Dr. Duong Dang Khoa
116. **IMPACT OF THE COVID-19 EPIDEMIC ON REAL ESTATE COMPANIES IN VIETNAM..... 1491**
Dr. Nguyen Thi Tuyet, MA. Le Thanh Nhan
117. **THE EXPERIENCES AND CHARACTERS OF KAREN ENTREPRENEUR FARMERS IN NORTHERN THAILAND: A CASE STUDY OF HIGHLAND KAREN FARMERS IN OMKOI DISTRICT, CHIANG MAI PROVINCE, THAILAND 1501**
Dr. Jirawat Rugchat, Ms. Pawanrat Buochareon
118. **THE DETERMINANTS OF VIET NAM'S URBANIZATION..... 1512**
Dr. Nguyen Thi Thanh Huyen, Le Thu Trang
Nguyen Thi Thanh Thuy, Vu Phuong Anh, Ngo Duy Chuong
119. **ECONOMIC INSTITUTIONS: A BARRIER OF REGIONAL COMPETITIVENESS OF THE RED RIVER DELTA REGION? 1527**
Dr. Nguyen Thi Phuong Thu, Le Vu Thuy Tien
120. **DEVELOPING COMMUNITY-BASED TOURISM FOR ADAPTING TO CLIMATE CHANGE IN THIENG LIENG ISLAND, CAN GIO MANGROVE BIOSPHERE RESERVE, HO CHI MINH CITY, VIETNAM 1537**
Ta Duy Linh, Duong Duc Minh

121. **MOTIVATIONS OF HOUSING TENURE CHOICE AMONG RURAL-
URBAN MIGRANTS: A CASE STUDY IN HANOI, VIETNAM1543**
MSc. Nguyen Le Dieu Linh
122. **ASSESSING THE POTENTIAL AND ORIENTATION DEVELOPMENT OF
TOURISM ROUTES IN PHU YEN PROVINCE, VIET NAM.....1554**
PhD. Student. Tran Quoc Nhuan, Dr. Pham Thi Binh
Assoc. Prof. Dr. Pham Xuan Hau
123. **AN ANALYSIS OF ECONOMIC STRUCTURE AND DIGITAL TRANSFORMATION
AT THE PROVINCIAL LEVEL: THE CASE OF NGHE AN.....1564**
MSc. Ngo Mai Phuong, MSc. Tran Thi Ngoc Phuong
124. **THE WORLD'S POLICIES ON DEVELOPING REAL ESTATE ENTERPRISES
AND GOVERNANCE IMPLICATIONS FOR VIETNAM.....1576**
PhD student. MBA. Le Nguyen Hong Phuong

ENTREPRENEURIAL FARMERS IN THE CHANGING WORLD: ARE THEY DISAPPEARING? EVIDENCE FROM VIETNAM

Dr. Trinh Anh Khoa

khoata24@fe.edu.vn

FPT Greenwich Centre, FPT University, Da Nang Campus, Vietnam

Abstract

Urbanisation, industrialisation and climate change have forced farmers to adapt to the new context. Previous studies have investigated factors correlated with the non-farm income structure of farm households, but very few studies, especially in developing economies, exploring drivers of non-farm business diversification decisions of farm households at the transition point from pure farm households to households having farm and non-farm business income or non-farm households. We know much less about external micro-level community and environmental factors that contribute to the livelihood transition of farmers. Employing a rich dataset of 1,868 repeatedly surveyed farmers extracted from the Viet Nam Access to Resources Household Survey (VARHS) in 2006-2016, this study investigates factors driving the non-farm business diversification decisions of farmers. Probit and ivprobit (probit regression with instrumental variable(s) - IVs) models were employed for estimating. Using data from ten years allows us to identify farmers' non-farm business diversification decisions more precisely and to examine the long-term impact of disasters (i.e., floods) on non-farm business diversification decisions of farmers. The results show that experiencing natural disasters in the previous years, credit utilisation, migration to the commune, extension services, information access, demographic characteristics, and non-farm wage are significant determinants of the non-farm business diversification decisions of farmers. The study provides some suggestions for enhancing farmers' income diversification to suit the new context.

Keywords: *Climate change, entrepreneurship, farmer, floods, diversification, poverty*

1. Introduction

Urbanisation, industrialisation, and climate change have forced farmers to adapt to the new context. However, we believe that the change is not easy because of the demographic challenges of rural regions (Gurría, 2007) and farmers' specific psychological characteristics, such as conservative. Farmer conservatory can be explained by the characteristics of farmer societies as described by Scott (1976), which are characterised by "a constant competing to remain equal" (Tucker, 2010, p.933). "Peasant [farmers] sociality is thus resistant to entrepreneurial innovation and development" (Tucker, 2010, p.933). Due to the characteristics of agriculture that depend on nature, farmers have to rely on each other to cope with natural disasters and support each other, resulting in farmers' timid and passive mentality (Nguyen, 2005). The village's law that regulates the behaviour of individuals is

the value system and standards of the village, creating the identity of individuals in the same village. This identity, in turn, creates a mentality of dependence on the collective and the habit of relying on the majority (Nguyen, 2005). The theory of social learning states that observing and reproducing a person's behaviour may result in imitating that behaviour (Jager et al., 2000). Imitation is an automatic social process related to the theory of social learning and normative conduct (Schmit and Rounsevell, 2006). People use imitation to learn new behaviours to economise their cognitive efforts (Jager et al., 2000).

Similarly, farmers rely on imitation and habits to efficiently use their limited cognitive resources (Jager et al., 2000). They will look for powerful solutions (such as imitation) to put into social processes when faced with uncertainties (Festinger, 1954 in Jager et al. (2000), Schmit and Rounsevell, 2006). Imitation is considered a vital factor in the innovation process in agriculture, such as using new fertiliser (Feder and Umali, 1993) and adopting conservation tillage practices (Warriner and Moul, 1992). Gautam and Anderson (2016) argue that a solid social network positively influences the livelihood diversification of rural households. The research of Cai et al. (2018, p.250) shows a positive correlation between the demographic structure of the village, such as the number of families aged between 16 and 64 and the business operation of households. McNamara and Weiss (2005) and Bhandari (2013) find that the percentage of non-farm household in the village positively affect the non-farm income diversification of households.

Rich production knowledge is accumulated through experience. Farmers have more experience have a better modern technology assessment ability (Adesina and Baidu-Forson, 1995) and risk assessment ability (Mubaya et al., 2012). On the other hand, more farming experience may negatively affect farmers' innovation as they are already familiar with farming. Tucker (2003) states that innovation mainly comes from hybrid villagers who used to live outside of the village or incomers. Surprisingly, to the best of our knowledge, no previous study has examined the influence of migration to the village on the income diversification of farmers. In this study, we consider the number of migrants to the village in the previous years can influence the non-farm business of farmers.

The biggest challenge to supporting rural entrepreneurship processes is the low level of education of the rural population (Gurría, 2007). Low educational attainment has been found to be correlated with cognitive impairment in individuals (Brucki and Nitrini, 2014). Due to limited cognitive resources, people do not continually optimise outcomes, but most of the day-to-day process is habitually repetitive choices to achieve satisfaction (Simon, 1976; Jager et al., 2000). This argument is supported by Banerjee (2003) that "people may not always seek out the best options because they are held back by psychological constraints or social norms" (p.2). Education is commonly used in previous studies regarding factors affecting adoption decisions (Adesina and Baidu-Forson, 1995). The higher the education level, the higher the technology adoption level of farmers (Strauss et al., 1991). Interestingly, Cai et al. (2018) find a negative effect of education on entrepreneurship in rural households. In addition to education, other demographic characteristics are also examined, including gender (Bhandari, 2013; Caldas et al., 2014; Cai et al., 2018), age

(Bonnieux et al., 1998; García-Arias et al., 2015; Weltin et al., 2017), household size (Hennessy and Rehman, 2008), number of working age members of the household (Gautam and Anderson, 2016), and farm size (Arslan et al., 2018).

Other external factors must also be present for the income diversification of farmers. Individuals who lack credit access have little chance of becoming entrepreneurs to lift themselves beyond their current circumstances (Banerjee and Newman, 1993; Beck et al., 2009; Oseni and Winters, 2009; Villasenor and West, 2015). A simple entrepreneurial activity in agricultural production, such as using modern inputs (e.g., fertiliser) of poor farmers in rural areas in some localities in order to improve agricultural productivity, also requires heavy subsidies (Dugger, 2007) or at least free fertiliser delivery support (Duflo et al., 2011). Credit is considered a resource used for investment, transformation and livelihood expansion. Cai et al. (2018)'s regression model revealed a negative and significant association between credit constraints and household entrepreneurship. Folmer et al. (2010) recommend capital market development as an essential driver of farmers' entrepreneurship.

The farming village's access to transportation networks, as a conduit for information flows and networking with key actors in the rural economy's agricultural supply chain, transporting farm inputs onsite and, most importantly, selling perishable farm outputs promptly. Reardon et al. (2001) emphasise the vital role of transportation improvement in promoting non-farm activity growth in Latin America. Regarding the role of information flows in income diversification, Mubaya et al. (2012) state that a lack of knowledge is an obstacle for households to make an investment decision. The research result of Strauss et al. (1991) shows that exposure to media plays an important role in information generation for technology adoption by farmers.

As mentioned above, agricultural production is risky as it heavily depends on the weather conditions. The adverse impacts of climate change put more pressure on agricultural production. Climate change will likely increase more disasters and diseases affecting agricultural productivity (WB and ADB, 2020). Previous studies have investigated the impacts of climate change on rural household livelihood strategies (e.g., Mendelsohn et al., 2006; Seo and Mendelsohn, 2008; Huang et al., 2014; Arslan et al., 2018). In particular, Huang et al. (2014) find that farmers' extreme weather experiences significantly influence crop diversification. Further, Arslan et al. (2018)'s study reveals that rainfall variation in the growing period is more likely correlated with livestock diversification, whereas less likely correlated with income diversification of households.

In this paper, we investigate internal and external factors affecting the non-farm business of farmers with some improvements. Using data in two years allows us to identify farmers' non-farm businesses more precisely. Notably, a household's non-farm business is identified if the household did not have a non-farm business in the income structure in 2014 but in 2016. This definition makes it clear that the decision to diversify non-farm business has only recently been made rather than may have been made before. The temporal data are challenging to resolve. Regarding the impact of climate change on the non-farm business of

farmers, we use the data from 2006 to 2016 to investigate the long-term and short-term impacts of natural disasters on the non-farm business of farmers. We include more external factors that can significantly influence the non-farm business of farmers that have been ignored in previous studies.

2. Method

This paper uses Viet Nam Access to Resources Household Survey (VARHS) from 2006 to 2016 for analysing.

Probit regression was employed to estimate factors correlated with farmers' non-farm business. The model takes the following form:

$$\Pr (Y = 1 | X) = \Phi (\beta X^T) \quad (1)$$

Where Y is the non-farm business of farm households taking the value of 1 if a household had non-farm business in 2016 but not in 2014 and a value of 0 otherwise. Φ is the Cumulative Distribution Function of the standard normal distribution. Parameters β are estimated by the maximum likelihood method. X denotes exploratory variables.

Among exploratory variables, we pay attention to the potential endogenous problem of the credit utilisation status of farmers. In particular, it is hard to determine whether households that want to diversify non-farm businesses are more likely to borrow or credit access influences the probability of diversifying the income of households (Cai et al., 2018). The estimations from probit regression may be biased due to this problem. We employed probit regression with instrumental variable(s) (ivprobit) to solve the problem. The ivprobit model can be written as follows:

$$Y_{1i}^* = \beta Y_{2i} + \gamma X_{1i} + \varepsilon_i \quad (2)$$

$$Y_{2i} = \Pi_1 X_{1i} + \Pi_2 X_{2i} + \delta_i \quad (3)$$

Where Y_{2i} is a $1 \times k$ vector of endogenous variable (credit utilisation), X_{1i} is a $1 \times k_1$ vector of exogenous explanatory variables, X_{2i} is a $1 \times k_2$ vector of the instrumental variable. Assuming $(\varepsilon_i, \delta_i) \sim N(0, \Sigma)$. β and γ are structural parameter vectors. Π_1 and Π_2 are reduced-form parameter matrices. Y_{1i}^* cannot be observed, but the following Y_{1i} is observable:

$$Y_{1i} = \begin{cases} 0, & Y_{1i}^* < 0 \\ 1, & Y_{1i}^* \geq 0 \end{cases} \quad (4)$$

We use the distance to credit provider(s) to instrument credit utilisation for some reasons. First, this variable has been used as an instrumental variable for credit utilisation in previous studies estimating the impact of credit utilisation on poverty (e.g., Churchill and Marisetty, 2020; Bukari et al., 2021). These authors argue that the influence of poverty on the distance to credit institutions is impossible, and the impact of distance to credit institutions on poverty (if any) must be via credit utilisation. Likewise, we argue that the correlation between distance to credit providers and non-farm business (if any) must be via credit utilisation. It is hard for the reverse direction to happen.

3. Results and discussion

We run different models to investigate the impacts of internal and external factors that influence the non-farm business of farmers with an emphasis on the long- and short-term impacts of flooding. We also run the ivprobit models to investigate the endogenous problem of credit utilisation, one of our variables of interest. F statistics values beyond the threshold of ten indicate that our IV is not weak (Stock et al., 2002). The estimating results from ivprobit are consistent with that of the probit models. The Wald test of exogeneity p-value is greater than 0.10, indicating that the estimating results from probit models are appropriate (Table 2). Thus, we only report the estimated results of the probit models (Table 1).

Across all models, we consistently find a positive and significant correlation between experiencing a flood in the previous years and non-farm business, but not the current year. As expected, we also find a positive impact of experiencing floods in the long-term on non-farm business, but it is insignificant. Due to data unavailability, we cannot examine the more prolonged impact of disasters on non-farm businesses like Huang et al. (2014)' study. However, ten years are long enough to test the long-term impact of a flood on the non-farm business of farmers. Our findings show that non-farm business diversification decisions of farmers are less likely to be influenced by both the immediate and long-term impacts of disasters (i.e., floods) but by the impacts of floods in a short period (i.e., two years in our study). Experiencing a flood in two consecutive years has a larger impact on non-farm business than in only one year. A possible explanation for the insignificant correlation between the long-term and immediate impacts of flood and non-farm business can be our argument about the negative side of farmers' agricultural experiences above. In particular, farmers familiar with agricultural production might hesitate to diversify into non-farm businesses requiring new knowledge and skills. On the other hand, experiences in agricultural production make it difficult for farmers to change in a very short-term under the impact of immediate disasters. Farmers who experience floods in the long-term have production strategies to cope with risks is another possible explanation for our findings.

Our models do not show a significant correlation between savings on non-farm business but credit utilisation. The finding is consistent with Cai et al. (2018)' finding regarding the importance of credit access in entrepreneurship of Chinese rural households. A non-farm business requires considerable capital explaining why savings cannot fulfil farmers' demand for a non-farm business project. The finding emphasises the important role of credit market development in rural entrepreneurship. However, the rural credit market is fragmented, characterised by the coexistence of formal and informal credit providers (e.g., Hoff and Stiglitz, 1990; Pham and Lensink, 2007). The asymmetric information in rural credit markets makes it difficult for the rural population to access formal credit institutions, while high-interest informal credit is not always available (Hoff and Stiglitz, 1990). Therefore, rural households primarily rely on friends and relatives to support their entrepreneurial projects (Sohn and Diaz, 2018). In case they, especially the poor, could borrow from formal credit institutions, most loans are small and are not enough to start a new business project. According

to Pham and Lensink (2007)'s statistics, the average loan volume from the formal credit providers is just around 4.8 million VND (equivalent to 406 USD).¹ Further, a large proportion of farmers who might have credit demand but do not borrow because of many influencing internal and external factors (Trinh et al., 2022). Therefore, solving the problem of rural credit market development is a concern for policymakers.

Regarding the impacts of demographic characteristics on non-farm business, young farmers are more likely to involve in non-farm business probably because young farmers are more willing to learn new things and to change (Morris et al., 2017). Agricultural production relies on the internal labour force. Our estimations also reveal this behaviour in farm households which made non-farm business diversification decisions. Household size shows a strong positive impact on the probability of non-farm business of farmers. On the other hand, the high number of members also puts more pressure on the household to diversify income sources. Deviating from previous studies (e.g., Adesina and Baidu-Forson, 1995; Strauss et al., 1991; Cai et al., 2018), we find a positive but insignificant effect of education on non-farm business. Notably, findings from our models show a significant and negative correlation between net monthly wage/salary and non-farm business, which supports our argument about the difference between non-farm income status and the non-farm business diversification decisions, and the passiveness of farmers. Farm households with high monthly wages/salary lack incentive to diversify into non-farm businesses requiring new knowledge and skills.

Deviate from the argument of Tucker (2003), the number of migrants to the commune in the previous 12 months exhibits a significant and negative effect on non-farm business, implying the purpose of migration is simply marriage, and the newcomers come from the same region (e.g., the same district) with not much significant differences in socio-economic conditions. Notably, the frequent visits of extension staff in the last 12 months significantly and positively influence farmers' non-farm business diversification decisions, indicating the importance of support from the government in enhancing farmers' entrepreneurship. Maulu et al. (2021) state that extension services are vital in rural development and poverty alleviation. The extension is an informal education form to help low-educated farmers accumulate scientific and technological knowledge (Kassie et al., 2011; Egziabher et al., 2013; Maulu et al., 2021). Our finding deviates from Diao et al. (2018)' argument that extension services do not significantly contribute to rural transformation. The success of extension service delivery in rural areas depends on many factors including the political environment and other socio-economic characteristics (Maulu et al., 2021).

We find a strong positive impact of access to information through the internet on non-farm business, although only five percent of farmers in our sample use the internet. This finding supports the argument of the World Bank about the importance of internet access, especially in developing countries:

¹ The authors use a dataset from 1998. The exchange rate was 1 USD = 11,800 VND on February 18th, 1998.

It [the internet] is a powerful tool for the delivery of essential services such as education and healthcare ... and contributes to enhanced government transparency and accountability. It also helps foster the social development of communities, including within the broader global context.

Source: <https://www.worldbank.org/en/topic/digitaldevelopment/brief/connecting-for-inclusion-broadband-access-for-all>

As the internet is not common in remote rural, however, we can assume that farmers who can access the internet may have a higher entrepreneurship spirit or live in a more advantaged area compared to their counterparts in other regions. However, the insignificant correlation between the regional category variable and non-farm business suggests another explanation. Diverse and available information from the internet can be the reason why internet access stimulates non-farm business diversification decisions of farmers. Also, according to the World Bank, expanding broadband in rural developing countries is a challenge requiring cooperation between the government and private broadband providers. In contrast, we find a significant negative correlation between electricity access, which is expected to be a significant driver of the non-farm business of farmers, and the non-farm business of farmers, although approximately 100 percent of farmers use electricity.

4. Conclusion

Diversification into non-farm activities is a crucial strategy for farmers to cope with the changes caused by urbanisation, industrialisation and the negative effects of climate change. However, farmers face many challenges when making a non-farm diversification decision, especially non-farm businesses requiring new knowledge and skills. Therefore, understanding factors affecting farmers' non-farm business diversification decisions is essential. Employing a unique dataset collected from 2006 to 2016 in Vietnam, this study examines internal and external factors influencing farmers' non-farm business diversification decisions.

Credit utilisation is an important driver of the non-farm business of farmers. However, the rural credit market in rural areas is fragmented with the coexistence of formal and informal credit providers. Formal credit providers hesitate to lend to farmers, while small-subsidised loans from the government and high-interest loans from informal credit providers cannot meet the farmers' demand. Therefore, the restructuring of the rural credit system and the diversification of rural credit programs are necessary to support farmers in non-farm business diversification. Besides the programs to support farmers in knowledge and production orientation, finding markets through extension services is critical. Programs to assist farmers in changing their livelihoods in the first few years after a disaster can be more effective than implementing them after a long period of farmers suffering a disaster. Promoting internet access for farmers in disadvantaged areas can encourage farmers to involve in the non-farm business. Although we find a negative correlation between the migration to the commune and the non-farm business of farmers, our estimation results indirectly support the view of encouraging young people to return to participate in

agricultural production in rural areas that Chen and Liang (2020) proposed to improve agriculture entrepreneurship because young farmers are more likely to engage in non-farm business. Due to data unavailability, we cannot investigate where the migrants come from. Further studies can re-examine the impact of the migration from other regions (e.g., other provinces) on the non-farm business of farmers.

AN ANALYSIS OF IMPACTS OF THE MONETARY POLICY IN VIETNAM

Assoc. Prof. Dr. Nguyen Van Cong

congyn@neu.edu.vn

Faculty of Economics, National Economics University, Hanoi, Vietnam

Abstract

This paper employs Structural Vector Autoregressive (SVAR) model to analyze impacts of the monetary policy on inflation and output growth in Vietnam using quarterly data from 1999Q2 to 2022Q3. The results show that: (i) the inflation responses expectedly to monetary policy shocks; (ii) higher interest rates, exchange rate depreciation has contractionary effects on output growth, while credit growth plays no role in determining output growth; (iii) past inflation and output growth play a key role in determining current inflation and output growth in Vietnam.

Keywords: *Monetary Policy, Inflation, Economic Growth, SVAR*

1. Introduction

Monetary policy which has the functions to regulate the monetary conditions of the economy with the aim to stabilize price, create favorable conditions for economic growth and improve life of the community is one of the most important macroeconomic policies. Monetary policy has increasingly played a crucial role in the planning and implementation of national macroeconomic policies.

Monetary policy has major impacts on the macroeconomic variables of the economy, still might be accompanied by undesirable consequences. In order to achieve the goals of regulating monetary policy and avoid unexpected effects, the the State Bank of Vietnam will need to base on a full or proper assessment of the timing and impacts of the use of monetary policy tools on the economy, namely money supply, credit growth, interest rates and exchange rates.

In Vietnam, there have been a number of studies using VAR and SVAR models to analyze impacts of the monetary policy on inflation and output growth such as Nguyen Viet Hung and Pfau (2008), Pham The Anh (2009), Nguyen Thi Thu Hang and Nguyen Duc Thanh (2010), Bhattacharya, R. (2013), Pham The Anh et al (2015), (The Anh Pham et al, 2022) ... However, previous studies often examined in the context when Vietnam's economy has been achieving great successes in economic growth and macroeconomic stability. The success of the economy has been being challenged by a series of recent adverse international economic events such as the US-China trade war, the Covid-19 pandemic, the Russia-Ukraine war, high inflation and monetary contractions in developed countries. Most of the previous studies used oil prices (and sometimes rice prices) in the international market as a proxy for the world price level. This choice was considered too simple and inappropriate

because oil and rice are major commodities whose prices are much more volatile compared to the overall price level in the world market. Another limitation of many previous studies was that the bilateral exchange rate between VND and USD rather than nominal effective exchange rate was used a proxy for exchange rate, so purchasing power parity (PPP) was not fully reflected. The empirical results on the impacts of the monetary policy shocks on inflation and economic growth in many cases were conflicting. This paper aims to make a contribution in this areas.

The purpose of this paper is to apply the SVAR model to find empirical evidence on the effects of monetary policy shocks on inflation and output growth in Vietnam in the period 1999Q2-2022Q3 and give some suggestions to effectively use monetary policy in controlling inflation and promoting economic growth in Vietnam in the coming years.

The paper is structured as follows. After the introduction, section 2 describes the research methodology and data. Section 3 provides empirical results and discussion. The final section concludes and draws some policy implications.

2. Method

2.1. Research Methods

This paper applies a structural vector autoregressive (SVAR) model to investigate impacts of the monetary policy in a small open economy. The SVAR model is very flexible and has an advantage over traditional large-scale macro-econometric models in that the results are not obscured by a large and sophisticated structure but are readily available and easily interpreted. Sims (1980) argues that SVAR models provide a more systematic approach to imposing restrictions, which may allow researchers to handling various economic issues and problems concerning the identification of the contemporaneous and dynamic relationships between macroeconomic variables and the policy instruments.

The relationship between macroeconomic variables can be modeled using SVAR as follows:

$$A_0 Y_t = A_1 Y_{t-1} + A_2 Y_{t-2} + \dots + A_p Y_{t-p} + \varepsilon_t \quad (1)$$

where Y_t is a $(N \times 1)$ vector of endogenous variables at time t , A_i is a $(N \times N)$ matrix of coefficients for $i = 0, 1, 2, \dots, p$; while ε_t is a $(N \times 1)$ multivariate white noise error process.

The SVAR model coefficients are estimated in two stages (Raghavan et al, 2007). The first stage is to obtain the following reduced form equations associated with (1):

$$Y_t = A_0^{-1} A_1 Y_{t-1} + A_0^{-1} A_2 Y_{t-2} + \dots + A_0^{-1} A_p Y_{t-p} + A_0^{-1} \varepsilon_t \quad (2)$$

$$Y_t = B_1 Y_{t-1} + B_2 Y_{t-2} + \dots + B_p Y_{t-p} + v_t \quad (3)$$

where $B_i = A_0^{-1} A_i$, $i=1, 2, \dots, p$ and $v_t = A_0^{-1} \varepsilon_t$. The expression described in (3) is the reduced VAR and v_t is the innovation corresponding to the reduced form and has zero mean and constant variance v_t . N equations in the VAR in (3) are estimated by OLS and the VAR residuals v_t are obtained.

The second stage consists of identifying the contemporaneous matrix A_0 and the variance-covariance matrix Σ through the following equation:

$$\ln L_t = -(1/2) \ln(2\pi) - (1/2) \ln |A_0^{-1}| \sum (A_0^{-1})' / - \frac{1}{2} \hat{v}_t' A_0^{-1} \sum (A_0^{-1})' \hat{v}_t$$

where Σ is restricted to be a diagonal matrix, while v_t is the estimated residuals from the reduced VAR. The residuals from the reduced VAR are transformed into a system of structural equations by imposing restrictions.

2.2. Data and unit-root test

The SVAR model used to analyze the impacts of monetary policy on inflation and output growth in Vietnam will include 10 variables and be divided into 2 sectors: foreign and domestic. The foreign sector is represented by three variables: output, price level, and interest rate. Vietnam is an open, small-scale economy, so the variables representing the foreign sector acting as exogenous variables only have a one-way effect on domestic variables. The domestic sector consists of seven variables: output, price level, money supply, aggregate credit, interest rate, and exchange rate. According to the Law on the State Bank of Vietnam (SBV) in 2010, the tools of monetary policy include: refinancing (Article 11), interest rate (Article 12), exchange rate (Article 13), required reserves (Article 14), and open market operations (Article 15); while the goal of monetary policy is to stabilize the value of money expressed by the inflation target (Article 3) (The National Assembly, 2010). In fact, the interest rates, exchange rates, credit growth and money growth are under the direct control of the SBV. In addition to controlling inflation, Vietnam's monetary policy also aims to stabilize monetary and financial systems and stimulate economic growth. Therefore, in this study, a combination of interest rates, credit growth, money growth and exchange rates is used as tools of the monetary policy while inflation and real GDP growth rate represents the target variable in the execution of monetary policy. The variables and scales are described in detail as follows:

- + Output (Y): The output is measured by the real GDP.
- + Money supply (M2): The monetary aggregate M2 represents the money supply including cash outside banks and deposits at commercial banks.
- + Aggregate credit (DC): The total domestic claims are used for the aggregate credit.
- + Interest rate (R): Lending rate at commercial banks is used to represent the interest rate variable.
- + Price level (CPI): The price level is measured by the CPI.
- + Exchange rate (NEER): Instead of using the bilateral exchange rate between VND and USD, the paper uses the effective nominal exchange rate² which is considered to be a better proxy for the exchange rate. The exchange rate is defined as the amount of VND per

² Calculated basing on exchange rates, from IFS, weighted by shares of total trade value for 1999Q2-2022Q3, from DOTS-IMF

unit of foreign currency, so an increase in the exchange rate means that the VND depreciates against the foreign currencies.

+ Foreign price level (FCPI): Previous studies often used the rice or oil price in the world market to represent the international price. In the author's view, this choice is convenient, but not reasonable because the prices of these commodities fluctuate sharply. This paper uses the weighted average CPI of Vietnam's 22 largest trading partners³ as a proxy for foreign price.

+ Foreign output (FY): Real GDP of OECD countries is used as a proxy for foreign output.

+ Foreign interest rate (FR): The U.S. Federal Funds rate is used as a proxy for the foreign interest rate.

Table 1. Variables included in the SVAR model

Variables	Abbreviation	Definition	Sources
Foreign sector			
Price	FCPI	Consumer Price Index	Own calculations from IFS/DOTS-IMF database
Output	FY	OECD real GDP	OECD
Interest Rate	FR	US Federal Funds Rate	IFS-IMF
Domestic sector			
Output	Y	Real GDP	GSO
Price	CPI	Consumer Price Index	IFS-IMF
Money Supply	M2	Monetary Aggregate M2	IFS-IMF
Aggregate Credit	DC	Total domestic claims	IFS-IMF
Interest rate	R	Lending interest rate	IFS-IMF
Exchange rate	E	Nominal Effective Exchange Rate	Own calculations from IFS/DOTS-IMF database

Note: IFS/DOTS-IMF: International Monetary Fund's database of financial indicators/trade trends

All data (except for the US federal funds rate) are seasonally adjusted using the central moving average (CMA) method. The central moving average is to ensure that shocks reflect changes from the long-term trend of those variables. All data (except for interest rates) are in log form (ln) in order to narrow the range of variables to be measured and to make the series more stable and thus the first difference of these variables (dln) represent their growth rates.

³ 22 Vietnam largest trading partners in the period 1999-2022 include: Belgium, Brazil, Canada, Hong Kong, China, France, Germany, Indonesia, India, Italy, Japan, Korea, Malaysia, The Netherlands, Philippines, Russia, Singapore, Spain, Switzerland, Thailand, United Kingdom and United States.

Unit-root Tests

Our first step is to check the above set of data series (in log form and seasonally adjusted) to see if they are stationary. The Augmented Dickey-Fuller (ADF) test is used to derive the accurate conclusion on unit roots of the variables. The number of lags in ADF test is selected according to Akaike Information Criterion (AIC). The test statistics suggest that both the domestic interest rate and the Federal funds rate are stationary at 1% significance level. All variables in log form and seasonally adjusted including LNY, LNCPI, LNM2, LNDC, LNE, LNFY and LNF CPI are not stationary, but their first differences (DLN) representing their growth rates are stationary at 1% significance level. Therefore, the paper will estimate the SVAR model with the Federal funds rate and the domestic interest rate as the base data while the remaining variables are in the first-difference form. The result of these unit-root tests are reported in Table 2.

Table 2. Unit root-test results

	LNY		LNCPI		RSA		LNDC		LNM2

3. Results

3.1. SVAR Estimation

We specify the endogenous max lag to eight (equivalent to two years), add an intercept, a time trend, and seasonal dummies to compute information criteria to choose the optimal number of endogenous lags for the VAR model. The result shows that many criteria like Akaike Info Criterion (AIC), Final Prediction Error (FPE), or sequential modified LR test statistic (LR) suggest that the model should be estimated with seven lags.

To estimate the structural model and calculate the impulse response function and variance decomposition, we impose restrictions on the matrices A and B. Specifically, for B, the author chooses the diagonal matrix form, implying each structural shock ε_j only directly (immediately) affects the variable Y_j in the VAR system. Meanwhile, matrix A is initially estimated according to Cholesky arrangement with the order of variables as DLNY, DLNCPI, RSA, DLNDC, DLNM2 and DLNE respectively.

After matrix A is estimated, we look for coefficients that are not statistically significant at a conventional level and restrict them to zeros. Then, we follow a similar approach to release restrictions above the diagonal of matrix A one by one to see if any of them is statistically significant or not. Only significant coefficients will be kept in matrix A (The Anh Pham et al, 2022).

3.2. Effects of monetary policy shocks on inflation

Impulse response function

Figure 1 shows the impulse responses of the inflation to monetary shocks from the SVAR for a time horizon of sixteen quarters. The impulse response function from the VAR is presented together with a two standard-error bands. In general, inflation in Vietnam in the period 1999Q2-2022Q3 has responded as expected to monetary policy shocks: credit growth (shock 4), money growth (shock 5) and exchange rate (shock 6) have positive influences on inflation while interest rate (shock 3) has a negative effect on inflation.

Note: Shock 3: RSA; Shock 4: DLNDC; Shock 5: DLNM2; Shock 6: DLNE.

Source: Own calculation and drawing by EViews 10

First of all, interest rate has a negative influence on inflation as expected by macroeconomic theories: Higher interest rate reduces consumption and investment, thereby reducing aggregate demand and helping to reduce inflationary pressure. However, this effect is fairly weak in Vietnam, especially in the first 8 quarters. Since the 9th quarter, higher interest rate actually has a more significant negative effect on inflation. In essence, raising interest rate not only reduces aggregate demand and helps curb inflation, but also affects aggregate supply. Increasing interest rate raises the cost of production, reduces aggregate supply, and leads to cost-push inflation. Its effect on aggregate demand is expected to be weak while its effect on aggregate supply is more direct and often stronger in developing countries (Agénor & Montiel, 2015), as interest expenses account for a significant proportion of firms' production costs.

Second, it can be observed that a positive shock in the credit growth has a strong and statistically significant influence on inflation in Vietnam after 2 quarters. The effect tends to increase over time and reaches its peak at around the 14th-15th quarter.

Third, the money supply shock has a slower effect on inflation compared to credit shock. Money supply shock has only a positive and statistically significant effect on inflation since the fifth quarter after the shock. The effect reaches its peak at around the 5th-6th quarter and then diminishes.

Finally, the exchange rate shock has a fairly rapid and strong effect on inflation in Vietnam. Inflation increased immediately right after the exchange rate depreciation shock and reaches its peak after 6 quarters and then stabilizes at that level in the medium and long term. This result is similar to some studies on the exchange rate pass-through effects into inflation (Pham The Anh et al., 2015).

Variance decomposition

Together with the impulse response function, the forecast error variance decomposition is computed to assess the relative importance of monetary shocks in accounting for variance in inflation in Vietnam. The results of variance decomposition are presented in Table 4. In the first 2 quarters, past inflation (shock 2) plays a key role in determining current inflation. However, since the third quarter, monetary shocks turn out to be the main source of Vietnam's inflation. Particularly, monetary shocks explained 59.1% of the variation in inflation in Vietnam after 1 year; 70.3% after 2 years; and 63.7% after 3 years. Among monetary shocks, the money supply shock and the credit shock play the most important role. These two money shocks explain around 50% of inflation variation since fifth quarter. The other two money shocks (exchange rate and interest rate shocks) have weaker influence on inflation in Vietnam. They explain approximately 15% of the variation in inflation in Vietnam.

Table 4. Variance Decomposition for Inflation (DLNCPI)

Period	S.E.	Shock1	Shock2	Shock3	Shock4	Shock5	Shock6

3.3. The effect of monetary shocks on output growth

Impulse response function

The impulse responses of the real GDP growth rate to monetary shocks are presented in Figure 2. In general, money supply growth has a positive effect on output growth, while increases in interest rates and exchange rate have contracting effects of output growth.

Figure 2. Impulse Responses of the Real GDP Growth to Monetary Shocks

Note: Shock 3: RSA; Shock 4: DLNDC; Shock 5: DLNM2; Shock 6: DLNE.

Source: Own calculation and drawing by EViews 10

First of all, the interest rate shock has a negative effect on output growth immediately in the second quarter. Its effect tends to increase since the seventh quarter.

Second, credit shock has almost no effect on output growth both in the short and long run in Vietnam. This fact contrasts with the picture in most developing countries where the credit channel is expected to be the most important channel in the monetary transmission mechanism (Agénor & Montiel, 2015). Its effect tends to be weak in Vietnam because a significant proportion of credit growth does not flow into production sector but into speculative markets such as the stock market and the real estate market.

Third, money supply shock has a positive influence on output growth since the second quarter. This effect tends to maintain until the eighth quarter and then appears to disappear.

Fourth, the exchange rate depreciation has contractionary effects on output growth in Vietnam. Output growth starts to decline since the second quarter after the shock. This effect tends to increase over time and reaches its peak after 11 quarters and then gradually shrinks. This contractionary effects of devaluation have been evident in developing countries (Agénor & Montiel, 2015). The depreciation of the domestic currency is expected to makes our goods cheaper relative to foreign goods and domestic goods become more competitive in the international markets and thereby increases our exports and decreases our imports. However, this impact might be weak in the short run. The main reason is that the production structure of the economy is rigid in the short run, even if relative prices do change. In that case, an increase in the relative prices of exported goods would not bring about a quick enough rise in the production of exports, in particular in the case of primary products such as crude oil, seafood, rice, coffee, that account for a significant share of Vietnam’s exports. In addition, manufactured products are often considered to be more sensitive to fluctuations in relative prices, but most of them depend heavily on imported intermediate inputs and raw materials such as garments, footwear, electronic goods, computers and their parts, so their benefit from currency depreciation is minor and therefore relatively insensitive to changes in exchange rates. In addition, Vietnamese enterprises rely heavily on imported inputs from abroad, so a decrease in the value of the Vietnamese dong will increase the price of imported inputs, increase production costs and reduce total supply, causing a contraction effect on output. As a result, the economy may experience periods of higher inflation and lower output growth following a shock to the depreciation of the Vietnamese dong.

Variance Decomposition

Table 5 shows the decomposition of the variance of output growth (DLNY). It is clearly that most of the output growth is determined mainly by its own past innovation (shock 1) during the first 6 quarters, then this effect diminishes but still explain its variations by 48.5% after 2 years and by 42.4% after 3 years. In addition, monetary shocks play an increasingly important role in determining output growth in Vietnam. Specifically, monetary shocks explain 34% of its variation after 1 year; increasing to 46.3% after 2 years; reaching 53.9% after 3 years. Among monetary shocks, the money supply shock plays the most important role. The money supply shock explains 14.6% of variations in output growth after 1 year, then its contribution increases sharply to 28.8% after 7 quarters and remains high in the following quarters. Next, interest rate shocks also play a significant role to variation in output growth. The interest rate shock explains the variation in output growth by 9.3% after 1 year; 11.5% after 2 years and 14.6% after 3 years. Credit and exchange rate shocks play a modest role to variation in output growth in Vietnam. These two shocks explain about 10% of growth variations in Vietnam over the studied period.

4. Discussion and Conclusion

The paper explores the impacts of monetary policy shocks on inflation and output growth in Vietnam for the period from 1999Q2-2022Q3. The main findings and policy implications of the paper are as follows:

First, increases in growth rates of money supply, aggregate credit, and nominal effective exchange rate increases inflation, while an increase in interest rates reduces inflation. While inflation inertia is the main cause of inflation in the short term, the monetary shocks are the main cause of inflation in the medium and long term. This result reinforces confidence in the role of monetary policy as an important tool to control inflation in Vietnam.

Second, an increase in the money supply and a decrease in interest rates have an expansionary effect on output. This implies that there is a trade-off between inflation and output growth using monetary policy by changes money supply growth and interest rates.

Empirical evidence also suggests that the effect of monetary shocks will be larger on prices and smaller on real output. Therefore, the State Bank of Vietnam should implement a prudent monetary policy in line with the long-term inflation and output growth targets.

Third, exchange rate depreciation tends to increase inflation but decrease output growth. Therefore, the State Bank of Vietnam should be very careful in conduct the exchange rate policy, especially should avoid a sharp devaluation of domestic currency.

Fourth, past inflation is crucial in shaping the current inflation. This implies the significant role of credibility of government's policy toward inflation. The government to be patient in fighting inflation. The government should keep low inflation for at least 2 quarters, in order to rebuild the public's confidence about a more stable environment of the general price level and help reduce expectations about future inflation.

Abstract

The study examines the relationship of foreign direct investment, economic growth, trade openness and environment in Vietnam from 1986 to 2021. Study utilizes time series data and Vector Error Correction Model (VECM), after determining the number of cointegrating relationships using the Johansen (1995) multivariate test, which is adjusted for small sample sizes using the scaling factor suggested by Reimers (1992), Reinsel, and Ahn (1992). The research result does not support the hypothesis "Pollution Heaven" in Vietnam. In long-term, FDI does not make CO₂ emissions increase, trade openness has a positive impact on economic growth and so does CO₂ emissions. In short-term, there is a correlation between trade openness and CO₂ emissions, but economic growth and FDI have a negative impact on CO₂ emissions. Based on the study findings, the article proposes some policies to attract green investment projects and improve the environmental situation in Vietnam in the future.

Keywords: *Environment, FDI, Pollution Heaven, VECM.*

1. Introduction

The world has coped with many challenges related to global warming and climate changes over the past decade. Some reports from the Intergovernmental Panel on Climate Change (IPCC) have acknowledged the link between global warming and greenhouse gas (GHG) emissions. Among different types of greenhouse gases, the amount of carbon dioxide (CO₂) emissions created by humans through the burning of fossil fuels appears to be the primary contributor to global warming (IPCC). CO₂ emissions have become an important issue in international agreements on foreign direct investment (FDI) inflows and environmental quality as developing countries continue to grow. With regard to CO₂ emissions in developing countries, especially in Vietnam, concepts such as "low-carbon city" and "green economy" are becoming increasingly popular. Therefore, the factors that

affecting CO₂ emissions is a priority for Vietnam in addressing greenhouse gas emissions and global warming.

In general, there are still many contradictions regarding the relationship between FDI, economic growth, trade openness and CO₂ emissions in foreign studies. So, the topic “The relationship between FDI, economic growth, trade openness and environment in Vietnam from 1990 to 2021” was selected to research. Not only does this study provide our understandings about the impact of FDI on CO₂ emissions but also allows us to determine the validity of FDI - led growth and the "pollution haven" hypotheses in Vietnam. Therefore, the result of this study is expected to provide useful information for policymakers in introducing effective environmental policies.

Studies on the relationship between foreign direct investment, economic growth, trade openness, and CO₂ emissions have been examined by many researchers using many different methods and data collected from various scopes.

FDI and Environment

Pradhan (2021) collected data in the period from 1992 to 2014 and emphasized the important role of FDI and GDP in reducing CO₂ emissions in these countries. Demena and Afesorgbor (2020) analyzed 65 primary studies generating 1006 elasticity estimates and concluded that the basic impact of FDI on environmental emissions is negligible, and FDI significantly reduces the amount of emissions after accounting for heterogeneity across studies. Qun Bao et al. (2011) used panel data from 29 provinces in China during 1992-2004 and applied simultaneous equation estimation techniques to assess the impact of FDI on the overall and regional pollution emissions in China. They found that FDI generally helps to reduce pollution emissions in China, contributing significantly to the technical efficiency and environmental impact of FDI, which vary considerably across regions and pollutants. Nguyen Duy Phuong and Le Thi Minh Tuyen (2018) used data from 1986-2015 to demonstrate a U-shaped relationship between per capita income and environmental degradation in Vietnam. Vo Thi Thuy Kieu and Le Thong Tien (2019) used data from 50 developing countries during 2011-2017 to show that FDI had a more severe impact on environmental degradation.

GDP and Environment

Mohsin et al. (2022) used data from 1971 to 2016 and found a significant negative long-term relationship and a positive short-term relationship between CO₂ emissions and GDP. Tang and Tan (2015) analyzed data from 1976 to 2009 and concluded that energy consumption and income have a positive impact on CO₂ emissions, while income squared has a negative impact on CO₂ emissions in Vietnam, supporting the EKC hypothesis of an inverted U-shaped relationship between CO₂ emissions and economic growth.

Pham Vu Thang and Bui Tu Anh (2022) used panel data from 10 ASEAN countries from 1990 to 2017 and found that economic growth leads to environmental degradation in some countries such as the Philippines, Vietnam, Laos, Myanmar, and Cambodia, while in

the rest of the ASEAN countries, economic growth improves the environment. Nguyen Thi Hop (2022) used an autoregressive distributed lag (ARDL) model and data from 1980 to 2018, and concluded that GDP has the strongest impact on greenhouse gas emissions.

Trade openness and Environment

Tachie et al. (2020) utilized an econometric method that considers the cross-dependence between research variables to demonstrate that trade openness increases CO2 emissions in the EU-18. Jun et al. (2020) applied a combination of wavelet analysis, phase shift technique, and Breitung and Candelon's (2006) causality test to indicate that trade liberalization has led to pollution in China, particularly after 2001 when China joined the WTO, and that trade openness causes short-term, medium-term, and long-term carbon emissions. Thai Ha Le and A et al. (2016) used particulate matter emissions (PM10) as a basic indicator of environmental quality and concluded that trade liberalization leads to environmental degradation in the global sample, and that trade openness has a positive impact on the environment in high-income countries but a negative impact in middle-income and low-income countries. In 2017, Le Trung Thanh and Nguyen Duc Khuong used an autoregressive distributed lag (ARDL) model to evaluate the impact of the environmental Kuznets curve (EKC) hypothesis and the pollution haven hypothesis (PHH) between 1990 and 2011. Their study concluded that trade openness, economic growth, energy consumption, and financial development have a positive impact on CO2 emissions, supporting the validity of the EKC and PHH hypotheses in Vietnam.

FDI and GDP

Todorov and A et al. (2022) utilized vector autoregression (VAR) method for annual data in the period of 2007 to 2019 to indicate that FDI did not affect the actual GDP growth rate of ten new member states (NMS) from Central and Eastern Europe (CEE), and FDI Granger-causes the economic growth of NMS from CEE neither in the short nor long term. Okon J. Umoh et al. (2012) used single and simultaneous equation systems to test for any type of feedback relationship between FDI and economic growth in Nigeria between 1970 and 2008, concluding that there is positive impact from FDI to GDP growth and from GDP growth to FDI. Huyen Dinh et al. (2019) employed various econometric methods in the period of 2000-2014 to indicate that FDI helps to stimulate long-term economic growth, despite its negative impact in the short term for the countries in their study. Le Trong Nghia (2022) used data from 2006 to 2010 to indicate that FDI has an impact on the economic growth of Vietnam and vice versa.

Trade openness and GDP

According to Ozturk and Radouai (2020), who utilized data on trade openness index, GDP, and human capital index obtained from the Federal Reserve Bank of St. Louis during the period of 1960 to 2018, the level of trade openness had a significant statistical impact but an insignificant effect on economic growth both in the short and long term. Focusing on 15 ECOWAS member countries during the period of 1990-2016, Kore M. Guei and Pierre

le Roux (2019) found that trade openness had a negative impact on per capita GDP in the long term. Hoang Xuan Binh (2011) examined the relationship between trade openness and economic growth in Vietnam from the time of its economic liberalization in 1986 to its WTO accession in 2007. He concluded that there was a positive relationship between trade openness and economic growth, although there were varying impacts during different periods and a two-way relationship between the speed of trade openness and economic growth.

Finally, foreign studies have been clear and specific in demonstrating the relationships between FDI, economic growth, trade openness, and the environment. However, there have been few domestic studies on this topic, with previous studies often conducted across multiple countries. Pham Vu Thang and Bui Tu Anh (2022) utilized data from 10 ASEAN countries between 1990-2017 to investigate the relationship between economic growth and environmental pollution. Nguyen Ngoc Dat and A et al. (2017) selected nine Asian countries to study the impact of FDI and environmental issues on economic growth from 1990 to 2014. Furthermore, there are many studies that indicate FDI has a negative impact on the environment and increases pollution in developing countries, but there are few studies that address the opposite, namely that FDI can reduce environmental pollution, particularly in Vietnam. Through a review of these studies and their arguments, this research project recognizes the importance of investigating the relationship between FDI, economic growth, trade openness, and CO2 emissions in Vietnam from both theoretical and practical perspectives.

2. Method

2.1. Research method

To examine the short and long-term relationship between Foreign Direct Investment (FDI), carbon dioxide emissions (CO2), gross national income (GDP) and trade openness (TO) in Vietnam from 1986 to 2021, the study uses the Vector Error Correction Model (VECM), estimated by the Maximum Likelihood Estimation method developed by Johansen (1995). The study conducted: (i) Testing the stationarity of time series and choosing the optimal lag for the model; (ii) Testing for cointegration; (iii) Estimating the VECM model; (iv) Diagnostic test for the VECM model.

According to Engle and Granger (1987), any VAR(p) model can be rewritten as a VECM model. With the VAR(p) model presented as follows:

$$Y_t = v + A_1 Y_{t-1} + A_2 Y_{t-2} + \dots + A_p Y_{t-p} + \epsilon_t$$

From the VAR(p) model, the VECM model is rewritten as follows:

$$\Delta Y_t = v + \Pi Y_{t-1} + \sum_{i=1}^{p-1} \Gamma_i \Delta Y_{t-1} + \epsilon_t$$

Where: Δ is the first difference operation; Y_t is a $(K \times 1)$ matrix of variables; $p - 1$ is the optimal lag; $\Gamma_i = -\sum_{j=i+1}^p A_j$; ϵ_t is a $(K \times 1)$ matrix of errors in the model.

2.2. Data

Table 1. Data source and description

Variables	Description	Source
CO2	Carbon dioxide emissions (tons per capita)	Global Carbon Project (GCP)
FDI	Foreign direct investment in Vietnam (millions USD per capita)	United Nations Conference on Trade and Development (UNCTAD)
GDP	Gross Domestic Product (USD per capita)	World Bank Indicator
TO	Trade openness, measured by the total value of exports and imports (billion USD)	World Bank Indicator

Source: Research team's synthesis.

The study used data from the World Bank, UNCTAD and the Global Carbon Project from 1986 to 2021. The sample of observations was collected by year, from 1986 to 2021 (36 observations). CO2 is the volume of carbon dioxide emissions per capita (tons) from the use of coal, oil and gas, FDI is the flow of foreign direct investment into Vietnam per capita (million USD), GDP is the gross domestic product per capita (USD 2015), TO is the trade openness calculated by the total value of exports and imports (USD billion). Data were collected from 1986 onwards because at this time Vietnam had just implemented economic reform, opened up for integration and from 1986 onward, FDI data was only available for collection. The variables are converted to natural logarithms to smooth the time series data before the estimation is performed.

3. Results

3.1. ADF test for unit root

Table 2. Augmented Dickey-Fuller unit root tests results

Variables	ADF test	t-statistics	Probability	Difference
lnCO2	-4.552	-3.702	0.0002	1
		-2.980		
		-2.622		
lnFDI	-5.311	-3.709	0.0000	1
		-2.983		
		-2.623		
lnGDP	-3.787	-3.709	0.0030	1
		-2.983		
		-2.623		
lnTO	-5.188	-3.702	0.0000	1
		-2.980		
		-2.622		

Source: Data processing results using Stata17.

Augmented Dickey-Fuller (ADF) (1981) tests results suggest that all series, including lnCO2, lnFDI, lnGDP and lnTO are stationary after taking first difference at the 1% level of significance. Knowing all series are integrated of order one (stationary after first difference), the next steps are to determine the optimal lag order and examine the number of cointegrating relationships among these series following Johansen (1995) framework.

Determine optimal lag order

Table 3. Selection order criteria

Lag	LL	LR	FPE	AIC	HQIC	SBIC
0	28.4552		2.5e-06	-1.52845	-1.46772	-1.34523
1	235.497	414.08	1.7e-11	-13.4685	-13.1649	-12.5525
2	270.12	69.248	5.5e-12*	-14.6325	-14.0859*	-12.9836*
3	286.388	32.534	6.2e-12	-14.6492*	-13.8597	-12.2674
4	301.511	30.247*	8.8e-12	-14.5945	-13.562	-11.4798

Note: * indicates the smallest criteria.

Source: Data processing results using Stata17.

To test for cointegration, first we have to specify how many lags to include. According to a research by Lutkepohl (2005, 148-152), choosing a lag order to minimize the SBIC or HQIC criteria provides consistent estimates of the true lag. However, minimizing AIC or FPE will overestimate the true lag order, even for large sample sizes. In addition, using too many lags for year-to-year data does not make much economic sense, so most empirical studies use lags of 1 to 2 for yearly data. Therefore, based on the results from (Table 3), indicated by “*” in the output, researchers decided to choose a lag of 2 for Johansen test and VECM model.

3.2. Testing for cointegration

The results from the stationarity test show the possibility that the I(1) time series may have (at least) one cointegration relationship. The next step is to verify the number of cointegrating equations that exist among the variables with the selected lag of 2.

H_0 : cointegrating equations $\leq r$

H_1 : cointegrating equations $\geq r + 1$

However, in the case of small sample sizes, Johansen statistics can be biased because the Johansen test is often used with a minimum sample size of 100 observations or more (Cheung and Lai, 1993). Therefore, based on the suggestion of Reimers (1992) and Reinsel and Ahn (1992), the Johansen statistic will be multiplied by a correction factor $\left(1 - \frac{mp}{T}\right)$. Where: m is the number of endogenous variables; p is the lag length; T is the number of observations used in the model. This method will help to correct for the small sample bias, so that statistical inferences can be made from the estimation results.

Johansen cointegration test results - Adjusted for small sample

Table 4. Johansen tests for cointegration

Maximum rank	Adjusted Trace statistics	5% Critical Value	1% Critical Value	Adjusted Max-Eigen statistics	5% Critical Value	1% Critical Value
r = 0	92.4656	47.21	54.46	46.1922	27.07	32.24
r ≤ 1	46.2733	29.68	35.65	33.6778	20.97	25.52
r ≤ 2	12.5955**	15.41	20.04	10.9018**	14.07	18.63
r ≤ 3	1.6937	3.76	6.65	1.6937	3.76	6.65

*Note: ***, **, * represents null rejection at 1%, 5% and 10% level of significance, respectively.*

*Correction factor is 0.7714 (= 1 - 4 * 2/34).*

Source: Data processing results using Stata17.

Trace and Max-Eigen statistics were adjusted by multiplying by the correction factor to accommodate for small sample sizes. The results (Table 4) show that, both statistics do not reject the null hypothesis H_0 at $r \leq 2$, suggesting that there exist at most 2 cointegrating relationships between time series at 5% significance level.

From the above tests and analyses, the research team estimates the short-term and long-term relationships between CO₂, FDI, GDP and TO using the VECM model.

3.3. Estimating the VECM model

The VECM model, given $r = 2$ equations and $K = 4$ variables, is specified as follows:

$$\Delta Y_t = v + \Pi Y_{t-1} + \sum_{i=1}^{p-1} \Gamma_i \Delta Y_{t-1} + \epsilon_t$$

Where:

- Δ is the first difference operation.
- Y_t is a (4×1) matrix of variables: $\ln CO_{2t}$, $\ln FDI_t$, $\ln GDP_t$, $\ln TO_t$.
- $p - 1$ is the optimal lag order, one less than VAR(p) model because of first difference operation.
- $\Gamma_i = -\sum_{j=i+1}^p A_j$.
- ϵ_t is a (4×1) matrix of errors.

In particular, ΠY_{t-1} represents Error Correction Mechanism (ECM)

$$\begin{aligned} \Pi Y_{t-1} &= \alpha \beta' Y_{t-1} = \begin{bmatrix} \alpha_{11} & \alpha_{12} \\ \alpha_{21} & \alpha_{22} \\ \alpha_{31} & \alpha_{32} \\ \alpha_{41} & \alpha_{42} \end{bmatrix} \times \begin{bmatrix} \beta_{11} & \beta_{21} & \beta_{31} & \beta_{41} \\ \beta_{12} & \beta_{22} & \beta_{32} & \beta_{42} \end{bmatrix} \times \begin{bmatrix} Y_{1,t-1} \\ Y_{2,t-1} \\ Y_{3,t-1} \\ Y_{4,t-1} \end{bmatrix} \\ &= \begin{bmatrix} \alpha_{11} \text{ECT}_{1,t-1} + \alpha_{12} \text{ECT}_{2,t-1} \\ \alpha_{21} \text{ECT}_{1,t-1} + \alpha_{22} \text{ECT}_{2,t-1} \\ \alpha_{31} \text{ECT}_{1,t-1} + \alpha_{32} \text{ECT}_{2,t-1} \\ \alpha_{41} \text{ECT}_{1,t-1} + \alpha_{42} \text{ECT}_{2,t-1} \end{bmatrix} \end{aligned}$$

- α is a (4×2) matrix of the adjustment coefficients
- β' is a (2×4) matrix of the co-integrated vectors

$$\text{ECT}_{1,t-1} = \beta_{11} Y_{1,t-1} + \beta_{21} Y_{2,t-1} + \beta_{31} Y_{3,t-1} + \beta_{41} Y_{4,t-1} + \mu_1$$

$$\text{ECT}_{2,t-1} = \beta_{12} Y_{1,t-1} + \beta_{22} Y_{2,t-1} + \beta_{32} Y_{3,t-1} + \beta_{42} Y_{4,t-1} + \mu_2$$

$Y_{i,t-1}$ ($i = \overline{1,4}$) are $\ln\text{CO2}_{t-1}$, $\ln\text{FDI}_{t-1}$, $\ln\text{GDP}_{t-1}$, $\ln\text{TO}_{t-1}$, respectively.

As discussed by Johansen (1995), if there are r cointegrating equations, then at least r^2 restrictions are required to identify the free parameters in β' . This study specifies four alternating combinations for the β' matrix with different set of restrictions, corresponding to four VECM models, each has two cointegrating equations:

Table 5. Structure of VECM models

Model	lnCO2	lnFDI	lnGDP	lnTO
1	0	β_{21}	β_{31}	1
	1	β_{22}	β_{32}	0
2	β_{11}	1	0	β_{41}
	β_{12}	0	1	β_{42}
3	1	0	β_{31}	β_{41}
	0	1	β_{32}	β_{42}
4	β_{11}	β_{21}	1	0
	β_{12}	β_{22}	0	1

Source: Research team's calculations and synthesis.

Long-run equilibrium relationships

Table 6. Cointegrating equation estimated results

Model	lnCO2	lnFDI	lnGDP	lnTO
1	0	-0.4648*** (0.0567)	-1.7883*** (0.2126)	1
	1	0.2124*** (0.0164)	-2.0164*** (0.0615)	0
2	1.3576* (0.7130)	1	0	-1.5308*** (0.3646)
	-0.3529*** (0.0389)	0	1	-0.1612*** (0.0199)
3	1	0	-2.8335*** (0.2749)	0.4569*** (0.0969)
	0	1	3.8466* (2.0548)	-2.151*** (0.7248)
4	-0.4959*** (0.01756)	-0.1053*** (0.0068)	1	0
	-0.8868*** (0.1486)	-0.6532*** (0.0575)	0	1

*Note: ***, **, * represents null rejection at 1%, 5% and 10% level of significance, respectively.*

Source: Data processing results using Stata17.

The results (Table 6) are β' matrices, containing estimates for the coefficients in the cointegrating equations in all four models. The signs of the coefficients are read in reverse, and the magnitude of the coefficients is interpreted as the elasticity as in log-log model.

In the long-run, FDI inflows have a negative impact on CO2, as FDI increases by 1%, CO2 decreases by 0.21%. Additionally, GDP has a positive impact on CO2 at 1% significance level, while FDI has a negative impact on CO2 also at 1% significance level. Therefore, GDP and FDI create asymmetric effect on CO2 in the long-run, with other factors remain constant. Specifically, in the long run, when GDP increases by 1%, CO2 increases by 2.02%, when FDI increases by 1%, CO2 decreases by 0.21%, provided other factors remain unchanged. CO2 has a negative effect on FDI at the 10% significance level, in the long run, when CO2 increases by 1%, FDI decreases by 1.36%, other factors being held constant. FDI has a positive effect on GDP at 5% significance level, in the long run, when FDI increases by 1%, GDP increases by 0.11%, other factors being held constant.

Test for short-run relationships

Table 7. Wald test for the short-run estimated coefficients of the VECM model

Equation	Excluded	chi2	Prob > chi2	Decision
lnCO2	lnFDI	32.77	0.0000	FDI causes CO2
lnCO2	lnGDP	4.20	0.0404	GDP causes CO2
lnCO2	lnTO	28.56	0.0000	TO causes CO2
lnFDI	lnCO2	0.62	0.4326	CO2 does not cause FDI
lnFDI	lnGDP	0.09	0.7662	GDP does not cause FDI
lnFDI	lnTO	1.14	0.2849	TO does not cause FDI
lnGDP	lnCO2	1.31	0.2533	CO2 does not cause GDP
lnGDP	lnFDI	2.24	0.1345	FDI does not cause GDP
lnGDP	lnTO	0.01	0.9412	GDP does not cause TO
lnTO	lnCO2	2.92	0.0872	CO2 causes TO
lnTO	lnFDI	0.56	0.4561	FDI does not cause TO
lnTO	lnGDP	1.25	0.2627	GDP does not cause TO

Source: Data processing results using Stata17.

The research team conducted Wald test on the short-term estimation results of the VECM model. In the short run, GDP has an impact on CO2 at 5% significance level, while FDI and TO have an impact on CO2 at 1% significance level. In addition, FDI has no effect on GDP in the short run, so it cannot be concluded that there is an indirect effect of FDI on CO2 through GDP. In particular, the two-way effect between TO and CO2 is also observed when TO has an impact on CO2 at 1% significance level, but CO2 affects on TO only open at 10% significance level.

3.4. Diagnostic tests for the VECM model

Lagrange-Multiplier Test

Table 8. Lagrange-Multiplier test results

lag	chi2	df	Prob > chi2
1	15.9892	16	0.45371
2	20.3797	16	0.20360

Source: Data processing results using Stata17.

Lagrange-Multiplier (LM) test is used to test for the autocorrelation of errors in the VECM model with two hypotheses as follows:

H_0 : there is no autocorrelation at the lag order

H_1 : there is autocorrelation at the lag order

The results (Table 8) show that the VECM model at both lags (1 and 2) does not have autocorrelation. Where p-values are all greater than 10%, so the null hypothesis H_0 in both VECM models cannot be rejected. From there, it can be seen that the specified VECM model is suitable for the selected data series and variables.

Testing for normally distributed errors

Table 9. Jarque-Bera test results

Equation	chi2	df	Prob > chi2
D_InCO2	2.087	2	0.35230
D_InFDI	0.147	2	0.92929
D_InGDP	1.150	2	0.56266
D_InTO	1.743	2	0.41829
ALL	5.126	8	0.74397

Source: Data processing results using Stata17.

Table 9 presents the test statistic values for each equation in the VECM model. The null hypothesis H_0 is errors are normally distributed. The results indicate that the null hypothesis H_0 cannot be rejected in all the individual equations and the overall equation since the p-values are all greater than 5%. Therefore, the estimates from the model will be efficient and consistent.

Testing the robustness of the VECM model

Table 10. The results Eigenvalue stability condition for the VECM model

Eigenvalue	Modulus
1	1
1	1
0.7141496 + 0.04767722i	0.715739
0.7141496 - 0.04767722i	0.715739
-0.1820609 + 0.6772661i	0.70131
-0.1820609 - 0.6772661i	0.70131
0.4689562	0.468956
0.3766546	0.376655

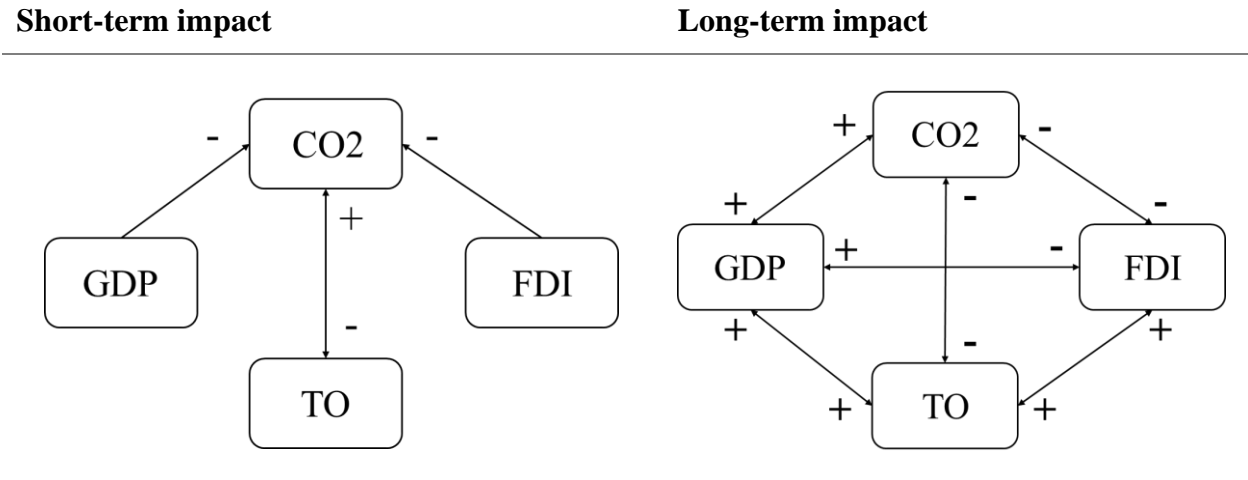

Source: Data processing results using Stata17.

The stability condition for VECM states that the model will have $(K - r)$ unit moduli. The VECM model in the study uses 4 endogenous variables and 2 cointegrating equations. Testing the robustness of the VECM model gives the results (Table 10) of exactly 2 unit moduli ($K - r = 4 - 2 = 2$), satisfy the condition of robustness of the VECM model. The

next moduli unit values are all at 0.72 or less. Therefore, research team can conclude that the cointegrating equations in the model are correctly specified and that the VECM model satisfies the condition of stability.

4. Discussion and Conclusion

4.1. Discussion

Note: (+) indicates a positive correlation, (-) indicates a negative correlation.

Source: Data processing results using Stata17.

Figure 1. Synthesis of the impact direction among variables in the short and long term

Firstly, regarding the relationship between foreign direct investment (FDI) and environmental pollution, experimental study results have shown that in the short term, the FDI inflow has a positive impact on environmental pollution (as reflected by the reduction in CO2 emissions) with a significance level of 1%. Conversely, no observable impact from CO2 to FDI has been detected. In the short term, the FDI inflow can contribute to reducing environmental pollution when Vietnam receives FDI from developed countries such as Korea, Singapore, Japan, and gains access to new energy-saving and environmentally friendly technologies. In the long term, observations have shown a two-way impact between FDI and CO2 emissions, with a 1% increase in FDI leading to a 0.21% decrease in CO2 emissions. However, environmental pollution also has a negative impact on FDI, with a 1% increase in CO2 emissions resulting in a 1.36% decrease in FDI. Solving the problem of environmental pollution is essential to maintain and enhance Vietnam's attractiveness to FDI, especially in selecting "green" FDI inflows to increase the positive impact on the environment through technology transfer and application.

Secondly, regarding the relationship between GDP growth and environmental pollution, in the short term, GDP growth has a positive impact on the environment with a significance level of 5%. This indicates that economic growth can lead to improvements in environmental quality in the short term in Vietnam, possibly due to increased investment in pollution control technology and improved environmental regulations. In the long term, GDP growth has a positive impact on the environment by increasing CO2 emissions. When GDP

increases by 1%, CO₂ emissions increase by 2.02% with a significance level of 1%. Economic growth often accompanies increasing consumption, and demand for goods and services, leading to an increasing number of large forest areas being cut down to serve agriculture, industry, logging, and mining, meeting the needs of human beings in a timely manner. To address this issue, the Vietnamese government has implemented many policies and programs to reduce deforestation. However, the effectiveness of these measures still needs to be considered as deforestation remains a serious issue in Vietnam.

Thirdly, regarding the relationship between trade openness and environmental pollution, the short-term results of experimental study show that there is a negative impact of trade openness on environmental pollution in Vietnam. The industrialization and economic growth of Vietnam in recent years have been due to trade liberalization policies. However, this has led to increased production, especially in the export sector, putting pressure on the environment due to the demand for energy and industrial emissions. This finding indicates the negative impact of trade liberalization on the environment, and Vietnam needs to balance trade policies in the short term to ensure the sustainability of economic growth. In the long run, trade openness has a positive impact on the environment by reducing CO₂ emissions. Specifically, the results show that when trade openness increases by 1%, CO₂ emissions decrease by 0.46%. From there, it is suggested that Vietnam needs to continue to implement and meet environmental and social standards to comply with international practices and take advantage of favourable conditions when participating in trade agreements.

Fourthly, experimental results showed that GDP has a positive impact when stimulating trade openness, which indirectly reduces environmental pollution. While long-term GDP growth may have a negative impact on the environment by increasing CO₂ emissions, if Vietnam's GDP growth contributes to promoting trade openness, it can reduce the negative impact of GDP growth on the environment. This suggests that economic growth needs to be balanced with environmental protection, ensuring the pursuit of sustainable economic development through the implementation of commitments and trade agreements that do not harm the environment.

4.2. Conclusion

Firstly, for foreign direct investment (FDI) enterprises: (1) continue to apply and effectively implement sustainable development practices to minimize environmental impact; (2) enhance cooperation with local suppliers and domestic enterprises to create conditions for FDI enterprises to develop both in scale and depth; (3) invest in research and development (R&D) to develop new environmentally-friendly products and technologies; (4) make good use of preferential policies from the government to focus on areas that generate high value-added, contributing to improving Vietnam's competitiveness.

Secondly, for management agencies: (1) continue to attract clean FDI sources while paying attention to limiting negative impacts of FDI flows on the environment; (2) implement green economic policies such as carbon taxes, pollution fees, and payments for

environmental protection projects; (3) manage and closely monitor import and export activities that have the potential to negatively affect the environment; (4) ensure consistency in incentive policies to avoid excessive competition among localities to attract FDI, with tight control over decision-making authority and intense competition; (5) prioritize investment in clean energy while conditionally supporting significant reductions in emissions and waste by businesses, with measures that support ecosystem recovery seen as essential green infrastructure, and investment in adaptive measures through investment in a combination of grey and green protection strategies.

Abstract

The main purpose of this paper is to evaluate the impact of information sharing, international supply chain cooperation and supply chain performance on export performance in the age of digital transformation. Based on the data collected from a sample of 303 enterprises operating in the seafood export sector, the study examines the impact by testing structural equation modeling through software SmartPLS and SPSS. As a result, supply chain performance, along with information sharing and international supply chain cooperation, has a direct positive impact on export performance while also acting as a mediator variable in the relationship between information sharing, international supply chain cooperation and firms' export performance. The study findings assist policymakers, organizations and seafood businesses in addressing export barriers and devising cooperative solutions to accelerate export performance in digital transformation era.

Keywords: *Export performance, information sharing, international supply chain cooperation, supply chain performance*

1. Introduction

With the continuous development of global integration, as one of the indicators reflecting the ability to successfully utilize resources in the international context, export performance is amongst the most extensively researched topics today. Vietnam is undergoing a vigorous process of international economic integration, particularly in the field of international trade through participation in free trade agreements. Therefore, it is more urgent than ever to study issues related to export performance and propose solutions to support enterprises' participation in the global market.

Approaching from a perspective based on supply chain cooperation, most studies show that supply chain cooperation improves export performance, especially in product quality and ability to develop new products (Stank et al., 1999; Carr et al., 2008). In particular, in supply chain operations, information sharing is known to play an important role in improving operational performance and profitability (Yeoh and Jeong, 1995; Katsikeas et al., 2000). Previous studies on supply chain cooperation and supply chain flexibility have both emphasized the importance of sharing supply chain information (Zhao, 2002). However, there are few analytical studies on what information should be given and with whom specific information should be shared (Lee et al., 1997). In the context of digital transformation, with the strong parallelism of technology, the world is witnessing a remarkable development in the use of data in every functional activity of the enterprise (Napoleone, 2020). The high-speed growth of digital data, on the one hand, is a valuable resource that helps businesses increase understanding not only about their customers and markets, but also becomes a common asset to help improve the performance of the whole company (Li et al., 2019). However, the prior publications have only conducted research on the direct relationship between one of the three factors of information sharing, international supply chain cooperation and supply chain performance to export performance instead of the relationships with the presence of mediator variables. Therefore, a research model to explain the connection between the aforementioned aspects and their impact in promoting export performance of enterprises, especially in the context of digital transformation is essential.

In the light of research direction, this study applies Self Selection Theory, Learning By Exporting Theory, Game Theory, Resource Dependency Theory, Social Exchange Theory, Collaborative Network Theory and takes Vietnam seafood enterprises as a case study.

This paper is structured into five parts: (1) Introduction; (2) Theoretical basis; (3) Research Methods; (4) Results; (5) Discussion, Conclusion and Recommendations.

2. Theoretical basis

International supply chain cooperation is now gradually becoming a mainstream trend in connecting sustainable development and core values in business activities in order to produce value for both the business and the entire supply chain (Tan et al., 1999; Carr et al., 2008; Huynh, 2012). There is no doubt that the supply chain's participants cannot function independently, in other words, internal and external cooperation is necessary for all business activities (Racela, 2007; Melander et al., 2019). In parallel with the development

of supply chain cooperation concept, information sharing is one of the foundational activities between businesses to invest mutual resources, common knowledge and make joint decisions in the process of cooperation (Lee et al., 1997). Under competitive pressure and unpredictable market fluctuations, establishing relationships and exchanging necessary knowledge has become an important issue in strategic planning of enterprises (Zhao, 2002; Ipek, 2011). Cooperation and information sharing will impact the overall performance of the entire supply chain through metrics that measure process performance, from raw materials to semi-finished products and into final products delivered to customers through a systematic distribution channel or other measures including cost, customer responsiveness, and uptime (Bottani and Montanari, 2010; Gordon Stewart, 1995). In recent decades, under the pressure of a volatile business environment, researchers and enterprises have shifted their focus from improving quality and reducing supply chain costs to improving supply chain adaptability and flexibility to meet elusive customer demands (Stank et al., 1999; Tiwari et al., 2015). Therefore, the issue of how to improve supply chain flexibility and the impact of supply chain performance on businesses has attracted a lot of attention from both domestic and international experts.

Due to the urgency of the topic, the authors propose a research model on the impact of information sharing, international supply chain cooperation and supply chain performance on export performance in digital transformation: a case study in Vietnamese seafood enterprises based on the following hypotheses:

Data generated, transmitted, stored and analyzed in the digital ecosystem needs to be communicated seamlessly on the same backbone, information is refined by supply chain stakeholder organizations to achieve the same goal of maximizing benefits, and managers make the best decisions by weighing up key information (Ajay and Maharaj, 2010). Digital technology is the basis for supporting the identification, collection and processing of large amounts of information and is a prerequisite for information interaction across the system (Napoleone, 2020).

H1: Digital transformation positively affects partner information sharing.

When companies share accurate and qualified information with supply chain partners, they will realize the advantages of cooperating to achieve a common objective (Davenport and Beers, 1995; Lee et al., 1997). Positive experiences with the quality of information shared (i.e., the dependability of their chain partners) are the fundamental basis for the degree of willingness to share more knowledge (Lee et al., 1997).

H2: Information quality positively affects partner information sharing.

The bullwhip effect is a distortion of demand information as this information is transmitted in the form of orders along the supply chain all the way to the most upstream suppliers. Bottani and Montanari (2010) indicated that the total supply chain inventory cost and Bullwhip effect would increase significantly as the number of stages in the supply chain increased, which in turn affects information sharing decisions.

H3: Complex supply chain structure negatively affects information sharing.

Export performance, according to Katsikeas et al. (2000), is a multidimensional concept that can be measured using both financial and non-financial measures. Previous research suggested that sharing information promotes export efforts and can actually assist export performance (Julien and Ramangalahy, 2003; Yeoh and Jeong, 1995). However, empirical research on the relationship between information sharing and export performance is required

H4: Information sharing positively affects export performance.

Sharing information regarding key performance indicators and operational metrics enhances supply chain insight, thus facilitating wise decision-making. Sharing information has a significant impact on the overall costs of running a successful supply chain as well as improving overall supply chain management (Ajay and Maharaj, 2010; Zhao, 2002). Rashed, Azeem, and Halim (2010) discovered that sharing information is necessary for improving supplier performance due to the connectivity and availability.

H5: Information sharing positively affects supply chain performance.

Bottani and Montanari (2010) observed that the inventory cost of the entire supply chain and the Bullwhip effect will increase significantly as the number of stages in the supply chain increases. However, in an integrated supply chain, businesses can reduce non-value-added activities and associated costs such as investment costs, operating costs and time costs of supply chain. This greatly increases the customer responsiveness and flexibility of the supply chain, while improving the efficiency and competitiveness of the entire chain (Gordon Stewart, 1995).

H6: Complex supply chain structure negatively affects supply chain performance.

Logistics side risks include cargo damage, supply-side constraints, warehouse issues, delivery delays, improper packaging, labor disputes, natural disasters, terrorist activities and transport infrastructure failures, wrong choice of mode of transport, transport complexity (Thun and Hoenig, 2011; Wagner and Neshat, 2012). Therefore, logistics side risks will disrupt business operations and the ability to deliver products on time of businesses in the supply chain.

H7: Logistics side risks negatively affect supply chain performance.

Finance side risks include exchange rate risk, price and cost risk, financial strength of supply chain partners, payment delays and financial processing (Musa, 2012). Several studies have shown that finance side risks not only have a negative impact on the company's financial performance, but also on overall supply chain performance (Mody, 2012; Musa, 2012).

H8: Finance side risks negatively affect supply chain performance.

Customer relationship management (CRM) refers to building long-term relationships with customers, managing their complaints, and improving overall customer satisfaction (Tan et al., 1999). CRM adds value to the business through customer loyalty, while enhancing supply chain's ability to meet requirements (Gawankar et al., 2013a).

H9. Customer relationship management (CRM) positively affects supply chain performance.

Improved supply chain performance entails better resource management, the accomplishment of operational goals, greater quality standards, increased product flexibility, and performance improvements. competitive execution (Nimeh et al., 2018). Ayoub and Abdallah (2019) indicated that sales, business efficiency, and export performance of enterprises increase as supply chain performance improves.

H10. Supply chain performance positively affects export performance.

Successful relationships are characterized by mutual trust, and partners trust each other to consistently deliver better customer service, easier adaptation, and improved profitability (Huynh, 2012). When an organization has identified the aspects from the partner as mentioned, it is easier for firms to cooperate and set mutual goals with each other (Smith, 1997).

H11. Trust among partners positively affects international supply chain cooperation.

Power is at the heart of all commercial partnerships (Hingley, 2005). The degree to which an organization or business depends on particular resources and other resources determines its advantage over a partner (Inkpen et al., 1997). If one partner in a relationship has more power than the other, they can exert pressure on the weaker partner to make decisions that will benefit the stronger partner (Kumar, 1996).

H12. Partners' power positively affects international supply chain cooperation.

The ability of firms in the supply chain to collaborate is affected by regulations set forth by the government of the organization or the partner. Policies are not permanent but will evolve over time (Huynh, 2012). During the operation of the supply chain, it is necessary to improve the cooperation of enterprises with the Government, domestic and international, to control and manage risks in the international supply chain.

H13. Government policies positively affect international supply chain cooperation.

According to Kim (2006) supply chain cooperation is positively correlated with supply chain performance. By lowering costs and gaining market share, business practices add value for shareholders. Lee et al. (1997) argued that supply chain cooperation increases the supply chain's ability to respond to sudden changes in the volatile supply and demand environment.

H14. International supply chain cooperation positively affects supply chain performance.

International supply chain cooperation, according to RBV theory, is a means for companies to grow with the support of partners' resources (Stank et al., 1999). In the export context, an exporter may have limited market and/or financial resources, while an overseas distributor may lack in-house production resources. Therefore, by sharing their resources including inventory, market, financial and resource knowledge, enterprises benefit from enhancing productivity and export performance (Racela et al., 2007).

H15. International supply chain cooperation positively affects export performance.

Through the synthesis and analysis of the above theoretical basis, the authors proposed the research model as shown in Figure 1.

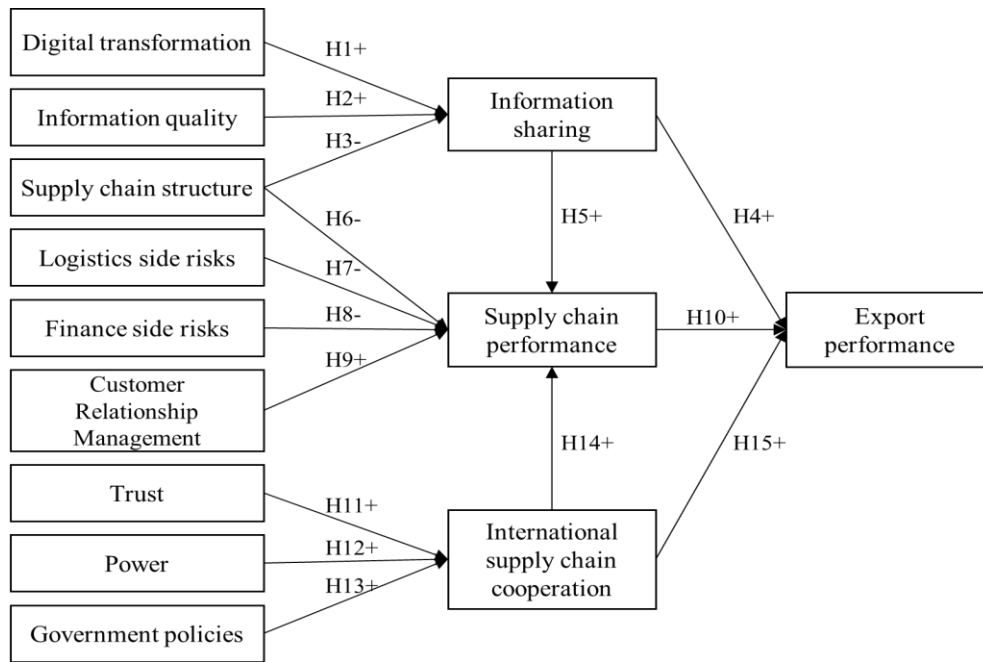

Figure 1. Proposed research model

Source: Authors' compilation

3. Method

In terms of qualitative research, the authors conducted in-depth interviews with experts and senior leaders such as directors, deputy directors, heads of departments, deputy departments, and officials in charge of supply chain cooperation. The interviewees came from government agencies, economic experts, businesses, and seafood-related organizations in Vietnam such as the Vietnam Association for Seafood Processing and Export (VASEP). The subjects interviewed with different characteristics will provide multidimensional and complete information for the study content, ensuring the achievement of the goal. Open-ended questions are included in the interview to facilitate participants' opinions under the author's guidance.

Qualitative research results show that the impact of information sharing, supply chain cooperation, and supply chain performance on export performance are accepted and no new factors are proposed. The list of factors included in the quantitative research is: (1) Digital Transformation (5 variables); (2) Information Quality (5 variables); (3) Supply Chain Structure (5 variables); (4) Logistics Side Risks (5 variables); (5) Finance Side Risks (4 variables); (6) Customer Relationship Management - CRM (5 variables); (7) Trust (5 variables); (8) Power (4 variables); (9) Government Policies (6 variables); (10) Information Sharing (2 variables); (11) Supply Chain Performance (3 variables); (12) International Supply Chain Cooperation (2 variables).

In terms of the quantitative research, the study employs a direct survey form with a small sample (20 enterprises). The majority of participants assented to the survey instrument, albeit necessitating lexical modifications and rationalized question construction. The team of authors built the originally planned sample of 300 survey votes. This number of observations both met the sample size requirements of Hair et al. (2014) with 270 observations. The anticipated quantity of observation records surpassing the minimum sample size confers greater value upon the study.

Of the 303 enterprises surveyed, the majority were small and medium-sized enterprises, of which up to 32% were enterprises [300;600] employees. The results of the survey of operating time of enterprises showed that the majority of enterprises operating in [5;10] years, which accounts for 27%. It is followed by the percentage of enterprises operating in [10;15] years with 24%. Seafood enterprises are mainly concentrated in the Mekong Delta region, accounting for 40% of the total seafood enterprises in the country. The main seafood items of enterprises are shrimp and fish, especially pangasius and tuna. Of which, shrimp accounted for 44%, pangasius 29%, tuna 5%, other fish 5%. In terms of processing type, up to 81% of enterprises producing frozen seafood, 10% of enterprises producing dry goods, 7% of enterprises producing fish sauce, and only 2% of enterprises producing canned products.

The data is processed using SPSS 20 and SmartPLS 4 software. Data from independent variables are analyzed through steps: Cronbach Alpha scale reliability testing, PLS-SEM model measurement evaluation, and SEM Analysis.

4. Results

4.1. Reliability of the scale by Cronbach's alpha coefficient

In the step of testing the reliability of the scale, the authors used Cronbach Alpha coefficients. The analysis results of Cronbach's Alpha coefficient of the scales used in the study are all greater than 0.7 and the total correlation coefficients are all greater than 0.4, so no observed variables are excluded. Thus, the scale of all factors has the required reliability to proceed with further testing.

Table 1. Cronbach's Alpha Reliability Test Results

Factors	Cronbach's alpha	The smallest Corrected Item-Total Correlation
Digital Transformation	0.744	0.656
Information Quality	0.841	0.791
Supply Chain Structure	0.834	0.785
Logistics Side Risks	0.712	0.608
Finance Side Risks	0.779	0.712
Customer Relationship Management	0.822	0.775
Trust	0.818	0.764
Power	0.796	0.723
Government Policies	0.832	0.786
Information Sharing	0.816	
International Supply Chain Cooperation	0.824	0.708
Supply Chain Performance	0.825	
Export Performance	0.864	0.829

Source: Authors' compilation

4.2. Exploratory Factor Analysis (EFA)

After analyzing the Cronbach's Alpha coefficient, the scales are next evaluated by the Exploratory Factor Analysis (EFA) to reduce and group the variables into factors, considering the degree of convergence of the variables by each component and the discriminant value between the factors.

The scales will be evaluated by exploratory factor analysis (EFA - Exploring Factor Analysis) as follows: Using Principal Component extraction method with Varimax rotation.

The scale of variables includes: Digital Transformation (DT); Information Quality (IQ); Supply Chain Structure (SS); Logistics Side Risks (LR); Finance Side Risks (FR); Customer Relationship Management (CM); Trust (TS); Power (PW); Government Policies (GP); Information Sharing (IS); International Supply Chain Cooperation (SC); Supply Chain Performance (SP); Export Performance (EP). After testing the scale with Cronbach's Alpha, scales with 54 observed variables are retained and divided into groups to be included in Exploratory Factor Analysis (EFA).

Group 1: Digital Transformation (DT); Information Quality (IQ); Supply Chain Structure (SS); Logistics Side Risks (LR); Finance Side Risks (FR); Customer Relationship Management (CM); Trust (TS); Power (PW); Government Policies (GP).

Group 2: Information Sharing (IS); International Supply Chain Cooperation (SC); Supply Chain Performance (SP).

Group 3: Export Performance (EP).

Table 2. Results of EFA

	Factors	KMO	p-value	Eigenvalues	Total Variance Explained	The smallest Factor loading
Group 1	Digital Transformation	0.817	0.000	6.580	62.188%	0.671
	Information Quality			3.506		0.674
	Supply Chain Structure			2.988		0.654
	Logistics Side Risks			2.693		0.708
	Finance Side Risks			2.387		0.749
	Customer Relationship Management			2.043		0.698
	Trust			1.849		0.659
	Power			1.574		0.639
	Government Policies			1.256		
Group 2	Information Sharing	0.622	0.000	2.501	80.329%	0.907
	International Supply Chain Cooperation			1.830		0.815
	Supply Chain Performance			1.292		0.912
Group 3	Export Performance	0.895	0.000	3.575	59.581%	0.751

Source: Authors' compilation

The results of EFA show that the KMO indexes are all greater than 0.5, so the EFA is consistent with the data. In addition, Factor Loading > 0.5, so the observed variables are important in the research factors and have practical significance. The significance level Sig (Bartlett's Test) = 0.000 < 0.05 indicates that observed variables are correlated with each other.

The factors DT, IQ, SS, LR, FR, CM, PW, CM, TS, GP, IS, SC, SP, EP all have Eigenvalues coefficient values greater than 1, so these factors are kept in the analytical model. The total value of the extracted variance is greater than 50%, meeting the requirements. The research model is well evaluated.

4.3. Quality of observed variables (indicators)

The Outer Loading coefficient of the observed variables is an indicator showing the degree of association between the observed variable and the latent variable.

Table 3 shows that the Outer Loadings coefficients of the first-order variables are all greater than 0.7, so the first-order variables are significant in the model (Hair et al., 2016).

Table 3. Results of Outer loadings

Factors	The smallest Outer loadings
Digital Transformation	0.783
Information Quality	0.760
Supply Chain Structure	0.755
Logistics Side Risks	0.745
Finance Side Risks	0.740
Customer Relationship Management	0.736
Trust	0.703
Power	0.751
Government Policies	0.746
Information Sharing	0.913
International Supply Chain Cooperation	0.839
Supply Chain Performance	0.921
Export Performance	0.738

Source: Authors' compilation

4.4. Discriminant validity

Fornell and Larcker (1981) recommended that discriminability is guaranteed when the square root of the AVE for each latent variable is higher than all correlations between the latent variables.

Table 4. Discriminant validity - Heterotrait-monotrait ratio (HTMT)

	CM	DT	EP	FR	GP	IQ	IS	LR	PW	SC	SP	SS	TS
CM													
DT	0.249												
EP	0.200	0.424											
FR	0.129	0.100	0.161										
GP	0.268	0.200	0.208	0.102									
IQ	0.219	0.633	0.360	0.254	0.130								
IS	0.084	0.545	0.690	0.160	0.178	0.463							
LR	0.185	0.241	0.179	0.180	0.136	0.232	0.053						
PW	0.310	0.236	0.235	0.076	0.511	0.214	0.112	0.253					
SC	0.210	0.119	0.442	0.078	0.438	0.121	0.079	0.108	0.504				
SP	0.315	0.235	0.603	0.306	0.152	0.214	0.271	0.387	0.300	0.211			
SS	0.329	0.143	0.244	0.111	0.157	0.075	0.248	0.152	0.203	0.059	0.351		
TS	0.418	0.162	0.149	0.091	0.235	0.202	0.115	0.161	0.247	0.318	0.235	0.143	

Source: Authors' compilation

According to the results in Table 4, all HTMT values are less than 0.85, so the discriminant validity is guaranteed.

4.5. Evaluation of collinearity/multicollinearity

To evaluate multicollinearity, the authors use the results of the PLS Algorithm analysis. The authors use Inner Collinearity Statistics (VIF) to test the VIF results and evaluate multicollinearity among latent variables. This is the most important item, because multicollinearity between the independent latent variables is a critical issue.

Table 5. Collinearity statistics (VIF) - Inner model

	CM	DT	EP	FR	GP	IQ	IS	LR	PW	SC	SP	SS	TS
CM											1.134		
DT							1.382						
EP													
FR											1.040		
GP										1.228			
IQ							1.363						
IS			1.054								1.067		
LR											1.055		
PW										1.232			
SC			1.032								1.041		
SP			1.082										
SS							1.016				1.139		
TS										1.061			

Source: Authors' compilation

The VIF table is represented as a matrix. There are 4 variables including EP, IS, SC, SP being evaluated in the SEM model as dependent variables and need considering multicollinearity between the independent variables affecting each of these dependent variables.

Dependent variable EP: being affected by 3 independent variables including IS, SC and SP, so the EP column has 3 values.

Dependent variable IS: being affected by 3 independent variables including DT, IQ, SS, so IS column has 3 values.

Dependent variable SC: being affected by 3 independent variables including GP, PW, TS, so the SC column has 3 values.

Dependent variable SP: being affected by 6 independent variables including CM, FR, IS, LR, SC, SS, so SP column has 6 values.

According to table 5, all VIF coefficients are less than 3, so there is no multicollinearity in the model (Hair et al., 2011). The structures in the SEM model above are all reflective.

4.6. Evaluation of relationships

To evaluate impact relationships, the authors will use the results of the Bootstrap analysis.

Table 6. Path coefficients - Mean, STDEV, T values, p values

	Original sample (O)	Sample mean (M)	Standard deviation (STDEV)	T statistics (O/STDEV)	P values
CM -> SP	0.130	0.135	0.050	2.592	0.010
DT -> IS	0.327	0.326	0.055	5.966	0.000
FR -> SP	-0.183	-0.188	0.048	3.815	0.000
GP -> SC	0.218	0.221	0.049	4.432	0.000
IQ -> IS	0.202	0.204	0.055	3.694	0.000
IS -> EP	0.485	0.484	0.033	14.491	0.000
IS -> SP	0.132	0.131	0.050	2.666	0.008
LR -> SP	-0.228	-0.230	0.054	4.225	0.000
PW -> SC	0.291	0.292	0.064	4.567	0.000
SC -> EP	0.281	0.283	0.044	6.438	0.000
SC -> SP	0.119	0.117	0.052	2.286	0.022
SP -> EP	0.354	0.355	0.036	9.942	0.000
SS -> IS	-0.165	-0.167	0.048	3.413	0.001
SS -> SP	-0.192	-0.193	0.044	4.404	0.000
TS -> SC	0.160	0.168	0.052	3.077	0.002

Source: Authors' compilation

The above results show that all the P Values of the effects are < 0.05, so these effects are statistically significant.

There are 3 variables affecting IS: DT, IQ, SS. The standardized impact coefficients of these 3 variables are 0.327, 0.202, -0.165, respectively. In which, there are 2 variables positively impacting IS, with the level of impact ranging from strong to weak: DT, IQ. SS is the only variable that has a negative effect.

There are 4 variables affecting SP: CM, FR, IS, SS. The standardized impact coefficients of these 4 variables are 0.130, -0.183, 0.132, -0.192, respectively. In which, there are 2 variables positively impacting SP, with the level of impact ranging from strong to weak: IS, CM. There are 2 variables negatively impacting SP, with the level of impact ranging from strong to weak: SS, FR.

There are 3 variables affecting SC: GP, PW, TS. The standardized impact coefficients of these 3 variables are 0.218, 0.291, and 0.160, respectively. In which, there are 3 variables positively impacting SC, with the level of impact ranging from strong to weak: PW, GP, TS.

There are 3 variables affecting EP: IS, SC, SP. The standardized impact coefficients of these three variables are 0.485, 0.281, and 0.354, respectively. Thus, the level of impact of these 3 variables on EP in order from strong to weak is IS, SP, SC.

4.7. The results of testing the research hypotheses

Therefore, from the above quantitative results, it can be concluded that all research hypotheses are accepted.

5. Discussion and Conclusion

5.1. Discussion of study findings

The study focuses on analyzing the relationships between information sharing, international supply chain cooperation and supply chain performance, thereby finding out their impact on export performance in the context of digital transformation. Sustainable and superior export performance requires reasonable levels of supply chain cooperation and information shared among enterprises which simultaneously augment overall performance of supply chain. In recent years, the rise of digital transformation era has exposed firms to the edge of innovation. With the help of blockchain technology and IoT, real-time data and insights about market trends, customer demands, logistics costs,... are shared in a unified system more traceably and precisely, which enables companies to anticipate and mitigate supply chain disruptions. Greater cooperation, communication, and transparency among supply chain partners allows enterprises to respond quickly to unexpected events and reduce the impact of disruptions on their operations.

Under the pressure of fierce competition in the market, the introduction of new products with shorter cycle times, along with the increasing level of customer expectations have pushed businesses to show attentive interest to supply chain cooperation. However, how to cooperate in the supply chain, exploit cost advantages, improve added value for products and increase competitive strength remains an open question. Particularly, in this study, the authors found that the impact of information sharing, international supply chain cooperation and supply chain performance of enterprises in Vietnam has not received meticulous attention.

First, information sharing is a critical factor for seafood export performance of Vietnamese businesses. While digital transformation and information quality facilitate information sharing, the complex supply chain structure may distort information quality and thereby hinder information sharing. These factors significantly impact business prediction and strategy planning and have the potential to enable businesses to quickly address potential supply chain disruptions. *Second*, improving supply chain efficiency can positively affect a company's export performance. However, in order for the supply chain to function properly, businesses need to be aware of the BullWhip effect which probably stems from the complex supply chain structure. Additionally, the risks related to logistics and finance are directly correlated with the operational performance of both enterprises and their partners. Due to the market complexity, businesses need to pay more attention to customer relationship management (CRM) in order to better meet the constantly changing needs and feedback of consumers about goods and services. *Thirdly*, international supply chain cooperation can significantly impact export activities, with trust and power dynamics influencing businesses and government policies encouraging similar operations. On the other hand, through cooperation, companies can leverage resources from partners to access new markets, enhance supply chain performance, and elevate product standards.

5.2. Recommendations

Based on the findings the authors suggest some implications as following:

First, the State needs to promulgate policies to support and create conditions for enterprises to cooperate with other enterprises, facilitate trade, and foster business growth through production and export against foreign barriers.

Second, Vietnam Association of Seafood Exporters and Producers (VASEP) needs to take an active role in developing information channels on seafood supply chains including and implementing digital transformation technology in both production and business, which eventually raises firms' awareness of exchanging information and cooperating in international supply chain.

Third, in order to improve their operations, Vietnamese seafood businesses must alter their cooperative culture and raise understanding of supply chain performance, export performance, and variables impacting export performance.

Fourth, businesses need to harness information technology systems to facilitate the flow of information, increase supply chain performance, and enable them to make more accurate decisions in export activities.

5.3. Limitations and future research directions

However, this research is not without limitations. First, this paper is primarily country-specific integrative insights of seafood firms while excluding other industries in other regions. Second, a framework that could comprehensively explain the influencing factors from both macro and micro perspectives still remains absent. Therefore, in order to resolve such inconsistencies, further research undertaken for multinational approaches to set

sustainable development goals is required. Additionally, future studies may substitute subjective survey methods with secondary data based on annual reports and actual business parameters to reduce risks and increase result reliability.

Faculty of Mathematical Economics, National Economics University, Hanoi, Vietnam

Abstract

The paper investigates the impact of macroeconomic volatility on the volatility of the Vietnamese stock market in the short and long term, during stable and unstable periods due to the Covid19 pandemic. We propose extended GARCH-MIDAS and EGARCH models with positive and negative macroeconomic volatility. The results show that the roles of positive and negative macroeconomic volatility are different in the context of stable and unstable markets, both in the short and long term. In a stable market, growth has a positive impact on the volatility of the stock market, while interest rate volatility has a negative impact. Particularly, their roles are also different in the short and long term. Growth has a more significant impact in the long term, while negative growth only has a short-term impact. When the market is unstable due to Covid 19, while growth is still important, the impact of interest rates is insignificant. Based on these findings, we propose some recommendations for policymakers and investors in the Vietnamese stock market.

Keywords: *Macroeconomic volatility, stock market volatility, GARCH-MIDAS*

1. Introduction

Stock market volatility is an important measure used in the field of financial asset pricing and risk management. Some theories indicate the influence of macroeconomic factors on stock market volatility. Among them, some classic theories include the theory of price discrepancy in business (Ross, 1976), the efficient market hypothesis (Fama, 1970), and the dividend discount model (Gordon and Shapiro, 1956). Because the value of production is closely related to the income of a business, when this value changes, it directly affects the dividend income of the stock. Interest rates also affect stock prices as they are the discount factor for future income streams and the opportunity cost of investing capital in stocks. This explains why macroeconomic factors can impact stock prices and cause stock market volatility to change over time.

Many studies have developed suitable models for measuring volatility in the stock market. These studies also separate volatility into short-term and long-term volatility. Short-term volatility measures the daily volatility of bond yields, while long-term volatility measures volatility over longer periods, such as months or quarters. The GARCH model

(Engle and Bollerslev, 1986) is a popular model used to measure short-term volatility on a daily basis because it has been tested in many different markets. This model is developed from the ARCH (Autoregressive Conditional Heteroskedastic) model, introduced by Engle (1982). Subsequently, some scholars have developed more advanced models to improve the effectiveness of the GARCH model in practice, such as the EGARCH (Nelson, 1991) and TGARCH (Zakoian, 1994) models, which are used to measure asymmetric effects in the stock market. Because the GARCH model has difficulty in analyzing the relationship with macro factors due to different frequency data, Engle and colleagues (2013) developed the GARCH-MIDAS model to separate conditional variance into short-term high-frequency volatility, estimated by the GARCH model, and long-term low-frequency volatility, estimated by the MIDAS regression (Ghysels & colleagues, 2007).

The relationship between stock market volatility and macroeconomic factors has been examined in various contexts in the short term. In developed countries' stock markets, some analyses have focused on the short-term impact of macroeconomic factors (Schwert, 1989; Diebold and Yilmaz, 2008; Thampanya et al., 2020). Specifically, Schwert (1989) described the relationship between stock market volatility and macroeconomic volatility using monthly data from 1827-1986 in the US. The results showed that interest rate volatility, inflation volatility, and monetary growth volatility almost always increased stock market volatility. The impact of industrial production growth was relatively weak. In many other markets, Diebold and Yilmaz (2008) found a connection between stock volatility and fundamental macroeconomic volatility. Data from 40 countries showed a positive correlation between the volatility of real GDP and stock volatility. The correlation was even stronger for low-income developing countries. This means that fundamental macroeconomic volatility can increase stock market volatility, which was not shown in Schwert's study in the pre-crisis period in the US stock market. Abbas and colleagues (2018) added that industrial production growth and oil prices were the two most important macroeconomic factors that could influence the direction of the stock market. Research on the role of macroeconomic factors in the short term in developing country markets is still limited. A typical study by Thampanya and colleagues (2020) in the ASEAN market of five countries from January 1995 to December 2018 showed that interest rates were the most important factor affecting stock market volatility, being an important financial tool in the ASEAN region. Additionally, the estimated coefficients showed differences between pre-, during-, and post-global financial crisis periods.

Other studies have focused on the influence of macroeconomic factors on long-term volatility in the stock market (Engle & colleagues, 2013; Conrad and Kleen, 2020; Fang & colleagues, 2020). Engle and colleagues (2013) analyzed daily data on the S&P 500 index from February 16, 1885 to December 31, 2004, with industrial production and inflation as the macroeconomic variables. The study showed that industrial production had a counter-directional effect, but its volatility had the same direction of impact on long-term volatility. Subsequently, Conrad and Loch (2015) used more macroeconomic variables to study the long-term relationship. The authors also believed that there was a relationship between

macroeconomic variables and stock market volatility. The GARCH-MIDAS model with two variables performed significantly better than all other models for long-term forecasts of the next 2 to 3 months (Conrad and Kleen, 2020). Fang and colleagues (2020) analyzed more macroeconomic variables for quarterly frequency, from the first quarter of 1969 to the fourth quarter of 2018. The authors found that the GARCH-MIDAS model was successful in selecting the most important variables to predict long-term volatility in the stock market. However, the authors suggested that real GDP and industrial production growth, which were not selected in previous studies, could have been exaggerated in their role in predicting long-term volatility in the stock market.

Later, Amendola and colleagues (2019) further extended the asymmetric effect with the GJR-Asymmetric-GARCH MIDAS model. Analysis of macroeconomic variables including the IP index and NAI (National Activity index) monthly showed the relative impact of macroeconomic fluctuations on the volatility at different horizons. In out-of-sample analysis, the GJR-Asymmetric-GARCH MIDAS model not only showed statistical superiority compared to other technical parameters such as GARCH, GJR-GARCH and GARCH-MIDAS models, but also demonstrated significant utility benefits for an investor with different risk aversion parameters. The strong efficiency was shown by selecting different samples and estimating the model in different contexts. This is supported by Wang and colleagues (2020), who further extended the short- and long-term volatility forecasting of stock indices with asymmetric effects and extreme volatility (10% and 90% quantiles) in both short- and long-term with the asymmetric GARCH-MIDAS model. The study of the Dow Jones Industrial Average (DJIA) from 2/10/1928 to 24/9/2018 showed that the asymmetric effect and extreme volatility effect are two important long-term effects in the volatility of stock indices. Asymmetric effect contributes more than the extreme effect. The threshold asymmetric model performs better than the traditional GARCH-MIDAS model in many different markets. However, this study does not clarify the origin of good and bad news, as well as the asymmetric impact of macro factors. At the same time, research on the role of macro variables in the long term in developing countries is still limited. Some studies have confirmed the good efficiency of the GARCH-MIDAS model in analyzing the volatility of high-frequency data, but mainly in other fields such as exchange rates (Zhou and colleagues, 2020) or oil prices by Pan and colleagues (2017).

This gap provides motivation for us to develop a model to evaluate the reaction of short-term and long-term stock market volatility to positive and negative macroeconomic fluctuations. This research is conducted in the context of a rapidly developing and deeply integrating economy in Vietnam, as it is a macroeconomic environment with strong fluctuations in recent years, especially during the economic crisis of 2008-2009 and the COVID-19 pandemic. The research results aim to indicate the nature of the relationship, including the degree of influence of positive and negative fluctuations, their differences in both short and long terms, and between different stages of the market. From there, it highlights the role of macroeconomic policies in short-term and long-term volatility in stock markets in developing and emerging countries.

This study focuses on specific points, including: (i) the impact of positive and negative macroeconomic fluctuations on stock market volatility, including symmetric or asymmetric effects on market volatility; (ii) the relationship in both short and long terms in a transitioning economy in Vietnam; (iii) the research context is stable market periods and unstable periods due to the COVID-19 pandemic to better understand the role of macroeconomic policy changes in different economic contexts; and (iv) using EGARCH and GARCH-MIDAS models extended with positive and negative macroeconomic fluctuations to evaluate asymmetric effects on the Vietnam stock market as well as other similar markets. From there, implications for policies contribute to the significance of risk analysis and regulatory policies in developing and emerging stock markets.

2. Method

We analyze the impact of positive and negative macroeconomic fluctuations by extending the variables in the model to estimate short-term volatility and long-term volatility of stock market. The study estimates the short-term impact from the exponential GARCH (EGARCH) model (Nelson, 1991) with additional explanatory variables. Among the asymmetric GARCH models, the EGARCH model is evaluated as the most appropriate for the Vietnamese stock market (Tien & colleagues, 2017). The model is written in the form of a mean equation and a variance equation as follows:

$$r_{i,t} = \mu + \sigma_{i,t} \varepsilon_{i,t} \quad \forall i = 1, 2, \dots, N_t \quad (1)$$

$$\log(\sigma_{i,t}^2) = \omega + \beta \log(\sigma_{i-1,t}^2) + \alpha \frac{|r_{i-1,t} - \mu|}{\sqrt{\sigma_{i-1,t}^2}} + \gamma \frac{r_{i-1,t} - \mu}{\sqrt{\sigma_{i-1,t}^2}} \quad (2)$$

Where $r_{i,t}$ is the return of the market index, measured by the log return of day i in month t , including N_t trading days; $\varepsilon_{i,t} | \psi_{i-1,t}$ is the random error component, under the condition of information $\psi_{i-1,t}$ occurred up to day $(i-1)$ in month t and: $\varepsilon_{i,t} | \psi_{i-1,t} \sim N(0,1)$.

In which $\sigma_{i,t}^2$: conditional variance measurement of day i in month t . This quantity can be rewritten as: $\sigma_{i,t}^2 = \tau_t \cdot g_{i,t}$; and short-term component $g_{i,t}$ is the short-term volatility on day i of month t , the long-term component τ_t called the long-term volatility in month t . In any month t , the long-term volatility τ_t remains constant, then formulas (1) and (2) can be rewritten as (3) and (4):

$$r_{i,t} = \mu + \sqrt{\tau_t g_{i,t}} \varepsilon_{i,t} \quad \forall i = 1, 2, \dots, N_t \quad (3)$$

$$\log(g_{i,t}) = \omega + \beta \log(g_{i-1,t}) + \alpha \frac{|r_{i-1,t} - \mu|}{\sqrt{\tau_t g_{i-1,t}}} + \gamma \frac{r_{i-1,t} - \mu}{\sqrt{\tau_t g_{i-1,t}}} \quad (4)$$

The EGARCH model measures the asymmetric impact of macroeconomic volatility on short-term volatility on the stock market.

The macroeconomic volatility at time t of the macro variable X_t can be estimated based on a 12th-order autoregression and dummy variables D_{jt} ($j = 1 \div 12$) to eliminate the autocorrelation and seasonal factors of the macro variable. According to Schwert (1989), macroeconomic volatility can be measured by the estimated error value $\hat{\varepsilon}_t$ obtained from model (6):

$$X_t = \sum_{j=1}^{12} \alpha_j D_{jt} + \sum_{k=1}^{12} \beta_k X_{t-k} + \varepsilon_t \quad (6)$$

In this study, we separate the volatility component of the macro variable X_t , denoted as VOL_X_t , into two parts, including positive macroeconomic volatility, denoted as $VOL_X_t^+$, representing negative volatility; and negative macroeconomic volatility, denoted as $VOL_X_t^-$, representing positive volatility. Then, the volatility at any time t can be expressed as:

$$VOL_X_t = VOL_X_t^+ + VOL_X_t^-$$

2.1. Model for assessing the asymmetric impact of macroeconomic volatility on short-term volatility of stock market.

We developed an EGARCH (1,1) model by adding macroeconomic volatilities to measure short-term volatility of the stock market index. The specific model is as follows:

$$\log(g_{i,t}) = \omega + \beta \log(g_{i-1,t}) + \alpha \frac{|r_{i,t} - \mu|}{\sqrt{\tau_t g_{i-1,t}}} + \gamma \frac{r_{i,t} - \mu}{\sqrt{\tau_t g_{i-1,t}}} + s^+ VOL_X_{t-1}^+ + s^- VOL_X_{t-1}^- \quad (7)$$

The coefficients s^+ and s^- indicate the impact of positive and negative macroeconomic volatility on the volatility of the stock index. If $s^+ > 0$, it means that positive macroeconomic volatility will increase the volatility of the stock index. If $s^+ < 0$, it means that positive macroeconomic volatility will stabilize the stock index. For negative macroeconomic volatility, if $s^- > 0$, it means that they will help stabilize the stock index. If $s^- < 0$, it means that negative macroeconomic volatility will increase the volatility of the stock index.

2.2. Model for assessing the asymmetric impact of macroeconomic volatility on long-term volatility of stock market.

This study develops a GARCH-MIDAS model by further expanding the macroeconomic volatility variables to measure monthly market volatility using the formula (8).

$$\log \tau_t = m + l^+ \sum_{k=1}^{K^+} \varphi_k(\omega_1) VOL_X_{t-1}^+ + l^- \sum_{k=1}^{K^-} \varphi_k(\omega_2) VOL_X_{t-1}^- \quad (8)$$

The coefficients l^+ and l^- indicate the impact of positive and negative macroeconomic volatility on the volatility of the stock market. If $l^+ > 0$, a positive macroeconomic shock will increase volatility on the stock market, and vice versa. If $l^+ < 0$, it means that a positive macroeconomic shock will stabilize the stock market. For negative volatility, if $l^- > 0$, a negative macroeconomic shock will help stabilize the stock market. If $l^- < 0$, it means that a negative macroeconomic shock will increase volatility on the stock market. The $\varphi_k(\omega_1)$ and $\varphi_k(\omega_2)$ diagrams are the weight of the MIDAS filter, which can be estimated in the form of finite polynomials or infinite polynomials (Ghysels & colleagues, 2007) and are determined by formula (9).

$$\varphi_k(\omega_i) = \frac{(1-k/K)^{\omega_i-1}}{\sum_{j=1}^K (j/K)^{\omega_i-1}}, \quad i=1,2 \quad (9)$$

The Relative Marginal Effect (RME) of long-term volatility on TTCK due to macroeconomic volatility with coefficients l^+ and l^- are as follows:

$$RME_{\tau}^+ = e^{l^+ \cdot \varphi_k(\omega_1) \Delta VOL_X_t^+} - 1 \quad \text{and} \quad RME_{\tau}^- = e^{l^- \cdot \varphi_k(\omega_2) \Delta VOL_X_t^-} - 1 \quad (10)$$

3. Results

3.1. Data

The research data consists of the stock market index and macroeconomic variables in the Vietnamese market from 2013 to 2021. The analysis data includes two periods: (1) a stable market period and (2) a period affected by the COVID-19 pandemic to evaluate the specific role of macroeconomic variables in each market context. Specifically, the stock market index used in the analysis is the VN-Index, which is listed daily on the HOSE exchange from June 30, 2013, to June 30, 2021.

The macroeconomic variables used in the study are the interbank interest rate (IRATE) and the industrial production index (IP) from August 2008 to November 2019. According to Engle et al. (2013), the interest rate represents the discount rate of expected future cash flows. Furthermore, other interest rates in the Vietnamese economy are often linked to the interbank interest rate published by the central bank. This is why this study uses the interbank interest rate to represent the overall interest rate in the economy. The second macroeconomic variable is the industrial production index of Vietnam. This index is published monthly by the GSO and reflects purely the real output and monthly economic growth (Girardin & Joyeux, 2013).

3.2. The impact of macroeconomic volatility on the short-term volatility of stock market

Table 1 summarizes the impact assessment of positive and negative fluctuations of the IP index and IRATE interest rate on the daily volatility of the VN-Index. The results show that the impact of macroeconomic volatility factors is different in conditions of positive and negative fluctuations. At the same time, the role of macroeconomic variables also differs between two periods of stable and volatile markets. Interest rates play a more important role in the context of a stable market, but growth plays a more important role in the context of an unstable market due to Covid19.

Table 1. The extended EGARCH model with positive and negative macroeconomic volatility

Coefficients	IP		IRATE	
	06/2013- 06/2019	06/2019- 06/2021	06/2013- 06/2019	06/2019- 06/2021

Note: *, **, and *** indicate statistically significant coefficients at the 10%, 5%, and 1% levels, respectively. Source: Author's calculations.

The impact of positive and negative volatility of the IP in the short-run volatility of the stock market

In more detail, the extended EGARCH model shows that positive and negative volatility of the IP index will have a significant impact on the daily volatility of the VN-Index. In the period from 06/2013-06/2019, the effect of positive growth shock is not clear because the estimated coefficients of VOL_IP^+ in this period are not statistically significant. On the other hand, the negative growth shock has a significant impact on the estimated coefficient of VOL_IP^+ of 0.003, which is statistically significant at 5%. This means that the more the growth volatility decreases, the lower the volatility on the stock market. The study also shows that there is no evidence of the impact of growth volatility on the daily volatility of the VN-Index in the context of a stable market.

In the context of the Covid19 pandemic and the market volatility, it seems that the role of the IP index has become more important. However, the impact coefficients remain the same as in the previous period. Specifically, the estimated coefficients for the positive and negative growth volatility are 0.003 and 0.0042, respectively, both statistically significant at the 5% level. This means that an increase in production growth volatility will create a cumulative effect that increases the daily volatility on the stock market, and vice versa, if the negative growth volatility decreases more sharply, it will reduce the daily volatility on the stock market.

The impact of positive and negative interest rate volatility in the short-run volatility of the stock market

Table 1 also shows that the role of volatility from interest rate increases and decreases differs in each period. Specifically, the shock of interest rate increases will have a significant impact in the stable economic period from June 2013 to June 2019. The estimated coefficient of the variable VOL_IRATE^+ during this period is -0.036, which is negative and statistically significant at the 10% level, meaning that an increase in interest rate volatility in the financial market will help stabilize the stock market. On the other hand, the role of the shock of interest rate decreases during this period is unclear because the estimated coefficient of the impact of VOL_IRATE^+ from June 2013 to June 2019 is 0.011 and is not statistically significant.

During the unstable market period from June 2019 to June 2021 due to COVID-19, the impact of the shock of interest rate decreases was more apparent. The estimated coefficient of the impact of VOL_IRATE^- is 0.039 and statistically significant at the 5% level. This indicates that the more significant the decrease in interest rate volatility in the financial market, the more stable the stock market will be. In contrast, the consequence of the shock of interest rate increases, which affect the daily fluctuation of the stock market index, is not clear during this period. This is because the coefficient of the positive volatility of interest rates (VOL_IRATE^-) is -0.035 and is not statistically significant. This shows that a policy to stabilize interest rates will have a significant impact on the stock market during a period of strong economic fluctuations due to COVID-19.

3.3. The impact of macroeconomic volatility on the long-run volatility of the stock market

Table 2 shows the impact of positive and negative macroeconomic volatility of IP and IRATE on the monthly volatility of the stock market index based on model (8). The results show that the role of macroeconomic volatility in the long run differs from the short term in different contexts of the stock market index.

Table 2. GARCH-MIDAS Model with positive and negative macroeconomic volatility

Coefficients	IP		IRATE	
	06/2013-06/2019	06/2019-06/2021	06/2013-06/2019	06/2019-06/2021
μ	0.057**	2.273**	0.054**	0.198**

The impact of positive and negative volatility of the IP index in long-run volatility of the stock market

In a stable market context, the role of positive and negative growth volatility is different. When the volatility of the IP index changes by the same amount, for example 1 point, if the previous growth volatility increases, it will increase the volatility of the VN-Index in the next period by $e^{0.961 \times 0.052 \times 1} - 1 = 0.051\%$, or 5.1 points because of the estimated coefficient of l_{IP}^+ of 0.961, which is statistically significant. Conversely, if the growth volatility decreases by 1 point, it will reduce the volatility of the stock market in the next period by $e^{0.172 \times 0.185 \times (-1)} - 1 = -0.031\%$ due to the estimated coefficient l_{IP}^- of 0.172, which is statistically significant at the 1% level. The weight chart in Figure 1 also shows that the impact of negative volatility decreases rapidly (IP.Neg.2013-2019 line). The magnitude of the impact will decrease rapidly after about 8 months. At the same time, the impact of positive volatility is longer-term

(IP.Pos.2013-2019 line). This shows that the effect of growth volatility has a longer-term impact compared to negative growth volatility.

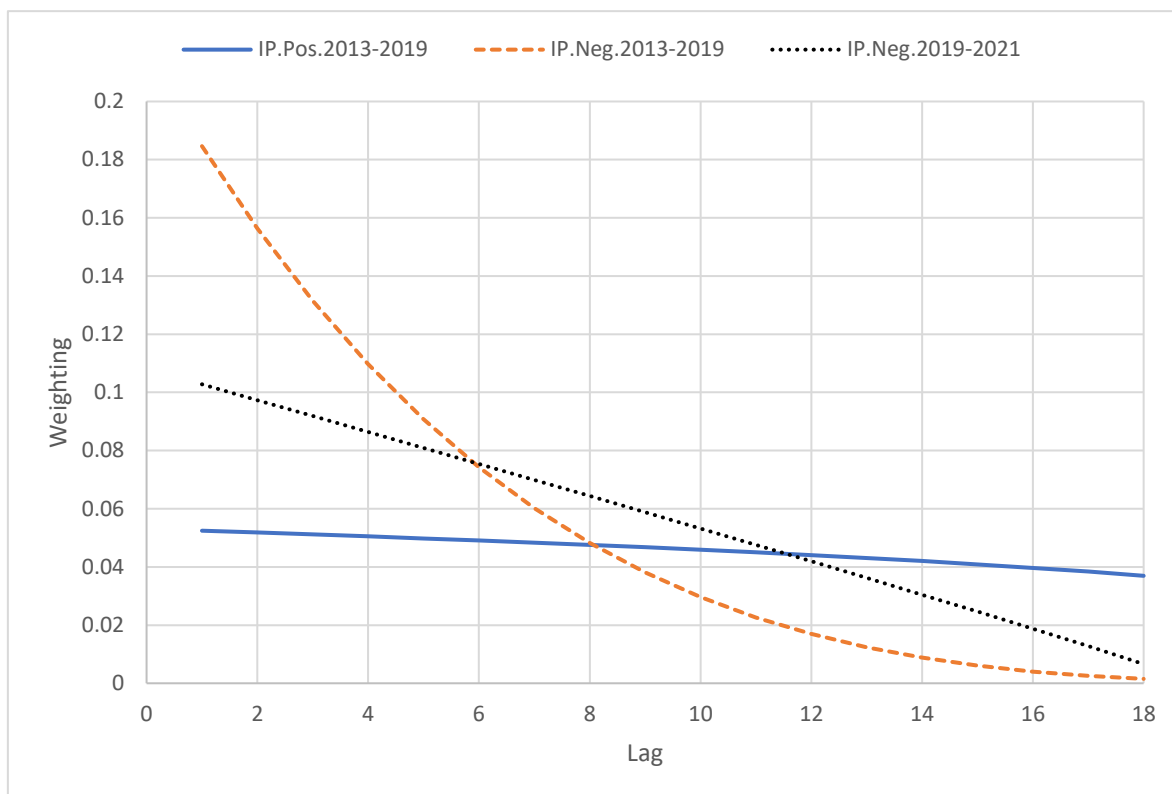

Figure 1. Lag weight diagram of negative and positive volatility of IP index

Source: Author's calculations

Starting from the end of 2019, the negative impact of IP growth is quite strong, while evidence of the positive effect is unclear in the context of economic volatility due to the impact of COVID19. The weight chart in Figure 1 (IP.Neg.2019-2021 line) shows the prolonged effect of negative volatility in an unstable market. Specifically, the estimated coefficient of l_{IP}^- in the period from 06/2019-06/2021 is 6.495, statistically significant at the 1% level. This means that the more stable the growth, the more stable the stock market. This also means that the signal from the decline in production growth does not help the stock market become more active. Table 2 also shows that the role of positive growth volatility is unclear in the context of an unstable market because the coefficient of l_{IP}^+ of the IP variable in the period from 06/2019-06/2021 is not statistically significant.

The impact of positive and negative volatility of Interest rate in long-run volatility of the stock market

Table 2 shows the important role of long-term interest rate fluctuations, especially in the context of a stable economy. An increase in interest rate fluctuations will reduce the volatility of the stock market index, while a decrease in interest rate fluctuations will increase the volatility of the index. Specifically, if the previous period's interest rate fluctuation increases by 1 point, it will reduce the volatility of the VN-Index in the next period by

$e^{-12.043 \times 0.052 \times (0.01)} - 1 = -0.007\%$, or 0.7 points, because the estimated coefficient l_{IRATE}^+ is -12.043 and the first lag weight is 0.052. Conversely, a 1-point decrease in interest rate fluctuations will increase the volatility of the stock market index in the next period to $e^{-5.433 \times 0.048 \times (-0.01)} - 1 = 0.0026\%$ or 0.26 points, because the estimated coefficient l_{IRATE}^- is -5.433 and the first lag weight is 0.048. The weighting chart in Figure 2 shows that the impact of interest rate volatility, both positive and negative, will decrease slowly over time (through the lines IRATE.Pos.2013-2019 and IRATE.Neg.2013-2019).

Figure 2. Lag weight diagram of negative and positive volatility of interest rate

Source: Author's calculations

Table 2 also shows that the impact of interest rates on the long-term volatility of the stock market in an unstable market is unclear. The estimates of the coefficients l_{IRATE}^+ and l_{IRATE}^- for the volatility of interest rate are not statistically significant. This result suggests that the increase and decrease in interest rates have not had a clear impact on the long-term volatility of the Vietnamese stock market during the period from 06/2019 to 06/2021. This means that the effectiveness of interest rate policy changes in an unstable market is unclear in the Vietnamese stock market in the long term.

5. Discussion and Conclusion

This paper investigates the role of macroeconomic variables in the context of the developing and emerging market of Vietnam. This is a highly volatile market and is heavily affected by the Covid19 pandemic on both the supply and demand sides of commodities due to sanctions. We study from both short-term and long-term perspectives as well as during the stabilization period and the period of Covid19 impact. GARCH-MIDAS and EGARCH

are used to test the degree of influence of positive and negative macroeconomic fluctuations. We use interest rates and industrial production index as two characteristic factors for the money market and the commodity production market. The results have some notable points as follows:

Firstly, the role of macroeconomic fluctuations is crucial in a stable market, where the impact of positive and negative macroeconomic volatility is significantly different. While growth fluctuations have a positive impact on the volatility of the stock market, interest rate fluctuations have a negative impact. This means that stronger growth fluctuations will increase the volatility of the stock market, while a decrease in growth fluctuations will decrease the volatility of the stock market. At the same time, an increase in interest rate fluctuations will decrease the volatility of the stock market, while a decrease in interest rate fluctuations will increase the volatility of the stock market. This shows the different effects of the State Bank of Vietnam's monetary policy and the Vietnamese Government's fiscal policy. Fiscal expansion policies aimed at stimulating higher growth will have a strong impact on the volatility of the stock market and make the market livelier. Overall, companies with good efficiency will attract long-term investors in this context. On the other hand, stable growth policies aimed at reducing fluctuations in actual growth will help stabilize the stock market. In the financial market, the instability of monetary policies also reduces the volatility of interest rates, which makes the stock market less volatile. When the financial market is unstable, a stable stock market shows that it is a stable investment channel. Stable monetary policies can also help attract long-term investors to participate in the stock market.

Secondly, in the context of a stable economy, the role of positive and negative macroeconomic fluctuations differs in the short and long term. Specifically, positive growth has a clearer impact in the long term, while negative growth affects fluctuations in the stock market in both the short and long term. Conversely, increasing interest rate fluctuations have a clearer impact in both the short and long term, while reducing interest rates only has an impact in the long term. This shows that expanding fiscal policies to achieve higher growth will have a stronger impact on stock market volatility in the long term. This means that policies aimed at stimulating higher growth will not have a significant effect on the stability of the stock market in the short term. Stable growth policies aimed at reducing real growth fluctuations help stabilize the stock market in the long term more than in the short term. Stable businesses also attract short-term investors, but dynamic businesses truly attract long-term investors. In the currency market, unstable monetary policy can cause interest rate fluctuations that may reduce stock market volatility in both the short and long term. Alternatively, when the financial market is unstable, a stable stock market indicates that it is a stable investment channel in the context of financial market fluctuations in both the short and long term. Stable monetary policies can help make the stock market more active, especially in the long term. An economy with a stable financial market also shows that the stock market is attractive to long-term investors, making it more active. This shows that the

central bank's stable interest rate policy is also a way to attract long-term investors to participate in the stock market.

Another point is that the role of macroeconomic fluctuations differs from that of the Covid19 market volatility period. During this time, the IP index seems to play a more important role, especially in the short term. Conversely, interest rate policies have little significant impact in the context of an unstable market. The impact of this factor is not clear, except in the case of a shock where interest rate fluctuations decrease in the short term. This shows that expansionary fiscal policy has a strong impact during crises, and growth-promoting policies help to invigorate the stock market. Businesses with good operational efficiency and high growth truly attract investors in this context, especially short-term investors. A stable fiscal policy aimed at reducing growth volatility truly helps to stabilize the stock market in this context. The effectiveness of tightening policies helps to stabilize the stock market. This is also evidence of the consequences of Covid19 containment policies causing a decrease in commodity supply and making the stock market less active. In the financial market, the effectiveness of interest rate stabilization policies is also very low in times of crisis. Evidence shows that reducing interest rates is effective in the short term during the Covid19 crisis period. Stable interest rates can help to invigorate the stock market.

Finally, results show the different lag effects of macro policies. Specifically, in a stable period, the impact of negative volatility decreases rapidly, while the impact of positive volatility is long-lasting. This also means that the positive impact of government growth-promoting policies is longer-lasting than growth stabilization policies. In times of market instability, the effectiveness of interest rate policies in the financial market will be quite long-lasting. This shows the special importance of growth-promoting and interest rate policies in the context of economic crisis in Vietnam. Therefore, investors, market managers, and risk managers are encouraged to apply appropriate methods of forecasting volatility and risk management in each context to continuously adjust in a timely manner to the State Bank's interest rate policies and growth-promoting policies in the context of Vietnam's developing economy.

MEASURING PERFORMANCE WITH DATA ENVELOPMENT ANALYSIS (DEA) INTEGRATED UNDESIRABLE VARIABLES - SOME POTENTIAL RESEARCH DIRECTIONS

Dr. Phung Manh Trung

pmtrung@vimaru.edu.vn

Vietnam Maritime University, Hai Phong, Vietnam

Abstract

Data envelopment analysis (DEA) is one of the most popular approaches to measuring the performance of operations. The nature of the approach is based on two ideas: maximizing output (output-oriented) or minimizing input (input-oriented). In real situations, there exist, however, many output variables that need to be minimized, and the input variables needed to be maximized to improve efficiency. This study will discuss and derive a performance measurement model that integrates these types of variables in mathematical programming. The results of the research can be applied to many professions and fields in practice.

Keywords: *Data Envelopment Analysis (DEA); technical efficiency; undesirable variables.*

1. Introduction

In a Data envelopment Analysis (DEA) model, the operation of decision-making units (DMUs) under measuring framework may exist both desirable and undesirable input and output variables. For example, the number of defective products is an unexpected output variable. We always aim to reduce the number of defective products to improve efficiency. On the other hand, in every production cycle, outputs such as waste or pollution are also considered as undesirable output variables. Apparently, minimizing these outputs will definitely improve the efficiency of the system.

The traditional DEA models (such as the variable efficiency to scale (VRS) model) assume that output variables need to be increased while input variables need to be reduced in order to improve efficiency or reach the best-practise (efficiency) frontier. Some researches consider the undesirable output variable as an input to minimize, the calculated results of the DEA model, nonetheless, may not accurately reflect the reality of the production process.

Conversely, in some other situations, the input variables may need to be increased to improve efficiency. For example, to improve the efficiency of a waste treatment process, the amount of waste (undesired input variable) handled should be increased rather than reduced as assumed in the traditional DEA model.

Seiford and Zhu (2002) have developed a research direction to handle undesirable input/output variables in the DEA - VRS model. The key to this approach is the use of invariant DEA classes. Accordingly, the efficient and inefficient classes are considered to be invariant to the metric of data transformation.

2. Efficiency Invariance

Assume that the input and output variables can be transformed in the form as $\bar{x}_{ij} = x_{ij} + u_i$ and $\bar{y}_{ij} = y_{ij} + v_i$ where u_i and v_i are non-negative random variables. Then the input-oriented and output-oriented DEA-VRS model can be written as follows

$$\min \theta - \varepsilon \left(\sum_{i=1}^m s_i^- + \sum_{r=1}^s s_r^+ \right) \quad (1)$$

subject to

$$\sum_{j=1}^n \lambda_j \bar{x}_{ij} + s_i^- = \theta \bar{x}_{i0} \quad i = 1, 2, \dots, m;$$

$$\sum_{j=1}^n \lambda_j \bar{y}_{rj} - s_r^+ = \bar{y}_{r0} \quad r = 1, 2, \dots, s;$$

$$\sum_{j=1}^n \lambda_j = 1$$

$$\lambda_j \geq 0 \quad j = 1, 2, \dots, n.$$

and

$$\max \phi - \varepsilon \left(\sum_{i=1}^m s_i^- + \sum_{r=1}^s s_r^+ \right) \quad (2)$$

subject to

$$\sum_{j=1}^n \lambda_j \bar{x}_{ij} + s_i^- = \bar{x}_{i0} \quad i = 1, 2, \dots, m;$$

$$\sum_{j=1}^n \lambda_j \bar{y}_{rj} - s_r^+ = \phi \bar{y}_{r0} \quad r = 1, 2, \dots, s;$$

$$\sum_{j=1}^n \lambda_j = 1$$

$$\lambda_j \geq 0 \quad j = 1, 2, \dots, n.$$

Ali and Seiford (1990) shows that any decision-making unit (DMU) is considered efficient in terms of a traditional DEA model if and only if that DMU satisfies the mathematical program (1) or (2). This conclusion is drawn from the occurrence of the constraint

$$\sum_{j=1}^n \lambda_j = 1$$

This property allows us to process negative input and output variables before applying the VRS model.

In general, there are three types of invariant when transforming data in the DEA. The first case is limited to “classification invariance”, where efficient and inefficient classifiers are invariant to the data transformation. The second case is the “order invariance” of inefficient DMUs. The last case is “solution invariance”, where the new DEA model (after

data transformation) must be absolutely equivalent to the original one, for example, both programming models must have in common results.

The method used in this study only deals with the first case of invariant. Readers can see the study of Pastor (1996) or Lovell and Pastor (1995) for a more detailed understanding of the invariance in the DEA model.

3. Undesirable Outputs

Desirable (good) and undesirable (bad) output variables are denoted by y_{rj}^g and y_{rj}^b , respectively. Here we want to increase y_{rj}^g and decrease y_{rj}^b to improve efficiency. However, in the output - oriented VRS model, both outputs are augmented to improve efficiency. To increase the desirable output variables and decrease the undesirable output variables, we can proceed as follows.

We first multiply the undesirable output variables by “-1” then find a suitable value of v_r that makes all the unexpected output variables positive, then $\bar{y}_{rj}^b = -y_{rj}^b + v_r > 0$. This

can be done by $v_r = \max_j \{y_{rj}^b\} + 1$.

Then, the model (2) can be re-written as:

$$\max h \quad (3)$$

subject to

$$\sum_{j=1}^n \lambda_j y_{rj}^g \geq h y_{r0}^g$$

$$\sum_{j=1}^n \lambda_j \bar{y}_{rj}^b \geq h \bar{y}_{r0}^b$$

$$\sum_{j=1}^n \lambda_j x_{ij} \leq x_{i0}$$

$$\sum_{j=1}^n \lambda_j = 1$$

$$\lambda_j \geq 0 \quad j = 1, 2, \dots, n.$$

Theoretically, we can treat undesirable outputs as inputs. However, this does not reflect the real production process. Another approach is to simply transform the undesirable outputs (for example $1/y_{rj}^b$) and then use the transformed variables as the outputs. In fact, the method used in this study applies a linear monotonous reduction transformation. Since the use of linear transformation preserves convexity, it is a good choice for the DEA model.

Figure 1 illustrates the proposal method. The five DMUs A, B, C, D and E use the same inputs to produce one desirable output (g) and one undesirable output (b). GCDEF is the frontier (output). If we consider the undesired output as input, then ABCD becomes the limit of the VRS model. Model (2) rotates the output frontier around EF and obtains a symmetric frontier. In this case, the DMUs A', B' and C', of A, B and C, respectively, are efficient.

Figure 1. The treatment of undesirable outputs

The target efficiency which a DMU can reach to is

$$\begin{cases} \hat{x}_{i0} = x_{i0} - s_i^- \\ \hat{y}_{r0}^g = h^* y_{r0}^g + s_i^+ \\ \hat{y}_{r0}^b = v_r - (h^* \bar{y}_{r0}^g + s_r^+) \end{cases}$$

4. Undesirable Inputs

The idea of undesirable output variables can also be applied to cases where input variables need to be increased instead of decreased in order to enhance efficiency (undesirable input variables). In this case, we use x_{ij}^I to denote the inputs to increase and x_{ij}^D to denote the inputs to decrease, respectively.

Next, we can multiply x_{ij}^I by “-1” and find the value of u_i that makes $\bar{x}_{ij}^I = -x_{ij}^I + u_i > 0$. Based on model (1), we can transform to the model with undesirable inputs as follows

$$\max \tau \quad (4)$$

subject to

$$\sum_{j=1}^n \lambda_j x_{ij}^D \leq \tau x_{i0}^D$$

$$\sum_{j=1}^n \lambda_j \bar{x}_{ij}^I \leq \tau \bar{x}_{i0}^I$$

$$\sum_{j=1}^n \lambda_j y_{rj} \leq y_{r0}$$

$$\sum_{j=1}^n \lambda_j = 1$$

$$\lambda_j \geq 0 \quad j = 1, 2, \dots, n.$$

In this case, the target efficiency of a DMU can be written as

$$\begin{cases} \widehat{x}_{i0}^D = \tau^* x_{i0}^D - s_i^- \\ \widehat{y}_{r0}^g = u_i - (\tau^* x_{i0}^I - s_i^-) \\ \widehat{y}_{r0} = y_{r0} + s_r^+ \end{cases}$$

5. Illustrative Example

5.1. Undesirable outputs in supply chain

We can consider an example consisting of 6 suppliers as shown in Table 1. This data is from the study of Weber and Desai (1996) where the input variable is the unit price of the product, the two output variables are the late delivery rate and the rejection rate. Obviously, these outputs are undesirable. We can use Supplier 3 as the rotation point, then the original vector of this DMU will be shifted to (3.3%, 8%). (Another treatment is the use of vector (100%, 100%)). The last three columns in Table 1 shows transformed data.

Table 1. Illustration example of supply chain operation with two undesirable outputs.

DMU	Price (per unit)	Original Outputs		Eff. Score	Tranformed Outputs		Eff. Score
		% Rejects	% Late deliveries		% Rejects	% Late deliveries	
1	0,1958	1,2	5	1,0753	2,1	3	1,0892
2	0,1881	0,8	7	1	2,5	1	1
3	0,2204	0	0	2300	3,3	8	1
4	0,2081	2,1	0	1	1,2	8	1
5	0,2118	2,3	3	1	1	5	1,6
6	0,2096	1,2	4	1,2685	2,1	4	1,4276

By utilizing the Add-in Solver in Excel, we can calculate the efficiency of the above DMUs in the case of the original output data and the transformed output data. If we do not transform the data of the undesirable output variables and compute the efficiency according to the output - oriented VRS model, DMU 5 will be ranked as efficient and DMU 3 will be ranked as inefficient. Conversely, if the data has been transformed, then DMU 5 becomes an inefficient DMU while DMU 3 becomes an efficient DMU. This more accurately reflects the business meaning of suppliers.

5.2. Non-performing loans in banking

Credit can be considered as one of the most important activities in the banking industry. Although there is a shift in income structure from credit to non-credit services, the proportion of this activity in total income still accounts for a high level. It can be said that credit growth is always one of the vital goals of commercial banks.

Similar to any development, credit growth always has its negative side, and as a result, undesirable outputs are produced. Specifically, they are “non-performing loans”. Although these are unexpected additions, they always go hand in hand and grow at a certain rate compared to credit growth. This raises a need for bad debt management in the banking industry. In terms of importance, this work is considered to be equivalent to credit growth. Therefore, the weight of this unexpected output is also equivalent to the expected output.

This section uses the data from the research of Phung (2023) Vietnam Maritime University Project (No. DT22.23.99). The data consists of 17 banks listed in Vietnam’s two Stock Exchange. The descriptive statistics of data is shown in Table 2.

Table 2. Descriptive statistics of variables in banking credit operation

(unit: million VND)

Variables	Mean	Median	Min	Max	St.D	
Inputs	Labor Expenses	4,129,082	3,236,162	394,130	11,428,468	3,051,006
	Fixed Assets	3,860,970	2,748,688	300,052	11,114,537	3,461,197
	Interest Expenses	17,040,136	11,194,263	2,196,765	64,890,703	15,387,874
Outputs	Loans	323,696,051	215,837,420	29,471,994	1,354,632,643	332,359,185
	CAR	11.18	10.88	8.35	16.62	1.92
	NPL 3	1,159,359	517,854	23,123	7,095,731	1,646,938
	NPL 4	961,525	574,218	7,448	7,535,242	1,304,189
	NPL 5	2,516,489	1,387,797	169,912	16,525,054	2,933,139

The calculating results of the efficiency of bank credit activities are shown in Table 3. Since this is only an illustrative example, this study does not show the names of banks. Here two models are utilized to calculate the efficiency scores, that are, traditional DEA-VRS and the model with undesirable outputs that presented in this paper.

Table 3. Efficiency of banking credit operation.

DMU No.	2018		2019	
	Trational DEA-VRS	DEA-VRS with undesirable	Trational DEA-VRS	DEA-VRS with undesirable
1	1,0000	1,2002	1,0000	1,2258
2	1,0000	1,0000	1,0000	1,0000
3	1,0000	1,0000	1,0000	1,0000
4	1,0000	1,0000	1,0000	1,0000

DMU No.	2018		2019	
	Trational DEA-VRS	DEA-VRS with undesirable	Trational DEA-VRS	DEA-VRS with undesirable
5	1,0034	1,0000	1,0078	1,0172
6	1,0177	1,1289	1,0000	1,0003
7	1,0000	1,0000	1,0000	1,1989
8	1,0233	1,1362	1,0116	1,2015
9	1,0000	1,0000	1,0000	1,0473
10	1,0000	1,0000	1,0000	1,0000
11	1,0000	1,0000	1,0000	1,0000
12	1,0000	1,0000	1,0089	1,0050
13	1,0000	1,0000	1,0000	1,0000
14	1,0000	1,0000	1,0000	1,0223
15	1,0000	1,0000	1,0000	1,0000
16	1,0000	1,0000	1,0000	1,0000
17	1,0315	1,0000	1,0000	1,0000

Table 3 shows some differences between the calculation results of the two models. For example, according to the traditional DEA model, Bank 1 is evaluated as efficient in both years. However, according to the model takes into account the undesirable output variable, this bank is considered as inefficient. In contrast, for the case of Bank 17, while the traditional DEA model determines that this bank is inefficient, the DEA model integrating the undesirable variables evaluates this bank as an unique efficiency. Obviously, considering non-performing loan as normal outputs is illogical and the calculation results from the traditional DEA model are unreliable.

6. Conclusion

Studying the efficiency of the decision-making units' operation is always a topic of special interest to managers. Among the quantitative methods to evaluate efficiency, DEA emerges as one of the most popular because of its simplification of constraining assumptions about the economic model of input-output variables in the production operation.

Unexpected outputs and inputs are variables that always appear objectively in the operating cycle of decision-making units. Trying to control these variables can affect the efficiency of the cyclic system.

In this study, the author presents the DEA - VRS model to calculate the efficiency of DMUs in which there exist some undesirable measures (outputs or inputs). The model presented in this study is based on the efficiency classifier invariance. Using two examples

of the case of supply chain operation with undesirable output variables such as delivery rejection rate and late delivery rate, and banking operation with non-performing loans, we can see that applying the model integrating the type of bad outputs more accurately reflect the system's performance than when this factor is omitted.

This study is a premise to apply to the study of the performance of many different fields such as banking industry (NPL ratio), manufacturing industries (industrial emissions), seaports. (Waste into the marine environment) ... However, it should be noted that the calculated results according to the model do not guarantee the invariant of the solution, but only the invariant of the ranking order. In other words, the calculation results from the model are suggestions on how to effectively rank the DMUs instead of quantifying the absolute efficiency scores.

INVESTIGATING THE MOTIVATIONS OF VIETNAM'S OUTWARD FDI: DOES RESOURCE SEEKING MATTER?

Dr. Phung Thanh Quang

pt_quang@neu.edu.vn

School of Banking and Finance, National Economics University, Hanoi, Vietnam

Abstract

This paper intends to analyze the motivations of outward FDI pattern of Vietnam using the gravity theory and panel data of 159 economies over the world during a 2007-2021 period. The author extends the gravity model proposed by Zhang & Daly (2011) to test the determinants of Vietnam's OFDI. The regression models confirmed that Vietnamese OFDI's location choice was positively impacted by high levels of political stability, export relations, and proximity to Vietnam. Meanwhile, natural resource advantages and the other good governance factors in one economy do not have statistically significant effects on the location choice. Whereas, Vietnamese new registered OFDI amount is negatively affected by governance effectiveness, rule of law, and regulatory quality. Based on the findings, the author proposes some recommendations to promote the Vietnam's outward FDI in the upcoming time.

Keywords: *Outward FDI, political stability, good governance, regulatory quality, resource seeking*

1. Introduction

Since implementing Renovations towards a market economy in 1986, Vietnam has gained numerous outstanding achievements in economic development and international integration. Vietnam has become a reliable destination of multinational corporations (MNCs) thanks to its political and macroeconomic stability and improved ease of doing business. In response, several domestic enterprises have started investing abroad since 1989. This is considered as initial steps in Vietnamese Investment Development Path (IDP), where outward foreign direct investment (OFDI) flows have increased but at much lower level than inward foreign direct investment (IFDI) ones (Dunning, 1981, 1986). Due to its large economic openness and reliance on international cooperation (Pham H.C. et al., 2021), Vietnam's OFDI has become an important factor contributing to its process of extensive economic integration and value chain enhancement. From strategically investing into neighbours such as Laos and Cambodia in the 1990s, Vietnam has expanded its OFDI locations to approximately seventy countries and territories by 2021 (FIA, 2022). While there have been many studies investigating the motives of foreign direct investment (FDI) into Vietnam (Quang et al., 2022; Nguyen, 2008a) or its effects to Vietnamese economy (Nguyen T.M.N, 2021; Jenkins, 2006; Le & Pomfret, 2011; Nguyen, 2008b; Nguyen et al., 2020), the few have been produced to analyse Vietnam's OFDI motivations. OFDI from emerging and developing countries are implemented in distinctive strategies as prevailing theoretical approach to OFDI largely focuses on MNCs in developed countries (Thu Ha et

al., 2021). Empirical research strands on OFDI in developing economies are nearly on prominent powers' strategies such as India and China. These giant economies themselves hold geopolitical senses and consequently tend to design distinctive OFDI plans which might not be applied in medium-scale economies like Vietnam. For example, China showed significant interests on African markets (Mourao, 2018) while Indian MNCs largely invested in developed countries (Hansen, 2009). Therefore, analysis of OFDI motives in Vietnam, a medium-scale economy, contributes to the current literature on OFDI from developing countries and comparisons with others with similar economic sizes at different stages of IDP. Using regression models with panel data of 159 economies in the period 2007-2021, this paper aims to investigate the determinants of Vietnamese OFDI's location choice and the amount of new-registered OFDI capital in host economies.

2. Literature review

In a country level, the IDP model is a classic theoretical framework analysing FDI patterns all over the world, in which the values of FDI flows inward and outward economies depend on their levels of economic development (Dunning, 1981, 1986). Developing countries are at IDP's initial stages IDP. Their OFDI scale begins flourishing; however, it would be much lower the IFDI one. Dunning et al. (2010) also provides empirical evidence on Trade Development Path (TDP) in parallel with IDP; accordingly, levels of trade increase with expansion of cross-border investment flows as economies constantly grow.

In empirical aspects, most studies show the universality of the IDP model. However, in the application of the IDP model, selected specific characteristics of economic structures, monetary policies and especially governance institutions should be taken into account to provide comprehensive analysis on OFDI's features in each country (Bellak & Jel-code, 2001; Liu et al., 2005; Stoian, 2013).

In essence, the empirical literature links economic development with OFDI in the IDP model with large considerations on good governance. When a developing economy grows at significant rates, several aspects of good governance, such as its abilities on control of corruption tend to be improved (Paldam, 2003). In addition, the state would be under increasing civilian pressure (Acemoglu & Robinson, 2000), or the economy can face vital conditions such as better education (Fukuyama, 2001) and a rising middle class (Pittaluga et al., 2015) to undertake institutional reforms towards more transparency and democracy. Therefore, economic development becomes a requisite for good governance in terms of improving democratic and transparent institutions (Boix & Stokes, 2003). These good governance conditions establish crucial fundamentals in appealing IFDI as well as nurturing domestic enterprises to become MNCs for OFDI. For the former, it is confirmed that MNCs are interested in foreign countries with good government infrastructure during their location choice (Globerman & Shapiro, 2002). For the latter, Das (2013) while studying developing countries' behaviours on OFDI, shows that good governance in home economies plays an indispensable role in encouraging these flows. However, weak governance in source countries might be a thrust for MNCs to escape bad institutions and invest abroad (Stoian & Mohr, 2016).

In a firm level, foreign investors can be divided into four categories based on their motives: natural resource seekers; market seekers, efficiency seekers, or strategic asset seekers (Dunning, 1977; Dunning & Lundan, 2008). This is also a key topic in various empirical studies assessing host countries' features and determining OFDI flows from developing and emerging economies. This is because MNC's motives and strategies are diverse across countries, depending on host countries' barriers such as corruption and ease of doing business, and MNCs' own capacity (Kravtsova, 2010).

For the first type, MNCs tend to select locations with ample natural resources and cheap labour to match their technical and administrative efficacy. Studies on China's OFDI flows show that this country is a typical case of resource-seeking motives (Hu, 2013; Kolstad & Wiig, 2012; Zhang & Daly, 2011). Weak governance and large values of natural resource exports in host economies are key drivers of its OFDI flows. Wang et al. (2012) affirm the Chinese government has implemented state-ownership interventions in outward investment activities to orient its OFDI capital to developing countries rather than developed ones. In doing so, China has succeeded in promoting investments in African countries where there are natural resource advantages and limited governance (Mourao, 2018). Market seekers invest abroad with their desires of expanding market shares abroad by providing products to host economies' domestic markets. This market entry usually comes after an increase in export to the host countries. Empirical evidence of Eem et al. (2019) and Goh & Wong (2011) points out that Malaysian MNCs employ market-seeking motives as host countries' market sizes and income levels positively affect Malaysian' OFDI flows. In addition, Ibrahim et al. (2019) vividly indicates that selected ASEAN countries such as Malaysia, Singapore, Indonesia, and Thailand boost their OFDI flows via the market-seeking motives. The efficiency seeking OFDI aims to rationalize firms' operation by technology transferred to host countries and taking advantages of their cheap labour conditions. These enterprises employ economy-to-scale features and a natural monopoly to increase their competitiveness. Among developing countries, Ma et al. (2020) shows that the motives of China's OFDI in the period 2005-2016 in ASEAN countries shifted from resource-seeking to efficiency-seeking.

Beside a traditional exploitative view based on the three aforementioned motives, Kim et al. (2015) investigate a novel theoretical concept, in which businesses can access a explorative view to conduce to their growth via seeking new knowledge and favourable conditions in host countries. Regarding the theory of Dunning & Lundan (2008), the approach of Kim et al. corresponds to the forth motive-strategic asset seeking. In host countries, strategic asset seekers use ownership methods which are ineffective or infeasible in their source country, generate gains from adjusted ownership, and improve their positions in abroad markets by weakening competitors. Analysis of Indian OFDI points out that its MNCs had a tendency of implementing market entries through strategic asset seeking, and largely invested in non-tradable high-tech services such as software and telecommunications in developed countries, which helps its OFDI flows increased sharply from 2001 (Hansen, 2009). This strategy was reinforced by Indian high-tech workforce migrating to developed countries, promoting strategic OFDI from India into those above industries and in turn boosting the Indian economy (Khadria, 2002).

Theoretical and empirical literature review shows that countries design different investment strategies: Although the IDP model is basically universal across countries, specific investigations should be carried out when governments implement intervention policies in developing countries as well as countries under the socialist regime in transition. Vietnam's outward FDI, to a certain extent, follow the IDP model (Phung, 2016a). However, the OFDI's motives have not been thoroughly investigated. To the best author's knowledge, only two papers by Phung (2016b) and Thanh Thu (et al. 2018) empirically analyse determinants of Vietnamese OFDI into its two neighbours, Laos and Cambodia, in which Vietnam's OFDI activities are positively influenced by the State' interventions as well as Vietnamese relative economic development levels compared to Laos and Cambodia. Such studies cannot fully reflect Vietnam's OFDI motives and strategies in its development path. For investigating the motivations of Vietnam's OFDI, we propose three main hypotheses as follow:

H1: Political stability in one country has positive impacts on Vietnam's selection of investment locations.

H2: Natural resource advantages have positive impacts on the registered OFDI amount.

H3: Good governance in host middle income country groups has negative impacts on the new registered OFDI amount.

We follow a gravity model of Zhang & Daly (2011) to test the aforementioned hypotheses. As this paper is the first quantitative one investigating determinants of Vietnam's OFDI strategies, the coefficients of the controls in the gravity model like population, geographical distance, GDP per capita are also analysed in terms of statistical significance levels to investigate associations of these factors with Vietnamese OFDI.

3. Method

We investigate Vietnamese OFDI strategies via constructing panel data of all countries and territories during a 2007-2021 period. The main reason to select the beginning year of 2007 is the highlighted point of Vietnam joining the WTO. It can be said that the year of 2007 is the unique step of Vietnam in the way of globalization and economic openness. We follow an empirical gravity model of Kolstad and Wiig (2012) and Zhang & Daly (2011), and add other independent variables on good governance to test our hypotheses:

$OFDI_i = \alpha + \beta_1 * Governance_i + \beta_2 * Natural\ resources_i + \gamma * Controls_i + \varepsilon_i$, where i is an index by country or territory, ε is an independent and identically distributed random variable.

The calculation and data sources of variables: *OFDI*, *Governance*, *Natural resources* and *Controls* are described in Table 1. We calculate the average value of these indicators in the period 2007-2021 to produce long-term variables (Zhang & Daly, 2011). In our regression models, we use their natural logarithmic numbers, as suggested by Goh & Wong (2011) to be able to compare their impacts and elasticities in relative terms, which cannot be investigated via the original model of Zhang & Daly (2011).

Table 1. Data and Sources

No	Name	Description	Variables ^(a)	Source
<i>Vietnamese outward FDI</i>				
1	OFDI	Annual Vietnam's new registered OFDI flows to host economy	Ln (OFDI)	FIA
<i>Controls</i>				
2	GDPP	GDP per capita	Ln (GDPP)	WDI
3	GGDP	Average GDP growth	Ln (1+ GGDP)	WDI
4	Inflation	Average inflation rate, consumer price index (CPI)	Ln (1+ Inflation)	WDI
5	OPEN	Ratio of inward FDI stock to GDP	Ln (OPEN)	WDI
6	POP	Average population	Ln (DIST)	WDI
7	DIST	Distance between capitals of an economy and Vietnam	Ln (DIST)	CPEII
8	EX	Vietnam's exports to an economy	Ln (EX)	WITS
9	IM	Vietnam's imports from an economy	Ln (IM)	WITS
<i>Governance, Natural resources</i>				
10	NR	Nature Resources Index, measured by the ratio of ores and metals exports to merchandise exports	Ln (NR)	WDI
11	COC	Percentage Rank of Control of Corruption	Ln (COC)	WGI
12	GEF	Percentage Rank of Governance Effectiveness	Ln (GEF)	WGI
13	POS	Percentage Rank of Political Stability	Ln (POS)	WGI
14	ROL	Percentage Rank of Rule of Law	Ln (ROL)	WGI
15	RQU	Percentage Rank of Regulatory Quality	Ln (RQU)	WGI
16	VOA	Percentage Rank of Voice and Accountability	Ln (VOA)	WGI

Source: Prepared by the author (2023)

Note: (a): logarithms of these figures to compare the results in regression models in relative terms.

There are four clarifications on our data and methodology of calculating the variables. Firstly, we use three data sources to calculate the Controls: Centre d'Etudes Prospectives et d'Informations Internationales (CEPII) for the distance variable, World Integrated Trade Solution (WITS) of the WB for the variables on imports and exports, and World Development Indicators (WDI) for the other Controls. Secondly, we calculate our dependent variable, OFDI, as annual average of new-registered OFDI capital from Vietnam to each country and territory over the world. Data on the new-registered OFDI capital is extracted from FIA data set, which records new OFDI registration licenses during the period of 2007-

2021. The measure of new registered capital is employed to reflect the Vietnamese MNCs' expectations at starting points of planning their investments abroad. In the period of 2007-2021, Vietnam has registered to invest in 59 countries and five territories (Macao, Hong Kong, Taiwan, British Virgin Islands (BVI), and Camay Islands). Thirdly, for governance variables, we use the WB's Database on Good Governance to measure 6 sub-indicators: Control of Corruption (COC), Governance Effectiveness (GEF), Political Stability (POS), Rule of Law (ROL), Regulatory Quality (RQU); and Voice and Accountability (VOA) (Kaufmann et al., 2010). Finally, we calculate natural logarithms of (1+ GDPG) and (1+ |Inflation|) as proxies for GDP growth and inflation to run our regressions. A one percentage point increase in (1+ GDPG) corresponds to an increase of one percent in GDP growth (GDPG). In addition, the absolute value of CPI is employed to test a hypothesis that the more stable CPI one country maintains (an inflation rate is near zero), the more motives Vietnamese firms have to invest via OFDI.

We use two regression techniques to test two hypothesis groups: probit for determinants of location choice and Fully modified ordinary least squares (FMOLS) for ones of the OFDI amount. In both regression techniques, we use robust standard errors to avoid heteroskedasticity, which leads regression techniques to become inefficient (White, 1980).

For determinants of location choice, the panel data is constructed in all countries and territories with available data. WITS records countries and territories that Vietnam trades with for significant amounts of exports and imports; therefore, we exclude countries which are not included in the WITS data set due to uncertainties in Vietnamese export and import values (see Table 2 for the variables' description). In addition, we use observations with missing no figures in all of the variables in Table 1 to run probit regressions. The *OFDI* variable in probit regressions has binary values of 0 if there are no OFDI flows from Vietnam to an economy in the period of 2007-2021, and 1, reversely.

Table 2. Description of variables

Variable	Observation	Mean	Std. Dev.	Unit
OFDI	59*	18.0	50.0	Million USD
GDPP	171	12,741	17,655	USD
GDPG	171	1.5	0.5	%
CPI	171	5.8	6.8	%
OPEN	171	10.3	58.5	%
POP	171	38.3	142.0	Million
DIST	168	9244.7	4517.5	Km
EX	171	455.7	1589.3	Million USD
IM	171	455.3	2062.3	Million USD
NR	171	7.9	13.7	%
COC	171	49.1	29.0	%
GEF	171	50.2	28.4	%

Variable	Observation	Mean	Std. Dev.	Unit
POS	171	47.9	27.7	%
RQU	171	50.7	27.9	%
ROL	171	49.3	28.7	%
VOA	171	49.5	28.0	%

Source: Prepared by the author (2023)

To examine factors that impact the OFDI amount, we employ the FMOLS estimate to regress $\ln(OFDI)$ with independent variables. In this model, only observations in Vietnamese host countries-or $OFDI = 1$ in probit regressions-is taken into account. Correlation matrix of the variables for this model is presented in Table 3. It can be seen that good governance variables are strongly correlated with each other.

4. Results

Regarding the determinants of location choice, the probit technique is employed with regressing the binary OFDI variable with *Controls*, *Natural resources*, and *Governance*. Results of six regressions are presented in Table 4. Among *Controls*, coefficients of three variables, *inflation rate*, *distance*, and *EX*, are statistically significant at different levels of 1%, 5%, and 10% in all 6 columns. At a 1% significance level, all 6 regressions show that geographical distance to Vietnam negatively impacts probability Vietnam choose one country to become its investment location. Meanwhile, export value from Vietnam to one

country has positive association with the probability of Vietnamese investment location, with the coefficients ranging from 0.41 to 0.45 at significance levels of 5% in two columns (4.1) and (4.3) and 1% in the four columns (4.2), (4.4) - (4.6). This result supports correlations between IDP and TDP models in Vietnam. In addition, countries with inflation rates farther than zero percent are more likely to be invested by Vietnamese enterprises. In other words, Vietnam tends to invest in countries with relatively large inflation rates. Finally, a coefficient of the population variable, *POP*, in column (4.3) is statistically significant at a 5% significance level with a magnitude of 0.0658. Population also has a positive effect on Vietnamese OFDI's location choice. However, this effect cannot be confirmed by other results in the remaining five columns of Table 4.

Source: Prepared by the author (2023)

Note: OFDI = 1 if a country is chosen for Vietnam's OFDI during 2007-2021; otherwise, OFDI = 0. Robust standard errors in parentheses, *** $p < 0.01$, ** $p < 0.05$, * $p < 0.1$.

Regarding *Governance* and *Natural resources*, only a coefficient of *POS* in column (4.3) is statistically significant at a 1% level with its magnitude of 0.176. Political stability positively influences the probability of Vietnamese location choice. In addition, it cannot be confirmed that natural resource advantages are a factor that induces Vietnamese firms to choose their investment locations. Similarly, five other sub-indicators of *Governance*, control of corruption (*COC*), governance effectiveness (*GEF*), regulatory quality (*RQU*), rule of law (*ROL*), and voice and accountability (*VOA*) do not significantly associate with Vietnamese OFDI's location choice.

To compare impacts' magnitudes among variables' coefficients with statistical significance at a 10% level or lower, the two variables *POS* and *DIST* have the largest effects on the location choice. In other words, political stability and distance are the most important factors in selecting investment location in the period of 2007-2021. The possibility of being selected as Vietnamese OFDI's host countries would be large if their political systems remain stable with their close geographical distance to Vietnam. Interestingly, the coefficients of the inflation rate variable are positive and statistically significant, but lower than ones of *POS*. This means Vietnamese's enterprises give priorities to stable political systems over stable economic ones, at least in terms of inflation, when choosing a location to invest abroad.

5. Discussion and Conclusion

Since renovations in 1986, the Vietnamese economy has grown considerably and started to participate in OFDI process, which has been promoted since the 2000s. This process follows the IDP model with its FDI flows larger than its OFDI ones. This paper aims to investigate factors affecting Vietnam's OFDI strategies on location selection and the amount of new registered OFDI capital in host countries. To do so, we employ panel data of 159 countries and territories in the period 2007-2021 with a probit technique for investigating determinants of the location selection and the data of 55 host economies with FMOLS technique for investigating ones of the new registered OFDI amount.

Trade relations, measured by export values, are positively associated with both probabilities that Vietnam chooses investment locations and the new registered OFDI amount in host economies. These findings support a hypothesis on TDP and IDP since trade and investment values have positive correlation with each other and correspond to the level of economic development.

In terms of location selection, proximity to Vietnam and high levels of political stability are the two most important determinant of probability of being chosen as a host economy. Priorities are given to political stability over macroeconomic stability, at least in terms of inflation. In addition, potential on natural resources cannot be confirmed to have significant effects on the choice of investment locations.

Regarding the choice of the new registered OFDI amount, high levels of political stability in host countries no longer affect this amount. Instead, other factors of good governance, including government effectiveness, regulatory quality, and rule of law have

negative impacts on this amount. If degrees of variables *GEF*, *RQU*, and *ROL* decrease by 1%, this OFDI amount in host countries increase by 1.93, 2.11, and 1.80 percentage points, respectively. Also, natural resource advantages are a crucial factor that positively impacts the value of new registered OFDI flows. If the ratio of ores and metals exports to merchandise exports in host countries increases by 1%, there is an increase of around 0.78-0.88 percentage point in Vietnamese new registered OFDI amount. Comparing impact magnitudes of all dependent variables, *Controls*, *Natural resources*, and sub-indicators in *Governance*, low levels of regulatory quality in host countries have the strongest effects on the OFDI amount.

Our empirical analysis contributes to the understanding of OFDI motives in developing countries in IDP initial stages. Before reaching a higher level of economic development like other countries in ASEAN like Singapore, Malaysia, Thailand and Indonesia, OFDI from Vietnam aimed at resource seeking rather than market seeking. In these first stages, Vietnamese strategies are similar to Chinese ones in the early 2000s. However, with its rapid economic development, China has shifted its strategies on the OFDI motives to market-seeking in selected regions (Ma et al., 2020). This also implies research topics and hypotheses for future studies on Vietnam's OFDI motives, as Vietnam climbs to higher stages of economic development.

Abstract

This study is conducted to review studies related to the impact of capital structure on the performance and vice versa. Then we synthesize the theoretical framework related to the relationship between capital structure and performance. Then a research model is proposed with deep explanations for the future research. Secondary data were collected from related researches and we employ the at-desk review to synthesize issues on the research topic. Conducting this research is really necessary to collecting data (both primary and second data) for running regression for testing the relationship between capital structure and firm performance and vice versa.

Keywords: *Capital structure, performance, relationship, literature, theoretical framework*

1. Introduction

Capital structure and operational efficiency of enterprises is a traditional topic that has been mentioned in many studies. However, consideration of this relationship is still well received by researchers and policy makers. The value of an enterprise is built up from the accumulation of business performance, but is dependent on the past and future investment decisions of the enterprise. Regarding investment decisions involving funding sources, enterprises can use debt, equity, or combine debt and equity. Operational efficiency of enterprises is influenced by financial decisions that have been confirmed in many studies, or capital structure also plays an important role in the success of enterprises (Kumar et al., 2017).

The discussion which is considered to be the beginning of discussing the relationship between capital structure and operational efficiency is found in the study of Modigliani & Miller (1958) (also known as M&M theory). M&M theory makes arguments based on the unrealistic assumption of a perfectly competitive capital market in which there are no corporate income taxes, no bankruptcy costs, and no financial distress costs on debt,... then the market value of an enterprise is unaffected by its capital structure. Later, other theories of capital structure are proposed, of which the trade-off theory of Myers & Majluf (1984) is widely accepted. Theories about capital structure also only mention that there is a positive impact of capital structure on the operating system of enterprises, but no theory has been found that can completely explain the relationship between capital structure and the operating system of enterprises (Le & Phan, 2017).

Empirical studies on the interaction between capital structure and performance: a study by (Berger & Di Patti, 2006; Margaritis & Psillaki, 2010; Fosu, 2013; Kiprop, 2014; Farooq & Masood, 2016; Mohanad & Ali, 2020) state that financial structure has a positive effect on firm performance. In contrast, studies conducted by Fama & French (1998), Gleason et al. (2000), Khan (2012), Le (2015), Zeitun & Haq (2015), Mai & Tran (2018), Le et al. (2021) discover that there is a negative impact of capital structure on the operational efficiency of enterprises. In addition, some studies confirm that: there is no evidence that capital structure and operational efficiency have a relationship (Karaca & Savsar, 2012; Rajhans, 2013).

Actual discussions on the relationship between the capital structure and the operational efficiency of enterprises show many different results, while new theories only assess a positive aspect in the relationship between them.

Although there have been many studies on the impact of capital structure on the operational efficiency of enterprises, this study still ensures a new contribution in terms of theory and practice when the research is expanded in the following aspects:

- The study shows that the relationship between the capital structure and the operational efficiency is two-way, which means, in addition to clarifying the impact of the capital structure on the operational efficiency, it also clarifies the opposite direction.
- This study uses the ‘firm size’ variable as a moderating variable for the actual relationship between the capital structure and the operational efficiency, while most of the previous studies did not use it as a moderating variable.
- The GMM method is applied to overcome the variable variance and endogenous problems.

2. Literature review

Debates on the topic of the relationship between the capital structure and the operational efficiency of enterprises occur not only on theories but also on empirical evidences. Other than theories that only find their positive relationship, empirical evidence shows mixed results about this relationship: there are conclusions that the capital structure has a both positive and negative effect on the operational efficiency, and there is also no evidence to indicate this relationship. According to the evidence collected, there are various reasons for the above relationship: differences in institutions of the countries (Ahrens et al., 2011); errors of estimation methods (Bhagat & Bolton, 2009; Love, 2011); and the fact that capital markets in developed countries perform better and are less prone to asymmetric information than those in developing countries (Eldomiaty, 2007); capital structure varies across industries...

2.1. The impact of capital structure on firm performance

M&M theory in 1958, which was supplemented and developed in 1963, states that firms with high profitability agree that they are using more debt to take advantage of tax shield benefits when determining income tax. The use of debt has made a positive impact on the operational efficiency of enterprises. Agency theory (Jensen & Meckling, 1976), pecking order theory (Myers & Majluf, 1984) agree that having a loan increases the value of firms.

When borrowing money, the pressure from the control of the creditor and from the cash flow generation forces enterprises to comply with the lender's regulations, minimizes the arbitrariness in management, and directs managers to not only know personal interests as before, but also work for the common interests of enterprises, thereby increasing performance.

Jensen's research (1986) also agrees that enterprises with high profit margins will be bolder in using debt leverage than others in order to better control cash flow, which is the basis for generating costs, helping them maximize the value of enterprises. Thus, enterprises with high profit margins often take advantage of more leverage. This conclusion is shown in the experimental results of (Berger & Di Patti, 2006; Margaritis & Psillaki, 2010; Fosu, 2013; Kiprop, 2014; Farooq & Masood, 2016; Mohanad & Ali, 2020; Nguyen, 2016; Ha, 2022).

The results contrary to the above viewpoint are that capital structure has a negative impact on the operational efficiency found in many empirical studies, typically the value-franchise hypothesis, When enterprises operate with high efficiency, they do not want to use the profit from this operation to pay for the loan interest, so enterprises with a lot of profits will lean towards the capital structure with a high percentage of equity. Empirical researches reveal the positive impact of the capital structure on the operational efficiency (Khan, 2012; Le, 2015; Zeitun & Haq, 2015; Mai & Tran, 2018; Le et al., 2021; IQBAL, Mazhar, 2022).

Contrary to the above research results, some studies confirm that: there is no evidence that the capital structure and enterprise value have a relationship (Karaca & Savsar, 2012; Rajhans, 2013). Zeitun (2014) also shows that debt has no impact on operational efficiency. One more conclusion is the same as above: there is no binding between the capital structure and ROE and growth ability of enterprises, but with ROA, it has the opposite effect, according to Hasan et al (2014). Chadha & Sharma (2016) conclude that debt ratio does not affect ROA and Tobin'Q, but does affect ROE, and debt level will negatively affect ROE. In Vietnam, Dinh & Tran (2022) in their study also showed that debt coefficient has a positive and statistically significant impact on ROE and also has a positive impact but not statistically significant with ROA.

Thus, summarization from theories and empirical evidence shows that the capital structure has an impact on the operational efficiency of enterprises in many directions: positive impact, negative impact, and even no impact.

2.2. The impact of firm performance on capital structure

Theories of the capital structure show that the capital structure has an impact on operational efficiency, and vice versa, which is that the operational efficiency has an impact on the choice of capital structure of enterprises (Modigliani & Miller, 1958; Jensen & Meckling, 1976; Myers and Majluf, 1984). According to the M&M theory, the operational efficiency can have a positive impact on the capital structure. Studies conducted by Givoly et al. (1992), Fraser et al. (2006), Berger & di Patti (2006), Margaritis & Psillaki (2007, 2010) have supported this viewpoint of M&M theory.

According to the pecking order theory of Myers and Majluf (1984), the operational efficiency can have a negative impact on the capital structure. Research results of Biger et al. (2007), Frank & Goyal (2009), Nguyen & Tran (2015) have proved this.

Some other studies show a non-linear relationship between the capital structure and the operational efficiency of enterprises. Research by Margaritis & Psillaki (2007, 2010) suggests that the direction of the impact of debt on operational efficiency is reversed when debt exceeds the threshold. The results show that there is a positive effect between debt and operational efficiency. However, the sign of the debt ratio turns from positive to negative when debt levels are high in some industries. There is a reciprocal relationship between the capital structure and the operational efficiency. Research by Lin & Chang (2011) shows that when the debt ratio is less than 9.86%, every 1% increase in the debt ratio will increase Tobin's Q by 0.0546%. When the debt ratio is between 9.86% and 33.33%, every 1% increase in the debt ratio will increase Tobin's Q by 0.0057%. No relationship will be found between debt and enterprise value when the debt ratio is greater than 33.33%. Berzkalne (2015) pointed out in his study that if the debt ratio maintained at 24.64%, the operational efficiency of these firms will reach the highest value and the increase of the debt ratio will increase the operational efficiency. Small and medium enterprises in this Baltic region should maintain their debt ratio below 62.97%. Nguyen & Nguyen (2018) conclude in their research that short-term debt ratio has a positive impact on ROE, long-term debt ratio and debt ratio have a negative impact on ROE.

Thus, summarization from theories and empirical evidence shows that the operational efficiency has an impact on the capital structure of enterprises in both positive and negative directions.

2.3. Capital structure and firm performance: firm size as a moderating variable

The size of the enterprise partly reflects the position of the enterprise in the market. In Vietnam, enterprises are classified into large enterprises, medium enterprises, small enterprises and micro enterprises, one of the criteria to classify enterprises as above is based on the size of capital, turnover, number of employees. Facing opportunities and challenges, large-scale enterprises often grasp and respond better than small and medium-sized enterprises. When accessing capital markets and debt loans, large enterprises have better and easier access than small and medium enterprises. For this reason, the size of the enterprise is used as a moderating variable of the relationship between the capital structure and the operational efficiency of enterprises of the enterprise, IQBAL, Mazhar (2022).

3. Theoretical framework

3.1. Capital structure

From Kyereboah-Coleman (2007) to Ross et al. (2013), all have the same opinion that: debt is a component constituting capital of an enterprise, a combination of liabilities and equity in an appropriate ratio is natural in most production and business activities of enterprises. Therefore, according to Seetanah et al (2014) to measure the level of debt of a business, it is necessary to base on capital structure, which is, equal to total debt divided by total assets. And so: capital structure = debt capital (liabilities) + equity.

According to Tran (2005), Breathey et al. (2018) liabilities are divided into short-term debt and long-term debt, and the capital structure of the enterprise = short-term debt + long-term debt + equity.

The definitions mentioned above show that the statements about capital structure are consistent with equity and debt sources (liabilities). In this paper, we employ the concept of capital structure = liabilities + equity.

Capital structure measurement

Myers (1984) argues that enterprises benefit from tax deductions through debt, thereby increasing the value of enterprises. Therefore, a positive relationship between the capital structure and the operational efficiency of enterprises is discovered (Taub, 1975; Roden & Lewellen, 1995; Champion, 1999; Berger & Di Patti, 2006; Margaritis & Psillaki, 2010; Fosu, 2013; Nguyen & Nguyen, 2018; Nguyen & Ha, 2022). On the other hand, there is an opinion that using internal capital instead of debt will be more beneficial. Therefore, researchers such as Friend & Hasbrouck (1986), Kester (1986), Titman & Wessels (1988), Nguyen & Nguyen (2018) prove that there is a negative impact between the capital structure and the operational efficiency.

Debt ratio

Equation: Debt ratios = 100% x (Average liabilities/Average total assets).

In which:

Average total liabilities: is all the liabilities of the enterprise at the beginning and the end of the period on the accounting books of the enterprise.

Average total assets: equal to the assets at the beginning of the period plus the end of the period divided by two taken in the accounting books of the enterprise.

Since most of the capital equations in enterprises are measured by = liabilities + equity, when looking at the capital structure of enterprises, it is easy for managers to measure whether their financial risk is high or low, depending on how much debt they use. If an enterprise has a debt ratio greater than 0.5, in addition to showing how much of its total capital is debt, it also indicates that they are using a debt-inclined capital structure, and the assets that they own sponsored mainly by loans. The smaller the debt ratio, the smaller the proportion of liabilities in the total assets of the enterprise, which also means that the level of risk is low and the solvency of the enterprise is good.

Core theories: Modigliani and Miller Theory, Trade off Theory, The Pecking Order Theory

First, Modigliani and Miller Theory

The basis for capital structure theory comes from the theorem Modigliani & Miller (1958). Assuming a stable market: tax obligations, transaction fees, bankruptcy costs and financial distress costs are not incurred, information is timely and available to all investors. This assumption was later deemed too restrictive, Harrison & Widjaja (2014). In 1963, Modigliani & Miller (1963) acknowledged the imperfection of the market, they changed

their previous view and suggested tax benefits of debt as a way to increase enterprise value. Interest payments are tax deductible, borrowing money from a bank effectively reduces the tax liability of the enterprise while paying dividends on equity does not benefit from tax.

Second, Trade off Theory

The trade-off theory provides evidence that for the advantages of debt financing, firms have a trade-off between the benefits of debt and the cost of debt. The benefit that debt brings is the benefit from the tax shield, the potential cost that debt can bring is the bankruptcy cost. In other words, tax advantages will increase the operational efficiency of enterprises. Although bankruptcy costs exist (Miller, 1977; Warner, 1977) conclude that they are much smaller than the tax benefits. There is a positive relationship between debt and the operational efficiency of enterprises is the argument that the trade-off theory wants to confirm.

Third, The Agency cost Theory

Regarding to business finance activities, there always exists a relationship between shareholders (owners), managers (representatives) on the other hand and financial intermediaries (Jensen & Meckling, 1976). The viewpoints of the parties on interests and debts are different. The main reason is that there is a separation of rights: ownership and management right, Berle & Means (1932). The information asymmetry makes people in the role of managers, who directly run the business's operations, they know better than anyone about the health status of the business. Managers in enterprises with high debt, in order to keep their jobs and benefits, they are forced to work hard to generate enough cash flow to pay interest, so they have to find ways to invest in profitable project. This mechanism helps to increase the value of enterprises (Jensen & Meckling, 1976).

Fourthly, The Pecking Order Theory

This theory makes the point of establishing a prioritizing order when finding financing fund: internal funding (retained earnings) is prioritized first, followed by debt financing, and the last when the limit from using the above two sources expires, enterprises will use the new form of issuing common shares. Debt helps businesses increase market awareness, thereby increasing the value of enterprises (Myers & Majluf, 1984).

In summary, although the theories of debt ratio are studied based on different assumptions, the scope of research in terms of different time and space, the final results that the given theories gets positive effect of debt ratio on operating performance. Whether or not the debt ratio has a negative effect on performance, the theories are not clearly mentioned.

3.2. Firm performance

When studying in the fields of business administration, economics, finance, and accounting, the concept of firm performance is quite familiar and is approached from many different aspects.

By the time, the concept of efficient operation/firm performance is recognized and evaluated in accordance with the goals that the business wants to achieve. Georgopoulos &

Tannenbaum (1957) supposed that efficient operation is considered efficiency when evaluated from the perspective of the output of the production process with the inputs needed to produce that output, so the enterprise is considered to have achieved its goal with that scarce resource, the enterprise can still produce a definite amount of output. With the input factors of the given production process, the enterprise produces the most optimal output of products and services, that enterprise is considered to have conducted its business well. Thus, to measure business performance, people use efficient operation (Machmud et al., 2018).

The level of competition between enterprises is increasing, enterprises often have to change their management methods, the concept of efficient operation is also more diverse, the interests of stakeholders are employees and customers. referred to in the concept of performance. Seashore & Yuchtman (1967) in their concept of efficient operation, in addition to referring to the ability to exploit scarce resources, also refers to the ability to exploit the business environment. Warmington et al. (1977) state that an enterprise achieves high performance when the productivity and satisfaction of members are inversely proportional to the turnover rate, dissatisfaction and cost. The ability of a firm to create value for its customers determines its performance (Porter, 1979).

The development of technology has led to a change in awareness and evaluation criteria of an enterprise's operating system, and it is not only the effectiveness of the enterprise itself, but it needs to be associated with the interests of stakeholders. Therefore, in his definition of efficient operation, Sandberg (2003) emphasizes the ability of enterprises to contribute in terms of jobs created, continuous creativity, survival and growth.

Thus, the operating system of an enterprise is both static and dynamic, which is the basis for the enterprise to achieve its ultimate goal. However, stemming from the limitations of time and data sources, we employ the view of efficient operation according to the approach that is *the ability to produce the most optimal amount of goods and services in the world, basis for the most efficient exploitation of input resources.*

Measurement

Firm performance can be measured by quantitative variables (through financial indicators) and qualitative variables (through non-financial indicators). Because the collected data are secondary data, we use financial indicators to measure the operational performance of enterprises. And also because the scope of the study is all of Vietnam's feed manufacturing enterprises (including listed and unlisted enterprises), the financial indicators are calculated based on accounting data taken from relevant reports of enterprises.

The group of indicators reflecting profitability: Return on Assets (ROA), Return on Equity (ROE), Return on Sales (ROS) are often proxied as firm performance variables.

Return on Sales:

$$\text{Return on Sales} = (\text{Profit after tax} / \text{Total average assets}) \times 100\%$$

ROA is determined by profit after tax (NPAT) divided by average total assets, the unit is %, NPAT is equal to total sales, income minus total expenses including tax expenses and loss transfers, if any, in the financial year of the enterprise. ROA reflects the return on

assets of a business. The total assets of a business include resources from the capital contribution of investors to liabilities, so ROA is a composite indicator that evaluates the ability of a business to convert assets into profits? If the larger ROA proves the management level, the business results of the enterprise are good, the enterprise is operating a reasonable asset structure. If the ROA is lower, it not only shows that the business results are not good, but it also reflects the inefficient capacity in investment and production management.

Return on Equity

$$\text{Return on Equity} = (\text{Profit after tax}/\text{Average equity}) \times 100\%$$

If ROA measures the efficiency of a business based on its ability to convert all assets to profit, ROE measures the efficiency of a business through converting only the equity portion into profit. ROE shows how the enterprise has managed and used the capital belonging to the owners? If this capital is used well, ROE will be high, and vice versa.

Return on Sales

$$\text{Return on Sales} = (\text{Profit after tax}/\text{Net revenue}) \times 100\%$$

If ROA, ROE are indicators to evaluate the efficiency of an enterprise based on numerical element indexes taken from the income statement, and the denominator indexes are taken from the enterprise's balance sheet, then ROS is calculated using indicators taken entirely on the income statement of enterprises. Therefore, this indicator shows the business performance of the enterprise in an accounting period (usually a calendar year). To calculate ROS, we assume the target of godly revenue because he wants to properly evaluate the reality of goods and service provision of enterprises. For every dollar of net sales generated, how many dollars of after-tax profit is in it? Therefore, most businesses want to achieve ROS with the highest possible rate.

ROA, ROE, ROS are all important indicators to measure profitability of enterprises and are determined based on profit after tax divided by average total assets (ROA), profit after tax divided by average capital owner (ROE) and profit after tax divided by net sales (ROS). The criteria to calculate ROA, ROE, ROS are taken from the income statement and balance sheet of the enterprise. Depending on the research purpose, the ability to collect data, in the formula for calculating ROA, ROE, and ROS, the numerical element can be profit before interest and tax or profit after tax. In this paper, profit after tax is used to calculate (Le & Phan, 2017). As for the denominator in the formula for calculating ROA, ROE, and ROS, we use the criteria of average total assets, average equity and net sales. With the argument that the total assets and equity at one point in time are not representative numbers of the enterprise for an entire period, the average total assets and average equity are calculated by taking the first number of shares. The period of adding the ending number divided by two can equalize the fluctuations of assets and capital during the period, so it can be a representative number for the whole period of the enterprise.

Besides ROA, ROE, and ROS, which are used to evaluate the performance of enterprises based on accounting books, we investigate more indicators of performance measurement based on market value.

Ratio P/E

P/E = Market value per share/Earnings per share

In exchange for a dollar of profit from a stock, the investor accepts spending how much is the meaning of the P/E ratio. A high P/E could be due to the high market price of the stock or to the low earnings received from the stock. If the P/E is low, the reason is the market price of the stock being low or the income received from the stock is high. Therefore, to evaluate the business performance of enterprises through this index, it is necessary to consider the criteria to calculate the P/E index over a period of time and to compare with other enterprises in the same industry to get the best accurate view.

Ratio Tobin'Q

Tobin' Q = Market value of equity + Liabilities/Total assets

Before the name Tobin'Q index was commonly used, it was also known as the "Kaldor" ratio, the name associated with the economist Kaldor (1966), who invented this ratio. As scientist James Tobin of Yale university continued to develop it, it became a ratio to measure the performance of businesses based on the recognized market value to date. This ratio shows the expectations that investors expect to have in the future when they invest in a certain stock. A high Tobin'Q ratio indicates that the company has more competitive advantages than other companies, Ross et al. (2013). Number is used as a benchmark against Tobin'Q, a value greater than one shows that the business is highly appreciated by the market.

While market-based financial ratios have many advantages, such as their ability to measure long-term, forward-looking performance and reflect shareholders' expectations, performance-based assessments activity in the present or in the past. However, when applying to each specific case, we do not choose the criteria to evaluate the business performance of enterprises based on market value, but chooses two indicators ROA and ROE. One of the reasons for choosing ROA, ROE is a representative indicator to measure the operational efficiency of Vietnamese feed production enterprises, which is (i) these two indicators are used by many researches; (ii) it represents the rate of return that businesses and investors are interested in, because it combines the information of the income statement (profit after tax) and balance sheet (total assets, equity). ROE helps shareholders gauge how well they can achieve the expectations they want from the money they have invested. Also based on ROE, they can vote whether or not to use retained earnings, should or should not increase or decrease the proportion of equity in short and long-term development strategies of enterprises. ROA is an appropriate metric to measure corporate performance and is often used in relation to capital structure (Derayat, 2012; Singh, 2013). This is because of the fact that total assets include both debt and equity, which means that firms with high debt use will not receive a high rate of return as in the case of ROE, Fosu (2013). ; (iii) Due to the data collected on Vietnamese feed manufacturers (including both listed and unlisted enterprises), P/E or Tobin's Q can only be evaluated for listed companies.

4. Proposed research model

The research model is built on the basis of inheriting previous studies and is shown in the diagram below:

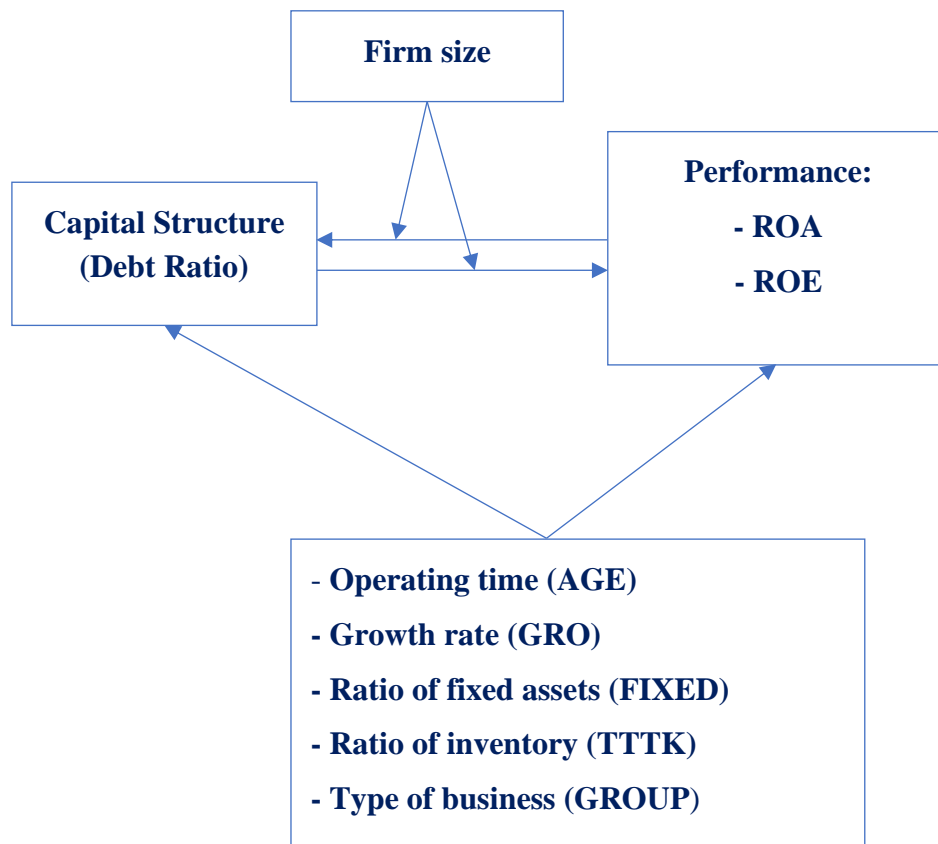

Figure 1. Research model proposed

The study investigates the relationship between Debt ratio and efficient operation (ROA, ROE) in both directions: (i) the influence of Debt ratio on corporate performance, now debt ratio acts as an independent setting variable, ROA, ROE act as dependent variables; (ii) the effect of corporate governance on shareholders, debt ratio acts as a dependent variable while ROA and ROE play two roles as independent variables. Besides, the project studies the influence of a number of factors such as: enterprise scale (SIZE) as a moderating variable; The control variables are: time of operation (AGE), growth rate (GRO), ratio of fixed assets (FIXED), ratio of inventory (TTTK), type of business (GROUP) to business relationship and corporate debt ratio. Therefore, from Diagram 1, we group into three models to determine this two-way relationship.

Model 1: ROA and influencing determinants

$$ROA_{it} = \beta_0 + \beta_1 Ttd_{it} + \beta_2 InSize_Ttd_{it} + \beta_3 Age_{it} + \beta_4 Gro_{it} + \beta_5 Fixed_{it} + \beta_6 Ttk_{it} + \beta_7 Group_{it} + \epsilon_{it}$$

Model 2: ROE and influencing factors

$$ROE_{it} = \alpha_0 + \alpha_1 Ttd_{it} + \alpha_2 InSize_Ttd_{it} + \alpha_3 Age_{it} + \alpha_4 Gro_{it} + \alpha_5 Fixed_{it} + \alpha_6 Ttk_{it} + \alpha_7 Group_{it} + \epsilon_{it}$$

Model 3: Debt ratio (TTD) and influencing factors

$$TTD_{it} = \mu_0 + \mu_1 ROA_{it} + \mu_2 ROE_{it} + \mu_3 InSize_RoA_{it} + \mu_4 InSize_Roe_{it} + \mu_5 Age_{it} + \mu_6 Gro_{it} + \mu_7 Fixed_{it} + \mu_8 Ttk_{it} + \mu_9 Group_{it} + \epsilon_{it}$$

In which

The dependent variable in models 1 and 2 is also an independent variable in model 3:

ROA_{it}, ROE_{it} reflect the business performance of enterprise i in year t. Business performance is measured through two quantitative indicators ROA, ROE, calculated data are taken from the accounting books of enterprises through the report of the General Statistics Office of Vietnam.

The dependent variable in model 3 is also the independent variable in model 1 and 2:

The study employs the debt ratio calculated by the average total liabilities divided by the average total assets as a representative variable for employees mentioned by many theories and researches. TTD_{it} represents the debt ratio of enterprise i in t year.

Mediating variable

Firm size is a variable used to moderate the relationship between shareholders and the operating system of enterprises. The variable InSize_Ttd in model 1, model 2 is the moderator variable that affects the performance relationship, and the variable InSize_Roa and InSize_Roe in model 3 is the moderator variable affecting debt ratio.

Control variables

- AGE_{it} is the active time variable representing the age that the enterprise has up to the time of the study. This variable represents the age of DN i in year t and has the unit of year, which is determined by the year of research minus the year of listing.

- GRO_{it} is the variable that represents the growth rate of DN i in year t. This variable is measured by the growth rate of sales in year i compared to year i-1.

- FIXED_{it} is a variable that represents the percentage of fixed assets acquired in total assets of enterprise i in year t. How much fixed assets will account for the total assets of the enterprise is also to show the level of operating leverage of the enterprise, as well as to show the asset structure that the enterprise is applying in favor of fixed assets. or leaning towards liquid assets.

- TTTK_{it} is a variable that represents the abundance and availability of raw materials and products of enterprises. This variable represents how much inventory accounts for the total assets of enterprise i in year t.

- GROUP_{it} is the variable showing the classification of enterprises i in year t into two categories: foreign-invested enterprises and domestic enterprises. The purpose to consider between these two types of enterprises is whether there is a difference in the way debt is used as well as the operating system?

- β_0 , α_0 and μ_0 are constants; β_j , α_j and μ_j (j takes values from 1 to n) are regression coefficients corresponding to the independent variable, the moderator and the control variable in the model; ϵ_{it} is the random error.

IMPACT OF FINANCIAL DEVELOPMENT ON ECONOMIC GROWTH: EVIDENCE FROM VIETNAM

Assoc. Prof. Dr. Nguyen Thi Dieu Chi

chintd@neu.edu.vn

School of Banking and Finance, National Economics University, Hanoi, Vietnam

Abstract

The link between financial development and national economic growth is a topic that interests both researchers and policymakers with different perspectives and evaluations existing. The International Monetary Fund cautioned after the 2008 financial crisis that financial development should not exceed a specific limit since it could impede growth. This research presents new empirical evidence on the long-term consequences of financial development on economic growth, focusing on Vietnam's ten-year dataset from 2011 to 2021, using the Autoregressive Distributed Lag Model (ARDL). During this period, Vietnam's financial depth and economic growth rate have an inverted U-shaped relationship, indicating that financial development significantly impacts growth only after reaching a specific level. This finding implies that a high level of financial development may sometimes benefit the national economy. To achieve sustainable growth, countries should focus on the optimal level of financial development.

Keywords: *ARDL, Economic Growth, Financial Development*

1. Introduction

Economic growth is a top priority for nations globally, and Vietnam is no exception. It refers to an increase in the Gross Domestic Product (GDP) or Gross National Product (GNP) over a specific period, and a rise in per capita income can quantify growth. The causes and factors that differentiate the economics of nations and the reasons for disparities in economic growth among them have been studied extensively. Financial development plays an essential role in fostering economic growth. The development of the financial sector can contribute to economic growth, physical capital accumulation, and economic efficiency. An organized financial system allocates financial resources to manufacturing areas, leading to economic growth. The flow of capital determines the efficiency of a financial market to the areas where it can promote economic efficiency at the lowest transaction costs. Developed nations typically have developed financial markets, while developing nations have less developed ones with more significant transaction costs. Most research indicates that the development of the financial sector positively affects economic growth, although some studies demonstrate the opposite.

Vietnam has a low level of financial development due to its economic reform, which began in 1986. In 2011, Vietnam became a middle-income country, with changes and improvements in the quality of growth and per capita income. Innovations in the financial

system have also impacted the economy's growth. Financial development has been crucial in fostering economic growth in Vietnam, particularly in the real estate market. Economic growth is an essential statistical index that reflects the economy's efficiency. Policies promoting the financial sector's development are crucial in accelerating economic growth. However, the relationship between financial development and economic growth may have a negative effect if the "hot" financial market growth produces inflation and inefficient investment. Thus, Vietnam should continue to develop its financial sector optimally, considering the impact on economic growth and ensuring sustainable growth.

2. Literature Review

Several empirical studies provided evidence of financial development's positive impact on countries' growth. The relationship between financial development and economic growth has been established at theoretical and empirical levels. Financial development is essential to developing and transitioning economies (Perotti & Vesnaver, 2004; Tasic & Valev, 2010). Chen (2006) investigated the link between financial development and growth for China in 1985-1998, reporting that the development of financial intermediaries is a driving factor of economic growth. Yang and Yi (2008) reported findings supporting the hypothesis that financial development promotes growth and rejected the hypothesis that growth leads to financial development for the case of Korea in the period 1971-2002.

Financial development has contributed to impressive economic growth in many developing countries. In addition, it has been suggested that relatively more financially developed countries can better avoid or withstand currency crises (Federici & Carioli, 2009). Therefore, enhancing the financial development of countries with developing economies may have significant positive consequences for the many organizations and individuals within such countries affected by economic downturns. These issues are particularly salient given the recent global financial crisis. Generally, financial development increases the supply of capital and, given the appropriate host-country policies, can also facilitate technological innovation. Technological innovation contributes to human capital formation, which can further enhance economic growth prospects (in fact, a bi-directional causality exists between technological innovation and human capital formation). Financial development can facilitate economic growth through direct as well as indirect channels.

In contrast to the theoretical positive long-run effects of financial development on economic growth, the relationship can be negative in the short run, according to the literature on banking and currency crises. Various papers in the banking and currency literature have found that rapid growth of domestic credit signals the onset of a financial crisis and economic downturn (Demirguc-Kunt & Degatriache, 1998; Gourinchas et al., 2001; Kaminsky and Reinhart, 1999). Darrat (1999) proposed that it is during the short run that higher levels of financial development benefit the real economy. However, those benefits disappear in the long run as the economy grows and matures. The study's empirical results generally support the view that financial deepening causes economic growth, yet with varying degrees of strength across countries and different proxy measures of financial deepening. Marques et al. (2015) examined a panel data set of 25 European countries for 1996-2011, reporting that

financial depth measured by a bank and domestic credit has an inverse U-shaped nonlinear relationship with economic growth. Their results suggested that governments should determine the optimal level of financial depth to avoid overdevelopment. Prochniak and Wasiak (2017) analyzed the impact of financial development and financial stability on economic growth using data from 28 European Union countries and 34 OECD countries from 1993-2013. Their results supported three hypotheses: (i) there exists a nonlinear relationship between financial development and economic growth; (ii) an excessive size of the financial system does not boost economic growth, even having a negative impact on growth; (iii) the inclusion of a crisis period in the empirical model provides new insight into the relationship between the financial system and economic growth.

Tarig et al. (2020) also reported a nonlinear impact of financial development on growth for the case of Pakistan using time series data covering 1980-2017, but it is in a U-shape. Accordingly, financial development boosts growth only when its level surpasses a certain threshold. Liu and Hsu (2006) investigated the impact of financial development on economic growth in three Asian countries, namely Taiwan, Korea, and Japan. They found that (i) high investment promotes economic growth in Japan while high investment does not lead to better economic growth if the investment is not allocated efficiently in both Taiwan and Korea; (ii) the finance aggregate has positive effects on Taiwan's economy but has negative effects in the other two countries, (iii) the stock market development has positive effects on Taiwan's economic growth, but its economy suffered from the Asian financial crisis in the late 1990s; (iv) capital outflows have a negative impact on all three countries while the effect of capital inflows is negative.

Many studies investigated the causal relationship between financial development and economic growth. Employing cointegration techniques with time series data from 16 countries from 1960-1990, Demetriades and Hussein (1996) found considerable evidence of a two-way relationship between financial development and growth. Kemal et al. (2007) reported no causal relationship between financial development and economic growth based on data from 19 highly developed economies. Odhiambo (2009) examined the dynamic relationship between interest rate reforms, financial development, and economic growth. The study concluded that the causal relationship between financial depth and economic growth supports a demand-following path. Abdullahi (2010) employed Panel data Granger causality and JJ cointegration for 15 Sub-Saharan African countries from 1976 to 2005. He concluded that a bi-directional causal relationship exists in five countries and reverse causality from economic growth to financial development in two countries.

3. Method

3.1. Research model

ARDL model

The author used the ARDL model to examine the impact of financial development on economic growth in the short and long run. At the same time, the author also used the

Sasabuvhi-Lind-Melum (SLM) test to see if there exists an inverted U-shaped relationship between financial development and economic growth.

ARDL model (p, q) where p is the lag of the dependent variable, and q is the lag of the independent variables. According to Pham Thi Hong Khoa et al. (2019), the model has the form:

$$\text{GDP}_t = a + \sum^p \beta_{i0} \times \text{GDP}_{t-i} + \sum^{q1} \beta_{i1} \times \text{FD}_{t-i} + \sum^{q2} \beta_{i2} \times \text{POPG}_{t-i} \quad (1) \\ + \sum^{q3} \beta_{i3} \times \text{TRADE}_{t-i} + \sum^{q4} \beta_{i4} \times \text{GOV}_{t-i}$$

In this model:

- GROWTH: Economic growth rate is measured by Vietnam's quarterly nominal GDP growth rate

- FD: Financial depth represents financial development, as measured by the money supply M2 divided by the total GDP

- TRADE: Openness of the economy, measured by total import and export turnover divided by GDP

- POPG: Population growth rate

- GOV: Total government spending

- P: The lag of the GDP variable

- q1, q2, q3, q4: The lags of the variables FD, POPG, and TRADE, respectively

To estimate the ARDL model, the research follows six steps, including Testing the stationarity of the variables in the model; Determining the appropriate delay and estimating the ARDL model, Bounds test; Estimating the long-run equation using the ARDL model; Estimating short-term equations by ARDL model: Checking the model's reliability and suitability.

3.2. Description of variables and research data

The variables in the study include three main groups: dependent variable, independent variable, and control variable:

Dependent variable: Economic growth (GDP)

Economic growth means an increase in the production capacity as well as the supply of goods and services of the economy in a certain period. According to previous studies by Nguyen (2019), and Pham et al. (2019), there are many ways to measure this variable, such as real GDP growth rate, nominal GDP growth rate, GNP growth rate, etc. ... However, according to Pham et al. (2009), the nominal GDP growth rate variable is consistent with the reality of our country.

Independent variable: Financial depth (FD)

Financial depth is a standard measure of financial development used by most research papers (Duong & Le, 2019). The variable is measured by the ratio M2/GDP, representing

the ratio of liquid debt to GDP. This ratio is expected to increase as finance grows more robust than the development of the production of goods and services and vice versa.

Control variables:

The two control variables used in this study are Openness of the economy (TRADE), population growth rate (POPG), and total government spending (GOV). Regarding the Openness of the economy, the variable is measured by the quotient of the total value of exports and imports of goods and services to the total GDP. The role of trade, mainly export, can increase foreign exchange earnings, improve the balance of payments, access new management and business methods, and improve economic structure. In terms of population growth rate, the variable is reflected by the quarterly population growth rate for the period 2010-2021. According to Pham (2019), in developing countries, including Vietnam, when the level of scientific and technological development is still low, the quantity and quality of the labor force will be low. It plays a decisive role in the production capacity of the economy. Finally, the GOV variable is calculated as the ratio of government spending to GDP equal to the total value of final government spending to GDP. The level of government spending can positively affect economic growth by promoting economic factors. However, it can also negatively affect economic growth through inefficient spending—consequences as well as the negative effects of taxes and interest (Duong & Le, 2019).

The data used in the research is taken from reputable sources such as the General Statistics Office of Vietnam, the World Bank, and Finance Vietstock quarterly in Vietnam from 2010-2021.

4. Results

4.1. Stationary test or unit root test

By using Dickey-Fuller (ADF) test, when the study runs the test, the result in the table below shows that $p\text{-value} > 10\%$ and $t > t_{\alpha}$ at three levels of significance, so findings fail to reject the null hypothesis, so variable FD is not stationary at the level (which requires no difference)

Table 1. Unit root test for FD

Null Hypothesis: FD has a unit root		t-Statistic	Prob.*
Augmented Dickey-Fuller test statistic		-1.227649	0.6539
Test critical values:	1% level	-3.592462	
	5% level	-2.931404	
	10% level	-2.603944	

Results show that rejecting the null hypothesis with significance at 1% or the variable FD is stationary at first order difference with significance at 1%. With the same method, findings show that Variable GDP is not stationary at the level (this requires no difference) with significance at 10%. However, the test for a unit root in 1st difference is stationary with significance at 1%.

Variable TRADE is not stationary in level with significance at 10%. However, it is stationary after taking the first difference with significance at 5%. Continuing to run a test for a unit root in 2nd difference for TRADE, table 2 indicated that P_value = 0, so it is stationary with significance at 1%.

Variable POPG is not stationary in the level after taking the first difference with all three test critical values. However, it is stationary after taking the 2nd difference. This finding means that after differencing POPG twice, it exhibits a constant mean and variance over time, indicating that it has reached a state of stationarity.

Variable GOV is not stationary in level with significance at 10%. However, it is stationary after taking the first difference with significance at 1%. In conclusion, the findings can assume that the statistical properties of these variables will remain constant over time, and input data have series that are integrated of order 0 and 1 as well. Hence, using the ARDL model for estimating is simpler and more efficient than other cointegration tests.

4.2. Estimate ARDL model

With the data, which have a basic structure is dated - regular frequency and the frequency set as quarterly, we can select lags for the model. The study also uses the Akaike information criterion (AIC), an estimator of prediction error and the relative quality of statistical models for a given set of data. When we estimate the ARDL model, it can see the selected model is (1, 4, 4, 3, 4).

4.3. Bounds test

Bound testing as an extension of ARDL modeling uses F and t-statistics to test the significance of the lagged levels of the variables in a univariate equilibrium correction system when it is unclear if the data-generating process underlying a time series is a trend or first difference stationary. Here the ARDL model is applied to examine the short and long-run association between variables. In the data, with significance at 5%, F-statistic falls between the lower bound I(0) and the upper bound I(1). This means the test is considered inconclusive, so it is still being determined about cointegration and long-run relationships.

Table 2. Bounds Test Results

Test Statistic	Value	Signif.	I(0)	I(1)
			Asymptotic: n=1000	
F-statistic	2.766712	10%	2.2	3.09
k	4	5%	2.56	3.49
		2.5%	2.88	3.87
		1%	3.29	4.37

4.4. Estimate the short-run and long-run coefficient

Table 3. Impact of Financial Development on Economic Growth

Variable	Coefficient	Std. Error	t-Statistic	Proi cub.*
GDP(-1)	0.755778	0.130809	5.777700	0.0000
FD	-0.007128	0.004244	-1.679560	0.1066
FD(-1)	-0.002204	0.004558	-0.483619	0.6332
FD(-2)	0.008909	0.004681	1.903349	0.0696
FD(-3)	-0.007703	0.004548	-1.693784	0.1038
FD(-4)	-0.006967	0.003978	-1.751624	0.0932
POPG	-91.71902	42.73919	-2.146017	0.0427
POPG(-1)	34.98873	49.59376	0.705507	0.4876
POPG(-2)	153.1164	45.94429	3.332655	0.0029
POPG(-3)	-126.3030	48.11214	-2.625180	0.0151
POPG(-4)	92.89511	41.31549	2.248433	0.0344
TRADE	0.087770	0.022592	3.885032	0.0007
TRADE(-1)	0.023314	0.023952	0.973369	0.3405
TRADE(-2)	-0.029389	0.024845	-1.182874	0.2489
TRADE(-3)	0.050708	0.024539	2.066472	0.0502
GOV	-0.428850	0.096975	-4.422263	0.0002
GOV(-1)	-0.054534	0.060212	-0.905701	0.3745
GOV(-2)	0.048005	0.059543	0.806233	0.4284
GOV(-3)	-0.083772	0.060289	-1.389494	0.1780
GOV(-4)	0.207815	0.075697	2.745348	0.0115
C	-0.184896	0.084614	-2.185163	0.0393

The table 3 shows the long-run relationship between the control variable (or independent variable) and the dependent variable using the ARDL model above. Findings show that both financial depth, population growth rate, and total government spending have an inverse relationship with economic growth in the long term. However, the relationship between financial depth and economic growth is not statistically significant. Meanwhile, the relationship between economic openness and economic growth rate is a covariate in the long term. Moreover, those relationships have statistical significance.

In the short run, the finding shows that the economic growth rate in the previous quarter can affect the economic growth rate in the present. In detail, GDP with a lag equal to 1 (or GDP(-1)) has a covariant relationship with variable GDP and statistical significance. Financial depth with a lag equal to 1, 3, and 4 has an inverse relationship with the economic growth rate. Meanwhile, financial depth with a lag equal to 2 has a covariate relationship with the economic growth rate. However, none of them has statistical significance. Population growth rate with lag equal to 1, 2, and 4 have covariate relationship with economic growth rate, but itself with lag equal to 3 has an inverse relationship with economic growth rate. However, only itself with lags equal to 1 do not have statistical significance. So, in the short run, the relationship between the population growth rate and the economic growth rate of Viet Nam can be a covariate from the first quarter of 2010 to the fourth quarter of 2021. Economic openness with lag equal to 1 and 3 has a covariate relationship with economic growth rate, and itself with lag equal to 2 has an inverse relationship. None of them has statistical significance. So, in the short run, I cannot conclude clearly about the relationship between economic openness and economic growth rate in Viet Nam at this period. Total government spending with lag equal to 1 and 3 has an inverse relationship with economic growth rate, and two others have a covariate relationship. However, only the last variable has statistical significance. So, in the short run, I cannot also conclude clearly about the relationship among these variables in Viet Nam at this period.

4.5. Stability test

In figure 5 with the test monitor whether a process drifts away from its meaning. The statistics use the sequence of residual deviations from a model to indicate whether the autoregressive model is misspecified. The chart is centered around the mean value of the process.

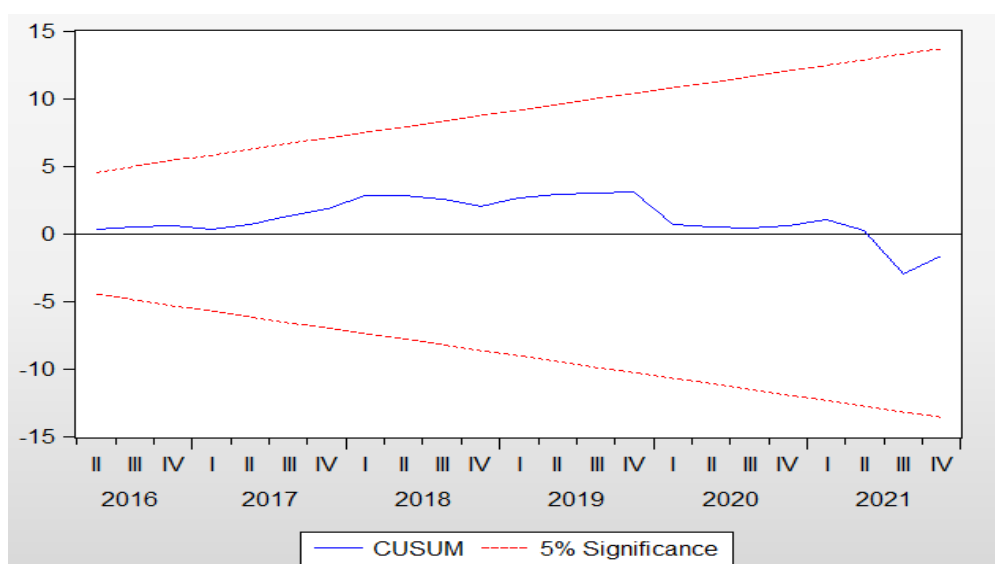

Figure 1. Stability Test of the Model

Figure 1 shows that the standardized deviations' sum does not exceed 5%, so it does not drift away from their mean. I conclude that the coefficient in the short run and the long run is steady in the period from I/2010 to IV/2021.

5. Conclusions

Despite the small sample size and several variables, the test results with data collected from 2010 to 2021 using the ARDL and SML tests show an approximately 5% significant level. The long-run and cointegration relationships between the variables cannot be concluded at the boundary. However, the outcomes of the overview test allow for the following two conclusions:

- Vietnam's economic growth is directly affected by financial development.
- Economic development is propelled by financial depth.

The following are some policy implications based on the experimental results:

First, determine the best circumstances for financial depth to ensure that the financial sector provides the most significant economic benefit. Financial development policies that are appropriate for an acceptable growth scale will have a direct impact on the economy's optimal growth rate.

Second, create intermediary financial markets by a roadmap and work proactively towards equal financial access for organizations, small enterprises, and economic regions.

Last but not least, promoting financial development will support transparency financial environment from which can limit monopolies, manipulations, and crimes in the financial and banking industries. Because, the government must adopt rules and regulations consistent with international practices and standards, and robust monitoring and punishment framework to deal with fraud and group interests in financial and banking sector activities.

Financial markets play a crucial part in economic growth because they shift and allocate capital from areas of excess to areas of scarcity. The economy can cut considerable expenses and operate more effectively when financial markets function properly. The quality of economic growth has increasingly improved as well.

Abstract

This study uses the gravity model of trade to identify and evaluate the impact of various factors on the export of Vietnamese seafood, based on panel data of 43 countries accounting for 92-93% of Vietnam's total export turnover. The results show that Vietnam's seafood exports are influenced by factors such as the importing country's population, exchange rate, FDI disbursement in Vietnam, the seafood production price index in Vietnam, average lending rates in Vietnam, as well as being members of APEC, WTO and FTA. Among them, the importing country's population, exchange rate, FDI disbursement in Vietnam, seafood production price index in Vietnam, and membership in APEC and WTO have a positive impact on exports, while average lending rates along with FTA have a negative impact. Based on the research results, the article proposes a group of solutions for each factor to develop Vietnam's seafood exports to countries around the world.

Keywords: *Export, Gravity model, Seafood*

1. Introduction

Research on international trade began with mercantilist ideas in the late 16th to 18th centuries. During that time, precious metals such as gold and silver were used as currency and constituted the wealth of nations. Mercantilist economists also argued that exports enriched a country as it stimulated domestic production while also bringing in rare precious metals to supplement the wealth of the country. In 1776, based on his support for free trade, Scottish economist Adam Smith argued that production and exchange of goods based on absolute advantage would bring economic efficiency to both exporting and importing

countries and thereby benefit the world as a whole. However, Smith's theory of comparative advantage did not answer the question of what would happen if a country had no advantage in any commodity. Therefore, in 1817, British economist David Ricardo developed the theory of comparative advantage. According to this theory, if a country (in the world example comprising of two countries) has an absolute advantage in producing both commodities, specialization of production and international trade can still occur and benefit both countries. In 1936, Gottfried Haberler, an American economist of Austrian origin, presented Ricardo's theory of comparative advantage on the basis of applying the theory of opportunity cost. According to this theory, each country has a comparative advantage over another country in producing a product if the opportunity cost of producing this product in this country is cheaper than in the other country, and in this trade relationship, both countries benefit equally. Based on these arguments, the views of authors in the mercantilist school still hold value to this day. For example, when domestic production capacity exceeds demand, it is necessary to encourage exports and limit imports, which is something that a country needs to pursue (Nguyen Thuong Lang, 2019). In the era of globalization, no country can develop its economy without participating in the process of international and regional integration. This is also true for Vietnam (Than Van Ha, 2007). With the advantage of having a coastline of 3,200 km stretching over 13 degrees of latitude from north to south and being located at the convergence of major fishing grounds, this area is evaluated as having a large and diverse amount of seafood resources. Thanks to these characteristic features, the Vietnamese fisheries sector has developed for a long time and made significant contributions to the country's economy. At the same time, these are also traditional export items that Vietnam has a competitive advantage in.

Before the Covid-19 pandemic broke out, the seafood industry had achieved certain successes and was one of the spearhead economic sectors, making significant contributions to economic development (Ngo Thi Ngoc Binh, 2022). According to the report of the Directorate of Fisheries in 2021, the seafood export turnover in 2021 reached \$8.89 billion, up 5.7% compared to \$8.41 billion in 2020. Compared to \$8.58 billion in 2019, Vietnam's seafood exports in 2020 did not decrease too much, helping Vietnam maintain its position in the top 3 among the 10 largest seafood exporting countries in the world, first in Southeast Asia and second in Asia. The seafood export market is expanding to more than 160 markets worldwide. Although faced with many difficulties due to the pandemic, after the situation was controlled, seafood production and exports quickly recovered strongly. To explain these successes, it is impossible not to mention the fact that our businesses are making good use of free trade agreements (FTA), which have helped to cut tariffs, increase competitiveness for Vietnamese seafood. In addition, the success may also stem from the Vietnamese government's policies to create favorable conditions, remove difficulties for businesses to compete fairly and develop together, and support them to overcome the Covid-19 period. One reason for this success may be the dynamic creativity of businesses in applying modern technology in the processing process, as well as actively researching quality regulations from importing countries. However, these opinions have not yet had specific statistical data, which are subjective and lack scientific evidence to explain how these factors affect seafood

exports. Besides, the seafood industry is also facing certain difficulties such as anchoring areas, estuaries with unstable silt, which do not ensure safe anchoring requirements, and food safety; lacking an environmental treatment system, source tracing, and infrastructure; the technology for loading, transporting, preserving, and processing products is backward, resulting in losses after harvesting, and the operation of the seafood value chain still has many weaknesses. From a practical perspective, studying the factors affecting Vietnamese seafood exports is extremely necessary to be able to identify and evaluate the level of impact of these factors on Vietnamese seafood exports, thereby providing a basis for proposing solutions.

From a research perspective, studying the factors that impact Vietnam's seafood export based on the gravity model in international trade has only been considered by a few scientists. Experimental studies worldwide have utilized the gravity model in international trade to supplement the model with factors suitable for the realistic conditions of each industry and country. From the initial three fundamental factors of national export GDP, national import GDP, and geographic distance between two countries, factors influencing the trade flows of countries have been expanded through experimental studies. However, at present, there is no comprehensive quantitative study in Vietnam on the factors affecting seafood exports to the world market based on the gravity trade model to supplement appropriate factors for Vietnam's practical conditions. With the practical requirements and research context mentioned above, the research on the factors influencing Vietnam's seafood exports through the gravity model in trade allows for adjustments and supplements of factors in the model to match Vietnam's conditions. It also identifies and quantifies the degree of impact of these factors on Vietnam's seafood exports, which is both practical and scientifically significant. The research results will be an important basis for building and proposing solutions to promote and develop Vietnam's seafood export activities to the world market in the coming period.

Given the above significance and reasons, the research team decided to choose the topic "**Approaching the gravity model in trade to study the factors affecting Vietnam's seafood exports**" for investigation. This study is structured into five parts: (i) Introduction, (ii) Research overview and theoretical basis, (iii) Research methodology, (iv) Research results and discussion, (v) Conclusion and recommendations.

2. Literature review and Theoretical basis

2.1. Literature review

International trade has been conducted since ancient times and can be considered as the earliest form of international relations. Nowadays, it still plays a central role in international economic relations. The reason why international trade is so important is that the results of other international economic relations are ultimately reflected in international trade. And it is widely known that international trade can increase welfare and efficiency through the process of enhancing competition, specialization, and economies of scale (Wang & colleagues, 2010). It includes various activities such as import and export of goods, processing, re-export and transit, and on-site export. However, to talk about the sector that

plays a major role and holds an important position in the economic development of each country, it is the import and export of goods (Binh & Mai, 2019). Fisheries - one of the characteristic economic-technical sectors - is one of the important maritime economic sectors of nations. The production and business of fisheries are based on effective and sustainable exploitation of aquatic resources, potential water areas, so it has a very close intersectoral relationship with agriculture, transportation, oil and gas, customs... In addition to the above reasons, the particularity of the sector is the exploitation and development of one of the renewable resources, so the fisheries sector further affirms its important role in the socio-economic development of the country. With such an important role, that is also the reason why many researchers are interested in the topic of seafood export.

Diop et al (1999) created a methodological system to study the impact of imports on sectors related to shrimp production, wholesale and retail. The results of the study show that as South Asian and Latin American countries increase shrimp imports, the profit margins of shrimp processors shrink. In particular, the reduction in shrimp prices is one of the factors affecting the increase in shrimp imports. Therefore, Diop and colleagues (1999) proposed to apply a policy of trade restriction in order to reduce supply and increase selling price, leading to increased profit for selling activities. Kennedy and Lee (2005) also reached similar conclusions, stating that since 2002 the domestic price of shrimp has decreased from \$7.95 to \$6.21/pound in 2004, a decrease of nearly 22% compared to the previous year. This is due to an increase in imports.

Lee & Kennedy (2010) used cointegration analysis to analyze the relationship between aquatic products, including barbs, vannamei, salmon, tilapia and catfish, both domestic and imported. The results of the analysis show that the US domestic catfish industry may be more negatively affected by the import of major seafood products such as salmon, sturgeon and shrimp, compared to imports of fish. Slippy skin. This study shows the negative impact of imported shrimp on the domestic shrimp industry and the seafood market in general.

Kepaptsoglou et al (2010) reviewed and analyzed recent empirical studies using gravity modeling in commercial flow analysis and found that gravity modeling has been a popular choice. favorite of researchers. More than 75 studies have used this model to analyze trade policies and their impact over the past decade. Kepaptsoglou and his colleagues (2010) have found that most empirical studies focus on evaluating policies and their significance, using panel and least squares data. conventional (OLS) to estimate the coefficients of gravity model specifications for the shrimp industry. However, the cost elasticity of shrimp of Asian origin has been shown to be quite high in the US market (Poudel & Keithly, 2008), suggesting a potential competitive alternative to imported shrimp. shrimp products in the country. In fact, the US shrimp industry has seen expansion in southern states where costs are relatively lower. According to Nowak-Lehmann et al (2007), panel data offer several advantages such as the ability to capture relationships over time and to observe individual effects between partners. Most studies over a period of at least 5 years use data, and only a few recent studies draw conclusions based on cross-sectional data from a year or an average of a time period.

In the study by Rabbani et al (2011), they applied an enhanced trade attractiveness model to identify the factors that are important in the importation of catfish, basa, and pangasius species into the United States. The study used time series model and separate analysis for three increasing gravity models of Vietnam, China and Thailand. The determining factors in ending or stopping trade include inverted exchange rates, US prices of catfish/basa/pangasius reported at US Customs, import prices and domestic prices. US address, labeling policy, tariffs, advertising costs, and other basic factors like GDP, population, and distance. However, GDP per capita rather than GDP for the whole economy was used as a factor in their study.

The use of the commercial attractiveness model to assess the impact of different factors on the export of seafood products from Vietnam to different markets, such as the United States and the EU, has brought many meanings. In a study by Disdier & Marette (2010). In 2016, the factors affecting Vietnam's seafood exports through TPP members were clearly presented by Nguyen Thi Quynh Trang. These factors follow previous research results including food safety standards, non-tariff measures, GDP, population, geographical distance, distance in economic development, exchange rates and commitments. bilateral and multilateral trade. Research by Pham Thi Ngan et al (2016) also said that the seafood import tax of the US and Europe does not affect Vietnam's seafood exports to these two markets.

Research papers by Sarker and Jayasinghe (2007); Emlinger et al (2008); Karemera et al (2009); Cardamone (2011) are some specific examples of the applications of commercial gravity models for fishery products and the influence of factors, such as transportation costs, size of the economy, etc. economy and wealth for seafood exports. Since there is a sign of preference for high values, this is potentially an important study (Haq et al, 2013). However, although trade plays a very important role in the seafood market, there has been little research on its application in this area. In fact, there are only a few exceptions that receive special attention, focusing on two types of questions relevant to the fishery trade: (1) Certain fish species, for example shrimp (He et al, 2013) and catfish, basa and catfish (Rabbani et al, 2011), have been studied for the determinants of commercial trade. . These studies cover the impact of food safety standards and non-tariff measures on trade flows (Anders et al, 2006; Nguyen & Wilson 2009; Liu et al, 2012; Tran et al, 2012; Shepotylo, 2016). An important capability of gravity modeling leads to the ability to investigate the impact of factors such as transportation costs, the size of the economy and the degree of induction there is on China's seafood exports. This is significant because developed countries prioritize the value and high quality of seafood (Swartz et al, 2010; Asche et al, 2015), while people in poor countries often choose to buy low-value seafood to save costs (Beveridge et al, 2013).

A study by Kim Sang-Gu and colleagues (2012) used a random effects model and panel data from 38 Korea's frozen fish export partner countries to identify factors affecting frozen fish exports. Research by Kim Eun-Ji and Kim Bong-Tae (2020) focuses on the main export commodities of seaweed and barbs, including dried and seasoned seaweed, canned barbs, and fish consumption. fresh (for sashimi) and raw ingredients. Similar to the study of

Kim Sang-Gu and colleagues, this study also uses a random effects model to assess the factors affecting the export of these commodities. Another particularly important note of this study is that it includes factors that affect many countries such as the European Union (EU), the United States, Peru, Australia, New Zealand, Canada, China, and Vietnam. South and many different countries. The authors have analyzed the determining factors, including FTA, and the results can be used as a basis to propose measures to increase exports for each item.

Natale et al (2015) used weight models to study the determinants of total global seafood exports during 1990-2010, compared with meat. These researchers point to the importance of growth in aquaculture for the expansion of the seafood business. In addition, several other studies have investigated the impact of phytosanitary measures (Anders & Casewell, 2006; Tran et al, 2011; Chen et al, 2018) and the impact of policies preferential incentives (Xie & Zhang, 2017) for seafood exports. The results of these studies can be used as a database to develop measures of seafood export production.

Straume (2017) and Asche et al (2018) presented key reports on changes in trading time for Norwegian salmon exports, while Zhang and Tveteras (2019) and Wang (2019) reported similar results for the EU and ASEAN countries, respectively. Some of these articles use enterprise-level data and do not focus on potential differences in trade patterns between farmed and wild-caught fish, despite the fact that fish farmers may target better access to specific market segments as they have control over the manufacturing process (Asche & Smith, 2018) and control over the manufacturing process also enables a more efficient supply chain (Asche et al, 2007). However, in the process of applying the model, Natale et al (2015) encountered a number of problems, including the removal of zero values in the data table when the linear computer log could not work. dynamics on observations are zero. These values may be due to no transactions in the relevant year, values below the lowest threshold, data loss, or underreporting. The removal of these values can lead to the loss of important information about the effects of the independent variables on the dependent variables, making data analysis inaccurate (Grant & Lambert, 2005). Previous studies have proposed several methods to solve these problems, including the Heckman model proposed by Gomez-Herrera (2013), and the possible sum of least squares by Martinez-Zarzoso (2013).

The factors affecting international trade flows of Indonesian raw fish and fishery products to the EU market are varied. Previous studies have demonstrated that macro variables such as GDP, population, exchange rates, prices and economic distance all have a significant impact on the international trade flows of these products. (Rabbani et al, 2011; Rani et al, 2014; Hidayati & Masyhuri, 2015; Natale et al, 2015). Wiranthi et al (2019) used a critical model to examine the determinants of Indonesian canned fish exports to the EU market. By using commercial attractiveness model and Poisson estimation, the study has shown that Indonesian canned designer fish is affected by competition effect while Thailand is more affected by growth. Import and effect components. The Philippines and Vietnam are more affected by composition and competitiveness effects. Finally, population, ornamental fish production volume and real exchange rate have a significant influence on Indonesia's

canned ornamental fish exports to the EU. This result is similar to previous experimental studies of Zarzoso & Lehmann (2003), and Elshehawy et al (2014).

Recently, the Asian Development Bank (ADB) conducted a study on Sri Lanka's export potential and the impact of non-tariff regulations on the country's trade. However, the scope of the study is limited to the analysis of some international regulations that are directly affecting fish exports and does not cover the entire range of Sri Lankan exports. Prior to that, Rahapakse & Arunatilake (1997) conducted a model-based analysis of trade attractiveness between Sri Lanka and other SAARC countries, including fish and many other export commodities. The results show that the non-tariff provisions have had a negative impact on trade relations between Sri Lanka and other SAARC countries. However, it should be noted that the article does not give enough information about Sri Lanka's seafood exports. As a result, that study has some more confusing limitations on Sri Lanka's seafood export pattern and the impact of trade regulatory measures on seafood exports. In addition, it is important to note that the European Union (EU) ban on seafood exports from Sri Lanka was not addressed in previous studies (Sandaruwan & Banerjee, 2020). Filling in the gaps in the study by Sandaruwan & Banerjee (2020) has shown that only 1% of processed seafood in Sri Lanka reaches its maximum value in the supervariable, which limits its potential. seafood industry to create jobs and profits. Researchers have also found that the elasticities of tax and non-tariff measures against processed fishery products are higher than those of unprocessed seafood products. This means that processed seafood products are more vulnerable to tax changes and non-tariff measures for unprocessed seafood products. However, converting unprocessed fishery products into processed seafood products could improve export revenue for Sri Lanka, but also increase the vulnerability of fishery products produced export.

2.2. Theoretical basis

According to CIEM (2016), the gravity model is used in the analysis of trade, investment, and labor between countries. This model predicts that bilateral trade depends on the size of the two economies and the distance between them. The gravity model was first used by Jan Tinbergen in 1962 and has been widely applied in empirical studies to measure the impact of factors on the flow of trade between countries. This was also one of the studies that helped Jan Tinbergen receive the first Nobel Prize in Economics in 1969 for developing and applying dynamic models and analyzing economic processes.

According to the model above, the factors influencing international trade between two countries are the scale of the exporting country's economy, the scale of the importing country's economy (as a composite factor representing supply and demand factors), and the distance between the two countries (as a composite factor reflecting the barrier between the two countries). Using mathematical analysis and multiple arguments, James E. Anderson (1979) developed a more specific theoretical foundation for the gravity model. He identified the simplest gravity model, which originated from the Cobb-Douglas expenditure system approach. Assuming that each country specializes in producing a specific commodity, without tariffs and transportation costs, the simplest model determines the impact on the

flow of trade between two countries as the income of the importing and exporting countries. Accordingly, the distance factor between countries creates trade barriers that are included in the model to estimate costs and tariff barriers between countries. With these foundations, James E. Anderson asserts that the gravity model in international trade needs to be further developed and used, expanded in building new versions, and identifying new factors that affect the flow of trade between countries.

From the above theoretical basis, the hypotheses are developed and selected to fit the practical context of Vietnam as follows:

GDP of Vietnam

In theory, an increase in the total value of goods and services produced in a country indicates an increase in the country's production of goods, which can lead to an increase in its exports. However, different studies on different products and countries have shown that the impact of GDP on exports varies among countries. The extent to which this factor affects the volume of exports and GDP of different countries and products also varies. However, in economies that do not primarily focus on exports, goods and services produced domestically may not necessarily serve export activities, meaning that the volume of exports and GDP may not necessarily be related to each other. On the contrary, as production capacity increases and the value of a country's production decreases, GDP may have an inverse relationship with exports. The theoretical scenarios can be diverse due to the scale of the exporting country's economy and its impact on exports. However, scientific studies and empirical evidence have shown that GDP and exports are positively and closely related (M. Sevela, 2002; Ly and Zang, 2008; M. Oumer and P. Nvâeeswara, 2015; M. Ebaidalla and A. Abdalla, 2015).

H1: The higher the GDP of Vietnam, the higher the export of seafood.

Population of Vietnam

Studies on the sugar, coffee, and paper industries have added population variables to the gravity model in trade and have shown that population is an important factor for a country's exports (M.Ebaidalla and A.Abdalla, 2015; G.Dlamini et al, 2016). The level of impact of population on seafood exports and overall trade can be analyzed from different perspectives.

From a labor supply perspective, a growing population can contribute to increasing production capacity and export volume. However, this also creates competition among businesses and requires them to improve techniques, increase productivity, and diversify products to increase supply. Therefore, the population of the exporting country (labor supply) has a positive impact on export volume.

H2: The higher the population of Vietnam, the higher the export of seafood.

Foreign direct investment (FDI) disbursement

An important factor added to the trade attraction model is foreign direct investment (FDI) into the exporting country. FDI provides significant financial resources for production development and contributes to enhancing overall export. In addition, FDI activities indirectly increase the scientific and technological capacity of the country, contributing to productivity and export potential. Strengthening FDI investment will have a positive impact

on the seafood export value, as indicated by various studies (Kristjánsdóttir, 2005; Díaz, 2013; Sejdini & Kraja, 2014; Elshenawy et al., 2014; CIEM, 2016; Alfred, 2019).

H3: The more FDI Vietnam attracts, the higher the seafood export value.

The production volume of Vietnam's aquatic products

The seafood production volume of Vietnam is an important indicator to evaluate the country's ability to supply raw materials to importing countries. Increasing seafood production volume implies larger scale production and higher supply capacity. For example, Vietnam's large seafood production volume allows this country to provide products to many countries and meet diverse requirements in import markets, thereby diversifying the export market. Increasing seafood production volume will have a positive impact on the seafood export value (Alfred, 2019; Rahman, 2019).

H4: The more the seafood production volume increases, the higher the seafood export value.

The GDP of the countries importing seafood from Vietnam

GDP of the seafood-importing countries of Vietnam. This variable was first demonstrated in Jan Tinbergen's research in 1962. The GDP of importing countries reflects an increase in the income of the nation, which in turn increases consumption demand and import volume. As a result, exporting countries can increase their export supply to importing countries. This factor has affected the export of many items of various countries, such as sugar, raisins, and coffee. When the GDP of a country increases, it indicates that the production capacity of the country also increases. Therefore, the competition between foreign products and domestic products becomes more intense.

H5: The higher the GDP of the importing countries, the higher the seafood exports of Vietnam.

The population of the countries importing seafood from Vietnam

The population of Vietnam's seafood-importing countries can influence the scale of the import market. The larger the population, the greater the likelihood of imports from that country, and this will also increase the export volume of the exporting country. This information was subsequently added to the trade attraction model by later studies (Miran, 2013; Oumer & Nvaeeswara, 2015; Ebaidalla & Abdalla, 2015; Dlamini & colleagues, 2016; Alfred, 2019).

H6: The higher the population of the seafood-importing countries, the higher the seafood exports.

The distance from Vietnam to the countries importing seafood from Vietnam

The initial factor in the traditional trade gravity model is the distance between countries. The closer the distance between the exporting and importing countries, the more likely they are to "attract" each other and trade more with each other than countries that are far apart. However, this factor has an opposite effect on the export volume of a country. Distance is identified as one of the important factors for the total bilateral trade volume, according to experimental studies by Céline Carrere (2003) and Martínez-Zarzoso and Nowak-

Lehmann, D.F. (2004). In the specific case of Vietnam, studies by Do Thai Tri (2006) and Nguyen Xuan Bac (2010) have shown that distance has an opposite effect on the country's export flow. The distance factor between countries has been used in most subsequent studies, such as Sevela (2002), Khiyav & colleagues (2013), Oumer & Nvaeeswara (2015), Ebaidalla & Abdalla (2015), Dlamini & colleagues (2016), and Rahman (2019).

H7: The further the distance between Vietnam and importing countries, the more the export of seafood decreases.

The nominal exchange rate between Vietnam and the countries importing Vietnamese seafood

Exchange rate: The exchange rate is a factor that has been studied and added to the trade gravity model. This rate directly affects the export price of goods and is an important factor in determining market demand. When the exchange rate decreases, the domestic currency price increases, and the foreign currency earned from export activities decreases. This results in the revenue from export activities being reduced in domestic currency and export volume decreasing. Conversely, when the exchange rate increases, the domestic currency price decreases, the amount of foreign currency earned increases, and the export volume increases. However, the condition for export activities to grow and develop is that the input costs of export goods do not correspondingly increase. To eliminate the impact of inflation differentials between countries and accurately reflect the purchasing power and competitiveness of a country, in the scope of this study, the real exchange rate is used. Authors such as Bhatt (2019), Weckström (2013), Antonio and Troy (2014), Dlamini and colleagues (2016) have indicated the effects of exchange rate policies on export volume.

H8: The higher the exchange rate, the more Vietnam's seafood exports increase.

Average interest rate of Vietnam

Average lending interest rates in Vietnam are affected by state policies that support seafood production businesses to develop the industry. This can be measured through factors such as corporate income tax rates, loan interest rates, infrastructure policies, preferential interest rate loan packages, support for raw materials inputs, administrative procedures and trade promotion (Khiyav & colleagues, 2013; Dlamini & colleagues, 2016; Ly and Zhang, 2008).

H9: As the lending interest rate in Vietnam increases, the export of seafood products decreases.

The average price of aquaculture production in Vietnam

Seafood production prices in Vietnam affect the quantity of exported goods negatively according to the theory of supply and demand. The H-O theory also shows a relationship between domestic production prices and comparative prices between countries. Therefore, high domestic production prices will reduce the ability to compete in export prices and decrease the volume of seafood exports. Empirical studies by Haleem and colleagues (2005) and Hussien (2015) also produced similar results. If domestic seafood production prices increase, Vietnam's export prices will also increase, but this will reduce its

ability to compete in export prices against competitive rivals and decrease the volume of seafood exports. Therefore, the hypothesis is:

H10: As seafood production prices in Vietnam increase, the export of seafood products decreases.

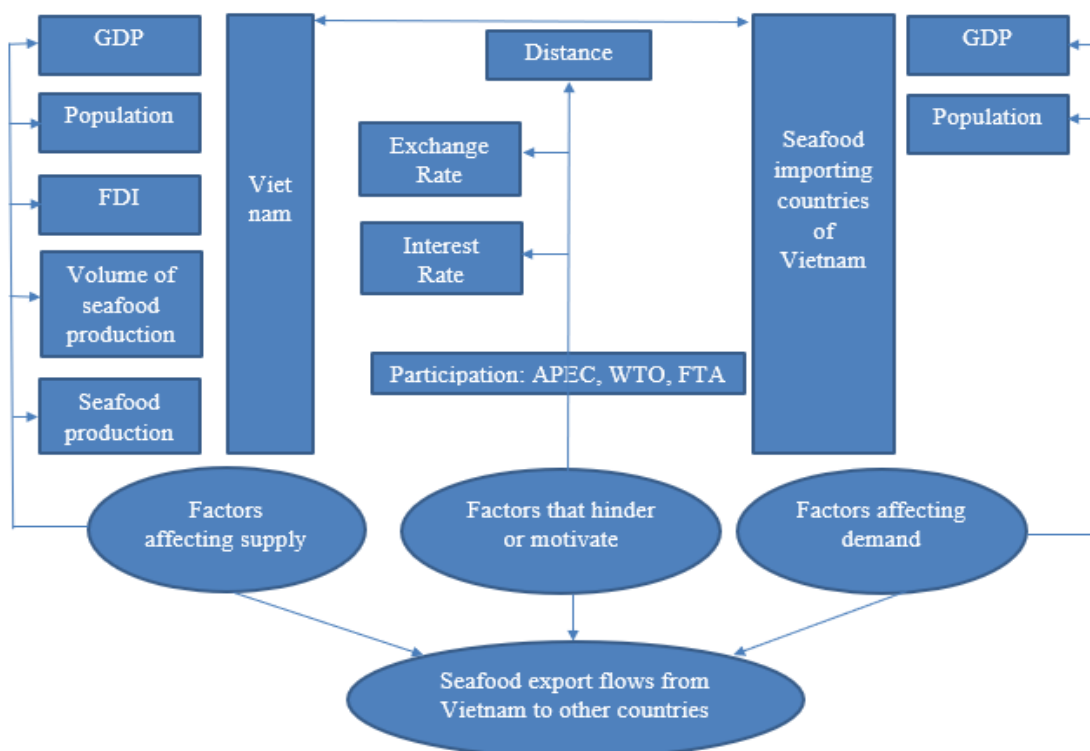

The level of openness of an economy can be measured by various variables, such as the openness index of the economy or the participation of countries in international trade organizations and forums. This is a factor that many researchers are interested in and add to the attractive trade model. The openness and international integration of countries are considered a way to promote trade and enhance exports (Khiyav et al., 2013; Dlamini et al., 2016; Ly and Zhang, 2008; South Africa Department of Trade and Industry, 2003; Stavytsky et al., 2019).

H11: Vietnam's seafood exports are higher if both Vietnam and the importing country join the WTO in year t.

H12: Vietnam's seafood exports are higher if both Vietnam and the importing country join APEC in year t.

H13: Vietnam's seafood exports are higher if both Vietnam and the importing country join FTA in year t.

After adjusting based on feedback from a preliminary study of practical conditions in Vietnam, the model of factors affecting Vietnam's seafood exports based on the attractive trade model is proposed as follows:

With the specific adjusted and identified factors mentioned above, the model to measure the factors affecting Vietnam's seafood exports is determined as follows:

$$\ln(EX_{Vjt}) = K + \beta_1 \ln(GDP_{Vt}) + \beta_2 \ln(DS_{Vt}) + \beta_3 \ln(FDI_{Vt}) + \beta_4 \ln(KL_{Vt}) + \beta_5 \ln(GDP_{Jt}) + \beta_6 \ln(DS_{Jt}) + \beta_7 \ln(KC_{Vj}) + \beta_8 \ln(TYGIA_{Vjt}) + \beta_9 \ln(LAISUAT_{Vt}) + \beta_{10}(\text{GIASANXUAT}) + \beta_{11}(\text{WTO}_t) + \beta_{12}(\text{APEC}_t) + \beta_{13}(\text{FTA}_t) + \varepsilon$$

3. Method

3.1. Collecting data

To ensure the accuracy of the data source, the study collected data from reputable organizations worldwide and in Vietnam. Specific data sources include: Vietnam's seafood export turnover and import tax data were collected from the Trademap - ITC database of the WTO; GDP data for Vietnam, GDP of seafood importing countries, and population data of seafood importing countries were obtained from the databank.worldbank database of the World Bank; FDI disbursement capital into Vietnam was collected from the database of the General Statistics Office of Vietnam; VND lending interest rates and X/VND exchange rates were obtained from the IMF database; The distance between countries, measured from the distance between the two capital cities of two countries, was obtained from the website <http://vn.toponavi.com>; Information on participation in WTO, APEC, EVFTA, CPTPP, and FTA organizations was directly obtained from the website of the World Trade Organization (www.wto.org), the Asia-Pacific Economic Cooperation (www.apec.org), and the Vietnam Chamber of Commerce and Industry (www.trungtamwto.vn).

The study uses a dataset with 860 observations of 43 countries and Vietnam over the period from 2002 to 2021.

Table 1. Explanation of variables and data sources.

Observed variable	Explanation	Data source
EX_{Vjt}	The export value of Vietnamese seafood to Japan in year t	ITC
GDP_{Vt}	GDP of Vietnam in year t	World Bank
DS_{Vt}	Population of Vietnam in year t	World Bank
FDI_{Vt}	Investment in Vietnam from foreign direct investment (FDI) disbursement in year t	General Statistics Office of Vietnam
KL_{Vt}	The production volume of Vietnam's aquatic products in year t	General Statistics Office of Vietnam
GDP_{Jt}	The GDP of the countries importing seafood products from Vietnam in year t	World Bank
DS_{Jt}	The population of the countries importing seafood from Vietnam in year t	World Bank

Observed variable	Explanation	Data source
KC _{VJ}	The distance from Vietnam to the countries importing seafood from Vietnam	Distancefromto
TYGIA _{VJt}	The nominal exchange rate between Vietnam and the countries importing Vietnamese seafood in year t	IMF
LAISUAT _{Vt}	Average interest rate of Vietnam in year t	IMF
GIASANXUAT _{Vt}	The price index of seafood production in Vietnam in year t	General Statistics Office of Vietnam
WTO _t	The value is 1 if both Vietnam and the partner country are WTO members in year t, and 0 if either Vietnam or the partner country is not a WTO member in year t	WTO
APEC _t	The value is 1 if both Vietnam and the partner country are APEC members in year t, and 0 if either Vietnam or the partner country is not a APEC member in year t	WTO
FTA _t	The value is 1 if both Vietnam and the partner country are members of the same Free Trade Agreement (FTA) in year t, and 0 if either Vietnam or the partner country is not a member of any FTA in year t	WTO

3.2. Data Processing

The study uses the Stata program to perform estimation and model testing for optimal OLS, REM, FEM, and GLS models. Specifically, the estimation techniques are carried out as follows:

(1) Choosing between OLS and FEM: Estimating the model using the OLS method by considering all coefficients as constant in different time and space conditions and estimating the FEM model by considering the correlation between the fixed factor and the residual. Conducting an F test with all $u_i = 0$ with the Prob coefficient. If this coefficient < 0.05 , there is a correlation between the fixed factor over time with the residual, which means that the FEM estimation is better than OLS. Conversely, if $\text{Prob} > 0.05$, the OLS estimation may be better than FEM.

(2) Choosing between OLS and REM: Estimating the model according to REM with the assumption that there is no correlation between the independent variable and the residual. Testing for random effects with $\text{corr}(u_i, X) = 0$ with the Prob coefficient. If this coefficient < 0.05 , there is randomness in the model, or there is no correlation between the independent

factor and the residual, which means that the REM estimation is better than OLS. Conversely, if Prob > 0.05, the OLS estimation may be better than REM.

(3) Choosing between FEM and REM: Using the Hausman test to choose a suitable model between REM and FEM. Testing the hypothesis H0: there is no difference in regression coefficients between the two REM and FEM models through the Prob coefficient. If this coefficient < 0.05, reject the H0 hypothesis. Conversely, if Prob > 0.05, the REM estimation will be better than FEM.

(4) Testing the phenomenon of autocorrelation: the correlation between independent variables and the residual has been corrected with assumptions in the REM or FEM models. However, to perform regression, the autocorrelation in the residual also needs to be eliminated. Conducting the Wooldridge test with the hypothesis H0: there is no autocorrelation phenomenon with the Prob coefficient. If this coefficient < 0.05, reject the H0 hypothesis, meaning that there is an autocorrelation phenomenon in the model. Conversely, if Prob > 0.05, there is no autocorrelation phenomenon in the model.

(5) Testing the phenomenon of constant error variance: the assumption of the regression model is that the variance of the error is constant. Testing $\text{Var}(u) = 0$ with the H0 hypothesis: the variance of the error is constant with the Prob coefficient. If this coefficient < 0.05, reject the H0 hypothesis, meaning that the variance of the error changes in the model. Conversely, if Prob > 0.05, the model has a constant error variance.

(6) Correcting model errors with GLS regression.

4. Results

4.1. Model selection

4.1.1. Choosing between OLS and FEM

Performing a regression using the Ordinary Least Squares (OLS) method to examine the impact of factors on Vietnamese seafood exports. The OLS regression results are shown in the table below.

Table 2. OLS regression results

lnEX	Coef.	Std. Err.	t	P>t	[95% Conf.	Interval]

Continuing with testing for multicollinearity among variables in the model, the results showed that some factors had large multicollinearity coefficients. Four variables, lnKL, lnGDPI, lnGDPv, and DSv, were removed until the multicollinearity coefficient met the required threshold. The results of the multicollinearity test for the remaining variables after removing the non-compliant variables are presented in Table 3.

Performing the F test with all $u_i=0$ yields a Prob of $0.000 < 0.005$ after running the FEM, which allows us to conclude that there is a correlation between the time-fixed factor and the residuals. This means that the FEM estimation is better optimized than the OLS model.

4.1.2. Choosing between OLS and REM

Performing the random effects model (REM) regression yields the following estimation results:

Table 5. Results of regression analysis using random effects model (REM)

lnEX	Coef.	Std. Err.	z	P>z	[95% Conf.	Interval]
lnDSi	.7955209	.1477701	5.38	0.000	.5058967	1.085145

Source: Compiled from STATA 15

After running the REM model, testing the random effect shows that $\text{corr}(u_i, X) = 0$ with Prob = $0.0000 < 0.05$. This means that we accept the presence of randomness in the model or that there is no correlation with the residuals. In this case, the REM estimation will be better optimized than OLS.

4.1.3. Choosing between REM and FEM

After the selection process based on pairwise comparisons, the results show that the estimation using FEM and REM models is more optimal than using the OLS model. Therefore, we proceed to choose between the FEM and REM models to see which model is more optimal using the Hausman test.

Table 6. Hausman test between FEM and REM.

Variable	Coef.		Difference (b-B)	S.E.
	FEM(b)	REM(B)		
lnDSi	.7529783	.7955209	-.0425426	.6573499
lnKC	-.1209247	-.1227704	.0018457	.
GIASX	.0114361	.0110938	.0003423	.
lnFDI	1.423158	1.415937	.0072208	.0272105
LAISUAT	-.0041497	-.0041824	.0000327	.
lnTYGIA	.1054876	.1596917	-.0542041	.0253484
WTO	.4614672	.4797091	-.0182419	.0195334
FTA	-.2591533	-.2762934	.0171401	.0060459
b = consistent under Ho and Ha; obtained from xtreg				
B = inconsistent under Ha, efficient under Ho; obtained from xtreg				
Test: Ho: difference in coefficients not systematic				
$\text{chi2}(7) = (b-B)'[(V_b - V_B)^{-1}](b-B)$ $= 11.70$ $\text{Prob} > \text{chi2} = 0.1650$				

Source: Compiled from STATA 15

The results of the Hausman test show a value of Prob = 0.1650, indicating acceptance of the hypothesis that there is no correlation between the independent variables and the residuals, and that randomness exists. This means that the REM estimation will be more optimal than FEM because the REM assumption is no correlation with the residuals and estimation based on random effects. Therefore, REM will be selected to estimate the impact of factors on Vietnam's seafood exports to other countries.

4.2. Model validation

4.2.1. Autocorrelation test

After conducting the Hausman test to choose between the FEM and REM models, an autocorrelation test is performed for the REM model with the following hypotheses:

H0: The model does not have autocorrelation

H1: The model has autocorrelation

The result of the autocorrelation test for the REM model is shown in table 7 below:

Table 7. Autocorrelation test for the REM model

Wooldridge test for autocorrelation in panel data	
H0: no first-order autocorrelation	
F(1, 42)	14.694
Prob > F	0.0004

Source: Compiled from STATA 15

The test result shows that the coefficient of Prob = 0.0004 < 0.005, so we reject the null hypothesis H0 and accept the alternative hypothesis H1, meaning that the REM model has autocorrelation.

4.2.2. Heteroskedasticity test

Similar to the autocorrelation test, we conducted a heteroskedasticity test for the REM model with the following hypotheses:

H0: The model has constant variance

H1: The model has varying variance

The result of the heteroskedasticity test for the REM model is shown in table 8 below:

Table 8. Heteroskedasticity test for the REM model

stimated results:	Var	sd = sqrt(Var)
lnEX	1.544968	1.242967
e	.1613705	.4017095
u	.435494	.6599197
Test: Var(u) = 0	chibar2(01)=	3931.30
	Prob > chibar2=	0.0000

Source: Compiled from STATA 15

The result shows that the coefficient of Prob = 0.000 < 0.005, therefore, rejecting the null hypothesis H0 and accepting the alternative hypothesis H1. This means that the REM model has heteroskedasticity.

4.3. Rectifying the chosen model using GLS method

To rectify the issues of autocorrelation and heteroscedasticity in the REM model, GLS regression was performed. The results are presented in table 9 below:

Table 9. GLS regression results

Estimated covariances		43		Number of obs	860	
Estimated autocorrelations		1		Number of groups	43	
Estimated coefficients		10		Time periods	20	
				Wald chi2(9)	1910.42	
				Prob > chi2	0.0000

Source: Compiled from STATA 15

The results show that the remaining variables in the model, after removing the variables identified in the multicollinearity test and addressing the issues of autocorrelation and heteroskedasticity in the REM model, are all statistically significant at the 95% level. Specifically, these variables are lnDSi, lnTYGIA, lnFDI, GIASANXUAT, LAISUAT, APECT, WTO, and FTA.

5. Discussion and Conclusion

5.1. Recommendations

5.1.1. Solution based on the population factor of importing countries

The population represents the demand for seafood. The selection of Vietnam's seafood consumption partners should be based on the population scale in that market. Seafood is one of the essential products, so the larger the population, the higher the consumption capacity, which will always be the preferred markets to choose from. Among them, potential markets with large populations to focus on include ASEAN, the United States, China, etc. After selecting the market, it is necessary to focus on researching and analyzing the characteristics of that market to have a long-term seafood export strategy.

5.1.2. Solutions based on exchange rate factors

Based on the model results, exchange rate policies have a significant and consistent impact on Vietnam's agricultural export activities. When the X currency increases, the export cost of Vietnamese products will increase, reducing the competitiveness of these products in the international market. The X/VND exchange rate also affects consumer purchasing power. Therefore, the Vietnamese government and businesses need to have flexible policies to cope with exchange rate fluctuations. Strengthening monitoring and forecasting of exchange rate conditions to make timely and effective decisions is necessary. At the same time, the government needs to protect the domestic market by establishing price regulations and trade agreements to ensure the rights and interests of export businesses.

5.1.3. Solutions based on FDI factor

Continuously attract foreign direct investment to increase the production capacity of the seafood industry. In addition, solutions need to be implemented to accelerate the disbursement progress of FDI capital after registration. Focus on investing in high-tech projects and manufacturing products with high added value and large scale in the seafood industry.

5.1.4. Solutions based on the production price index factor

Product quality is one of the most important factors in improving production prices. Manufacturing and exporting high-quality seafood products will increase their value and selling price. Investing in modern production technology during the process helps to improve productivity and product quality while reducing production costs. In addition, there needs to be coordinated efforts from the government, such as strengthening product quality management and control to increase brand value.

5.1.5. Solutions based on the factor of Vietnam's average lending interest rate

The government needs to be flexible in managing interest rate policies, particularly prioritizing monetary policy easing or low-interest stimulus packages for businesses to access capital and expand production because low-interest rates have a positive impact on export turnover. In particular, research results have shown that interest rate policies have a stronger short-term impact after they are issued. Therefore, in addition to issuing policies, the government needs to push forward the implementation process of interest rate and credit policies to have a timely impact on production.

5.1.6. Solutions based on the degree of openness of the economy

Develop domestic and international relationships through trade promotion activities to expand markets, promote and sign bilateral and multilateral trade agreements. Expand cooperative relationships with domestic and international organizations and individuals through organizing and participating in workshops, projects, and forums. Act as a bridge between Vietnamese businesses and international non-governmental and non-profit organizations. Introduce seafood-related activities and projects to international partners and customers to attract interest in cooperation and investment in Vietnam. Publish Vietnamese documents and media worldwide. Be responsive to the demands and preferences of markets to provide information on consumption trends and forecast prices for businesses.

5.2. Conclusion

The estimated results using the GLS method to correct for the REM model allowed for the determination of factors influencing seafood exports in Vietnam based on the gravity model.

$$\ln EX = 0.975 \ln DS_i + 0.3051 \ln TYGIA + 1.202 \ln FDI + 0.008 GIASANXUAT - 0.010 LAISUAT + 0.728 APECT + 0.548 WTO - 0.255 FTA - 10.205$$

Compared to the hypotheses, the regression results for the explanatory variables are statistically significant. The majority of the factors are similar to previous studies. However, the biggest difference in this study compared to previous studies is the reverse impact of the FTA variable. It can be seen that China, a large country with significant export potential, has only signed 15 FTAs. Currently, Vietnam has 17 FTAs, of which 15 are already in effect and 2 are being negotiated. The excessive signing of FTAs without changes in institutional and management aspects has sometimes made domestic businesses unable to compete with foreign businesses that enjoy lower tariff rates. This may be some of the reasons leading to this result. In addition, the producer price index has gone against the initial hypothesis and

has a positive impact on seafood exports. The reason for this result is that in the process of fishing and aquaculture, Vietnamese fishermen have not yet applied solutions and technologies leading to increased production costs, but this increase in cost is insignificant compared to the value obtained from seafood exports. Furthermore, it can be seen that Vietnam's seafood exports are currently facing many anti-dumping lawsuits. Therefore, the correlation between seafood production prices in Vietnam and those in other countries is still low.

IMPACT OF CAPITAL STRUCTURE ON PROFITABILITY IN THE BANKING SYSTEM

Huynh Thi Thanh Truc

truchtt@tdmu.edu.vn

Faculty of Economics, Thu Dau Mot University, Binh Duong Province, Vietnam

Abstract

Choosing the right capital structure has a great impact on a bank's ability to generate profits, especially in the context of macroeconomic fluctuations and fierce competition among banks in the current financial market. Researching the influence of 31 banks from 2010 to now, through quantitative analysis, the research results show that banks that choose capital in favor of equity have the ability to improve business results. Moreover, large-scale banks have many advantages in the market, so they often have higher business efficiency, the same is true for older banks. However, inflation and the bank's market share have not had a positive impact on the bank's profit.

Keywords: *Bank, capital structure, quantitative analysis*

1. Introduction

In recent years, our country's economy has achieved a high growth rate compared to other countries. Contributing to this growth has merit from economic entities such as individuals, individual business households, enterprises, and banks. In which, banks are financial intermediaries holding a key role to connect the two sectors of savings and investment in the economy, and banks are also facing fierce competitive pressure due to the growth of the economy as well as the growth of domestic and foreign non-bank financial intermediaries. Depending on the performance, adaptability and profitability of banks, the impact of this capital structure on banks is also different. As a result, banks with weak competitiveness may be replaced by stronger banks. It shows that a bank with more profitable and stable ability is consistent with the better their competitive advantage. In the current international competitive environment, the existence of a bank will be assessed by an important criterion of profitability.

The current profitability of banks is not stable over the years and periods for many different reasons and many researchers do it with the goal of finding out the factors that affect the profitability in the banking system. This is also an issue that managers and investors need to manage businesses and make investment decisions. Because of this reason, this topic will give a systematic and an investigation of the factors affecting profitability in commercial banks in the case of Vietnam.

2. Literature review

Profitability is defined as the ability of a business to generate profits over the long term under the assumption that operating conditions remain constant. This is an indicator that shows the relationship between the capital structure and profitability of a business over a certain period

of time. At the same time, profitability also shows the results of using capital and tangible assets of the business. The production and business capacity, debt repayment capacity and investment expansion of an enterprise are guaranteed when the enterprise has large enough profitability. On the contrary, if the enterprise has low profitability, it will have difficulties in maintaining production and business activities, problems such as the production and business or financial difficulties can also arise at the same time (Nguyen Van Ngoc, 2012).

According to Le Ha Diem Chi (2022), financial capacity is a factor that shows the scale of a bank's operations, its ability to mobilize capital as well as its ability to extend credit will be high if the bank has a large equity capital. To ensure competitiveness in the context of integration, each bank needs to focus on increasing its own capital. Most banks with large charter capital are constantly expanding the scale of operations, developing products, improving service capacity and increasing convenience for customers.

Isayas, Y. N. (2022) conducted a study of 14 banks for the period 2008-2019. The study showed that firm size, liquidity ratio, tangible assets, capital adequacy, leverage and speed real GDP growth has a positive and statistically significant effect on profitability of banks, while firm age and inflation rate have a negative effect but the effect is not statistically significant. on the profitability of banks in Ethiopia.

Nguyen Anh Tu, Pham Tri Nghia (2019) conducted factors affecting the bank performance of joint-stock commercial banks in Vietnam through unbalanced panel data of 27 commercial banks in Vietnam in the period 2005 - 2017, and by fixed factor regression model (FEM). Research results show that bank performance tends to be positive with credit risk, equity structure and loan/total mobilized capital ratio; in contrast, bank performance tends to be inversely related to assets with liquidity and quality of management. In addition, the authors suggested to commercial banks about increasing capital mobilization to increase credit output, and at the same time rebalancing the capital allocated to liquid assets with profitable assets to optimize their performance. Further, commercial banks need to have scenarios to respond to macroeconomic crises in order to minimize losses in operations. Also, some recommendations to the State Bank of Vietnam, there should be appropriate management to regulate the efficiency of commercial banks in the short term such as the borrower may not must bear credit costs when commercial banks incur bad debts; and in the long term, it is necessary to manage to reduce the inflation rate of the economy in order to enhance the performance of commercial banks, thereby promoting the development of the real economy.

3. Method

The study analyzes data of 31 banks in the period from 2010 to present. The data are collected from audited financial statements and annual reports.

Based on the theoretical basis and through a review of domestic and international studies, building a research model based on the combination of factors in experimental studies of Berger (1995), Adelopo (2018), Gupta, N., & Mahakud, J. (2020), the author chooses ROA, ROE as two dependent variables, two research models for the case are rewritten as follows:

❖ for ROA

$$ROA_{it} = \beta_0 + \beta_1 SIZE_{it} + \beta_2 CAP_{it} + \beta_3 CIR_{it} + \beta_4 RD_{it} + \beta_5 AGE_{it} + \beta_7 TANG_{it} + \beta_8 MP_{it} + \beta_{11} GDP_{it} + \beta_{11} INF_{it} + \epsilon_{it}$$

❖ for ROE

$$ROE_{it} = \beta_0 + \beta_1 SIZE_{it} + \beta_2 CAP_{it} + \beta_3 CIR_{it} + \beta_4 RD_{it} + \beta_5 AGE_{it} + \beta_7 TANG_{it} + \beta_8 MP_{it} + \beta_{11} GDP_{it} + \beta_{11} INF_{it} + \epsilon_{it}$$

Where:

ROA or ROE is a measure of the bank's profitability;

SIZE is the size of the bank, measured in the natural base logarithm of total assets;

CAP is the equity ratio, measured by Equity/Total Assets;

CIR is a cost-to-income ratio, measured by operating expenses/operating income;

RD is the coefficient reflecting non-interest income, reflecting income diversification, total non-interest income/Total revenue;

AGE is the age of the bank;

TANG is the indicator representing tangible assets;

MP is the indicator reflecting the strength and market share of the enterprise, measured by the total assets of 1 bank / total assets of the 31 banks studied;

GDP and INF are growth and inflation;

4. Results

4.1. Descriptive statistical analysis

Table 1. Descriptive statistical analysis

Variable	Obs.	Mean	Std. Dev.	Min	Max
ROA	253	0.0081	0.0066	-0.0076	0.0305
ROE	253	0.0932	0.0693	-0.0459	0.2682
NIM	253	0.2828	0.0125	0.0010	0.0884
SIZE	253	14.1502	0.4415	13.2500	15.1800
CAP	253	0.0817	0.0282	0.0269	0.1911
CIR	253	0.5374	0.1657	0	1.1152
RD	253	0.2183	0.1639	-0.1775	1.3457
AGE	253	1.3056	0.2682	0	1.7993

GDP	253	0.0620	0.0116	0.0294	0.0720
INF	253	0.0582	0.0481	0.0063	0.1867

Source: The authors

Based on descriptive statistics of the variables in the study. In general, ROA of 31 banks on the stock exchange in Vietnam in the period 2010-2020. The mean is 0.81%, the minimum and maximum values of ROA are -0.76% and 3.05%, respectively, with standard deviation of 0.66%. This shows that, in recent times, besides some effective banks, there are still a few banks that are operating inefficiently in the fierce competition. ROE has a mean of 9.32% with a standard deviation of 6.93%. With the fluctuation between the minimum and maximum values of ROE at -4.49% and 26.82%, respectively, it shows that there is fierce competition in the digital revolution and globalization of capital flows.

SIZE - bank size with an average value of 14.15 with the smallest decreasing by 13.25% and the value the largest is 15.18%, showing that there is no big difference in the magnitude between commercial banks.

Regarding CAP, it shows that the equity ratio accounts for 8.17%, the rest is from other sources of capital.

4.2. Correlation coefficient matrix analysis

In order to check whether the correlation between the independent variables and the research of the study has multicollinearity phenomenon, the table of correlation matrix data of the research study will show the issues that need attention as follows:

Table 2. Correlation matrix

Items	SIZE	CAP	CIR	RD	AGE	RISK	TANG	MP
SIZE	1.0000							
CAP	-0.4993	1.0000						
CIR	-0.3943	-0.0345	1.0000					
RD	0.1868	-0.0456	0.1403	1.0000				
AGE	0.2947	0.0600	-0.3622	-0.2623	1.0000			
RISK	0.0784	-0.0700	-0.0514	0.0221	0.0472	1.0000		
TANG	-0.3212	0.4460	0.1999	-0.0910	0.0940	-0.0732	1.0000	
MP	0.7886	-0.3418	-0.3908	0.0687	0.3982	0.0252	-0.1005	1.000

Source: The authors

From the table above, we can see that some pairs of variables have a positive correlation relationship and some variables have a negative relationship. Independent variables have low correlation with each other, correlation coefficient < 0.8, there is no phenomenon of multicollinearity.

4.3. VIF analysis

To check the multicollinearity of the variables, we have the following statistical table:

Table 3. VIF analysis

Variable	VIF	1/VIF
SIZE	4.77	0.209853
MP	3.87	0.258305
CAP	1.92	0.521158
CIR	1.72	0.580730
AGE	1.54	0.650984
TANG	1.50	0.665263
INF	1.39	0.721705
RD	1.34	0.747497
GDP	1.07	0.938242
RISK	1.02	0.980923
Mean VIF	2.01	

Source: Analysis

According to Hoang Trong et al. (2008), predictors with $VIF = 2.01 < 10$, the research model is considered to have no serious influence on multicollinearity.

4.4. Results

The study performs additional tests such as: Pooled OLS, FEM and REM to examine the relationship between variables. Through the table of the results of the variables corresponding to the regression models as shown when running with Stata 15 program. In order to choose the best and most suitable regression model for the study, the authors perform the tests.

Table 4. The test of Hausman

Items	Test	FEM	REM	Hypothesis	Result
ROA	Hausman Frob > chi2= 0.0274 < 5%	Prob > F = 0.0000 < 1%	Prob > chi2 = 0.0000 < 1%	Reject hypothesis H0 => Accept hypothesis H1	FEM
ROE	Hausman Frob > chi2 = 0.1309 > 5%	Prob > F = 0.0000 < 1%	Prob > chi2 = 0.0000 < 1%	Reject hypothesis H1 => Accept hypothesis H0	REM

Source: Analysis

After using Hausman test to select the model: Hausman test gives Prob value $> \chi^2 = 0.001 < 5\%$, so we reject hypothesis H1 (ϵ_i and independent variable are not correlated) accept hypothesis H0 (ϵ_i and correlated independent variable). Thus, Hausman test results FEM model is better than REM for ROA, REM model is better than FEM for ROE.

Next, we use the F test to choose between the FEM and Pooled OLS models.

Table 5. The F test

Items	Test	Result
ROA	F(30,212) = 5.81 Prob > F = 0.0000 <5%	FEM
ROE	F(30,212) = 6.80 Prob > F = 0.0000 <5%	FEM

Source: Analysis

After using the F-test to select the model: The test results for the FEM model are better than POOLs for ROA, ROE. So, the general result is as follows: FEM is the best model for the dependent variable ROA. REM is the best model for the dependent variable ROE.

Table 6. Diagnostics test

Items	Test	Model selection	Sta.	Hypothesis	Result
ROA	Heteroskedasticity	FEM	Prob > $\chi^2 = 0.0000 < 5\%$	Reject hypothesis H0 => Accept hypothesis H1	There is a phenomenon of variance
	Autocorrelation	FEM	Prob > F = 0.000 < 5%	Reject hypothesis H0 => Accept hypothesis H1	There is autocorrelation
ROE	Heteroskedasticity	REM	Prob > F = 0.000 < 5%	Reject hypothesis H0 => Accept hypothesis H1	There is a phenomenon of variance
	Autocorrelation	REM	Prob > F = 0.000 < 5%	Reject hypothesis H0 => Accept hypothesis H1	There is autocorrelation

Source: Analysis

4.5. Results based on GLS

The models all have problems with autocorrelation or variable variance, so the topic analyzes according to FGLS to correct defects, the results are as follows:

Table 7. Regression coefficient and P-value based on FGLS

Source: Analysis

Note: *, **, *** correspond to the significance level of 10%, 5%, 1%).

The research results show that an increase in equity has a positive effect on financial performance (ROA), moreover, the larger the bank's size, the higher the financial efficiency of the bank. Similar results show that bank age has a positive effect on firm profitability. However, inflation has an impact on the bank's business performance, moreover, the market share of enterprises has not had a good impact on the profitability of the business.

5. Discussion and Conclusion

Some solutions to improve profitability in the coming years:

5.1. Bank expansion

The balance sheet of banks is shown specifically through a system of indicators to reflect the situation of assets and capital to form assets (According to Circular 49/2014/TT-NHNN). In which, total bank assets including cash, gold, silver and gems, deposits at the State Bank, deposits and loans to other credit institutions, fixed assets (fixed assets).

Tangible fixed assets are the main labor materials with physical form satisfying the standards of tangible fixed assets, participating in many business cycles but still keeping the original physical form such as buildings, architectural objects, machinery, equipment, means of transport... Meanwhile, intangible fixed assets are assets that have no physical form but can be determined and are held and used by enterprises in production and business, provision of services or leased to other entities in accordance with the standards for recognition of fixed assets.

Thus, in order to improve business efficiency or profitability, banks are forced to focus on the most rational use of facilities such as premises, projects (tangible fixed assets), and constantly improve technology, software, equipment (intangible fixed assets) and expand the scale of business activities by opening more branches and transaction offices carefully and with a roadmap and objective appraisal.

5.2. Improve efficiency of capital cost

According to Circular 49/2014/TT-NHNN, the bank's capital sources include equity and liabilities. Equity is one of the basic capital sources of the bank and formed with the establishment of the bank. Similar to businesses, one of the basic business objectives of a bank, besides profits, is to "preserve and develop equity. Further, the bank must maintain and grow that capital during its operation. This can be done by the bank by adding more capital or using retained profits to reinvest, demonstrating investment policy in both breadth and depth. Equity capital of a commercial bank is the amount of capital actually allocated by the owner or actually contributed by shareholders and capital contributors and recorded in the charter of the bank (according to Clause 1 of this Article). Article 29 of Circular 40/2011/TT-NHNN regulating the charter capital of banks). One of the ways to expand capital is the fact that businesses and banks pay dividends in shares, such as the Bank for

Agriculture and Rural Development of Vietnam (Agribank), which has been granted an additional 3,500 billion VND by the Ministry of Finance

5.3. Developing new branches, expanding new market shares, new products

Regarding the development of new branches and new transaction offices: In the period after the 2009 Asian financial crisis, a few weak banks were bought out at non-dong prices, a series of banks increased their equity capital in recent years. After the increase in charter capital, banks expand their market share by opening new branches, transaction offices and new products, more diversified in cross-selling products. However, the expansion of market share by increasing the number of transaction offices and branches must comply with the regulations of the State Bank, specifically Circular TT 21/2013/TT-NHHH.

In terms of expanding new market shares, new products are of special interest to banks, especially in the era of the industrial revolution 4.0, banking products and services are extremely competitive, therefore, banks do not have enough strong financial resources to invest in new technologies, new software and new services.

5.4. Forecasting the macroeconomic situation in the country

Banks are forced to grasp the domestic economic situation through management policies, fiscal policies, monetary policies and the world political and economic situation in order to forecast and make appropriate business strategies for each period, specifically the input and output interest rate policy, the level of provisioning in accordance with the economic situation and the Basel II standards in Circular 41/2016-TT-NHNN and especially the ensure the level of capital adequacy, meet the desired profit level.

Abstract

The purpose of this article is to identify the factors affecting the quality of information on the financial statements of listed enterprises on the stock market. Mixed studies is used in the article, in which qualitative research is used first with the method of discussion with experts to determine the appropriate factor. The results show that there are six influential factors to build the research model, in which accounting voucher impact on other factors in the research. Then, quantitative research is used to retest the model. The results show that all six factors selected are statistically significant, arranged in order of decreasing influence: audit firms, managers, accounting standards, accounting documents, accounting books and tax. Based on the study outcomes, we give some recommendations to listed enterprises for improving the quality of accounting information and new directions in future research.

Keywords: *Financial statement, level of influence, listed enterprises, quality of information.*

1. Introduction

In the current era of technology and information, which has developed rapidly, financial statements are still the basis for complete and reliable information. Financial statements for the purpose of providing financial information useful to current and prospective investors, lenders, and other creditors in making loan facility decisions is one of the capital providers.

The quality of the financial statements can be fundamental or complementary depending on their usefulness to the information of the financial statements. In fact, over the

years, there have been many scandals related to information disclosure and the quality of published information, causing negative impacts on the global market. There is no shortage of cases related to the disclosure of information about the financial status of listed companies in Vietnam. Consequences of the scandals have significantly affected the confidence of investors and the public in the quality of financial statement accounting information from listed companies.

Information systems success model was developed by Delone and McLean (1992). This is the most influential and popular premise theory to this day through the citation of thousands of scholarly articles. In 1992, the author pointed out 6 factors affecting information systems, including: system quality, information quality, information system use, individual-related impact factors, and influencing factors. organization related activities. In which, the main factor that the research team relies on to form the research paper is the quality of information. The research model of Nelson et al. (2005) both inherits the previous research of Delone and McLean and adds four additional factors to assess information quality including: accuracy, completeness, relevance and comprehensibility... Research by Ferdy van Beest & ctg (2009) and Geert Braam & Ferdy van Beest (2013) have many similarities. These two studies are based on the criteria of information quality of financial statements published by IFRS and IASB to build a second-order scale consisting of 5 first-order components: appropriate, truthfully presented, understandable, and capable. comparative, timely. The research team has inherited these components to build the scale of information quality of financial statements.

2. Method

a. Qualitative research methods

Conducted by interview technique. The process of discussing with experts in the field of accounting to select appropriate variables that they believe have a significant impact on the quality of financial reporting information. Here, the research team has introduced twelve factors, including: Accounting standards; Audit firms; Financial paper; Information technology; Objectives of preparing financial statements; Manager; Accounting books; Fixed assets; Frequency of meetings of the board of directors; Accounting information; Tax; Professional qualifications in finance and accounting of the board of directors. The discussion process excluded four factors because of the low impact or difficulty in the survey process, including: Information technology; Objectives of financial reporting; Fixed assets; Frequency of meetings of the board of directors; Accounting information; Professional qualifications in finance and accounting of the board of directors.

b. Quantitative research methods

Data collection subjects: people with qualifications and expertise in the field of accounting - auditing and management executives.

Research sample size: The sample size is determined depending on many factors. In which, researchers can determine sample size based on two methods of population

estimation: multiple regression analysis and exploratory factor analysis (EFA). The research project is expected to use a combination of the two methods above to process the data.

For exploratory factor analysis (EFA), the sample size will be determined by the formula: $n = k \times \text{number of observed variables}$; where the sample size determination ratio k is usually: 5:1 (Hair et al., 2014). So, in this study with the number of observed variables of the research model being 22 and the k coefficient of 5/1, the minimum sample size is 110.

For multiple regression analysis, the sample size is usually determined by the formula: $n = 50 + 8k$ (where k is the number of independent variables of the model). With the number of independent variables in this study being 6, the minimum sample size is 98.

Thus, combining the sample size requirement of EFA analysis and multiple regression analysis, and considering the time condition, the number of observations of the study is 300 will be suitable.

Sampling method: The study used a non-probability sampling method. The research will select listed companies that are easily accessible.

Data collection: Conducted through survey questionnaires. More than 300 survey questionnaires were distributed to accountants, auditors and business managers.

3. Result

3.1. Test of Cronbach's Alpha coefficient

Scale reliability analysis by Cronbach's Alpha to evaluate the relationship between the observed variables in the same factor. This method allows the analyst to eliminate the inappropriate variables in the research model. Corrected Item - Total Correlation coefficient represents the correlation between each observed variable with the remaining variables in the scale. According to Cristobal et al. (2007), when the observed variables have the value Corrected Item - Total Correlation from 0.3 or more, the scale is evaluated as good. According to Hoang Trong and C.N.M. Ngoc (2008), if the value of Cronbach's Alpha coefficient is from 0.6 or higher, the scale is eligible to conduct the analysis of the next steps.

The results of **Cronbach alpha** reliability estimate show that the correlation coefficient of the total variables of the observed variables in the scale of NQL, CTKT, CT, SKT, CMKT, THUE are all greater than 0.3 and Cronbach's Alpha coefficient of the total variables are all greater than 0.6. Thus, the variables are all acceptable and eligible to be included in the analysis in the next steps.

Table 1. The results of testing the reliability of the scale

Observed variables	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted
1. Cronbach's Alpha coefficient of the scale Manager (NQL): 0.603				
NQL1	6.977	3.619	0.470	0.425

Observed variables	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted
NQL2	7.617	3.668	0.307	0.669
NQL3	7.215	3.467	0.476	0.410
2. Cronbach's Alpha coefficient of the scale Audit firms (CTKT): 0.797				
CMKT1	11.726	4.332	0.585	0.758
CMKT2	11.805	3.985	0.683	0.708
CMKT3	11.746	4.488	0.573	0.764
CMKT4	11.871	4.165	0.596	0.753
3. Cronbach's Alpha coefficient of the scale Accounting documents (CT): 0.725				
CT1	8.234	1.928	0.539	0.645
CT2	8.317	1.873	0.564	0.614
CT3	8.314	2.017	0.534	0.650
4. Cronbach's Alpha coefficient of the scale Accounting books (SKT): 0.708				
SKT1	8.185	1.886	0.530	0.614
SKT2	8.132	2.115	0.521	0.625
SKT3	8.145	2.019	0.529	0.614
5. Cronbach's Alpha coefficient of the scale Accounting standard (CMKT): 0.797				
CMKT1	11.726	4.332	0.585	0.758
CMKT2	11.805	3.985	0.683	0.708
CMKT3	11.746	4.488	0.573	0.764
CMKT4	11.871	4.165	0.596	0.753
6. Cronbach's Alpha coefficient of the scale Tax (THUE): 0.845				
THUE1	8.056	7.007	0.669	0.809
THUE2	7.871	6.795	0.640	0.822
THUE3	7.980	6.357	0.722	0.785
THUE4	8.063	6.655	0.696	0.797

Source: Result of research data analysis

3.2. Exploratory Factor Analysis (EFA)

Factor analysis is conducted to examine the relationship between variables across all factors. The KMO coefficient is used to assess the suitability of the factor analysis. A KMO value between 0.5 and 1 is sufficient for factor analysis to be appropriate, and vice versa.

The Bartlett test is used to examine the correlation between observed variables within the factor. The Bartlett test is statistically significant when Sig Bartlett's Test < 0.05, indicating that the observed variables are correlated with each other within the factor.

The test results show that the KMO coefficient is 0.856, which satisfies the criterion of $0.5 \leq \text{KMO} \leq 1$, and the Bartlett's test has a Sig of $0.000 < 0.05$. Therefore, the observed variables are correlated with the representative factor. These measured variables of the research group are meaningful and appropriate, meeting the conditions for conducting EFA.

Table 2. KMO and Bartlett's Test

Kaiser-Meyer-Olkin Measure of Sampling Adequacy		0.856

12	.505	2.406	85.055						
13	.478	2.277	87.332						
14	.452	2.151	89.482						
15	.430	2.049	91.532						
16	.393	1.870	93.402						
17	.340	1.619	95.022						
18	.307	1.460	96.482						
19	.286	1.361	97.843						
20	.236	1.124	98.967						
21	.217	1.033	100.000						

Source: Result of research data analysis

The initial Eigenvalues of the first six factors are all greater than 1, with the smallest value of 1.048 for the 6th factor. Therefore, these six factors best summarize the information from the 21 observed variables in EFA. The total extracted variance of the independent variables is 68.181% (>50%), indicating that the six main factor groups have explained 68.181% of the variation in the observed variables. The research model is appropriate for EFA analysis.

Source: Result of research data analysis

The factor loading coefficients are all greater than 0.5 and no variable loads on both factors with a similar loading coefficient. Therefore, the factors ensure convergence and distinguishability during EFA analysis.

4.3. Correlation Analysis

Table 5. Regression coefficients

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	Constant	2.344	.359		6.527	.000		

T_NQL	.174	.038	.218	4.532	.000	.941	1.362
T_CTKT	.382	.051	.401	7.561	.000	.772	1.296
T_CT	.080	.073	.076	1.096	.004	.456	1.294
T_SKT	.018	.077	.017	.236	.014	.402	1.289
T_CMKT	.104	.061	.100	1.695	.031	.624	1.302
T_THUE	-.140	.043	-.170	-3.256	.001	.797	1.255

a. Dependent Variable: T_CLTT

Source: Result of research data analysis

The form of general regression equation:

$$\mathbf{T_CLTT = 2.344 + 0.174 \times T_NQL + 0.382 \times T_CTKT + 0.080 \times CT + 0.018 \times T_SKT + 0.104 \times CMKT - 0.140 \times THUE}$$

The regression coefficient: Regression coefficients, from β_1 to β_5 , are positive (>0), in addition that coefficient β_6 is negative (<0). All regression coefficients are statistically significant at the level of significance less than 0.05 (Sig. < 0.05). The variables included T_NQL, T_CTKT, T_CT, T_SSKT, T_CMKT, have positive coefficients, thus, these independent variables have positive effects on the dependent variables. T_THUE variable has a negative effect on dependent variables. The variance Inflation Factors (VIF) is less than 2, showing no multicollinearity phenomenon.

Table 6. Model summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin - Watson
1	.597 ^a	.357	.344	.56106	2.137

a. Predictors: (Constant). T_THUE, T_CT, T_NQL, T_CTKT, T_CMKT, T_SKT

b. Dependent Variable: T_CLTT

Source: Result of research data analysis

Adjusted R^2 is equal to 0.357, which means 35.7% of changes in the dependent variable are explained by the independent variables. The remaining 64.3% are explained by factors, which are not included in the model. The Durbin Watson index is equal to 2,137, less than 3, so there is no autocorrelation.

Table 7. Analysis of variance (ANOVA)

Model	Sum of Squares	df	Mean Square	F	Sig.
1 Regression	51.685	6	8.614		
Residual	93.178	296	.315	27.365	.000 ^b
Total	144.863	302			

a. Dependent Variable: T_CLTT

b. Predictors: (Constant). T_THUE, T_CT, T_NQL, T_CTKT, T_CMKT, T_SKT

Source: Result of research data analysis

The results of ANOVA analysis showed that F-value (6, 296) is equal to 27,365 with a level of significance less than 5% (Sig. = 0.000^b). This proves overall adjusted R² is not zero, equivalent the linear regression model built is appropriate overall.

The coefficients such as adjusted R², Sig. F is inappreciable, there is no heteroscedasticity, no multicollinearity. It can be concluded that the model is suitable to explain the factors affecting the quality of information. Financial statements of listed enterprises in Vietnam.

4. Discussion and conclusion

4.1. Discussion

To compare the influence of each independent factor against the independent variable, the study is based on the standardized Beta coefficient. Regression model shows that there are 6 factors affecting the quality of financial information on financial statements of listed companies in Vietnam: NQL with $\beta = 0.218$, securities companies with $\beta = 0.401$, CT with $\beta = 0.076$, SKT with $\beta = 0.017$, and accounting accuracy. with $\beta = 0,100$ and THUE with $\beta = -0.170$. The effects are explained as follows:

- NQL increased by 1 unit, the quality of financial reporting information increased by 0.218 units.

- CTKT increased by 1 unit, the quality of financial reporting information increased by 0.401 units.

- CT increased by 1 unit, the quality of financial reporting information increased by 0.076 units.

- SKT increased by 1 unit, the quality of financial reporting information increased by 0.017 units.

- CMKT increased by 1 unit, the quality of financial reporting information increased by 0.100 units.

- THUE increased by 1 unit, the quality of financial reporting information decreased by 0.170 units.

Through the above research results, among the 6 factors, the accounting document has the strongest positive effect ($\beta = 0.401$) and the opposite effect is THUE ($\beta = -0.170$).

4.2. Conclusion & Solution

This study inherits from previous research results the quality of financial reporting information in the world and in Vietnam, combined with data collected from quantitative and qualitative research methods to determine the influencing factors and influence levels as well as build a research model suitable for listed enterprises in Vietnam. Based on the results of the reliability assessment: Scale using Cronbach's alpha, Validating the value of the EFA exploratory factor analysis scale; and Regression analysis have shown that 5 factors positively affect the quality of information on financial statements by increasing levels from Accounting books, Accounting standards, Accounting documents, Managers, Audit firms - specific factors of the study and at the same time have an impact on other factors affecting the quality of information on financial statements. Besides the factors that have a positive effect, there is a tax factor that has a negative effect compared to the other factors. Based on these results, the study proposes recommendations to improve the quality of information on the financial statements of listed enterprises in Vietnam as follows:

- For the Audit firms, it is necessary to raise awareness about the importance of the quality of the audit members; choose reputable and experienced auditing firms, because most investors make investment decisions based on the opinions of financial statement auditors.

- For Managers - considered the biggest intangible asset of the company, it is necessary to improve the leadership ability of managers in finding strategy and direction for the company, thereby creating Core core value that is definitely for the company. At the same time, the owner must also create favorable conditions for the manager to feel secure and have a long-term commitment.

- For accounting documents, it is necessary to improve the way of managing accounting vouchers. The organization of accounting vouchers needs to base on the production scale and submit them to the organization and management to determine the appropriate quantity and type of vouchers. The relevant laws, regulations, and circulars also form the basis for strengthening the validity of the document.

- For accounting Standards - an important legal framework, the listed enterprises should aim to apply IFRS international standards to receive more investment opportunities and expand their scale. In addition, the listed enterprises should invest in recruiting and training a team of qualified accounting staff to meet the requirements of converting from Vietnamese accounting standards to IFRS international accounting standards.

- For Tax, these businesses must comply with the national tax policy, declare tax, completely, honestly and comply with applicable tax laws. At the same time, interprises must also prepare tax returns relating to the use of provisions or accounting estimates to ensure that such provisions or estimates are satisfactory and to update quickly with changes in tax policy, if any.

Asbtract

The objective of the article is to analyze and evaluate the factors affecting the readiness of enterprises to export organic agricultural products in Vietnam. The article uses Cronbach's Alpha test, EFA factor analysis and linear regression model to analyze factors based on data collected from a survey of 202 enterprises exporting organic agricultural products in Vietnam. Research results have shown that Export market characteristics; Government support; Export motivations have a strong impact on the readiness to export organic agricultural products. Meanwhile, Ability to attract capital from credit institutions and Geographical characteristics have a marginal impact on export readiness. Besides, the total capital and the number of years in operation of the enterprise also affect differently on the preparedness to export organic produce of enterprises in Vietnam. From this result, several policy implications have been proposed to help promote enterprises' readiness to export organic agricultural products to international markets.

Keywords: *Readiness level, Organic agricultural products, Export.*

1. Introduction

In line with socio-economic development, especially in industrialized countries, the trend of clean and safe food is no longer an idea but is actually existing in people's lives. People are increasing their demand for organic food - which is both good for health by providing many safe nutrients, preventing cardiovascular disease, blood sugar... and as a solution to preserve the environment and develop while still ensuring sustainability. Although the demand for organic agricultural products is enormous and tends to increase,

the supply has not shown any sign of catching up with the demand. This is an opportunity for the economy of Vietnam - a country which always takes pride in the production scale and diversity of the agricultural sector. Many agricultural products have top production in the world. Currently, organic products are mainly consumed domestically and exported to markets such as Japan, the UK, Korea, Singapore and Russia, etc. Vietnam ranks fifth among countries with organic agricultural area in Asia.

The problem of demand for organic agricultural products and the modest ability of supply to meet the needs of the market has been brought to notice, but there have not been many in-depth studies in this area, especially the bottlenecks that need to be solved. For example, the reason why the "gold mine" of this market has not been "dug into", is it because the technical standards are too high? Or because of the trust issues with clean agricultural products? Or is it because switching from traditional farming to organic farming is expensive and complicated? It can be said that the development of organic agriculture contributes to bringing clean Vietnamese agricultural products closer to international friends. If this opportunity is exploited, our country's economy will also flourish, people's living standards will be improved and our country's position in the international arena will be further enhanced. The authors conducted a study to analyze and evaluate the factors affecting the readiness to export organic agricultural products of enterprises in Vietnam, thereby proposing a number of solutions to help Vietnamese enterprises improve their export readiness in organic produce.

This study's structure consists of five parts: (i) Introduction, (ii) Research overview and theoretical background, (iii) Research methodology, (iv) Research results and discussion and (v) Conclusion and recommendations.

2. Literature review and theoretical basis

2.1. Literature review

Nguyen Ngoc Quynh et al (2018) *assessed the factors affecting the export of Vietnamese agricultural products to the European Union (EU) market*. It is known that the EU is one of Vietnam's traditional export markets (export turnover to the EU market accounted for 19.7% of Vietnam's total export turnover in 2016). Based on previous studies, along with the actual characteristics at the time of the study, the authors have built a model of 5 factors affecting the export of Vietnamese agricultural products to the EU.

All the above impact variables are collected by the authors from the database of the United Nations (UN), the International Monetary Fund (IMF)... and have obtained 432 observations (including 27/28 EU member countries, excluding Luxembourg due to lack of data) during the period 2001-2016. The analysis was carried out based on the feasible generalized least squares (FGLS) model. The research results confirm the export-promoting effect of the economic scale factor, which is reflected in GDP, free trade and export-restricting effect of the importing country's sea contiguity on Vietnamese agricultural products. Geographical distance and GDP per capita were not statistically significant in this study. The advantage of the model is that the FGLS method has overcome the phenomenon

of Heteroscedasticity in this study, thereby helping the authors to assess the impact of factors on the export of agricultural products of Vietnam to the EU market. The authors also recommend that: it is necessary to expand research into other aspects, such as the efficiency of export activities and the potential of Vietnam's agricultural exports to this market...

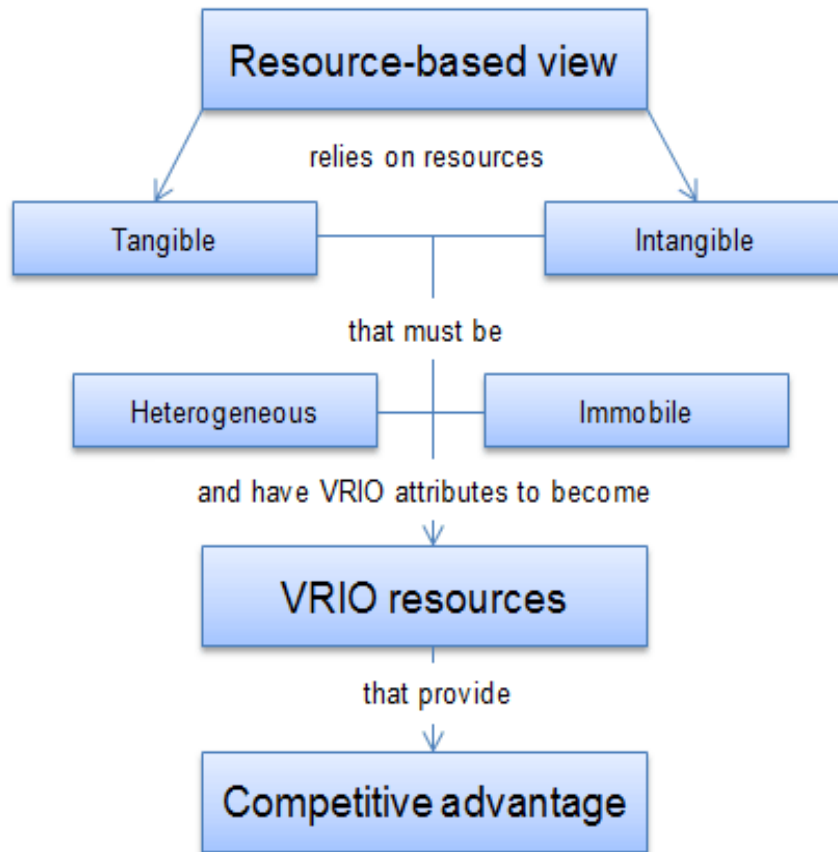

In another work, Stephan Gerschewski et al (2020) studied *the factors affecting the export readiness of small and medium enterprises in the geographical area of New Zealand*. The authors have based on important theoretical perspectives related to export and internationalization including business perspective (Andersson, 2000) and internationalization perspective (Johanson & Mattson, 1988; Axelsson & Easton, 2000). 1992). In particular, the business perspective strongly focuses on entrepreneurs as individuals promote internationalization of enterprises (Shane & Venkataraman, 2000). This view is mainly based on the Schumpeterian concept of the entrepreneur. According to Schumpeter (1934), the entrepreneurship function includes the introduction of new products and production methods, the opening of new markets, the identification and access to new sources of supplies and materials, and the reorganization of an industry. Therefore, entrepreneurs exert an important influence on the internationalization behavior of a firm (Acedo & Jones, 2007; Andersson, 2000; Shane & Venkataraman, 2000; Stevenson & Jarillo, 1990). As for the view of internationalization (Johanson & Mattson, 1988; Johanson & Vahlne, 2003) emphasizes the important significance of networks for export and internationalization, particularly in the context of enterprises medium and small. From a network-based point of view, successful internationalization depends strongly on network growth and interdependence with other firms, even more than the advantage of ownership (Axelsson & Easton, 1992; Dunning, 1988; Johanson & Mattson, 1988).

Through exploratory factor analysis (analysis of main components and factors with eigenvalues greater than 1 and varimax rotation) and reliability analysis (using Cronbach's α) based on collected data from 96 SME exporters in the manufacturing sector, Stephan Gerschewski et al found that almost all the given independent variables have a certain impact on the export readiness of these enterprises. Specifically, the factors including the Intrinsic Motivation to stimulate export; Formalizing export activities (associated with marketing elements); Domestic expansion prior to export are factors that positively affect export readiness (proven true). Besides, two independent variables including Import prior to export and Export planning are not statistically significant during model testing at 10% significance level.

2.2. Theoretical basis

Through a selective and unified analysis and synthesis, the authors have based on a number of previous theoretical models as the basis for their research. Resource-based view (RBV) is an approach to achieving competitive advantages that emerged in the period 1980 - 1990, after a series of works by Wernerfelt, B. ("The Resource - based view of the firm"). Prahalad and Hamel ("The core competence of the corporation"), Barney, J. ("Firm resources and sustained competitive advantage") and others were published. The main idea of the theory is that a firm's competitive advantage lies primarily in its efficient use of a set of valuable tangible and/or intangible resources. Firms in the market are different because

they possess different resources. Businesses will succeed if they are equipped with the most suitable resources and know how to combine resources more effectively than their competitors. RBV focuses on analyzing the internal resources of the business as well as linking internal resources with the external environment.

Source: *Strategic Management Insight* (2021)

Based on the above theory, the research hypotheses are constructed and selected as follows:

Export stimulus

Export motivation leads to encouragement and promotion of participation in export activities under the export behavior of enterprises. Perceiving export motives means that through its operating environment, enterprises understand the factors that drive their export decisions. At the same time, it helps to understand the real motivations to promote and encourage enterprises to export.

The study of export motives of enterprises includes external and internal motives. Internal motivations are those associated with the internal environment of the firm (Lenidou et al., 2007). Thus, perceiving export motives within the enterprise are the motives that business managers perceive from the internal environment of the enterprise. Jobber (2004) divides the importance of the factors within the firm's capacity related to market selection as skills, resources, product adaptation and competitive advantage. Katsikeas (1996) investigated the incentives for Cypriot producers to decide to continue and maintain export operations in the EU, in which the results showed an appreciation of

the factor of excellent governance. Recently, Nylund (2015) argues that the factors affecting the decision to choose a market are largely dependent on the resources and business environment of the company at a particular time. Management's perception of economic and political risks in export markets largely depends on the expertise and knowledge, accumulated experience... of business managers.

Extrinsic motivations originate from the firm's domestic market environment or the foreign environment (Lenidou et al., 2007). Thus, perceiving export motives outside the enterprise are the motives that business managers perceive from the environment of the home country and the host country. Katsikeas (1996) studied the incentives that encouraged Cypriot producers to decide to continue and maintain export activities in the EU, in which the results show an appreciation of the factor of the government's export policy. Albaum and Duerr (2008) argue that the factors promoting internationalization of enterprises in general or entering the international market in particular are due to the push factors from the domestic market (small scale, low economic openness, competition) and pull from foreign markets (large market size, high economic openness). Therefore, research hypothesis H1 is proposed as follows:

H1: Export motivation has a positive effect on a firm's readiness to export

The company's ability to raise capital

The ability to raise capital of an enterprise is the ability of a commercial legal entity to raise capital to create capital for its business activities in various forms. For example: Borrowing capital, raising capital, issuing and offering securities, joint venture, domestic and foreign association; formation of a real estate trust fund.

Financial capacity means the ability to ensure financial resources for the operation of the business in order to achieve set goals. To be more precise, the financial capacity of an enterprise is the ability to mobilize capital from different sources to meet the activities of the enterprise and the ability to ensure the financial safety of the enterprise. Financing capabilities are traditional performance techniques including the company's ability to obtain sufficient loans from commercial banks; the company's ability to finance external operations with retained profits, the amount of current capital, the company's liquidity and purchasing power of capital requirements. In this regard, the research team hypothesized the following:

H2: A firm's ability to raise capital has a positive effect on its export readiness

Export market features

The characteristics of the foreign market pose both opportunities and challenges for exporters, so businesses need to seize opportunities and limit challenges to ensure their success. (Cavusgil & Zou, 1994). Characteristics of foreign markets may include: The attractiveness of the export market (economic development, demand potential, etc.), barriers from the export market (Zou & Stan, 1998). , the level of competition in the export market (Cavusgil & Zou, 1994; Zou & Stan, 1998; O'Cass & Julian, 2003; Altıntas et al., 2007; Sousa et al., 2008; Chen et al., 2016), potential demand from export markets (Cavusgil & Zou, 1994),

cultural similarities (Cavusgil & Zou, 1994; Sousa et al., 2008), similarities in laws and legal frameworks (Cavusgil & Zou, 1994; O'Cass & Julian, 2003). Furthermore, Sousa et al. (2008) found that cultural similarities affect export performance. When the export market is culturally similar to the domestic market, businesses can have an advantage in communicating with consumers and local governments. In particular, the level of competition in the export market is a factor of interest to many researchers (Chen et al., 2016).

Research results of Cavusgil and Zou (1994), Gemünden, (1991), Zou and Stan (1998), Katsikeas et al. (2000), Sousa et al. (2008), Chen et al. (2016) show that the characteristics of the foreign market are factors that have a direct impact on the export results of enterprises. Therefore, the team put forward a research hypothesis as follows:

H3: The characteristics of the export market have a positive effect on the level of export readiness of enterprises

Geographical features

Geographic distance is an issue that has been mentioned in studies of international trade. Tinbergen (1962) uses geographic distance to reflect costs in international trade. Specifically, the greater the geographical distance between countries, the greater the transportation costs, the longer the transit time and vice versa. In the scope of the study, agricultural products are products with high price elasticity and there is not much difference in quality between different countries. Therefore, the import markets will tend to choose the suppliers that are closer to their country to save cost and reduce shipping risk. Chen (2004) calculates the geographical distance based on the longitude and latitude of the main cities of the countries and regions, thereby showing that the geographical distance reduces trade between pairs of countries. The greater the geographical distance, the more problems in transporting goods between two countries such as risks in transportation and cargo insurance, thereby increasing costs. In addition, when transporting heavy goods in conditions of long distances, it requires insurance, which also increases the cost of trade transactions between the two countries with large geographical distances. Products with low added value will suffer from high costs if the distance is long.

Geographic distance also represents the cost of international transactions for goods and services. These costs include the cost of time, the cost of accessing market information (Heo and Doanh, 2015). In addition, it also comprises costs incurred due to differences in culture, preferences and institutions (Blum and Goldfarb, 2006).

Contiguousness status: This variable is generally considered to have a restrictive effect on export. Countries with a landlocked geographic location have higher costs of transportation, insurance, and customs than other countries with a contiguous geographic location (Arvis et al., 2010). The reason is that it is often more expensive to use road transport than sea transport. As a result, the cost of exporting goods to a landlocked country tends to be higher than the cost of exporting goods to a contiguous country. Through the above studies, the authors make the following expectations about hypothesis H4:

H4: Geographical features are negatively related to the export readiness level of enterprises

- *Export barriers*

Export barriers are considered as issues that limit the ability of firms to start, develop and maintain operations in foreign markets (Morgan & Katsikeas, 1997). Export barriers can include: procedural barriers (Altintas et al., 2007; Al-Hyari et al., 2012), barriers to competition (Altintas et al., 2007), barriers to entry differences (Altintas et al., 2007), tariff barriers (Morgan & Katsikeas, 1997), information barriers (Al-Hyari et al., 2010), geographical distance barriers (Virvilaite & et al., 2010). Seinauskiene, 2015).

According to Katsikeas and Morgan (1994), since firms know about the environment in which they operate, it can be hypothesized that there is a positive correlation between actual problems and perceived problems. Therefore, exporters are aware of export barriers in their export activities. According to Leonidou (1995, 2004), export barriers are limitations that hinder the ability of enterprises to improve, develop or maintain business operations in foreign markets. According to Arteaga-Ortiz and Fernández-Ortiz (2010), an export barrier is any factor or component, whether internal or external, that hinders or discourages an enterprise from improving, increasing or maintaining export activities. According to Leonidou (1995) internal barriers are associated with the ability of the company's organizational resources and access to export business. The external barriers of enterprises originate from the domestic environment and the export market environment.

From the studies done by the previous authors, the research team hypothesized H5 as follows:

H5: Export barriers are negatively related to the export readiness level of enterprises

- *Government support*

According to Gençtürk and Kotabe (2001), government export support programs are available external resources of information, empirical knowledge and provide enterprises with external capacity to solve problems in export. Kotabe and Czinkota (1992) argue that export support programs help reduce export barriers. For SMEs with limited knowledge and resources, the Government's support will add more resources for businesses, thereby reducing export barriers, bringing success in export activities for businesses. There are many ways to classify export support programs such as financial and market support (Shamsuddoha et al., 2009); financial and non-financial support (Ayob & Freixanet, 2014); under four components: information, education and training, trade and financial facilitation (Leonidou et al., 2011); lists of support programs in each country (Gençtürk & Kotabe, 2001; Ali, 2007)... Among the above classifications, the classification divided into four components is quite clear, showing the full range of government support programs, which helps businesses overcome export barriers. This is also the approach of the authors in this study.

As stated by Francis and Collins Dodd (2004), export promotion programs provided by the government help businesses, especially SMEs, overcome real barriers and understand

the importance of export support services. Shamsuddoha, Ali and Ndubisi (2009) conducted a study on the effects of export support programs on SMEs in developing countries. The result shows that market development support has a large and direct influence on export activities, while financial services only affect indirectly. Research by Jaud and Kukenova (2011) suggests that agricultural products need extended and long-term financial resources if they want to develop export activities. According to Do Thu Hang (2016), export support policies include financial support, technical support, support for awareness raising, information about export markets and risk support. Therefore, the research team hypothesize:

H6: Government support is positively related to the export readiness level of enterprises

- *Export readiness level*

According to Rosnan et al. (2015), the concept of export readiness is considered as the starting point to recognize the transformation potential of enterprises from a domestic company to an international company. Export readiness is a term commonly used by export support organizations to denote that a company has the character, capacity and courage to enter international markets. Export readiness is often used to describe a company that is willing and able to obtain the information, resources and support provided and use it effectively.

The formal research model and hypotheses are presented in Figure 2.

3. Method

3.1. Data Acquisition

The research team used research data including both primary and secondary data. In there:

The secondary data: It is collected from articles discussing the export of agricultural products, the factors affecting the willingness to export organic agricultural products of foreign and Vietnamese enterprises. The research team has sought data from books, reports, and websites from time to time, focusing on the period between 2015 and 2022 relating to the export of agricultural products from abroad and in Vietnam.

The primary data: The research team has conducted an online survey for organic agricultural enterprises in Vietnam that have intention of exporting these kinds of products to foreign markets. During the implementation of the survey, 220 samples were collected, of which 202 valid samples were put into data processing using SPSS software version 25.0.

The research team proposes a model consisting of 6 independent variables, 3 control variables and 1 dependent variable. The research team collects primary data through a set of questionnaires (Google form) including questions that are referenced and developed by the research team. The questionnaire will be sent by email to both production enterprises and commercial enterprises participating in exporting organic agricultural products to foreign countries. The data collection process will be done using a 5-level Likert scale.

3.2. Data processing

The secondary data: The collected documents continue to be synthesized and classified in addition to systematic methods of analysis, data comparison, evaluation to find useful information, and completing the theoretical basis of the problem.

The primary data: The model used in the study is a multivariable linear regression without intermediate or moderator variables so the research team used data analysis software SPSS version 25.0 with Cronbach's Alpha tools to measure the suitability of the scale for the variables included in the model and EFA factor analysis to check the convergence of the observed variables and the separation between the independent variables. Linear regression is also used to evaluate the influence of factors on the dependent variable. The tool to measure is a 5-level Likert scale indicating the influence of observed variables on the export readiness of organic agricultural products of enterprises in Vietnam from 1 - strongly disagree to 5. - Very agree. In addition, Independent Samples T-Test and Anova tools are also used to test the difference in the evaluation of enterprise information.

4. Results

4.1. Description of the study sample

4.1.1. Descriptive statistics relating to internal information of the business

Regarding the total capital of enterprises, 42.1% of enterprises have total capital from 3 to less than 20 billion VND, accounting for the largest number of participating enterprises. The second largest share with 25.7% is the group of enterprises with a total capital of 20-100 billion VND and nearly 21.8% for enterprises have total capital of less than 3 billion VND. And finally, to ensure the objectivity of the research paper, the group obtained a small number of surveyed enterprises from the group with a total capital of over 100 billion VND.

Regarding the number of employees participating in annual social insurance, the results are mainly enterprises with fewer than 100 employees (accounting for 52%). The two groups of employees participating in social insurance annually, less than 10 people and from 100 to 200 people, have 18.8% and 19.3% votes, respectively. In general, this result can show that employers have been paying attention to the labor of enterprises who participate in social insurance.

Survey results: The number of years of operation of enterprises shows that 38.6% of enterprises participating in the survey have 5 - 10 years of operation. 29.7% of enterprises participating in the survey have less than 5 years of operation. Enterprises participating in the survey have 11-15 years of operation, accounting for 24.8% and the remaining 6.9% belong to enterprises with more than 15 years of operation. This result can reflect the level of interest of enterprises in the export topic of enterprises operating from 5 to 10 years, which may be the period of transformation and development of enterprises.

4.1.2. Descriptive statistics related to export activities of enterprises

The number of years the enterprise has been involved in exporting is an important factor in the study's thesis analysis. Of the 202 results obtained, the majority of enterprises

have exported from 1 to 5 years (accounting for 56.1%). Besides, 28.7% of enterprises have exported for more than 5 years, partly showing the importance and experience of exporting goods to foreign markets. The rest are enterprises that have only exported for less than 1 year, accounting for the smallest proportion with 15.2%.

For the factor “Number of countries enterprises have exported”, the results show that up to 49.1% of enterprises have exported from 3 to 10 countries. This is followed by 29.2% and 21.6% respectively, corresponding to the proportion of Vietnamese enterprises exporting to "greater than 10 countries" and "less than 3 countries". This number is quite reasonable because it reflects partly the scale and number of years that the enterprise has exported.

Surveying the number of products exported to the international market, 42.7% of enterprises export from 5 to 10 products. 33.3% of enterprises that have less than 5 products exported abroad are followed. The smallest portion of the survey data is represented by enterprises exporting 10 products. It can be seen that businesses also somewhat diversify their products to attract more consumers while selling abroad.

Out of a total of 202 survey questionnaires, 84.2% of enterprises export in the field of “Agricultural products”. This is completely consistent with the target group, which consists of companies that have engaged in the export of agricultural products, specifically organic agricultural products to foreign markets. This result also ensures that the number of agricultural exporters participating in the survey is large enough to serve the next analysis process.

4.2. Cronbach's Alpha reliability test

Table 1. Reliability level of factors

	Number of variables	Cronbach's α
Export stimuli	4	.816
Capability to raise capital	4	.790
Export market's features	5	.816
Geographical features	4	.806
Export barriers	4	.841
Government support	5	.858
Export readiness level	4	.850

Source: Summary of the research team

The summary table of Cronbach's Alpha reliability analysis results shows that all the survey variables have high coefficients (all above 0.6). In which the factor “Government support” has the highest reported value of 0.858 and the factor “Capability to raise capital” has the smallest value with a coefficient of 0.790. In general, the results of the reliability scales of the variables in the survey are suitable and can be used for further analysis.

4.3. EFA exploratory factor analysis

4.3.1. Exploratory factor analysis with independent variables of export readiness

Table 2. KMO and Bartlett test results for independent variables

KMO and Bartlett's Test		
Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		0.855
Bartlett's Test of Sphericity	Approx. Chi-Square	2240.192
	df	325
	Sig.	0.000

Source: Summary of the research team

We hypothesize as follows:

H1: The observed variables are correlated with each other in the population.

H0: The observed variables are not correlated with each other in the population.

Based on the results obtained from EFA exploratory factor analysis, it can be seen that the data set is completely suitable for EFA analysis. In which the KMO coefficient is 0.855 in the range [0.5-1]; Bartlett test results with significance level of Sig coefficient is $0.000 < 0.05$; so we reject the hypothesis H0: observed variables are not correlated with each other in the population. Thus, the data used for factor analysis is completely appropriate.

4.3.2. Exploratory factor analysis with dependent variables of export readiness

Table 3. Results of KMO and Bartlett test of dependent variable

KMO and Bartlett's Test		
Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		0.823
Bartlett's Test of Sphericity	Approx. Chi-Square	328.670
	df	6
	Sig.	0.000

Source: Summary of the research team

We hypothesize as follows:

H1: The observed variables are correlated with each other in the population.

H0: The observed variables are not correlated with each other in the population.

The KMO coefficient is 0.823, in the range [0.5-1], it can be seen that the factor analysis is consistent with the collected data. Bartlett test results with significance level of Sig coefficient, which is $0.000 < 0.05$. So we reject hypothesis H0: observed variables are not correlated with each other in the population. The results prove that observed variables are correlated with each other in the factor.

4.3.3. Summary of EFA exploratory factor analysis results

Table 4. Summary of EFA . exploratory factor analysis results

	KMO coefficient	P - value of Bartlett test	Total variance (%)	Conclusion
Independent variables	0.855	0.000	64.721	Fully - qualified for analysis
Dependent variable	0.823	0.000	69.108	Fully - qualified for analysis

4.4. Correlation of factors affecting the level of export readiness of enterprises test (pearson correlation)

Table 5. Correlation analysis results

	N	202	202	202	202	202	202	202

** . The correlation is significant at the level of 0,01 (2 - tailed).

* . The correlation is significant at the level of 0,05 (2 - tailed).

Source: Summary of the research team

The results show that all Sig. (2-tailed) in the linear correlation between groups of independent variables (DC, KNHDV, DDTT, DL, RC, HTCP) with the dependent variables (MDSS) are guaranteed to be less than 0.05. This result ensures that the condition on the relationship between these two groups of variables is suitable for further research analysis.

After proving the linear correlation between the groups of independent variables and the dependent variable, the research team analyzed the degree of correlation between groups of variables. The relationship between the two groups (DC and KNHDV) and (RC and HTCP) is so strong that export readiness with the r-index correlated with 0.472 and 0.425, respectively.

Next is the level of correlation between groups of independent variables and dependent variables (MDSS). The research results show that the correlation between DDTT and MDSS has the highest value ($r = 0.575$). On the contrary, the variable DL and the variable MSM have the weakest correlation with $r = 0.364$.

In addition, all variables have a linear correlation at the 95% reliability level. At the same time, the results also show that the correlations between the variables are positive, which means that an increase in the variability of one group of variables will increase the value of the other group of variables.

4.5. Regression analysis

Table 6. Results of analysis of coefficient of determination of regression function

Model Summary ^b					
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.748 ^a	0.560	0.547	0.42729	2.092
a. Predictors: (Constant), DC, KNHDV, DDXK, DL, RC, HTCP					
b. Dependent Variable: MDSS					

Source: Summary of the research team

Based on the above table, we can see that the adjusted R² value is 0.547, which reflects the regression variable explaining 54.7% of the change of the dependent variable. Durbin - Watson is 2.092 (ranging from 1.5 - 2.5), from which no first-order correlation occurs.

Table 7. Results of regression coefficient between factors affecting export readiness

Coefficients ^a								
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	-0.729	0.288		-2.535	0.012		
	DC	0.131	0.059	0.125	2.223	0.027	0.715	1.398
	KNHDV	0.116	0.058	0.112	1.987	0.048	0.704	1.421
	DDTT	0.349	0.060	0.324	5.867	0.000	0.739	1.353
	DL	0.113	0.057	0.106	1.985	0.049	0.796	1.257
	RC	-0.180	0.054	0.185	3.341	0.001	0.736	1.358
	HTCP	0.280	0.058	0.275	4.804	0.000	0.690	1.450
a. Dependent Variable: MDSS								

Source: Summary of the research team

Linear regression equation:

$$\text{MDSS} = -0,729 + 0.131*\text{DC} + 0.116*\text{KNHDV} + 0.349*\text{DDTT} + 0.113*\text{DL} - 0.180*\text{RC} + 0.280*\text{HTCP}$$

Explanation:

- When the independent variables of the DC group increase by 1 unit, the dependent variable (MDSS) increases by 0.131 units and the independent variable (DC) has a positive effect on the dependent variable (MDSS) (provided that other independent variables remain constant). The above results are consistent with the study done by Katsikeas (1996) and Nylund (2015). For each company, the operational goals are different so the business strategy will also have many differences. Enterprises doing business in the domestic market that have achieved certain success in branding will decide to export for the purpose of expanding their name. This will also be an opportunity to help businesses earn higher profits when accessing large foreign markets.

- When the independent variables of the KNHDV group increase by 1 unit, the dependent variable (MDSS) increases by 0.116 units and the independent variable (KNHDV) has a positive effect on the dependent variable (MDSS) (provided that other independent variables remain constant). This is a new finding of the research team relating to the capability to raise capital on the export readiness level of enterprises. Any company that makes a decision to expand its business requires a large amount of capital to implement. Capital can be raised from owners, but this source can be limited in scale. To optimize efficiency, businesses often choose to raise their capital from credit organizations. The capital raised quickly and timely with a large enough amount reflects the potential and reputation of the enterprise.

- When the independent variables of the DDTT group increase by 1 unit, the dependent variable (MDSS) increases by 0.349 units and the independent variable (DDTT) has a positive effect on the dependent variable (MDSS) (provided that other independent variables remain constant). Especially when this is the independent variable having the greatest impact on the dependent variable. This result is similar to previous studies such as those of Katsikeas et al. (2000), Sousa et al. (2008) and Chen et al. (2016). These are factors that influence directly on business activities in foreign markets and business decisions. For an export market with a large customer base, which means that the demand for organic agricultural products is high and regularly - consuming, businesses will prioritize for development.

- When the independent variables of the DL group increase by 1 unit, the dependent variable (MDSS) increases by 0.113 units and the independent variable (DL) has a positive effect on the dependent variable (MDSS) (provided that other independent variables remain constant). Although this variable has an impact on the dependent variable, contrary to the hypothesis stated by the research team, the geographical feature factor has a positive influence. This conclusion is in contrast to previous studies by Chen (2004) and Arvis et al. (2010). Domestic and abroad studies have also researched the impact of this factor on the level of export readiness and have discovered a definite impact. In addition, the team

assumed that, during the survey, the set of questions relating to geographical features presents a positive trend in whether close distance factor or contiguousness factor is more favourable when exporting to these markets. Therefore, the assessment of the enterprise also reflects the exact meaning of the questionnaire and the reality.

- When the independent variables of the RC group increase by 1 unit, the dependent variable (MDSS) decreases by 0.180 units and the independent variable (RC) has a negative effect on the dependent variable (MDSS) (provided that other independent variables remain constant). This result is consistent with the research results of Leonidou (1995, 2004) and Arteaga-Ortiz & Fernández-Ortiz (2010). During the deeper international economic integration process as today, besides the positive aspects from FTAs such as tariff preferences, export activities in general face many trade barriers. Because trade is increasingly complex and demanding, especially in the agriculture sector. In order to successfully penetrate into strict markets such as the EU, Japan, Korea, etc. Vietnamese agricultural products in general, organic agricultural products in particular must compete fiercely with many countries, and at the same time must satisfy many food safety standards and strict technical regulations of these countries. Therefore, this factor easily leads to the fear of enterprises in making decisions to export to potential markets.

- When the independent variables of the HTCP group increase by 1 unit, the dependent variable (MDSS) increases by 0.280 units and the independent variable (HTCP) has a positive effect on the dependent variable (MDSS) (provided that other independent variables remain constant). This is similar to previous works such as Francis and Collins Dodd (2004) or Jaud and Kukenova (2011). Government agencies such as the Ministry of Industry and Trade and the Ministry of Agriculture and Rural Development always pay much attention to the export of agricultural products of domestic enterprises when they coordinate together by organizing many meetings themselves to consult and answer inquiries of enterprises about exporting to a specific market. These actions help businesses grasp useful and important information, especially about export procedures, which makes it easier for them to meet the right process.

5. Discussion and Conclusion

5.1. Suggestions

The government should have policies aimed at effectively exploiting abundant natural resources for agriculture, such as: land resources, water resources, marine resources and labor. One of the competitive advantages of Vietnamese agricultural products in the world market for centralized agricultural production is fertile agricultural land. Vietnam is located in the tropical monsoon climate, which has provided our country's agriculture with a large amount of sunlight, and suitable temperature to help plants grow. In addition, this benefit allows farmers to plant many crops in a year and ensure high-yield crops of good quality. Water resources in Vietnam are also quite abundant. Currently, agriculture is the industry that consumes the most water, so only 10-15% of the reserve should be exploited to meet the demand for production and life.

It is necessary to invest in science and technology in organic agricultural production such as human resource training, highly applicable scientific topics such as biotechnology in organic production, research on organic farming and animal husbandry process that is suitable to each type of plant and animal; research on biological fertilizer products, biological plant protection drugs, animal feeds and organic aquaculture. Suppliers should research and create new varieties of plants and animals with high yield, high quality, good resistance to pests and diseases, suitability for organic farming processes and adaptation to climate change.

The government needs to continue the communication and propaganda work on organic agriculture. In many appropriate forms, companies should focus on exploiting basic science and technology information and update new information as well as new models of organic agriculture to replicate in production in the near future. It is necessary to assign tasks to ministries, departments and agencies in the agricultural sector to have an information network on forecasting, so that businesses and production associations can regularly monitor information and make some production plan adjustments: increase/decrease output or redirect products, from raw export to processing. In addition, information on policies and laws related to production, export, and technical standards should be clearly disseminated to people, production households and production enterprises.

To export organic agricultural products, organic certification is always one of the top requirements. The Ministry of Science and Technology needs to coordinate with the Ministry of Agriculture and Rural Development to continue conducting field surveys to diversify organic certification organizations.

Ministries, and sectors need to have coordination and cooperation to support the export of agricultural products, specifically, the government should consider minimizing procedures in the stage of inspection, grant GAP certificates, and take advantage of the amount of on-site labor done at the garden to help farmers sell agricultural products for domestic use and export. Other supports can be considered, such as: supporting tax and credit policies for the production, processing, preservation and export of agricultural products; deploying a package of solutions to extend tax and land rent for businesses, organizations and individuals, etc.; reducing interest rate for enterprises exporting organic agricultural products; having a preferential electricity price policy applied to cold storage operation and other policies to support fees, air freight and sea freight for key markets.

On the business side, market research must be paid more attention because the consumption market is much more difficult than traditional agricultural products. Moreover, businesses need to proactively prepare capacity, source of goods, improve competitive benefits through building a long-term, methodical plan and strictly complying with regulations on traceability, simultaneously build and protect brands to promote sustainable exports, maintain and diversify markets. It is essential to be proactive and flexible in the risk management strategy, especially in the currently complicated and volatile period, such as the Russia-Ukraine conflict, which causes a sudden increase in logistics costs, exporting to China being in a state of fluctuating opening and closing. Therefore, businesses require information as well as experts to assess the situation and develop a proactive response plan to minimize risks.

5.2. Conclusion

From the above results, the study has resulted in one factor negatively impacting the willingness to export organic agricultural products of enterprises in Vietnam, which is export barriers. The remaining 5 factors that have a positive impact on the level of willingness to export organic agricultural products of enterprises in Vietnam are respectively: characteristics of the export market, government support, export stimuli of enterprises, capability to raise capital from credit organizations and geographical features. In addition, the intrinsic characteristics of the enterprise including the total capital and the number of years of operation also have various degrees of impact on its export readiness.

Abstract

Diversifying non-interest income sources and restructuring the operating structure of commercial banks is considered a necessary development trend in the current context of Vietnam's banking system. A study analyzes and evaluates the factors affecting non-interest income, including the Covid-19 pandemic, based on a data sample of 27 commercial banks in Vietnam from 2009 to 2022. The study shows that factors such as capacity management (RELROE), bank size (SIZE), capital adequacy ratio (CAR), and Covid-19 have a positive impact on non-interest income, while liquidity (LIQ), net interest margin (NIM), loans to assets ratio (LOAN), credit risk (RISK), and inflation rate (INF) have a negative impact. The article provides recommendations to improve the non-interest income of Vietnamese commercial banks. Specifically, research has also shown that the Covid-19 pandemic positively impacts non-interest income. Based on that, the article provides some recommendations to improve the non-interest income of Vietnamese credit institutions.

Keywords: *Covid-19 pandemic, commercial banks, non-interest income.*

1. Introduction

The income of a commercial bank consists of two categories: interest income and non-interest income. Interest income is the traditional source of income, mainly from loans and deposits, and accounts for a large proportion of the bank's total income. However, since the early 1980s, the market for loans and deposits from commercial banks has started to decline (DeYoung & Roland, 2001). This trend originated from regulations restricting product competition in the banking market, especially due to the development of information technology systems that have eliminated some of the traditional comparative advantages of commercial banks. In response to this trend, commercial banks have increased the production and sales of fee-based financial services (DeYoung & Roland, 2001). In Vietnam, diversification of non-

interest income sources is seen as an inevitable trend for commercial banks (Huynh Thi Huong Thao et al., 2021). Especially after Vietnam officially became the 150th member of the World Trade Organization (WTO), the number and scale of bank networks increased rapidly with the participation of domestic and foreign investors. This is both an opportunity and a challenge for Vietnamese banks as the market becomes increasingly competitive. With their management expertise and years of experience in the banking sector, foreign banks have many advantages in providing non-traditional financial products and services. This requires Vietnamese commercial banks to continue improving their industrial platforms and diversifying their products and services in a modern direction to keep up with the trend.

This study aims to evaluate the factors affecting the non-interest income of commercial banks, with a focus on the impact of the Covid-19 pandemic. To achieve this goal, after the introduction, section 2 will provide an overview of previous studies and research hypotheses. The research methodology and model will be introduced in section 3. Section 4 will present and analyze the results achieved, thereby providing a basis for making recommendations to increase the non-interest income of Vietnamese commercial banks in section 5.

2. Literature Review

The two primary sources of revenue for the bank are interest income and non-interest income. According to DeYoung & Rice (2004), non-interest income is revenue that is not directly related to lending activities, it comes from service activities; trading in gold, silver, precious stones, foreign exchange; securities trading and other service activities. Income from non-traditional banking activities like commissions, fees, and other related fees accounts for most of non-interest income (Olowolaju & Segun, 2018).

2.1. Net interest margin

Net interest margin is an important variable in assessing non-interest income factors because it represents net interest income (Alfarisi, 2015). Hakimi et al. (2012) showed that net profit margin is negatively and significantly correlated with non-interest income. A bank with a higher net profit margin indicates an orientation toward developing traditional operations rather than new ones based on information technology and applications that generate more fees and commissions. Having the same result, Le Duc Quang Tu (2017) indicated that net interest margin has a negative impact on non-interest income, suggesting that Vietnamese banks have to trade off between non-interest income and profit margin.

H1: There is a negative relationship between Net interest margin and non-interest income

2.2. Bank size

Bank size is understood as the total assets of commercial banks. As demonstrated by Hahm (2008), relatively big banks will dominate the production of consumer loans by utilizing economies of scale. Big banks must use non-interest revenue to supplement their interest income due to the fierce competition in the market for these lending products. According to Rogers & Sinkey Jr (1999), bank size is one of the most important factors affecting non-interest income. However, the research results of Vu Xuan Dung and Doan Viet Hung (2018) show that bank size has no impact on non-interest income of Vietnamese commercial banks.

H2: There is a relationship between bank size and non-interest income

2.3. Loans to assets ratio

According to Craigwell & Maxwell (2006), a high level of loan-to-total assets is indicative of an intermediary-based lending strategy, in which banks rely on interest income. On the contrary, non-interest income will increase when the bank has a strategy of income diversification. Therefore, a high loan-to-asset ratio corresponds to a low non-interest income (DeYoung & Rice, 2004; Craigwell & Maxwell, 2006). However, the research results of Nguyen The Binh and Nguyen Duong Gia Tran (2022) showed that has a positive impact on non-interest income.

H3: There is a positive relationship between loans to assets ratio and non-interest income

2.4. Capacity management

DeYoung & Rice (2004) pointed out a negative relationship between capacity management and non-interest income. This implies that well-managed banks tend to generate lower non-interest income to total assets. The extra portion of non-interest income is not large enough to justify its increased risk, so well-managed banks are not inclined to expand into potentially high-value activities. poor risk exchange. With the same results, Islam et al. (2019) argue that leadership capacity has a negative impact on non-interest income, which means that banks with good management expertise will not earn non-interest income by taking on higher risk.

H4: There is a negative relationship between capacity management and non-interest income

2.5. Capital adequacy

Theoretically, a bank's capital adequacy ratio that is excessively high could be a sign that it is being overly cautious and ignoring potential profit possibilities. Within financial markets and banking regulators, a guaranteed level of capital is needed to enable the bank to engage in new activities such as trading in securities, derivatives and investments (Merton & Bodie, 1992; Hahm, 2008). In addition, banks with high capital are more able to absorb losses from non-traditional activities (Rogers & Sinkey Jr, 1999). Therefore, the capital adequacy ratio has a positive impact on non-interest income (Nguyen Thi Diem Hien & Nguyen Hong Hat, 2016; Vu Xuan Dung & Doan Viet Hung, 2018). However, the relationship between capital adequacy ratio and non-interest income is negative and insignificant in study of Damankah et al. (2014).

H5: There is a positive relationship between capital adequacy and non-interest income

2.6. Credit risk

Credit risk is the risk arising from the borrower's failure to comply with the terms of the credit contract such as: late payment of the loan, incomplete payment of the loan principal and interest when due. According to Damankah (2014), loan provisions are the traditional way that banks use to manage credit risk and bad debts. Risk is a very important factor for most banks when conducting their business in both traditional and non-traditional activities. In principle, the ability to handle unforeseen losses will determine the level of risk of the

bank (Goddard et al., 2004). Increased risks from traditional activities could be the driving force behind banks to step up non-traditional activities.

H6: There is a positive relationship between credit risk and non-interest income

2.7. Bank Liquidity

Bank liquidity is the ability of a bank to instantly meet the cash withdrawal needs of depositors and lenders. According to Rogers & Sinkey (1999), one uncertainty that banks face is liquidity risk, which includes unexpected deposit withdrawals and unexpected borrowing needs. Liquidity acts as a shield against losses arising from “burning” assets to meet liquidity needs. If banks need more liquidity to increase non-interest income activities, the empirical relationship between them will be positive (Roger & Sinkey, 1999). Research by O'Donnell et al. (2002) shows that liquidity is the dominant factor in non-interest income of banks. Damankah et al. (2014) find a positive and significant relationship between liquidity and non-interest income. However, Vu Xuan Dung and Doan Viet Hung (2018) pointed out that liquidity (LIQ) has a negative, opposite effect on non-interest income. From the above studies, the research team expects a positive impact of liquidity on non-interest income.

H7: There is a positive relationship between bank liquidity and non-interest income

2.8. Customer deposits

According to Damankah et al. (2014), when banks can mobilize more deposits, the propensity to lend will be higher, thereby increasing the level of participation in traditional activities. Conversely, if a bank is constrained in terms of the amount of deposits it can raise, it will engage more in non-traditional activities. Similar to this, Nguyen The Binh and Nguyen Duong Gia Tran (2022) demonstrated that when lending activities are constrained due to a restriction on deposits, banks are compelled to concentrate on replacing their income sources by government securities, foreign currency trading, securitization of existing assets, and derivative securities. These sources of income increase non-interest income. Therefore, customer deposit has a negative impact on non-interest income (Rogers & Sinkey Jr, 1999; Damankah et al., 2014; Nguyen The Binh and Nguyen Duong Gia Tran, 2022).

H8: There is a negative relationship between customer deposits and non-interest income

2.9. Inflation

The rate of inflation greatly affects the capital market. The high inflation environment discourages the development of long-term capital markets such as bond markets and pension funds (Hahm, 2008). High inflation is also often seen as a negative signal for the stock market. Therefore, banks will need to consider investing in capital market instruments. In contrast, low inflation and high capital market growth allow the expansion of non-interest income of commercial banks (DeYoung & Rice, 2004). Vu Xuan Dung and Doan Viet Hung (2018), Nguyen The Binh & Nguyen Duong Gia Tran (2022) also found a negative relationship between inflation rate and non-interest income. However, the study of Lin et al. (2012) shows no effect from inflation. Nguyen Thi Diem Hien & Nguyen Hong Ha (2016) also have similar results.

H9: There is a negative relationship between inflation and non-interest income

2.10. GDP

Gross domestic product (GDP) is often used to represent economic growth. Hahm (2008) commented that GDP has a negative impact on non-interest income. The reason is that a sluggish economy is likely to reduce income from investment activities, thereby causing banks to have to expand non-interest income if they do not want to depend on income from interest. Research by Rahim Atellu (2012) also shows similar results. However, some studies in Vietnam have different results. Nguyen Thi Diem Hien & Nguyen Hong Ha (2016) showed that GDP has a positive impact on non-interest income, while Doan Viet Hung (2020) does not find any relationship between non-interest income and GDP.

H10: There is a relationship between GDP and non-interest income

2.11. COVID-19 pandemic

Li et al (2021) investigated the impact of the Covid-19 pandemic on the relationship between non-interest income and bank profitability and bank risk. The economic impact of the pandemic has resulted in tighter credit standards, which in turn reduces demand for loans. Research by Le Thanh Tam et al. (2022) showed that, despite the strong outbreak of the Covid-19 pandemic, the Vietnamese banking system still witnessed a remarkable development. By reducing dependence on interest income by lending, Vietnamese commercial banks have diversified income to achieve growth during the pandemic. Vietnamese commercial banks have increased non-interest income through card issuance, insurance, bond issuance or any other financial services. The research team believes that the COVID-19 pandemic has brought economic activities to a halt, thereby reducing demand for credit services. However, social distancing promotes non-traditional services such as electronic payments and cards.

H11: There is a positive relationship between COVID-19 pandemic and non-interest income

3. Method

The study uses panel data of 27 commercial banks in Vietnam in the period 2009 to 2022, including: 4 state-owned commercial banks (Agribank, Vietcombank, VietinBank, BIDV) and 23 domestic private commercial banks. Total assets of commercial banks in the sample account for most of the total assets of Vietnamese commercial banks. Therefore, the research sample is highly representative of the Vietnamese commercial banking system. The study data were taken for the period 2009 to 2022. In this period, 2020 and 2021 are the two years of the COVID-19 pandemic, and the first period of 2022 onwards, is the recovery period.

- The data is taken from the synthesis of Fiin Group, the audited annual financial statements of 27 commercial banks and some indexes that the research team self-calculated based on the above secondary data.

- Macroeconomic data such as Gross Domestic Product (GDP), Inflation Rate (INF) are taken from the World Bank's website.

The study uses panel data to analyze the factors affecting non-interest income of Vietnamese commercial banks. Panel data provides more informative data, less collinearity

between variables, suitable for studying the change over time of cross units. In particular, the effects of the Covid-19 pandemic and the mobility of non-interest income of banks are better studied with panel data.

The study combined using 3 models: (1) the constant coefficient model (Pooled OLS), (2) the fixed effect model FEM (Fixed Effect Model) and (3) the random effect model. Random Effect Model (REM). Then, the F-test and Hausman-test are used to select the most suitable model. Then, the research team tested the model's defects by using the LM - Breusch and Pagan test to check for variable variance and the Wooldridge test to check for autocorrelation in the model. Finally, the study uses regression results according to GLS model to analyze the factors affecting non-interest income.

The study will approach the research model of DeYoung & Rice (2004), Hahn, (2008), Hakimi et al (2012). These studies are studied in countries with developing economies and are quite consistent with the database that can be collected in Vietnam. In addition, the study also references studies in Vietnam by Vu Xuan Dung and Doan Viet Hung (2018), Nguyen The Binh and Nguyen Duong Gia Tran (2022) on factors affecting non-interest income. Through domestic and foreign studies related to the topic, the authors have identified research models as follows:

$$NII_{i,t} = \alpha + \beta_1 NIM_{i,t} + \beta_2 SIZE_{i,t} + \beta_3 LOAN_{i,t} + \beta_4 RELROE_{i,t} + \beta_5 CAR_{i,t} + \beta_6 RISK_{i,t} + \beta_7 LIQ_{i,t} + \beta_8 DEPO_{i,t} + \beta_9 GDP_{i,t} + \beta_{10} INF_{i,t} + \delta COVID_{i,t}$$

4. Results

4.1. Descriptive statistics

Table 1. Descriptive statistics of original data sample

Variable	Mean	STD	Min	Max

4.2. Regression results

To choose between the pooled OLS model with fixed effects (FEM) and random effects (REM) models, the research team conducted an F-test for the collected data set.

At the 5% significance level for this test, the results show that $P\text{-value} = 0.000 < 0.05$, which means that hypothesis H_0 is rejected. Therefore, we conclude that there is a fixed effect, the Pooled OLS model is not suitable to use in this case.

Therefore, the authors continue to test the fit between the fixed effects model (FEM) and the random effects model (REM). To determine the fit between these two models, the research team used Hausman test.

From Hausman test results, the research team found that $P\text{-value} = 0.7535 > 0.05$, that is, not enough basis to reject hypothesis H_0 , then the residual and independent variable in the model have no correlation. together. Therefore, using the random effects model REM is more suitable for the data of the subject

The research team used LM - Breusch and pagan test to check the phenomenon of variable variance. Results $P\text{-value} = 0.0000 < 0.05$, rejecting hypothesis H_0 , which means that the model has variable variance.

The research team used Woolridge test to test the phenomenon of series correlation. Results $P\text{-value} = 0.0000 < 0.05$, rejecting H_0 , which means that the model has serial correlation phenomenon.

To overcome the model defects, the research team uses the GLS model. The results of GLS regression are as follows:

Table 2. Regression results according to GLS model analyzing factors affecting non-interest income

Variables	Thubq	
	Coef	P- value
NIM	-0.07512	0.002**
SIZE	0.00356	0.000***
LOAN	-0.01008	0.000***
RELROE	0.02727	0.000***
CAR	0.06113	0.000***
RISK	-0.26089	0.001**
LIQ	-0.00229	0.000***
DEPO	-0.00373	0.142
INF	-0.01678	0.008**
GDP	0.03504	0.283
COVID	0.00250	0.086*

4.2.1. NIM

The research results show that the estimated coefficient of the NIM variable has a negative value and is statistically significant at the 1% level. Therefore, there is enough basis to accept the hypothesis H1: Net profit margin (NIM) has a negative impact on non-interest income of Vietnamese commercial banks. This conclusion is also consistent with the study of (Hakimi et al., 2012; Le Duc Quang Tu, 2017). When the NIM of Vietnamese commercial banks shrinks and thins, NIM is affected but still wants to keep the growth rate, commercial banks tend to promote income diversification, reduce transaction costs for banks, boosting income especially in the service segment.

4.2.2. SIZE

The research results show that bank size and non-interest income have a significant and positive relationship. Therefore, there is enough basis to accept hypothesis H2. This result is similar to the results of studies by DeYoung & Rice (2004), Hakimi et al. (2012), Nguyen The Binh and Nguyen Duong Gia Tran (2022). With large banks, they can take advantage of economies of scale, be more flexible in investing in modern technologies, promote income diversification and increase non-interest income.

4.2.3. LOAN

The research results show that loans to assets ratio variable and non-interest income have a negative relationship because the coefficient is negative and has statistical significance at 10%. This shows that, with a negative influence coefficient, the hypothesis H3 provides enough basis to accept. This result is similar to some studies such as: DeYoung & Rice (2004), Craigwell & Maxwell (2006). Like the above studies, the higher the ratio of customer loans to total assets, the more evidence that the bank is focusing on interest income instead of non-interest income.

4.2.4. RELROE

The research results show that the relationship between capacity management and non-interest income is positive. Therefore, the study results are contrary to the proposed hypothesis. This can be explained, banks with leaders with good management capacity, better risk management ability, will know to seize opportunities to develop the bank.

4.2.5. CAR

The research results show that the relationship between capital adequacy ratio and non-interest income is positive. Therefore, hypothesis H5 has enough basis to accept. The above results are consistent with the research of Rogers & Sinkey Jr (1999), Nguyen Thi Diem Hien and Nguyen Hong Hat (2016), Vu Xuan Dung (2018). When CAR increases, operational safety increases, commercial banks tend to expand their network, restructure and diversify products to increase revenue.

4.2.6. RISK

The research results show that credit risk (RISK) and non-interest income have a negative relationship with non-interest income with the coefficient of influence = -0.2789 and

statistically significant at 1%. This shows that the research results are different from the hypothesis. When credit risk increases, the bank's receivables from credit decreases, therefore, interest decreases, and at the same time the amounts associated with interest are also less. However, it is also because of the increased credit risk that the bank will have to allocate risky assets to other items - for example, investing in off-balance sheet items such as guaranteeing, implementing outside commitments, trading derivative financial contracts to reduce risk, and allocating investment portfolio.

4.2.7. LIQ

The research results show that liquidity and non-interest income have a significant and negative relationship. This result is contrary to some studies such as Rogers & Sinkey Jr (1999), Damankah et al. (2014), however, has the same result with Vu Xuan Dung and Doan Viet Hung (2018). Liquidity is an important factor determining the safety of credit institutions in general and banks in particular. The liquidity of the banking system decreased, the quality of credit became unstable, so banks promoted non-credit activities.

4.2.8. DEPO

According to the research results, customer deposits (DEPO) variable is not statistically significant at 5%, indicating that there is no impact of deposit size on non-interest income of Vietnamese commercial banks during the research period. Therefore, hypothesis H8 is not accepted. Presumably, during the study period the banks did not have liquidity risk problems, and there was no financial pressure.

4.2.9. INF

The research results show that the inflation rate (INF) and non-interest income have a negative relationship because the coefficient is negative and has statistical significance at 10%. Therefore, there is enough basis to accept hypothesis H10, this result is consistent with the study of DeYoung & Rice, (2004), Hahm (2008), Vu Xuan Dung and Doan Viet Hung (2018), Nguyen The Binh and Nguyen Duong Gia Tran (2022).

4.2.10. GDP

The research results show that the growth rate of gross domestic product (GDP) is not statistically significant. This indicates that, GDP growth rate has no impact on non-interest income of Vietnamese commercial banks, or, hypothesis H9 is not enough to accept. The above research results are similar to Vu Xuan Dung and Doan Viet Hung (2018).

4.2.11. Covid

The research results show that there is a relationship between Covid-19 and non-interest income of Vietnamese commercial banks. Covid has a positive effect. This is a new contribution, because it shows that, in economic conditions with shocks, such as Covid-19, the production activities of banks such as lending are delayed, but other activities are used up. re-commitment has increased demand, for example selling guarantee contracts. Enterprises in the economy do not need to borrow capital from banks, but only need banks

to commit to help them with financial obligations. Therefore, in the context of social distancing, this is an opportunity for commercial banks to develop non-credit services.

4. Discussion and conclusion

The research team examines the impact of various factors such as scale (SIZE), leadership factor (RELROE), capital adequacy ratio (CAR), liquidity (LIQ), deposit scale (DEPO), loan scale (LOAN), net interest margin (NIM), credit risk (RISK), GDP growth rate, inflation rate (INF), and Covid-19 on the non-interest income (NII) of Vietnamese commercial banks during the period 2009-2022. The results indicate that:

- GDP and customer deposits (DEPO) had no impact on non-interest income.
- Liquidity (LIQ), net interest margin (NIM), loans to assets ratio (LOAN), credit risk (RISK), and inflation rate (INF) had a negative impact on non-interest income.
- Capacity management (RELROE), bank size (SIZE), capital adequacy ratio (CAR), and Covid-19 had a positive impact on non-interest income.

Based on the results above, the research team has made some recommendations to improve the non-interest income of commercial banks in Vietnam as follows:

Firstly, based on the conclusion that liquidity has an inverse effect on non-interest income, commercial banks in Vietnam need to consider adjusting the amount of cash and deposits in credit institutions at a reasonable level, balancing the increase in income and liquidity risk. Liquidity is an important factor for safe operation. Banks must create liquidity, allowing depositors to withdraw money when needed while protecting borrowers from the liquidity needs of depositors (Douglas & Raghuram, 2001). Therefore, commercial banks need to forecast and grasp the withdrawal and borrowing needs of customers to keep a reasonable amount of money, avoiding surplus liquidity leading to "idle capital", wasting resources that can generate income.

Secondly, based on the affirmation that the Capital Adequacy Ratio (CAR) has a positive impact on non-interest income, commercial banks should consider increasing the ratio of owner's equity to total assets to increase non-interest income. Commercial banks can issue more shares to large partners to increase owner's equity and take advantage of their partners to expand the scale of operations. In addition, it is necessary to consider accumulating owner's equity through profit distribution policies, prioritizing retained earnings, and dividend payments in shares.

Thirdly, based on the conclusion that the leadership factor has a positive impact on non-interest income, commercial banks should increase their management capacity and upgrade their management system to be compatible with international standards. In Vietnam, some banks have brought a new generation into leadership positions. New managers have more advanced thinking in diversifying income compared to old managers who usually focus on credit services to increase income. Moreover, applying technology to the management system also helps leaders predict and understand the situation better to make decisions that promote non-traditional activities.

Finally, based on the conclusion that the COVID-19 pandemic has a positive impact on non-interest income. In the future, if the economy suffers a similar shock, commercial banks should actively reduce interest income activities because it highly depends on whether the economy can resist as well as recover. In fact, during the COVID-19 period, non-interest income sources such as card fees, commissions, and digital banking of many commercial banks had a strong breakthrough. In addition, the diversification of products and services to suit the needs of customers during the crisis period also increases satisfaction and loyalty to commercial banks, contributing to the stable income growth.

Abstract

The study was conducted to assess the impact of the UK and Vietnam Free Trade Agreement (UKVFTA) on the export of Vietnam's agricultural products to the UK market. The study uses a qualitative research method combined with a quantitative analysis method through the use of the SMART model with data sources collected from UN Comtrade and the scenario of reducing import tariffs to 0% when UKVFTA regulations come into effect. Based on the research results, the author's analysis shows the prospects and competitive advantages of agricultural products in the UK market. Through the results of the analysis, the authors identify the strengths, limitations that still exist and the causes of them, thereby offering solutions, orientations and recommendations to promote the export of Vietnam agricultural products to the UK in the near future.

Keywords: *Agriculture, export, trade creation, trade diversion, UKVFTA.*

1. Introduction

Agricultural products are one of the key manufacturing and export industries, making great contributions to Vietnam's export turnover in recent years. In the first 7 months of 2022, the export turnover of Vietnam's agricultural products reached about 32,3 billion USD, up 12,2% over the same period last year. In recent years, Vietnam's agricultural products in general have continuously made their mark on the export map as the 11th largest supplier of processed fruits and vegetables to the United States, and the largest supplier of coffee to Russia (in terms of quantity) is particularly favoured by quality assurance and meeting the strict criteria of the European market.

The United Kingdom (UK) is considered to be one of the most globalised economies in the world and is an important member of the OECD, WTO, etc. For Vietnam, the UK is

an important strategic partner, especially when UKVFTA is implemented. UKVFTA has brought prosperity to the trade exchanges, specifically a huge change to Vietnam's agricultural export industry when we had the opportunity to appear on store shelves in large, high-end UK supermarket chains. Through the deep bilateral relations between Vietnam and the United Kingdom, Vietnam's agricultural products export has a growing potential. However, the question is how much impact does UKVFTA have on trade? What solutions can the Vietnamese government and enterprises use to compete with other British partners?

2. Literature Review and Theoretical Framework

2.1. Literature review

The empirical study of Cheong (2016) adopted the CGE general equilibrium model, showing the positive impact of trade liberalization between China and South Korea on exports. Mohammad et al (2014) also used the general equilibrium model to analyze the current situation and potential of trade liberalization between Bangladesh and India.

The research conducted by Huang & Associates (2021) using the gravity model reveals the factors affecting Vietnam's tea export, and concludes that the free trade agreement is one of the positive impacts on Vietnam's tea export. Anh (2021) also used gravity model to evaluate the impact of UKVFTA on Vietnam's export of electronic products to the UK market.

There are some optimistic studies on the positive impact of UKVFTA on Vietnam's exports to the United Kingdom. The study of Ha Van Hoi (2022) shows that although there are some challenges in the implementation of UKVFTA, it has produced many positive effects and benefits on Vietnam's textile and clothing exports and tariff incentives. Therefore, it proposed a series of long-term and short-term measures aimed at developing Vietnam's textile industry.

Unlike Huong & Associates, Tien & Associates (2021) used intelligent tools to study the impact of EVFTA on the trade flow of footwear in Vietnam and the EU. In this study, the research team compiled a theoretical review focusing on footwear. In addition, many studies use other models to predict the impact of free trade agreements on export trade of goods.

Vu Thuy Duong, 2020 used the GISM model to predict the impact of the new generation of free trade agreement on Vietnam's export of seafood to member countries. Nguyen et al. (2022) applied the WITS-SMART model to predict the potential impact of Vietnamese seafood imports under the European Free Trade Area. Nguyen Tien Hoang (2021) analyzed the impact of EVFTA on EU imports to Vietnam by using the SMART pharmaceutical model. James Cassing (2010) applied the SMART model to show the impact of the free trade agreement on Vietnam's economy. Nguyen (2021) assessed the impact of EVFTA on Vietnam's export of timber and timber products to the EU. T.T. (2021) used the intelligent model to evaluate the impact of EVFTA on Vietnam's footwear exports to the EU.

At present, there are many theoretical and empirical studies showing the impact of free trade agreements on Vietnam's commodity exports. However, due to the novelty of the agreement, UKVFTA, on the contrary, has not conducted a comprehensive and detailed study on the impact of the agreement on Vietnam's export of agricultural products to the United Kingdom.

2.2. Theoretical framework

2.2.1. General Equilibrium Theory

The General Equilibrium Theory was put forward by the French economist Leon Walras at the end of the 19th century to explain the supply, demand and price of an economy with a large number of markets and commodities. This theory shows that there is an equilibrium price of goods. When the market prices of all goods reach equilibrium, the economy will reach the overall equilibrium. The overall balance model is explained by endogenous variables in the model, such as price, export output, import output, household income, etc. The advantage of the overall balance model is that it provides an empirical basis for assessing the impact of trade policies (e.g. through free trade agreements). However, the model has some shortcomings, such as the impact of non-tariff barriers (SPS, TBT, etc.) and issues related to customs and technical standards.

2.2.2. Partial Equilibrium Theory

Marshall (1890) believed that the equilibrium price was determined by the intersection of demand and supply curves, provided that other factors remained unchanged (*ceteris paribus*). The change of supply and demand curve will change the equilibrium price level of the market. Marshall's theory was later adopted by Wiener (1950), Francois (1997), Zheng (2010), Bachetta and others (2010). By further expanding some relevant theories, such as trade creation theory, trade transfer, government tax and social welfare.

2.2.3. Viner's Model Theory

Viner model focuses on two indicators: trade creation and trade redirection to evaluate the effectiveness of free trade agreements. In particular, the establishment of trade is to transfer production from low-productivity partner countries to high-productivity partner countries. Compared with other countries exporting similar goods to one country, the occurrence of trade transfer increases the export of (exporting country) and correspondingly reduces the import. Because the assumptions of the model are far from reality, the use of the Viner model also brings some limitations. Suppose that each exporter source has a single price, and each country always imports goods from one country and one country, but in fact, a country can import from many different countries, including free trade agreement member countries.

2.2.4. Gravity Model Theory

The gravity model is used to evaluate a posteriori method, that is, after countries sign free trade agreements. Tinbergen (1962) and Poyhonen (1963) first used gravity models to evaluate bilateral trade between European countries. The export of one country to another

country is explained by its economic scale (measured by gross national product or GDP) and the geographical distance between countries. The disadvantage of this model is that it relies on data to produce accurate estimates and the data need to be a complete feature of the pre- and post-analysis to evaluate the actual impact.

2.2.5. SMART Model Theory

The SMART model is its own balance model based on the core assumption of the Armington hypothesis, which assumes that goods imported from different countries are imperfect substitutes. By default, these substitutes are integrated in WITS software. The model is used to analyse the impact of changes in the domestic market, and provide information on all aspects of the expected period of policy changes. At the same time, the model also assumes that the demand of consumers is determined by a two-step optimization process, which involves the distribution of expenditures by commodity and country. The main disadvantage of this model is its own balance model, so its results are limited to the direct impact of any national policy change.

2.3. Objectives

The purpose of this study is to determine the quantitative impact of UKVFTA on the export of Vietnamese agricultural products to the UK market. At the same time, it also proposed some management policies and enterprise-oriented programs to the government to continue to take advantage of the new opportunities brought by UKVFTA and minimise the risks in the future environment of trade relations.

3. Method

3.1. Research scope

Scope of content: The study uses the SMART model with a tariff scenario of 0% to estimate the impact of UKVFTA on the export of agricultural products with 4-digit and 6-digit HS codes through HS codes through trade creation values.

Time range: Vietnam's export to the UK in the 5-year period, from 2018 to 2022. The simulation scenario uses data from Vietnam's agricultural exports to the UK in 2021.

3.2. Research instruments

This study combines two methods: qualitative research method and quantitative research method, and uses SMART model to evaluate the indicators and effect of the UKVFTA agreement on Vietnam's export of agricultural products to the United Kingdom.

Through the qualitative research method, the authors collect secondary data sources to get richer and more detailed information about the research issues. The information is collected from government websites, featured articles in domestic and foreign scientific journals and portals of state management agencies. The data collection and processing are all in accordance with the basic principles and are completely accurate.

In quantitative research, two models are usually used to evaluate the impact of free trade agreements on imports and exports of countries, including:(i) Computable General Equilibrium (CGE); (ii) Partial Equilibrium Theory (PGE) and Viner model. In this

research, the author team uses a Partial Equilibrium Theory (PGE) to evaluate the impact of exports on specific markets (UK).

The author team uses qualitative and quantitative research methods, combined with SMART method, to help investigate the impact of tariff reduction in UKVFTA on the export of Vietnamese agricultural products to the United Kingdom, and details the 6-digit HS code in commodity HS code classification system. When applied to partial analysis, the SMART method has many advantages. Typically, SMART is attached to a part of the Information and Data of the World Integrated Trade Solution (WITS) provided by Worldbank, making it easy to fulfill the basic entry requirements by extracting export information from a database available from WITS.

SMART is the most ideal model to analyse the impact of FTA on a nation's commodity exports. It is based on the theoretical basis of partial equilibrium theory, trade creation and diversion theory, import demand theory and export supply theory, elastic theory and parameters. The model is helpful to determine the impact of tax policy on trade creation and trade diversion, and predict the growth potential of commodity exports when a country joins the FTA.

In order to run the SMART model, the author team uses the data selected from UN COMTRADE, Trade Map, the portal website of the General Administration of Customs of Vietnam on the trade value of agricultural products exported from Vietnam to the United Kingdom (the total export volume of agricultural products from Vietnam, the import demand of the United Kingdom, etc.) and the MFN tariff data applicable to the United Kingdom in UKVFTA. The data provided by SMART supports automatic extraction and is collected manually by the author team. In addition, data for qualitative analysis, including statistical data and descriptions related to agricultural products, were collected from reports and websites of Vietnamese institutions. All data are from authoritative and mainstream information sources, covering the five years from 2018 to 2022.

This study combines research methods and the use of SMART models to analyze the impact of tariff reduction on trade creation and trade diversion. In the case of tariffs, agricultural products exported from Vietnam to the United Kingdom have to meet the strict requirements of the rules of origin and the import tariff will be reduced to 0%, after the UKVFTA agreement comes into force. Since then, there have been basis and data to evaluate the impact of the UKVFTA agreement on Vietnam's export of agricultural products to the United Kingdom, and put forward strategic policies that help promote Vietnam's export of agricultural products to the United Kingdom to achieve the most effective economic benefits.

4. Results

Trade Creation

From the SMART simulation results, the total value of trade creation (increase in exports) in 2021 is estimated at about 533.000 USD when the tariff scenario is reduced to

0%. Among these agricultural products, HS 1901 (*Malt extract; food preparations of flour, groats, meal, starch or malt extract, not containing cocoa or containing less than 40% by weight cocoa; defatted, not elsewhere specified or included; food preparations of products of headings 04.01 to 04.04, not containing cocoa or containing less than 5% by weight of cocoa, defatted, not detailed or included elsewhere*) contributed the highest total value of trade creation, although turnover did not account for a significant proportion of total exports.

With the scenario of tariff reduction to 0%, the value of trade creation of agricultural products is estimated as follows:

Table 1. Trade creation value by product group

HS Code	Export turnover (USD)	Trade Creation (USD)	Contribution rate (%)
0401	1,435	85,703	16.05%
0409	1,860,148	458	0.09%
0712	241,554	283	0.05%
0901	55,907,176	8,108	1.52%
1212	53,766	21,814	4.09%
1702	11,486	826	0.15%
1704	57,791	8,116	1.52%
1806	7,540	28,425	5.32%
1901	211,887	246,771	46.21%
1904	600,832	86,386	16.18%
1905	17,228,675	34,144	6.39%
2005	277,284	10,040	1.88%
2008	12,341,220	2,457	0.46%
2009	1,046,479	460	0.09%
Total	89,847,273	533,991	100.00%

Source: Calculated by the research group

Of the goods in heading HS 1901, HS 190110 (*Preparations suitable for infants or young children, put up for retail sale*) accounted for 93.19% of the total trade creation of the industry group with value added. export growth amounted to 229,963 USD.

Although it is the group of goods with the largest trade turnover among Vietnamese agricultural products exported to the UK market (nearly 56 million USD), the value of trade creation with the tariff scenario is reduced to 0% of HS 0901 (*Coffee, roasted or unroasted, whether or not decaffeinated; coffee pods and skins; coffee substitutes containing coffee in*

certain proportions) is remarkably low. Items in HS 0901 include HS 090111 (*Coffee, unroasted: Not decaffeinated*, USD 512) and HS 090112 (*Decaffeinated*, USD 7,596). Although the UK is a potential market for Vietnam's agricultural exports, it is a market with strict requirements on animal and plant quarantine. In 2021, the UK's coffee imports from Vietnam will have decreased by 35,5% in volume and 31,1% in value compared to 2020. This led to a decline in Vietnam's coffee market share falling to 17,04%. The main cause comes from the impact of the Covid-19 pandemic and the home-drinking culture of tea in UK households; the tastes of UK consumers are clearly different when brewed coffee. Instant coffee is the most popular type of coffee, so instant coffee brands are easier to reach consumers than ground coffee.

Trade Diversion

Based on simulation results from the SMART model, the reduction of tariffs to 0% of Vietnamese agricultural products has created a trade diversion value, which is shown in detail in the following table:

Table 2. The value of trade diversion of Vietnamese agricultural product groups exported to the UK when tariffs are cut to 0%

HS Code	Export turnover (USD)	Trade Diversion	Contribution rate (%)
0401	1,435	70,027	13.24%
0409	1,860,148	731	0.14%
0712	241,554	766	0.14%
0901	55,907,176	4,045	0.76%
1212	53,766	42,041	7.95%
1702	11,486	1,762	0.33%
1704	57,791	14,983	2.83%
1806	7,540	34,750	6.57%
1901	211,887	244,380	46.20%
1904	600,832	28,022	5.30%
1905	17,228,675	62,310	11.78%
2005	277,284	20,543	3.88%
2008	12,341,220	3,533	0.67%
2009	1,046,479	1,124	0.21%
Total	89,847,273	529,017	100.00%

Source: Calculated by the research group

The above table shows that the trade diversion effect is approximately equal, about 2% apart from the trade creation effect. It indicates that when the UKVFTA comes into effect, it will increase exports, but Vietnamese goods have not really created a breakthrough to be able to dominate the market compared to other competitors, such as: France, China, the Netherlands, etc. UKVFTA, when it comes into force, will increase exports of mainly goods that enjoy preferential tariffs, and it also proves that competitive pressure from rival countries is still very large.

Under chapters 09, 19, and 20 of the HS classification system that implements UKVFTA and imposes 0% tariff on Vietnamese imports, the countries with the largest decline in agricultural exports to the UK market include:

Table 3. Countries with the largest decrease in export turnover are HS 0901, HS 1905 and HS 2005 groups to the UK market

Country	Export turnover before UKVFTA (USD)	Export turnover after UKVFTA (USD)	Changes (USD)
HS 0901			
France	195.642.970	51.874.045	-143.768.925
Spain	69.879.824	28.779.567	-41.100.257
China	7.820.886	1.644.522	-6.176.364
Poland	9.613.237	6.058.329	-3.554.908
HS 1905			
France	461.827.380	385.581.238	-76.246.142
Netherlands	291.124.941	227.342.634	-63.782.307
Germany	418.768.432	355.130.173	-63.638.259
Ireland	422.860.397	398.068.941	-24.791.456
HS 2005			
Germany	34.699.863	8.906.390	-25.793.473
France	51.081.011	26.774.152	-24.306.859
Italy	148.847.281	135.176.976	-13.670.305
Spain	80.193.188	68.781.760	-11.411.428

Source: Calculated by the research group

For the above commodities, since the UKVFTA agreement came into force, the share of UK imports from European partner countries has dropped significantly, and the total value has changed by hundreds of millions of dollars.

In particular, France suffered significant losses because they were among the countries with the largest changes in market share (total value decreased by 24.432.926 USD) China, the largest trading partner of the UK, is also facing a decline in exports of 6.176.364 USD. In addition, the strong impact of the COVID-19 on the global economy has also led to substantial fluctuations in trade between the UK and its partners. In general, the impact of the transfer of some agricultural products in Vietnam is relatively low, and it does not really bring huge competitive pressure to the competitors exporting similar products to the UK market, it can only create a small bright spot in market redistribution. This is mainly because Vietnam enjoys lower tariffs on goods exported to Britain. However, it is undeniable that the impact of trade transfer helps Vietnam's agricultural products to occupy market share in the hands of major competitors such as France, Germany or Spain.

Table 4. Total effect from UKVFTA

Effect	Trade value (USD)	Contribution rate (%)
Trade creation	533,991	50.3
Trade diversion	529,017	49.7
Total	1,063,008	100

Source: Calculated by the research group

The research results show that the UKVFTA has an impact on promoting the export of Vietnamese agricultural products to the UK market, especially key products such as: Malt extract, flour food products, sheet, raw powder, starch; Milk and cream, not concentrated and not containing added sugar or other sweetening matter; Bread, dough (pastry), pies, cookies and other cakes. These are items that have a large commercial impact and are considered complementary in the UK market structure. When the tariff rate is completely reduced to 0%, the trade impact of UKVFTA on Vietnam's agricultural sector is quite positive. The trade creation impact is 50.23%, which means that Vietnamese agricultural products will have a higher price competitive advantage over British domestic agricultural products. With a trade diversion effect of 49.77%, the UK will prioritise importing goods from Vietnam, rather than importing similar products from other countries. However, in the long term, this advantage will no longer exist when the UK is implementing the "Global Britain" trade strategy, actively negotiating to join FTAs, in order to promote exports, and is ready to open the market with other countries. international partners.

Currently, Vietnam's agricultural export turnover to the UK market is still low, accounting for only about 1% of the total import demand for agricultural products here, while

the opportunity in this market is huge. Most of Vietnam's agricultural exports are crudely processed, without high added value, while the tax on Vietnam's deep-processed products entering the UK market is 0%.

5. Discussions and Conclusion

5.1. Summary of the study

The topic "Impacts of the Vietnam - UK Free Trade Agreement (UKVFTA) on the export of Vietnam's agricultural products" is based on the SMART model, as the basis and focus by the appropriateness in assessing the impact of the FTA on the export of goods between the two economies participating in the Agreement through the effects of trade creation and trade diversion. The topic was analysed and clarified the contents, including:

(i) Theoretical basis for the mechanism of impact and methods of assessing the impact of FTAs on the export of Vietnamese agricultural products to the UK market in the context of UKVFTA implementation;

(ii) Analyse the current situation of the UK market and Vietnam's agricultural product industry, thereby concluding the outstanding advantages and disadvantages for Vietnamese agricultural products to the UK market in the context of the application of UKVFTA;

(iii) Using the SMART model in the context of tariff reduction to 0% to quantify the impacts of the UK - Vietnam Free Trade Agreement (UKVFTA) on agricultural exports through value creation, trade establishment and trade diversion. The simulation results for the group of agricultural products under the 4-digit HS code and the 6-digit HS code (excluding meat and aquatic products) from Vietnam to the UK in 2021 show that: (i) the total trade value (increase in export value) due to tariff reduction was estimated at 1.06 million USD, up nearly 1.5% compared to the total value of Vietnamese agricultural exports to the UK market, in which the value of trade creation trade accounts for more than 50% of the remaining contribution from trade diversion; (ii) in the agricultural product group the 4-digit HS code, HS code 1901 (*Malt extract; food preparations of flour, groats, meal, starch or malt extract, does not contain cocoa or contains less than 40% by weight of cocoa, completely defatted, not elsewhere specified or included; food preparations of products of headings 04.01 to 04.04, not containing cocoa or containing less than 5% by mass of fat-defatted cocoa, not elsewhere specified or included*) make a major contribution for the increase in the value of Vietnam's agricultural exports to the UK market, specifically, HS 1901 contributed 246,771 USD, accounting for nearly 47% of the value of trade creation and more than 45 % for total commercial diversion value; (iii) in the group of agricultural products with 6-digit HS code, the product with HS code 190110 (*Preparations suitable for use in infants or young children, put up for retail sale*) made the largest contribution to the total trade

value. , with a trade creation value of nearly \$230 thousand and a trade diversion value of more than 200,000 USD; (iv) a number of agricultural products Vietnam exports to the UK market with great value (HS0804, HS0812, HS0813, HS0904) and enjoys a preferential tariff rate of 0%, thus this group of products does not contribute to the increase in export value under the scenario of tariff reduction to 0%.

The research results can be said to be clear evidence to confirm that UKVFTA has a positive impact on the value of Vietnam's agricultural exports to the UK market, the impact is quantified and estimated in detail through simulation results according to the scenario of tariff reduction to 0%. The value of trade creation benefited from FTA tariff preferences, the value of trade diversion also gives an overview when UKVFTA will be completed, capable of creating competitive advantages for Vietnamese agricultural products compared to other products. countries exporting to the UK market with the same items.

From the positive impact of the Vietnam - UK Free Trade Agreement (UKVFTA) on Vietnam's exports of agricultural products to the UK, we can conclude that international economic integration is the right direction for Vietnam. Thanks to the free trade agreement, Vietnam's export barriers have been eliminated, which helps to balance the trade balance and achieve Vietnam's trade surplus goal in the next stage.

5.2. Recommendations and Conclusion

Orientation for agricultural development and export of Vietnamese agricultural products to the UK until 2025 with a vision to 2030

Many experts believe that Vietnam still has a lot of room to continue exploiting the UK market in the near future. So, how should the government and enterprises develop the country's agricultural sector?

Vietnam's agricultural products industry should pay attention to standards and quality as well as food hygiene and safety according to the standards of partners. In order to penetrate into difficult markets such as the UK, Vietnamese agricultural products need to adopt VietGAP, GlobalGAP and other standard planting methods to meet these standards, and farmers need to obtain advanced mechanical technology and high-tech production lines. In addition, production enterprises also need to introduce traceability technology into the planting and production process to improve the transparency of the origin and achieve green and sustainable development. This will help Vietnam go further in the international market where traceability requirements of goods are required. In addition, Vietnam should earnestly fulfil its commitment to achieve net zero emissions. In order to fulfil its commitment, farmers should minimize pesticide residues and focus on natural and organic elements, which will help make products more "green", ensure the health of producers and consumers.

Recommendations for the export supply chain of agricultural products

Currently, transportation costs are one of the major difficulties of exporting Vietnamese agricultural products to the UK. Compared to other agricultural product exporting countries, Vietnam is suffering from a relatively large level of transportation besides the underdevelopment of transportation services in Vietnam. Transportation plays a very important role in the process of exporting goods. Therefore, to be able to strongly increase the export of agricultural products from Vietnam to the UK, Vietnam should have ways to cut transportation costs, besides improving the quality of transportation services. It is necessary to have more tightly managed frozen warehouses, cold logistics chains throughout from the place of cultivation to the places of consumption to help easily control quality and minimize damage during the transportation of goods. And always ensure that the quality of agricultural products is in line with the strict standards of the UK market.

Recommendations for improving the quality of agricultural products

Focusing on product quality is one of the prerequisites for Vietnam to compete with other export markets. Vietnam needs to invest in more modern technology machines around the world as well as provide farmers and producers with more knowledge on how to preserve agricultural products. Agricultural products need to be carefully stored to keep fresh during the whole process of export to the UK market. Producers should adjust the structure of agricultural products according to the value chain from raw material export to processed products; From simple product processing to post-processing. In addition, we need to invest in innovation, from the quality of machinery, equipment, technology, production process to the quality of human resources, in order to improve product quality, packaging and preservation of agricultural products.

Enterprises need to introduce traceability technology into agricultural planting, producing and processing, because the UK consumers always pay attention to the transparency of production companies. So, enterprises producing high-quality food with clear traceability, towards green and sustainable development, will have many advantages in this market. Using information technology and electronic devices to facilitate information updating, data management and product traceability is the current trend. And with the application of traceability, agricultural products will be the foundation for Vietnamese enterprises to reach further into the international market with strict requirements on goods. Because the requirements for goods traceability are very high, this is the passport for the next step in integration and positioning of Vietnamese goods on the world stage.

Strengthening the quality management of export enterprises is regarded as the key link to ensure that all agricultural products are exported from Vietnam to the UK market,

when agricultural products must meet food hygiene standards and consumer market requirements. The State shall closely inspect and control the production and export process, so as to timely identify enterprises that do not comply with regulations and are subject to sanctions. Not only that, enterprises should be prohibited from exporting agricultural products that affect the overall quality of agricultural products exported by Vietnam. In addition, since farmers are the main raw material suppliers of enterprises for export processing, attention should be paid to the quality management of families planting agricultural products. In order to make agricultural products meet the quality inspection from the beginning, farmers participating in agricultural product breeding must comply with the national provisions on food hygiene and safety. Therefore, strict control of the supply chain from production input to export is a sustainable solution.

Abstract

Following the COVID-19 pandemic, the real estate market has rebounded and progressed. However, the mid-range commercial housing segment remains constrained, and real estate prices are increasing faster than income growth, resulting in a mismatch between housing needs and income levels. This study aims to investigate the relationship between borrowers' ability to use financial leverage and their behavioral attitude in real estate transactions in Vietnam. The study uses a combined model of the Theory of Planned Behavior (TPB) and Technology Acceptance Model (TAM) based on quantitative data collected from 1,002 surveys and qualitative data from 10 expert interviews in the real estate, finance, and economics fields. The results indicate that both "Policies" and "The ability to use financial leverage" have a positive influence on "Behavioral attitude," while "Real estate features" have a negative effect. Based on these findings, the authors propose policy recommendations for credit institutions to enhance their quality and support for borrowers. At the same time, the government should establish stricter legal frameworks and policies to manage the real estate market effectively and meet the housing requirements of the population.

Keywords: *Housing bubble, Real estate features, Real estate market, Vietnam*

1. Introduction

Yunus (2012) posits that the housing market, which represents the real estate market, is crucial in determining people's quality of life by meeting the demand for residential accommodation, urban development, industry, and tourism. Liu and Xiong (2018) share this

perspective, stating that real estate is a leading industry group in the economy and a vital component of the financial system in many countries worldwide. Sughana and Sheela (2021) note that owning a house with hard-earned income and meagre savings has become challenging due to the impressive increase in real estate value. Therefore, it is necessary to study financial leverage and people's behavioral attitudes toward the challenges of real estate transactions meticulously and comprehensively.

The authors develop the research based on two original theories: Ajzen's (1991) Theory of Planned Behavior (TPB) and Davis's (1989) Theory of Technology Acceptance (TAM). The authors aim to strengthen the study's foundations by exploiting the literature review of these theories and research hypotheses.

2. Literature review and hypotheses

2.1. Borrowers' behavioural attitude in real estate transactions

Based on the definition of "attitude" in Ajzen's Theory of Planned Behavior (1991), the borrower's "behavioural attitude" in real estate transactions is understood as the borrower's assessment of the outcome obtained from performing the act of borrowing capital to carry out real estate transactions. Precisely, it reflects the degree of favourable or unfavourable evaluation of the borrower's behaviour, and these assessments are based on three reflection factors, including: "perception of usefulness", "perception of convenience", and "social influence" when using loans. For studies on the personal loan model, Hayhoe *et al.* (1999) and Kisaka (2014) agree with the above point of view when arguing that "attitude" plays an essential role in the intention to carry out the action of the borrowers. Meanwhile, the studies of Opoku & Abdul-Muhmin (2010), Panghegar *et al.* (2014) and Liang & Osmadi (2015) also reached the same conclusion regarding the "attitude" factor in terms of research on individuals' real estate transaction decisions. Therefore, when studying the behaviour of borrowers in real estate transactions, the findings of "behavioural attitude" plays an important role. Borrowers' behavioural attitude in real estate transactions.

2.2. Hypotheses

2.1.1. Government policies

Eberly & Krishnamurthy (2014) assert that the government plays a crucial role in promoting and reviving the real estate market through policies related to real estate credit. These policies have a direct impact on borrowers' access to capital and loan interest rates. Slamet (2016) indicates that there is a negative correlation between borrowing interest rates and borrowers' ability to use financial leverage. In other words, if interest rates are high, borrowers will weigh the risk of paying interest more carefully, which can lead to a decrease in demand for loans to purchase real estate. Conversely, real estate credit policies can also stimulate borrowers' interest if they are offered incentives such as favorable interest rates, terms, and loan limits (Devlin, 2002; Gupta & Sinha, 2015). Apart from real estate credit

policies, the state's investment policies in infrastructure can also create opportunities for the real estate market in certain regions.

Therefore, the hypothesis is proposed:

H1: Government policies have a positive impact on the ability to use financial leverage in real estate transactions.

Government policies play a crucial role in influencing the price characteristics of real estate by establishing legal regulations and sanctions that help stabilize the property's actual value. As Warrent-Myers (2012) notes, the "actual value of real estate" is the value that real estate can generate stable income over the long term if utilized properly. Implementing appropriate regulations related to real estate prices can help the government manage the risks of a real estate bubble and ensure that individuals have access to properties with genuine value.

Therefore, the hypothesis is proposed:

H2: Government policies have a positive impact on real estate features.

Dale & McLaughlin (2000) argue that government policies to protect the real estate market can ensure its sustainability and health, increasing investor confidence. Ensuring market sustainability involves managing credit risks for the real estate sector and establishing clear tax regulations, loan procedures, and related fees. These policies can positively influence the attitudes of individuals towards investing in real estate, as they perceive it as valuable and convenient. For financial intermediaries such as banks, streamlined regulations on loan procedures, costs, and customer care services also help improve borrowers' attitudes towards real estate investment (Wu *et al.*, 2016).

Therefore, the hypothesis is proposed:

H3: Government policies have a positive impact on the behavioural attitude of borrowers in real estate transactions.

2.1.2. Ability to use financial leverage in real estate transactions

Black (2020) identifies two main factors affecting the ability to use financial leverage in real estate transactions: borrower variables and borrower resource variables. From the borrowers' aspect, Sayani & Miniaoui (2013) and Slamet (2016) show that "Interest" is a significant factor affecting borrowers' intention to borrow capital. Geetha (2016), Breeden (2018), and Weida *et al.* (2020) add two more factors: "Financial capability" and "Risk appetite." "Financial capability" indicates a borrower's ability to repay the loan, while "Risk appetite" reflects the borrower's willingness to take risks. From the aspect of loan providers, "Collateral" is a crucial resource that borrowers need to have to get loans, as stated by Aivazian *et al.* (2015), and the amount of capital provided to the borrower will increase with the value of the asset provided as collateral. In addition to borrowers and resources, "Market opportunity" is another factor that affects investors' ability to use financial leverage. Investors in the real estate market evaluate the added

value and profit opportunities of investment properties in the future, or they assess real estate market opportunities. Shilling & Wurtzbaach (2012) and Islam *et al.* (2015) highlighted the importance of this factor.

Based on the literature review mentioned above, the authors propose that the ability to use financial leverage in real estate transactions is influenced by several factors, including: “Interest rate”, “Financial capability”, “Risk appetite”, “Collateral”, and “Market opportunity”.

Vidada & Rakhmanita (2017) indicate that there is a positive correlation between the value of the real estate and its associated characteristics such as geographical location, living space, and quality. Therefore, real estate with more advantages will have a higher value. Due to the high cost of real estate ownership with these advantages, many individuals without sufficient capital opt to borrow from credit institutions. However, borrowers must meet certain requirements, such as loan repayment capacity, interest rates, collateral, and legal regulations. Consequently, when the ability to raise capital is greater, borrowers will have a higher demand for real estate ownership with more advantages.

Therefore, the hypothesis is proposed:

H4: The ability to use financial leverage has a positive impact on real estate features.

Marx & Turner (2019) suggest that loans are helpful in fulfilling immediate capital needs for individuals who require them for shopping, investments, or daily expenses. Furthermore, for investors, the ability to mobilize capital from different sources provides more profitable investment opportunities. In the present scenario, borrowers have diverse loan options, including commercial banks, non-banking financial intermediaries, and investment funds, which allows them to choose a suitable loan source based on their financial capability. Ajzen’s (1991) theory of planned behaviour asserts that an individual’s behavioural attitude is positively influenced by perceived usefulness, convenience, and social influence, highlighting the relationship between convenience and individual behaviour.

Therefore, the hypothesis is proposed:

H5: The ability to use financial leverage has a positive impact on the behavioural attitude of borrowers in real estate transactions.

2.1.3. Real estate features

Brata *et al.* (2017), Rahayu & Zanky (2018), and Rachmawati *et al.* (2019) suggest that when investors consider purchasing real estate, they prioritize factors such as “price,” “credibility of the real estate providers” and “quality” of the property. On the other hand, Martz *et al.* (2006), Opoku & Abdul-Muhmin (2010), and Liang & Osmadi (2015) mention characteristics of real estate that contribute to its latent value, such as “quality of public services”, “living space”, and “location”. The authors also propose a new factor that reflects the potential value of the real estate, which is the “future value increment”. This factor is relevant because certain regions and areas may receive infrastructure investments as part of government socio-economic development policies.

Based on the literature review mentioned above, the authors propose that the real estate features are influenced by several factors, including: “Credibility”, Location and space of the house”, “Quality and price of the house”, and “Future value increment”.

Nasar & Manoj (2015) posits that the perceived value of quality products is an essential factor influencing the attitude of customers towards buying real estate. Similarly, Rachmawati *et al.* (2019) observed that the quality of real estate has a positive effect on customers’ purchasing attitudes. Hence, customers’ attitude towards real estate is likely to be favorable when the value of the property aligns with its quality. Furthermore, investors can benefit from public utilities around the property that enhance the property’s location. This positively affects investors’ perception of convenience and usefulness when considering real estate investment.

Therefore, the hypothesis is proposed:

H6: Real estate features have a positive impact on the behavioural attitude of borrowers in real estate transactions.

3. Research methods and model

3.1. Research methods

The authors employ both qualitative and quantitative research methods to comprehensively analyze and accurately examine the issues related to behavioral attitude, financial leverage utilization, and credit accessibility intentions used in real estate transactions by individuals in Vietnam.

For qualitative research, the authors conducted surveys and collected data directly from experts using face-to-face and online methods. The authors successfully connected with 10 experts from the fields of real estate, finance, and economics. The results revealed that the interviewees shared similar opinions with the authors and advocated the proposed hypotheses. The majority of the candidates were aware of the significance of using financial leverage in real estate transactions.

In the quantitative research, the authors developed a preliminary questionnaire based on ideas from previous research and consulted with experts for feedback. The questionnaire was then refined and used to collect data through face-to-face and online methods, resulting in 1,002 observations. After filtering the data, 889 valid responses were used for analysis. The authors utilized various statistical methods, including Cronbach’s Alpha, exploratory factor analysis (EFA), confirmatory factor analysis (CFA), and structural equation modelling (SEM), and employed software such as SPSS 26 and AMOS 24 to process the data.

3.2. Research model

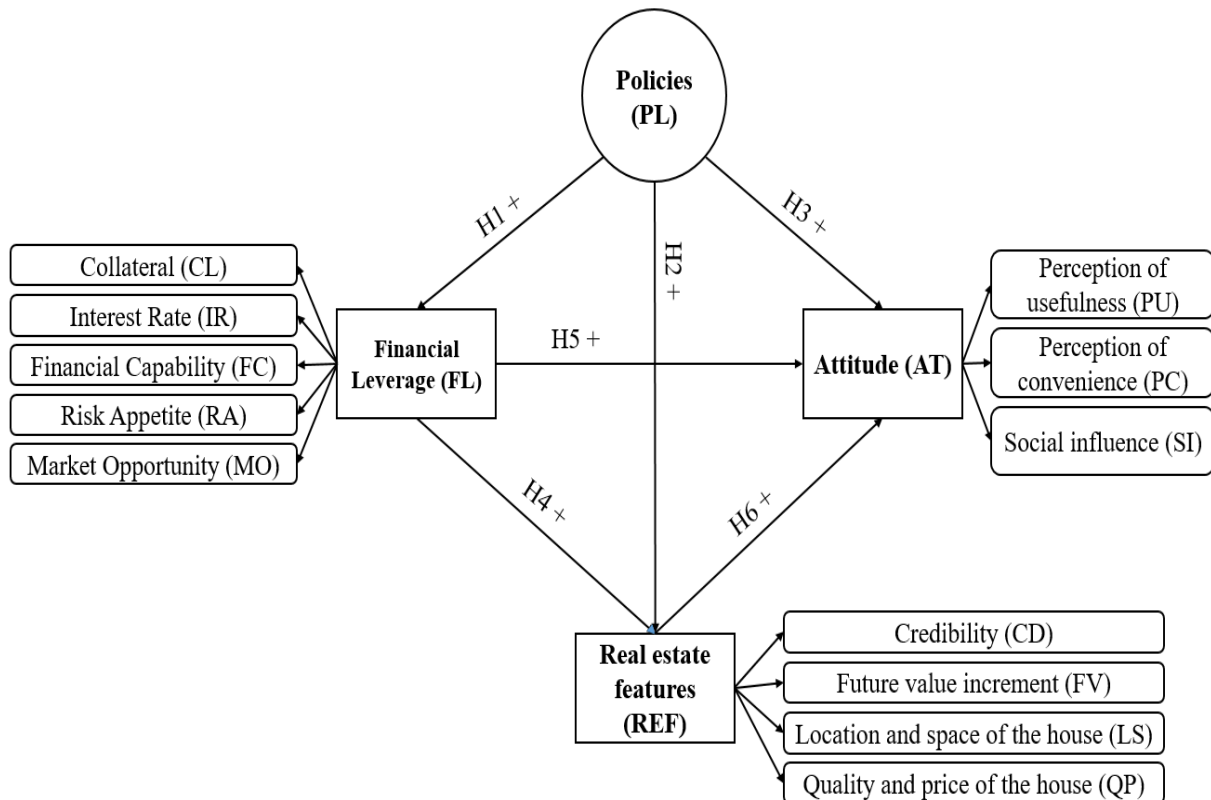

Figure 1. Preliminary research model

Source: Authors' recommendation

The research model incorporates factors derived from an extensive review of prior studies, as well as feedback from experts in the financial and real estate domains. In which, the independent variable, Policies (PL), is composed of 7 observable variables. The ability to use financial leverage (FL) encompasses 5 reflecting factors: collateral (CL) with 4 observable variables, interest rate (IR) with 4 observable variables, financial capacity (FC) with 5 observable variables, risk appetite (RA) with 4 observable variables, and market opportunity (MO) with 3 observable variables. Real estate features (REF) are represented by 4 reflecting factors, including credibility (CD) with 3 observable variables, future value increment (FV) with 3 observable variables, location and space (LS) with 5 observable variables and quality and price (QP) with 5 observable variables. Finally, behavioral attitude (AT) is reflected by 3 factors that capture the perception of usefulness (PU) with 4 observable variables, perception of convenience (PC) with 5 observable variables, and social influence (SI) with 4 observable variables.

4. Results and discussion

4.1. Descriptive statistics of the study sample

Table 1. Descriptive statistics of the sample

Characteristics		Frequency	Ratio
Gender	Male	383	43.1%
	Female	506	56.9%
Age	24 - 30	289	32.5%
	30 - 45	353	39.7%
	45 - 60	209	23.5%
	Above 60	38	4.3%
Average monthly income (1 USD = 23,450 VND)	Below \$1,000	566	63.7%
	\$1,000 - 2,000	252	28.3%
	Above \$2,000	71	8.0%
Living area	Urban	665	74.8%
	Countryside	224	25.2%

Source: Calculations of the authors

Based on the statistical results presented in **Table 1**, it can be observed that the descriptive statistics of the study with respect to control variables indicate that there is a relatively equal representation of men and women among the survey participants. The largest group of participants (353 or 39.7%) were aged between 30-45 years. The majority of the participants were from urban areas. In terms of income, most respondents had an average income of less than \$1,000 per month. These results reflect the reality of the high cost of real estate in Vietnam and the low income of a large proportion of the population, highlighting the need for credit access in real estate transactions. The descriptive statistics of the control variables closely mirror the actual state of using financial leverage in real estate transactions in Vietnam.

4.2. The results

The KMO (Kaiser-Meyer-Olkin) coefficient of $0.940 > 0.5$ indicates that the factor analysis used in the study is appropriate for the research data. Bartlett's test result of 29198.893 with a significance level of $\text{sig} = 0.000 (< 0.01)$ confirms that the observed variables used in the analysis are significantly correlated with each other within the same factor.

Table 2. KMO and Bartlett's Test

KMO and Bartlett's Test		
Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.940
Bartlett's Test of Sphericity	Approx. Chi-Square	29198.893
	df	1275
	Sig.	.000

Source: Calculation result from SPSS 26

For the test of extracted variance of factors, the total variance extracted for the 11th factor is 69.437% > 50%. The Eigenvalues for each factor are greater than 1, indicating that the observed variables converge well into factors. The 9 factors together explain 68.985% of the variation in the survey data, and after removing unsatisfactory factors, the remaining factors are able to represent the original survey data effectively. In this study, the authors used a factor loading cutoff of 0.4, which was appropriate given the large sample size. The results also show that the factors of perceived usefulness and perceived convenience were combined into a new variable called the perception of convenience, as there were more contributing factors. This decision was justified by the authors, as the boundary between usefulness and convenience is often blurred when using financial leverage in real estate transactions. Additionally, the factors of investor credibility and value-added were combined into a new variable called credibility, as the two factors were closely related. It was noted that for credible investors, their products tend to retain value and even increase in value over time.

Table 3. Summarize the reflective factors of the Second-order construct

Second-order construct	First-order construct	Standardized Regression Weights	P-value	Conclusion
Financial leverage (FL)	CL	0.587	***	Accept
	IR	0.572	***	Accept
	FC	0.835	***	Accept
	RA	0.545	***	Accept
	MO	0.779	***	Accept
Behavioural attitude (AT)	PC	0.778	***	Accept
	SI	0.752	***	Accept
Real estate features (REF)	CD	0.821	***	Accept
	LS	0.768	***	Accept
	QP	0.730	***	Accept

Source: Calculation result from SPSS 26 and AMOS 24

The results in **Table 3** demonstrate that all factors effectively represent representativeness with statistical significance at sig = 0.000 < 0.01. The factor loading values in order of contribution for the representativeness variable FL are FC (0.835), MO (0.779), CL (0.587), IR (0.572), and RA (0.545). The AT representative variables include

PC (0.778) and SI (0.752). Furthermore, the REF representative variables include CD (0.821), LS (0.768), and QP (0.730).

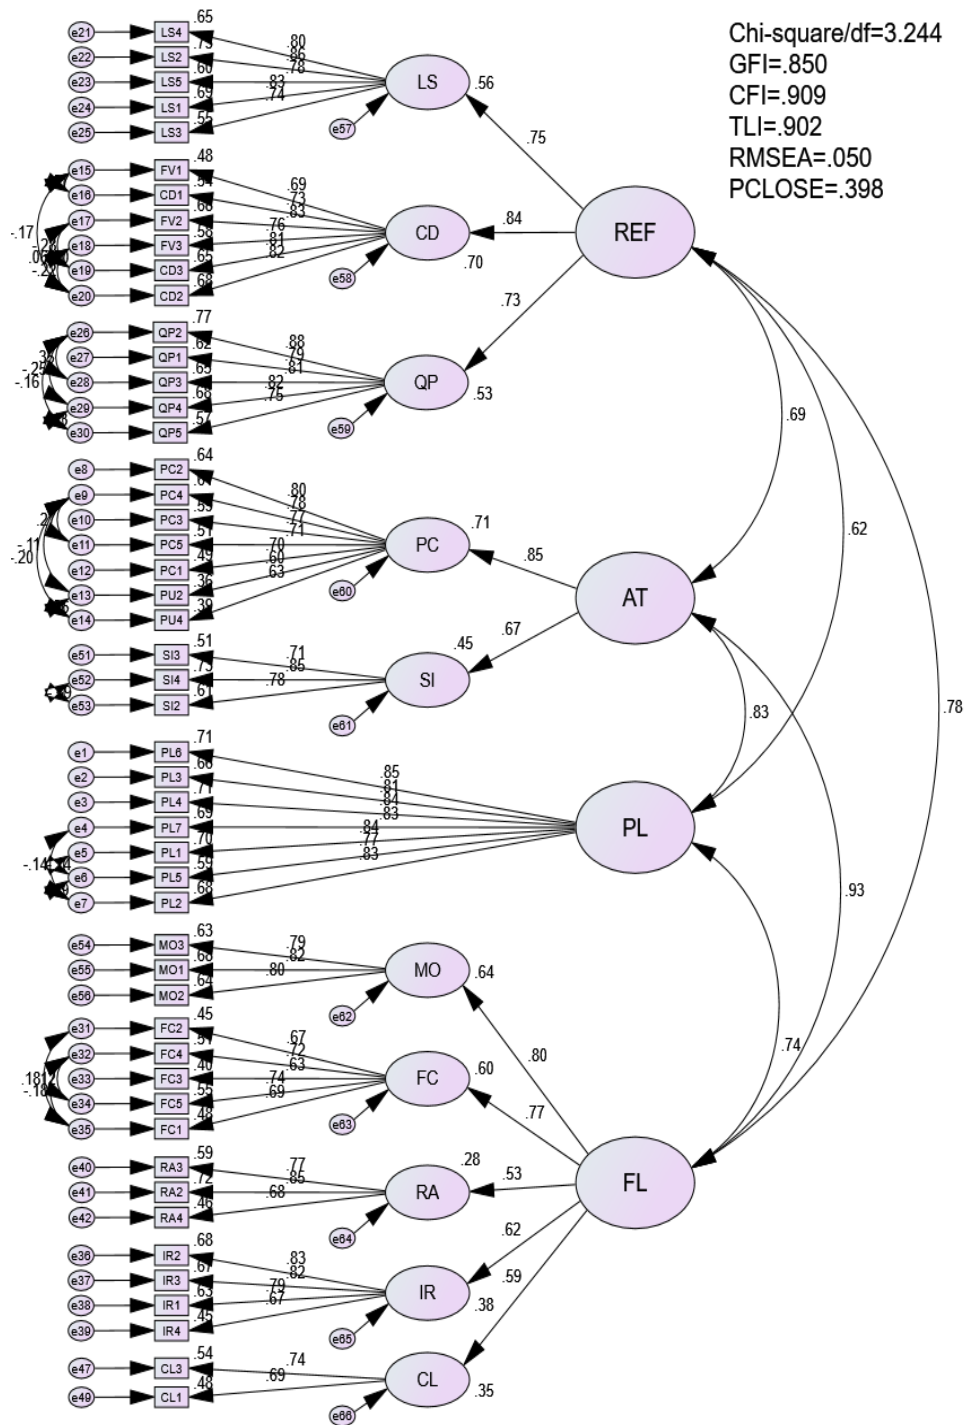

Figure 2. The results of confirmatory factor analysis (CFA)

Source: Calculation result from SPSS 26 and AMOS 24

The results of **Figure 2** of the CFA analysis show that all observed variables have a standardized regression coefficient greater than 0.5 and have a P-value = 0.000 < 0.01, so it is confirmed to have a good performance in the CFA model. The results of the criteria for measuring the model's fit show that the Chi-square/df = 3.244 < 5 is acceptable. The GFI

coefficient = 0.850 ranges from 0.8 to 0.9 but is still acceptable (Baumgartner & Homburg, 1995; Doll *et al.*, 1994). CFI value = 0.909 > 0.9 is good, TLI value = 0.902, and RMSEA coefficient = 0.050 < 0.06 should be evaluated as good.

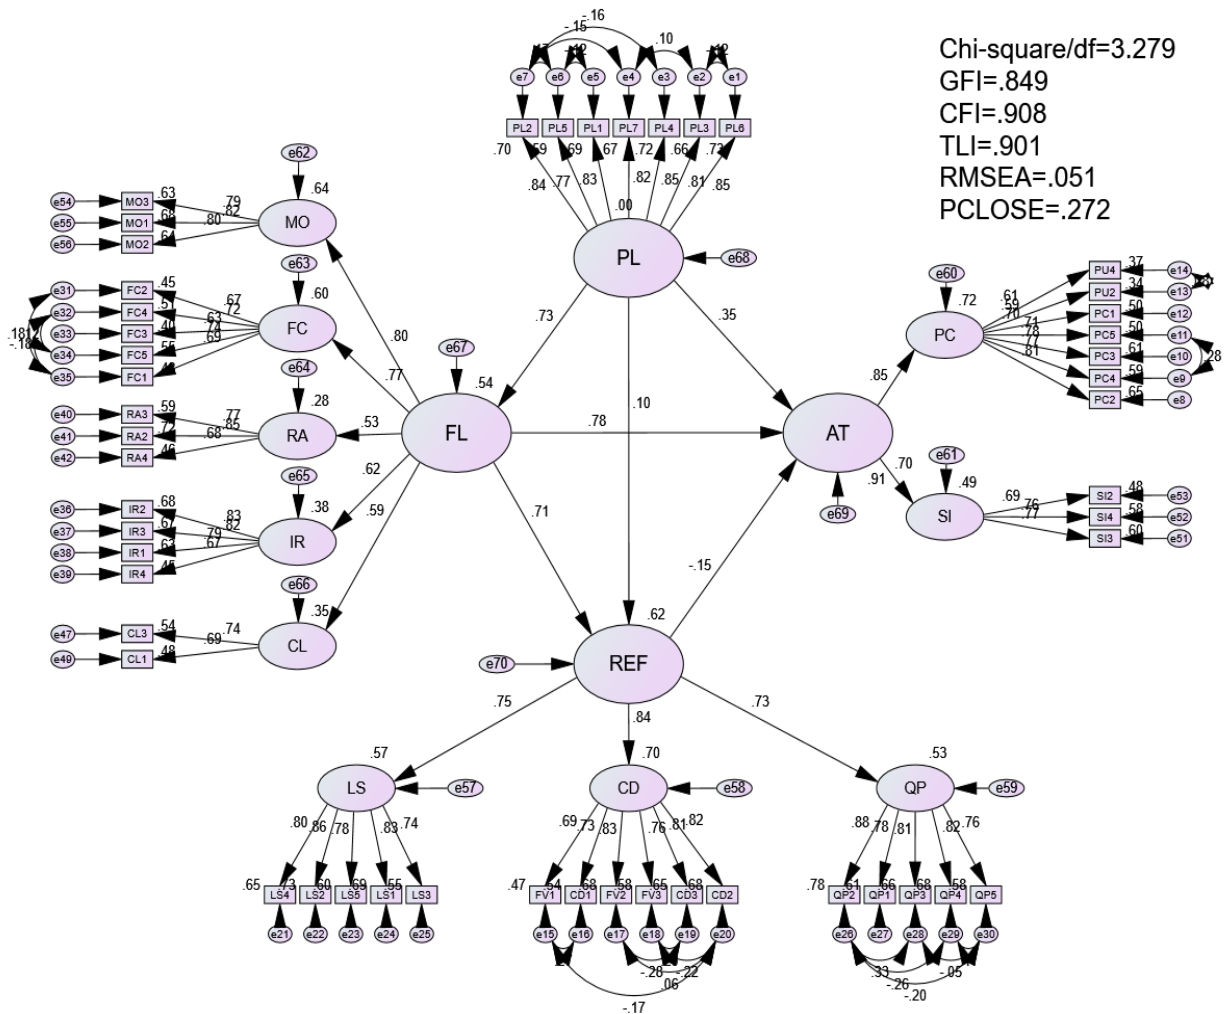

Figure 3. SEM results of the theoretical model

Source: Calculation result from SPSS 26 and AMOS 24

Table 4. Hypothesis testing results

Hypothesis	Relationship	Standardized Regression Weights	P-value	Conclusion
H1	FL ← PL	0.735	***	Accept
H2	REF ← PL	0.104	0.065	Accept
H3	AT ← PL	0.348	***	Accept
H4	REF ← FL	0.706	***	Accept
H5	AT ← FL	0.782	***	Accept
H6	AT ← REF	-0.147	0.037	Accept

Source: Calculation result from SPSS 26 and AMOS 24

According to **Figure 3**, the criteria to measure the model's fit show that the Chi-square/df value = $3,279 < 5$ should be assessed as acceptable. The GFI coefficient = 0.849 ranges from 0.8 to 0.9 but is still acceptable (Hair *et al.*, 2014). CFI value = 0.908 is good, TLI value = 0.901 and RMSEA coefficient = $0.051 < 0.06$, so it is also considered good.

The results of **Table 4** indicate that most of the hypotheses are accepted at a 1% significance level (95% confidence level), with the exception of hypotheses H2 and H6, which are found to be significant at a 5% significance level (95% confidence level). The standardized regression coefficients show that the factor with the strongest impact on hypothesis H5 is 0.782, which is the largest among all the factors. The factors with the strongest impact on hypotheses H1, H4, and H3 have standardized regression coefficients of 0.735, 0.706, and 0.348, respectively. The level of influence of hypothesis H6 is the lowest, with an impact coefficient of -0.147.

4.3. Results discussion and policy implications

Based on the results of the analysis and model study, the authors found that:

The findings of this study confirm the direct impact of “Policies” on “The ability to use financial leverage”, “Behavioral attitude”, and “Real estate features”, thereby leading to the acceptance of H1, H2, and H3. These results align with Dale & McLaughlin (2000) and Wu *et al.* (2016). The findings posit that current government policies, such as tax regulations and real estate transaction processes, have contributed to the increased transparency and openness of the real estate market. The simplification of loan procedures and the provision of customer care have also positively influenced individuals investing in real estate. Moreover, the study's findings are consistent with Hanson & Hillier (1998) and Reis (2003), which indicate the significant impact of policies on people's attitudes towards real estate transactions. Additionally, Smith *et al.* (2008) and Ogu & Ogbuozobe (2001) found that policy plays a crucial role in creating a favourable environment that supports investment in housing for households. Residential infrastructure development also enhances the location and living space around the property, thereby increasing its value. The research results provide important implications for policymakers and financial intermediaries in the real estate investment market. The authors suggest that regulatory bodies prioritize providing timely, transparent, and clear information about the market to the public. In addition, long-term infrastructure and traffic development planning in residential areas should consider the interests of real estate users to create a favourable investment environment. Lastly, financial intermediaries should ensure transparency in their loan terms and procedures to facilitate informed decision-making by potential investors. These recommendations can help foster a more open and supportive investment environment in the real estate market, ultimately benefiting investors and the overall economy.

The findings of the study confirm that “The ability to use financial leverage” has a direct impact on both “Behavioral attitude” and “Real estate features”. Consequently, H4 and H5 are supported. These results align with Marx & Turner (2019), who suggest that borrowing for purchases and investments helps borrowers address their capital burdens

quickly. These findings are consistent with Liang & Osmadi (2015) and Mohamad *et al.* (2017). The analysis concludes that, besides their own capital, individuals who can acquire an immense amount of money tend to be more selective in their choice of real estate properties. They are more likely to invest in properties that offer more significant advantages and are worth the capital they borrow. Based on these findings, the research team recommends that relevant government agencies, credit institutions, and financial intermediaries improve their policies and regulations to increase the borrower's financial leverage. This could be achieved by clearly defining the beneficiaries of preferential loan packages in terms of interest rates and collateral and streamlining loan procedures. Such measures would positively impact the attitude of borrowers towards investment in real estate. Furthermore, the study suggests that strict regulations on real estate credit limits should be implemented to address the "bubble" situation that causes real estate prices to be higher than their actual value. This would promote sustainable development in the real estate market and prevent potential economic instability.

Hypothesis H6 suggested that the real estate features have a positive impact on the borrower's behavioral attitude in real estate transactions. However, the research results contradict this hypothesis. This finding is different from Rachmawati *et al.* (2019), which reflects the relationship between the reputation of real estate supply and social influences on buyers. In fact, the higher the reputation of the project owner, the less the buyer's attitude and behavior are affected by social factors such as advice from relatives or information on social networks. Moreover, the majority of the surveyed individuals in this study were relatively young, had a low frequency of real estate transactions, and purchased houses for the purpose of living. As a result, they did not have high requirements for the characteristics of real estate and did not pay attention to the high-end segment with high prices. The policy implications for buyers and investors are to prioritize information selection, trust the reputation of the project owners and providers, and avoid being influenced by irrelevant information to make informed decisions. Regarding policies, the research team suggests that managers should direct credit flows to the real estate sector to meet the real needs of the people, particularly in the social and affordable housing segments where supply is limited. Additionally, the imbalance between supply and demand in the high-end housing and villa segments, which currently demonstrate signs of excess supply, should be addressed.

4. Conclusion

The study provides valuable insights into the factors influencing the behaviour attitude of borrowers in real estate transactions in Vietnam, which have significant implications for credit loan models in the sector. Specifically, the study identifies three direct factors that influence borrower behaviour: "Government policies", "The ability to use financial leverage", and "Real estate features". The analysis reveals that "Government policies" affects both "The ability to use financial leverage" and the "Real estate feature". Furthermore, the study demonstrates that "The ability to use financial leverage" positively impacts "Real estate features". The findings suggest that financial intermediaries need to develop specific solutions to improve borrowers' access to credit in the real estate sector,

given its unique characteristics. Additionally, the authors offer recommendations for government agencies to promulgate policies that support the sustainable development of the real estate market in Vietnam. Overall, this research expands and enriches the existing theory of credit loans in the real estate sector, providing empirical evidence on the factors influencing borrower behaviour in Vietnam. The study's results have practical implications for financial intermediaries and policymakers, enabling them to make informed decisions that promote sustainable growth and development of the real estate market.

Despite the valuable contributions of the study, the authors acknowledge certain limitations that need to be addressed in future research. Firstly, the survey sample was only taken from certain places in Vietnam, such as Hanoi and other cities, which may limit the generalizability of the study. To overcome this, future studies can expand the geographic reach and increase the survey length to assess the differentiation of various demographic segments. Secondly, the study did not compare the access to real estate credit between those with knowledge and experience in the financial and real estate sectors and those with little knowledge and experience. Therefore, future studies can include the factor "Financial literacy" to analyze the influence of financial expertise on "Borrowers' attitude" in using financial leverage. Thirdly, the study did not explore the impact of "behavioural attitude" on "intention to use financial leverage". Thus, future research can expand the research model of influencing factors that affect the intention to use financial leverage in real estate transactions. Finally, the authors did not test the proposed solutions in practice, so the effectiveness of policy implications has yet to be evaluated. Future studies can investigate real estate credit from the perspectives of credit institutions and managers to provide more comprehensive results.

ANNOUNCEMENT EFFECT OF CORPORATE BOND ISSUANCE ON VIETNAMESE LISTED COMPANIES' STOCK PRICE

Dr. Ha Hong Hanh

hanhhh@neu.edu.vn

National Economics University, Hanoi, Vietnam

Abstract

Corporate bond has become increasingly prominent in the context of Vietnam as sustainable capital instruments and the integrity of capital market attract more attention of investors as well as the Government. Vietnam Chamber of Commerce and Industry (VCCI) (2022) reported that the corporate bond market reached approximately 20% of national GDP by the end of 2022 as a result of the Government effort and local enterprises capital demand. In turn, the purpose of this paper is to investigate the effect of corporate bond issuance announcements on the stock price of issuing companies. The announcements effect of corporate bond issuance is measured by the abnormal returns which are calculated using the market - adjusted returns (MAR) model (Altman et al., 2004; Soongwang, 2007) while the stock price is measured by market value to asset replacement cost (Tobin, 1969; Xia & Fang, 2005). The research is conducted with 410 listed companies and 1078 firm - year observations. The key findings show that positive cumulative average abnormal return resulting from corporate bond issuance positively affect stock price. Based on the result, it is evident to confirm that there is a signaling impact of bond issuance announcements on stock price indicating that the market considers bond offers to be a favorable news.

Keywords: *Corporate bond, Corporate bond issuance, Stock price, Listed companies.*

1. Introduction

In the past, companies in emerging countries were interested in borrowing from banks (Luengnaruemitchai & Ong, 2005). However, the interest rate charges of banks are relatively high and they are usually reluctant to issue loans or debentures with long maturities (Eichengreen, 2004). As an alternative, companies can issue long-term bonds at low interest rates (Navarrete, 2001) and deduct interest payments as business expenses. In the context of Vietnam, as an emerging economy, the VCCI survey (2020) reported that that the majority of surveyed firms (47.9%) evaluated corporate bonds as moderately importance debt instruments beside loans from bank and other financial institutions (Chart 1). While the number of firms considered the bonds as slightly important and unimportant are 22.9% and 10.3% respectively, the smaller number of firms evaluated this debt instrument as very important and important are 1.5% and 17.4%. The statistic confirmed that the corporate bond market has been increasing considerably in the recent years. The studies of bond offerings to the public has been an interesting debate because of the importance of this corporate financing alternative.

Figure 1. The importance of corporate bonds from enterprises' viewpoint

Source: VCCI (2020)

As the bond market has been becoming the major source of funds, there is a possibility that it could have an impact on corporate cost of capital as well as firm value (Kong & Shen, 2007; Sierpińska & Bak, 2016; Bessembinder et al, 2018; Huaman et al, 2022). Several studies such as Gebhardt et al (2005), Zhang et al (2020) found that bonds and stocks have the same unique operating cash flows and could influence fundamental corporate capital. Therefore, statistical correlations between bonds and stock characteristics as stock price, credit spread, stock volatility are expected. In this sense, one convincing explanation for the correlation between bond issuance and stock price is investors and public evaluate the issuance behavior as a favour news.

In summary, from academic and practical perspectives, the study aims to provide evidence to fill the “research gap” in respect to existing literature review of corporate bonds and stock price. In detail, the study focuses on two main objectives: firstly, identify the measurements of announcement effect of corporate bond issuance and stock price; secondly, empirically examine the impact of corporate bonds issuance on stock price of listed companies within the typical context of Vietnam.

In order to achieve the above objectives, the study firstly apply VOSViewer to depict a comprehensive and reliable literature review of research issues. VOSViewer is an updated and modern tool of bibliometric analysis method that helps researchers to visualize prior studies by co-authorship, co-citation, keywords occurrence and bibliographic coupling research patterns, trends and connection networks. Secondly, the study summarizes measurement method of announcement effect of corporatate bond issuance and stock price basing on literature review. Ultimately, the research tests the empirical model to identify correlation between research objects.

To present these above issues, the paper is structured as follows. Section 2 reviews existing literature review while Section 3 introduces research methodology including data

collection, variable measurement and proposed empirical model. Section 4 represents the empirical analysis including research result and robustness tests. Section 5 is overall conclusion, contributions and some identification for future research and some limitations of the study.

2. Literature review and hypothesis development

2.1. Bibliometric analysis on corporate bond and stock price

In order to develop a comprehensive and reliable literature review on the research issues, the paper applies the bibliometric analysis and the bibliographic visualization maps from the data of 207 academic publications on Scopus database from 1974 to 2023 via VOSViewer. The method obtains relevant information on scientific production, following the methodological structure of a rigorous bibliometric process, which ranges from the search for descriptors or keywords to the configuration of visualizations of tables and maps that allowed to consider the contributions by authors, journals and topics that have shaped the evolution of this field of study.

The generations of bibliometric maps present the overall understanding on the intellectual structure of corporate bond and cost of capital made up of 207 articles where the analysis of co-occurrence of author keywords (Illustration in chart 2). The map identified five main lines of association between corporate bonds and stock market, corporate social responsibility, credit risk, stock returns, credit spread.

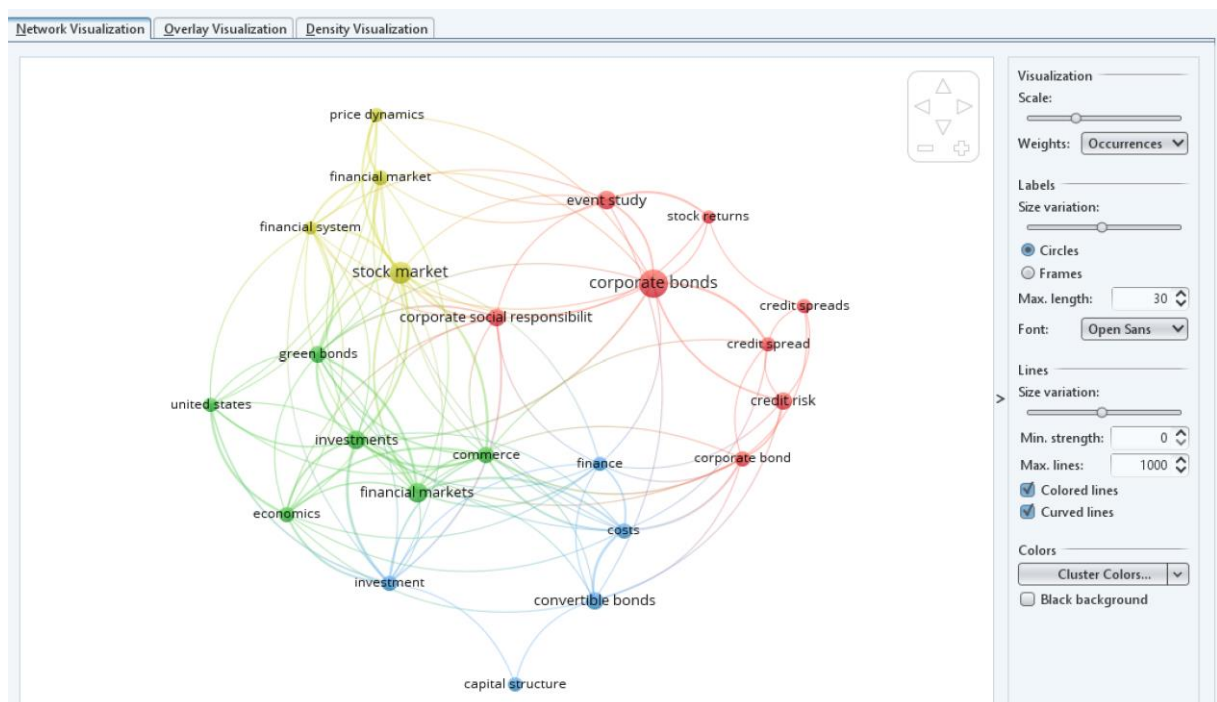

Figure 2. The association lines between corporate bonds and other typical keywords

Table 1 presents the authors who had the highest cited publications. In the scope of this research, the paper focuses on these typical articles to accumulate and analyze research

trends of existing literature review. The result shows that a study by John (1993) “Top-Management Compensation and Capital Structure”, which was published on the The Journal of Finance has been cited by 403 times and a study by Ramelli (2020) “Feverish stock price reactions to COVID-19”, which was published on the Review of Corporate Finance Studies has been cited by 376 times are classical outstanding research.

2.2. Literature review on corporate bond issuance and stock price and hypotheses development

Corporate bonds benefit issuing organizations by either attracting more investors (Ramelli, 2020) or positively changing in the trading activities of a company’s common stock (Lewis et al, 1999; Longstaff, 2010). Reboredo (2018) found that changes in stock prices are positively related to leverage changes, indicating that firm value is positively affected by changes in debt level. The author also noted that financial leverage could increase a firm’s value but also increases portfolio risks. In addition, the research result showed that when a company promote corporate bond issuance, the rate of return can be magnified.

Signaling theory which was demonstrated by Ross (1977) illustrating a strong assumption that corporate managers are better informed about their companies rather than their creditors or investors. It means that they are insider and they could achieve a better position to foresee their companies’ future cash flow. Any signal they suggest that cashflows that are better than expected may enable investors to create value. Potential investors are therefore constantly watching for these types of signals. The theory affirms that the financial structure of a company provides information about its financial situation and company quality and that the values of company will increase with their levels of leverage. Higher debt ratios could be a positive signal of management expectations concerning future cash flows.

The theory of information asymmetry also has been applied in the research field of corporate bond issuance to explain a problem in debt markets of borrowing and lending. In

these typical markets, the borrower is more equipped information about his financial position than the lender. This results in information asymmetry situation and a market failure (Bessembinder et al, 2018). Several authors suggest that the private equity such as corporate bonds or self - financing are the financial intermediates best suited for situations where information is significantly asymmetric (Bernile et al, 2007; Gompers, 1995). Roll (1988) confirmed that change of prices is based on the new information, so stock prices reflect some of new information in the stock market. In accordance with the studies of Bessembinder et al (2018), Zhang et al (2020), Huaman et al (2022), Krebbers et al (2022), the disclosure requirements of corporate bond issuance increase information exposure by directly reducing the asymmetric information between corporate insiders and the debt market participants. As a result, both parties gain benefit from corporate bond issuance by reducing corporate information asymmetry.

Prior research such as Titman (1985), Kim and Ryan (2013), Kim and Jeon (2015), Sierpińska and Bak (2016) state that investors often follow subjective norms when they form their investment portfolios. Some findings suggest that common subjective norm constrained institutional investors are frequent issuance, good credit rating, the Government's policy. In addition, identification from existing literature review show that firms with bond market access could be considered to be larger, have stronger credit ratings and higher reliable level of leverage and these characteristics are attracted the investors demand. In spite of the fact that investor demand is higher for firms with lower leverage, investors seem to be more interested in frequent issuers in the bond market. These behaviors are explained by debt sourcing theories that proposes that a firm build reputation in credit markets through borrowing and repaying private debt initially, and that repeating this process over time allows the firm to build a reputation in credit markets (Diamond, 1991). Several academic research prove this statement and conclude that debt market liquidity improves after issuing corporate bonds (Bolton and Freixas, 2000; Bolton and Freixas, 2006; Dangel and Zechner, 2004; Ni and Giles, 2010). Overall, corporate bonds issuances will attract investors' attention; therefore, debt market liquidity improves after issuing the bonds and as a result the stock price positively increase (Diamond 1991).

From the viewpoint of positive corporate bond issuance effect on stock price, several studies of Tang & Zhang (2020), Vasylieva et al (2021), Frino et al (2019), Ammann et al (2006), Chen et al (2005) found significant positive abnormal returns following the issuance of bonds. For the Japanese listed stock exchanges, Kim & Stulz (2002) found that 0.23% stock price reactions to bond issue announcement. The prior research contributed evidences to existing literature review, however, there is still little research in the context of emerging economies.

From the well-established arguments in the literature review, the paper proposes the following hypothesis:

Ho: Corporate bond issuance has a positive impact on stock price

3. Method

3.1. Data and sample selection

All data in this paper refer to firms traded on Vietnamese Stock Exchanges including Hanoi Stock Exchange (HNX) and Hochiminh City Stock Exchange (HOSE) during the seven consecutive years from 2016 to 2022. The sample includes public debt issuance by companies that have no outstanding debt securities at the time of issuance. The study excludes private placement of debt issues. The final data used in this study were reduced to 410 listed companies (issuers) after excluding non-public listed companies, financial institutions and insurance companies, and companies with other major corporate events such as bonus issuances, dividend announcements and stock splits, as well as those with missing data and outliers. Furthermore, to have clean data, companies with existing long-term debt on their balance sheets were also excluded.

Because it is quite common for companies to issue securities several times during one year, meaning there are multiple yearly issues, the method of De Haan and Hinloopen (1999) is employed to make the necessary adjustment so that the multiple issues are aggregated into a single annual figure. In addition, an incremental approach is used to analyze the determinants of new debt issues (Hovakimian et al., 2001; Denis & Mihov, 2003). This approach allows for the identification of companies that have no outstanding debt securities at the time of issuance and therefore enables a more accurate investigation of the company variables that contribute to the debt securities issuance decision.

Event study is used to estimate and draw inferences about the impact of bond issuance on the issuing companies' equity market behavior. The issue date is used instead of the announcement date because the issuance of bonds is generally associated with major corporate events, as evidenced by the 60% of bonds issued for new investment and merger and acquisition (M&A) activities in 2007 (Bank Negara Malaysia, 2007). When the announcement was initially made, the major corporate activities were most likely of higher concern to the market and its reaction can therefore be attributed to the corporate news on M&A or investment activities. As such, it is believed that those earlier announcements indicated more concern over the major corporate events rather than their accompanying financing choices. The actual effect on the financing choice would be felt only upon the issuance announcement. Moreover, according to Kapoor and Pope (1997), it is appropriate to use the issue dates to avoid the problem of uncertainty because some announced proposed bonds are withdrawn. Market reaction therefore may not occur until just before the issue date. This is further supported by Chen et al (2005), who found that only one-third of announced debt issuances were successfully issued.

The investigation window is from day $t=-60$ through day $t=+60$. The pre-event investigation window therefore ranges from day $t=-60$ to $t=-1$ and the post-event investigation window ranges from day $t=+1$ to $t=+60$. The confounding effect is not an issue because companies with major corporate events that are not associated with bond financing are excluded from the sample.

This study uses daily data to compute abnormal returns because this approach provides smaller standard deviations than using monthly returns (Brown & Warner, 1985). The use of daily returns is potentially more effective in that it permits researchers to take advantage of precise information about the specific day of the month on which an event takes place. In accordance with Martel and Padron (2006), the use of daily data reduces the possibility of other types of news being included in the effect. Likewise, Kothari and Warner (2006) also state that the use of daily rather than monthly security return data permits more precise measurement of abnormal returns and more informative studies of announcement effects.

3.2. The proposed empirical model and variables measurement

3.2.1. The proposed empirical model

To investigate the announcement impact of corporate bond issuance on stock price, this paper applies methods of previous studies in literature review such as Tang & Zhang (2020), Vasylieva et al (2021), Frino et al (2019), Pandey (2004), Buferna (2005), and Guha & Kar (2006). The regression model is used in the study as following:

$$Q_{i,t} = \alpha + \beta_t \text{CAR}_{i,t} + \varepsilon_{i,t} \quad (1)$$

$$Q_{i,t} = \alpha' + \delta_1 I_{i,t-1} + \delta_2 \text{AsyInfo}_{i,t-1} + \varphi \text{ContVars} + e_{i,t} \quad (2)$$

Where:

The dependent variable $Q_{i,t}$ is firms i 's Tobin's Q ratio in t , which in the firm market value over replacement cost of firm's asset, so it can be viewed as a standard stock price.

The independent variable CAR is the cumulative abnormal returns, which is obtained by summing up the abnormal returns.

$\text{AsyInfo}_{i,t-1}$ is the measure of information asymmetry.

3.2.2. Variables measurement

Dependent variable

$Q_{i,t}$ is firms i 's Tobin's Q ratio in t , which in the firm market value over replacement cost of firm's asset, so it can be viewed as a standard stock price. According to Tobin's Q theory, when Q is more than 1, the market value is higher than the replacement cost and the cost of equipment for the new factory is lower than the firm's market value, so the firm inclines to increase the investment cost. Otherwise, when Q is less than 1, the market value is lower than the replacement cost, so the firm inclines to decrease the investment cost.

The specific calculation is stated above, in which $\text{Asyinfo}_{i,t}$ is the measure of information symmetry. In the scope of this paper, the price delay measurement method is applied. This method was first proposed by Hou and Moskowitz (2005), which reflects how fast market information can be integrated in stock price. The reason why they construct this index is for measuring the speed with which certain stocks respond to market information. The more asymmetric information, the slower stock prices will respond to new information, as well as a greater degree of price delay. Therefore, the price delay is a good measure of the degree of asymmetric information. Specifically, it can be estimated as following regression:

$$R_{i,t} = \alpha_i + \beta_i R_{m,t} + \sum_{n=1}^4 \delta_i^{-n} R_{m,t-n} + \varepsilon_{i,t} \quad (3)$$

where $r_{i,t}$ is the return of firm i at time t , $R_{m,t}$ is the value-weighted market index at time t .

According to Hou and Moskowitz (2005), the stock itself is not excluded. Using the estimated coefficients from regression, measurement of price delay for each firm at the end of fiscal year is computed. First, R^2 is calculated by estimated regression (3). Then, the price delay is calculated as following:

$$\text{PriceDelay} = 1 - \frac{R_{\delta_i}^{2(-n)}}{R^2} \quad (4)$$

Because our tests are based on fiscal year data, we compute measure of price delay (Delay) as Hou and Moskowitz (2005) for each firm at the end of fiscal year by estimated regression (3) using daily stock return. Kong and Shen (2007, 2008) give further research on China stock market R^2 and Delay index, and they found both are related to information environment.

Independent variable

The independent variable CAR is the cumulative abnormal returns representing the announcement effect of bond issuance. The abnormal returns in this study are calculated using the market-adjusted returns (MAR) model in accordance with studies of Altman et al (2004), Charitou et al (2005), Agrawal et al (2006), Soongswang (2007). In the MAR model, the stock returns are compared to an expected return of the market over the event period. For each sample security, the return on security i ($R_{i,t}$) for the time period t relative to the event is:

$$R_{i,t} = R_{m,t} + e_{i,t} \quad (5)$$

where $R_{m,t}$ is the market return at time t , as calculated from a market portfolio or a market index, and $e_{i,t}$ is the component of returns that is abnormal or unexpected. The MAR model assumes that $\alpha = 0$ and $\beta = 1$. Given this return decomposition, the abnormal return, $e_{i,t}$ is the difference between the observed return and the market return:

$$e_{i,t} = R_{i,t} - R_{m,t} \quad (6)$$

Equivalently, $e_{i,t}$ is the difference between the return that is conditional on the event and the expected return that is not conditional on the event or the market return. Thus, the abnormal return is a direct measure of the (unexpected) changes in company value and returns associated with the event.

Following MacKinlay (1997), the abnormal return observations must be aggregated to draw general inferences related to the event. The aggregation is made along two dimensions: through time and across stocks. The following average company-unique return, in this case the average abnormal return (AAR), is estimated for each day surrounding the issuance of bonds:

$$\text{CAR}_t = \sum_{i=1}^N e_{i,t} / N \quad (7)$$

4. Results

4.1. Event study result

Figure 1. Cumulative abnormal return

Source: Author's assessment

Figure 1 presents the cumulative abnormal return (CAR) for bond issuers. Bond issuers generally experience an increasing CAR trend over the 60 days before ($t=-60$) the event day or the bond issuance date ($t=0$) and over the first 10 days ($t=+10$) of the post event period. There was a decline in CAR from 60 days to 55 days before the event date when there were abnormal losses. Thereafter, the cumulative abnormal return surged to a positive value starting from day $t=-45$, fluctuated between 1% and 3%, and finally increased substantially after day $t=-1$, one day prior to the event day. After the event day, the CAR continued to rise for three days and finally reached a peak of 6.84% on day $t=+9$. However, immediately after the ninth day, the CAR began to show a declining trend, dropping to a low of 4% at day $t=+23$. The CAR rose again after day $t=+24$ and fluctuated between 4.5% and 5.5% until 45 days ($t=+45$) after the issuance date but failed to be sustained thereafter.

To examine the proposed hypothesis of whether there are significant cumulative abnormal returns, a t test is carried out over different intervals and the result is shown in Table 2. Overall, bond issuers enjoy a significant positive cumulative abnormal return 10 days after the issuance date and 21 days surrounding the event day at the $\alpha=0.10$ and $\alpha=0.05$ levels, accepting the null hypothesis. A positive relationship between bond issuance and equity market return implies that increasing the leverage position of a company can have a positive impact on stock prices. The favorable information content and signal could also be attributed to the use of the funds from the bond instruments that are generally meant for productive purposes such as company growth and expansion. In summary, the equity market appears to generally react positively to the issuance of bonds.

A significant and positive cumulative average abnormal return 21 days surrounding the bond issuance date explains the signaling model of Ross (1977), which suggests that

increased debt levels convey positive news. Market participants perceive that higher debt levels show insiders' confidence that future cash flows will increase to service the higher debt levels. Additionally, Ross's (1977) signaling model also states that the information asymmetry between a company and outsiders leads the former to make certain changes in its capital structure that could change the relative position and/or power of capital providers (e.g., stockholders and debtors). Thus, the equity market reacts according to the changing capital structure. The finding of this study In contrast, the higher leverage is a signal that a company is confident about its ability to meet interest obligations and thereby indicates its ability to generate future cash flows, which ultimately translates into a higher company value.

Table 2. T test of different CAR intervals

Interval	CAAR	Interval	CAAR
-5 to -1	0.59%	-30 to -1	1.93%
+1 to +5	1.37%	+1 to +30	0.29%
-5 to +5	3.54%	-30 to +30	3.80%
-10 to -1	0.12%	-40 to -1	1.19%
+1 to +10	1.74%*	+1 to +40	0.38%

-20 to -1	1.74%	-60 to -1	3.38%
+1 to +20	-0.09%	+1 to +60	0.21%
-20 to +20	3.22%	-60 to +60	5.16%

** significant at $\alpha = 0.05$; *significant at $\alpha = 0.10$

Source: Author's assessment

4.2. Multiple regression result

Table 6 illustrates the multiple regression analysis. The R^2 value of 64.4% implies the moderate impact of cumulative abnormal returns, which represents the bond issuance effect, on the Tobin's Q ratio, which represents the stock price. It could be explained that there has been a positive effect of abnormal return caused by the bond issuance announcement on the enterprise's stock price.

The regression analysis result is consistent with previous studies of Bhullar & Sahoo (2023), Saadaoui et al (2022), Li et al (2020) which suggested that an announcement of external financing signals might cause positive stock price reaction.

Table 3. Multiple regression result

Source: Author's assessment

5. Conclusion

In summary, the research findings reveal that there is an increase in the cumulative abnormal return or the equity return of issuing firms. However, these figures are insignificant except during the 21 days surrounding the issuance date. A positive cumulative abnormal return, which represents for announcement effect of corporate bond issuance, indicates that an increase in debt has a positive effect on stock prices. This empirical result confirms that the announcement of corporate bond issues in the context of Vietnam could serve a market signal to the public and potential investors.

In spite of the above findings, the study maintains several limitations. Firstly, as highlighted by Davidson et al (1995) and Lewis et al (2003) the cumulative abnormal return measurement depends on the design and characteristics of a corporate bond. Therefore future studies should focus on different types of bonds such as maturity, coupon rate, convertible or straight debts. Secondly, several proxies of dependent variable should be considered. Specifically, in order to measure asymmetric information of the stock price, literature review addressed some methods such as price non-synchronization ($1 - R^2$) or information disclosure score (InfoIndex). Ultimately, the research sample could be aggregated based on business sector classifications. The effect of bond issuance announcement might differ for companies in different sectors. A small research sample applied in this study could be not relevant.

Abstract

The article studies the impact of capital structure on firm value of 40 companies listed on the HSX and HOSE in the period 2013-2022. The study uses regression methods such as: Pooled OLS, REM, FEM and finally GLS after performing the tests. The results show that capital structure measured by debt ratio (CTV) has a positive effect on firm value with the representative variable being ROE and Tobin's Q. The study also shows variables such as: business size (QUYMO), growth rate (TDTT), asset turnover (VQTS) has the same results with capital structure, but the age of the business (TDDN) gives the opposite result. At the same time, the study also showed that the current ratio has a negative impact on the ROE value but has a positive effect on the value of Tobin's Q. Meanwhile, there is no evidence that the assets structure (CTTS) have any impact on firm value.

Keywords: *Capital structure, logistics business, firm value.*

1. Introduction

Vietnam is regarded as a potential and appealing market for the growth of the transportation service business. However, despite its rapid growth, Vietnam's logistics sector remains underdeveloped in the foreign market. As a result, domestic transportation firms must establish clear business objectives and capital-use plans based on each suitable growth strategy, with the goal of increasing company value in order to obtain a competitive place in the market. The worth of a company is determined not only by its money, but also by its

capital structure. So the issue for managers is how to decide the financing source ratio to optimize enterprise worth while attracting both domestic and international money. That is the problem that runs through the research topic: “*The Impact Of Capital Structure On Firm Value Of Listed Logistics Companies*”

2. Theoretical Framework

2.1. Capital structure and Firm value

2.1.1. Capital Structure

Capital Structure is a financial term that represents the percentage of loaned capital to equity in total capital used by businesses for output and business operations. A company's capital framework is an essential component. It has a direct impact on the growth of those companies. As a result, each company must devise flexible strategies to optimize its capital structure and fit its present situation. The following factors are commonly used to assess company equity: general debt ratio, current debt ratio, long-term debt ratio, debt-to-equity ratio, and self-financing ratio (the ratio of equity to total assets). The general debt percentage is used as the dependent variable in this study.

2.1.2. Firm value

Previous research has characterized enterprise value in a variety of ways: Firm value is a gauge of an enterprise's economic success Grossman and Stiglitz (1977); Sarma and Rao (1969). Corporate value concentrates on the enterprise's capital structure, enabling the enterprise to compare the value of the firm with many various capital structures Quiry et al. (2011); Lin Woon Leong & Song Bee Lian (2022) contend that Enterprise value is the enterprise's market value.

From the definitions given in previous studies, enterprise value is understood as the sum total of monetary values that represent the benefits that the business receives now and in the future. Currently, there are many methods with different viewpoints to determine the value of enterprises such as: from the point of view of absolute valuation, there is the discounted cash flow method or the asset method... but from the point of view based on absolute valuation. In terms of relative valuation, indicators such as NPV, ROA, ROE, EPS, EVA, P/E, or Tobin's Q index... represent enterprise value. In this piece, we illustrate Firm value using both the ROE and Tobin's Q indicators. The ROE ratio measures success per dollar of stock spent by investors, but it is thought to represent only the book value of the company because it is computed solely from profit on the balance sheet. As a result, we use the Tobin's Q ratio to symbolize the worth of a business because it is a combination of a company's book value and market value, as well as investors' future expectations.

2.2. Research hypothesis

The majority of theories and observational data linked to capital structure and firm value have given dependable scientific grounds for the effect of capital structure on firm value. The paper suggests hypotheses and research models to clarify the research goals based on the results of earlier studies, which it will supplement and adjust to be more suitable.

2.2.1. Effect of capital structure on firm value

According to capital structure theory, a company's financial strategy can be used to fund investment initiatives with the aim of maximizing the worth of the company by deciding the capital structure (a combination of debt and equity). Meanwhile, sectors like logistics that must engage in fixed assets will probably be able to use loans more frequently. The typical explanation is that debt's cost of capital is frequently "cheaper" than equity's cost of capital. As a result, when using debt, businesses will benefit from "tax shields" because interest costs are exempt before tax, lowering the income tax that businesses must pay and raising the income tax rate of the owner's revenue, increasing the worth of the company. This is congruent with the findings of other writers, including Durand (1952), M&M (1958, 1963), Antwi et al. (2012), Mohammad et al. (2013), Hoque and partners associates (2014), Do Van Thang et al. (2010), that capital structure has a favorable effect on company value. The following is our study hypothesis:

H1: Capital structure has a positive effect on firm value

2.2.2. Effect of firm size on firm value

Horne & Wachowicz (2009) claim that company size has a favorable and significant effect on the firm's worth. Total assets can be used as a proxy for firm scale Taswan (2003), so the higher the total assets, the bigger the company. The simpler it is to obtain financing, the more investors are interested in the firm and the larger it is. This is so because investors are more likely to buy stock in large companies because of their status as stable entities. Investors have high hopes for big businesses because of this circumstance, which has caused the company's share price to rise on the capital market. The proof indicates that the size of big companies is expanding, which will cause investors to react favorably and raise the company's worth. Consequently, firm growth has a favorable impact on firm worth. Horne & Wachowicz (2009). There have also been successful experiments done by Vidhi Chaocharia and Yaniv Grinstein (2007), Hoje Jo and Maretno A. Harjoto (2011), and M. Hirdinis (2019). The study proposition is then made from there:

H2: Firm size has a positive effect on firm value

2.2.3. Effect of growth rate on firm value

Fahmi (2014) argues that growth rate is a measure of a company's ability to maintain its position in the industry and overall economic development. The growth rate of the business is calculated by the growth rate of total assets. Therefore, the growth rate of the business is proportional to the growth rate of the company's assets. According to research by Ardina Zahrah Fajaria (2018), companies with high growth rates show that the company is expanding its business or operating a high-productivity business. This will be a positive signal for investors to pay attention, so the demand for shares will increase, which can increase the value of the business. From there, we put forward the research hypothesis:

H3: Growth rate has a positive impact on firm value

2.2.4. Effect of asset structure on firm value

According to Nyamasege et al.'s research, the asset structure indicates the quantity allocated in each section of the assets, and the proportion of those assets defines the company's asset structure. The allocation is significant because it pertains to the amount of money required for the company's long-term objectives, which will influence investors' perception of the business D.Aggarwall (2017). The enterprise's investment index is based on its asset structure, which is determined by dividing fixed assets by total assets. This high ratio indicates that the company is moving in new paths, has a stable future investment, and has comparatively high business leverage. This sends a positive indication to investors and makes it simpler for the business to raise money, resulting in an increase in the company's worth. From there, we put forward the research hypothesis:

H4: Asset structure affects firm value positively

2.2.5. Effect of current ratio on firm value

The current ratio is a frequently employed metric to assess the capacity to pay current debt, claims Sawir (2015). Fraser and Ormiston's research from 2004 found that an organization's amount of current payments is a good indicator of its financial health. A greater current ratio will indicate that the company can settle its present current obligations promptly and easily, which lowers the company's risk of bankruptcy. According to research by Brigham & Houston (2018), buyers favor businesses with high liquid assets because they are thought to be capable of making payments on time. Conversely, the lower the value of the current ratio, the more the lower the liquidity of the company and can significantly negatively affect the value of the company. The higher the current ratio value, the higher the liquidity of the company, which can positively affect the value of the company. We then advance the following study proposition:

H5: Current ratio has a positive effect on firm value

2.2.6. Effect of the age of the business on firm value

The business age indicates how long the company has been in operation. The longer a company is in the market, the simpler it is to establish itself as a genuine expert in their field. However, according to Jovanovic's (1982) model, older firms are closer to the optimal state and thus grow less. This is due to the company's decreasing ability to adapt to new knowledge. Meanwhile, the development rate is an indicator that is closely linked to the value of the company, so the impact of the business's age is opposite to the enterprise's value. Studies by Evan (1987), Dunne et al. (1989) and Hughes (1994) also show a negative relationship between age and firm growth. From there, we put forward the research hypothesis:

H6: Firm age has a negative effect on firm value

2.2.7. Effect of asset turnover on firm value

According to Widodo (2018)'s study, the asset turnover ratio will assess how well a company's assets are managed in terms of producing total net income. The worth of a

company's overall asset turnover is one of the factors that prospective buyers will consider. As a company's overall asset circulation rises, it can be determined to be effective in asset utilization. A higher proportionate value of total asset movement will be joined by an increase in net sales, which will be followed by an increase in net profit, influencing the company's income. The greater the profit margin, the higher the company's worth. This is also true for the findings of R.B Utami and Prasetiono (2016) and Firdaus (2020). From there, we put forward the research hypothesis:

H7: Asset turnover has a positive impact on firm value

3. Method

The article uses quantitative research methods with secondary data from financial statements of logistics companies listed on HSX and HOSE that have been audited for the purpose of measuring the level of capital structure affecting the firm value to statistically analyze the most general description of the research sample. In addition, the article uses the Pearson correlation coefficient to consider the suitability of the research variables when included in the regression model and finally implement the regression models: Pooled OLS, REM, FEM and GLS as well as performing tests: F, LM, Hausman, variable variance, linear multi - addition, self -correlation and verification of secific regression coefficients (T - Test) with 40 listed Logistics businesses on the stock market in the period from 2013-2021 with Stata 15.0 software.

Sources: The research team

A total of 40 enterprises were investigated. There were 305 observations in total. The table above shows the maximum, minimum, mean, and standard deviation from 2013 to 2021.

The descriptive analysis for both dependent and independent variables is shown in the table above.

Logistics companies use nearly 0.3078 average debt in total capital. This ratio is much lower than the debt ratio of other industries according to research statistics of Le Thi Minh Nguyen, (2016); Dang and Do, (2021), Vo Minh Long (2017).

The average firm size (QUYMO) is 13.57. The average growth rate (TDTT) of logistics companies by 2022 is 0.159. Asset structure (CTTS) is measured by the ratio of residual value of tangible fixed assets with an average value of 0.3973. The asset turnover ratio (VQTS) has a pretty good value of 0.8134. This shows that the use of assets and capital to generate revenue of Logistics companies is quite effective. Logistics companies have an average age (TDDN) of 20.18 years and have a current ratio (TSTTNH) of 4.51 times.

4.2. Correlation analysis

Table 2. Correlation matrix result

	(ROE)	(TobinsQ)	(CTV)	(QUYMO)	(TDTT)	(CTTS)	(TDDN)	(TSTTNH)	(VQTS)
ROE	1.000								
TobinsQ	0.9472	1.000							
CTV	-0.1154	-0.121	1.000						
QUYMO	-0.0207	-0.011	0.515	1.000					
TDTT	0.1251	0.097	0.018	0.072	1.000				
CTTS	-0.0217	0.012	0.135	0.060	-0.064	1.000

TSTTNH	-0.0407	-0.044	-0.234	-0.326	0.010	-0.067	-0.056	1.000	
VQTS	0.0119	0.000	0.035	-0.043	0.026	-0.106	-0.084	-0.062	1.000

Sources: The research team

The correlation coefficient (r) has an small absolute value. This supports the argument that there is no multicollinearity among the model's explanatory variables. According to the correlation coefficient matrix, capital structure, firm size, firm age, current ratio are negatively correlated with both ROE and Tobin's Q. Meanwhile, growth rate is positively correlated with both ROE and Tobin's Q. Asset structure is negatively correlated with ROE but positively correlated with Tobin's Q. Asset turnover is positively correlated with ROE but do not have correlation with Tobin's Q.

4.3 Model estimation

For bothh models, research team will compare and select a suitable model among ordinary least square (OLS), fixed effects model (FEM), random effects model (REM) and generalized least squares (GLS).

4.3.1. The Breusch-Pagan test

In order to consider and select the appropriate model among the three regression methods, the research team used the Breusch-Pagan test and the Hausman test.

The Breusch-Pagan test shows $\text{Prob} > \chi^2 = .000 < \alpha = 5\%$, so with a statistically significant value of 5%, reject H_0 . That is, with the data collected, indicating that the REM modeling method is appropriate, OLS is not suitable because of the existence of random effects in each enterprise over time.

4.3.2. The Hausman test

After selecting the FEM model instead of the OLS method, the research team in turn considered the existing table data based on FEM and REM modeling methods. From the FEM and REM models, the authors will go to the Hausman test to compare the effectiveness of FEM and REM models.

Hausman's test results show that $\text{Prob} > \chi^2 = 0.2538$ in model 1 and $\text{Prob} > \chi^2 = 0.3721$ in model 2, both value $> \alpha = 5\%$, so there is enough evidence to accept the H_0 hypothesis. Thus, random effects method (REM) is more suitable than fixed effect model (FEM).

However, before analyzing in details the factors affecting firm value, the team research will use the following tests: auto-correlation, heteroskedasticity, and multicollinearity, and make the necessary corrections to modify the model.

Table 3. The results of the defect testing models

Test	Model 1	Model 2
Wooldridge test	$\text{Prob} > F = 0.0055$	$\text{Prob} > F = 0.0055$
Breusch- Pagan Lagrangian	$\text{Prob} > \chi^2 = 0.0000$	$\text{Prob} > \chi^2 = 0.0000$
Mean VIF	VIF= 1.147	

Sources: The research team

4.3.3. Auto-correlation test

The Wooldridge test is used to test whether auto-correlation exists for regression models. Place hypothesis:

H_0 : no autocorrelation phenomenon

H_1 : autocorrelation.

The test result for $\text{Prob} > F = .0055 < \alpha = .05$, suppose H_0 is negative, that means autocorrelation occurs.

4.3.4. Heteroskedasticity test

To test whether the variance was altered or not, the authors used the Breusch- Pagan Lagrangian test. Under the assumption:

H_0 : there is no change in variance

H_1 : there is a change in variance.

The test result show $\text{Prob} > \chi^2 < \alpha = .05$ in both models, so H_0 is rejected with statistically significant level of 5%, indicating that heteroskedasticity occurs.

4.3.5. Multicollinearity test

To detect the phenomenon of multicollinearity in the model, the author uses the VIF. The coefficients of VIF of the variables are less than 2, indicating that there is no multicollinearity.

The test results show that the auto-correlation (Prob > F = 0.0055), heteroskedasticity (Prob > chibar2 = 0.0000) occurs in both models. Therefore, the authors correct the defect of the regression model by generalized least squares (GLS) regression.

Table 4. Result of Generalized Least Squares (GLS) Regression

Variances	Firm Value (Represented by ROE)		Firm Value (Represented by Tobin's Q)	
	Coef	P- value	Coef	P- value
CTV	-0.4260348	0.022	-0.0504022	0.029
QUYMO	0.0258425	0.026	0.0032409	0.035

TSTTNH	-0.001083	0.784	-0.0001492	0.797
VQTS	0.061663	0.026	0.0079268	0.041
_cons	1.217464	0.000	0.1161774	0.000

Sources: The research team

The results show that the current ratio does not affect the firm value. Capital Structure and Firm Age have negative impacts on Firm Value when measured in both ROE and Tobin's Q, whereas Firm Size, Growth Rate, Asset Structures and Asset Turnover Ratio have positive impacts on Firm Value.

From the result, the research team came up with the following two research models:

Model 1: Firm Value represented by ROE

$$\text{ROE} = -0.426 * \text{CTV} + 0.0258 * \text{QUYMO} + 0.164 * \text{TDDT} + 0.152 * \text{CTTS} - 0.0085 * \text{TDDN} + 0.0617 * \text{VQTS} + 1.217464$$

Model 2: Firm Value represented by Tobin's Q

$$\text{Tobin's Q} = -0.0504022 * \text{CTV} + 0.0032409 * \text{QUYMO} + 0.0234983 * \text{TDDT} + 0.0228346 * \text{CTTS} - 0.0008528 * \text{TDDN} + 0.0079268 * \text{VQTS} + 0.1161774$$

- Dependent variances: ROE, Tobin's Q.

- Independent variance: Capital Structure (CTV)

- Sub Variances: Firm Size (QUYMO), Growth Rate(TDDT), Asset Structure (CTTS), Firm Age (TDDN), Asset Turnover Ratio (VQTS).

4.3.6. Research hypothesis test results

From the above analysis, the research team has come up with the results of testing the following hypotheses:

Table 5. Result of testing hypotheses

Hypotheses	Result
H1: Capital structure has a positive effect on firm value	Rejected
H2: Firm size has a positive effect on firm value	Accepted
H3: Growth rate has a positive impact on firm value	Accepted
H4: Asset structure affects firm value positively	Accepted
H5: Current ratio has a positive effect on firm value	Rejected
H6: Firm age has a negative effect on firm value	Accepted
H7: Asset turnover has a positive impact on firm value	Accepted

Sources: The research team

From the test results, the research team came to the following conclusions about the research hypotheses:

H1: Capital structure has a negative effect on firm value

H2: Firm size has a positive effect on firm value

H3: Growth rate has a positive impact on firm value

H4: Asset structure affects firm value positively

H5: Current ratio has a no effect on firm value

H6: Firm age has a negative effect on firm value

H7: Asset turnover has a positive impact on firm value

5. Discussion and Conclusion

This research analysed and came up with conclusions about the direct impact of capital structure, firm age, firm size, growth rate, asset turnover ratio, current ratio and asset structure on the firm value of listed Logistics companies effect of these factor on firm value.

5.1. Discussions of the results

Capital structure (CTV): The research results show that capital structure negatively impacts both ROE and Tobin's Q. When businesses use debt, it will bring the benefits of tax shields, but at the same time, businesses will have to bear a huge burden, which is the cost

of financial distress. Especially for Logistics businesses facing a lot of business risks such as fluctuations in energy prices, input materials; competition between enterprises in the same industry; supply chain risks. This can also be the reason why businesses that use a lot of debt will easily go bankrupt, causing the value of the business to decrease.. This is consistent with Myers' hierarchical order theory (1977) and research results by Dang Ngoc Hung et al. (2019), Do Thi Van Trang and Pham Thi Van Huyen (2021),...

Firm age (TDDN): Research results show that business age negatively impacts both ROE and Tobin's Q. The older the business, the closer to the optimal condition and thus the growth level of the business will be less. Especially for the Logistics industry always have to try to change and adapt to the new transformation from technology in the era of social integration today. Since then, the value of long-term Logistics businesses may be reduced cause there is no change in the supply chain restructuring leading to the growth of the enterprise not catching up with the growth of the industry. The results of this study are consistent with earlier research by authors Evan (1987), Dunne et al. (1989), Hughes (1994),...

Firm size (QUYMO): The research results show that QUYMO variables have a positive impact on both ROE and Tobin's Q. The large businesses scale will tend to be more stable and more reputable in terms of economic potential, thereby attracting attention and the investment from many partners both domestic and foreign, helps the value of the enterprise's assets increase. In addition, large -scale enterprises will often have lower probability of bankruptcy, from which financial difficulties decrease, contributing to increasing firm value. This result is consistent with the research of Aggarwal and Padhan, (2017), Carpentier (2006), Ahmad and colleagues (2012),

Growth rate (TDTT): The research results show that the growth rate has a positive influence on both ROE and Tobin's Q. Business growth rate is measured by the growth rate of total assets. The higher the greater the asset growth, the greater the solvency of the enterprise's debt. This is suitable for logistics businesses because of a large amount of assets such as ships and boats will significantly help the operation of businesses in increasing the growth rate. This will help businesses avoid bankruptcy risks and increase firm value. This is consistent with the results of the research of Cheng & Co -colleagues (2010), Hermuningsih (2013), Abor (2005), ...

Asset Turnover Ratio (VQTS): The research results show that asset turnover ratio positively affects both ROE and Tobin's Q. The higher the ratio, the more efficient the business is at generating revenue from assets. Besides, the operational efficiency is associated with the firm value. The activities of Logistics businesses are often associated with assets such as machinery, boats, warehouses, etc. Therefore, the effective use of these assets will create high revenue for businesses and at the same time show that the business operates effectively, thereby increasing the firm value. This result is consistent with the research of Vo Minh Long (2017), Le Thi Phuong Vy et al (2013), Asiri et al. (2014) ...

Current ratio (TSTTNH): The results of the study show that current ratio is not statistically significant to ROE and Tobin's Q. This result is consistent with the study

conclusion of authors Asmaul Husna and Ibnu Satria (2019) that there is no scientific evidence on the impact of current ratio on firm value.

Asset Structure (CTTS): Research results indicate that asset structure has a positive impact on both ROE and Tobin's Q. Asset structure is measured by the share of tangible fixed assets in total assets. The larger the proportion of tangible fixed assets proves that firms invest a lot in their facilities and equipment and have many investment projects that can bring high profits. In particular, Logistics businesses require a large volume of fixed assets to serve their service activities. Therefore, Logistics businesses with a large proportion of fixed assets will often have abundant resources in operation and high firm value. This result is consistent with research by Liu Dehua (2021), Rindu Rika Gamayuni (2015), Nagaraja and Vinay (2015).

5.2. Recommendations and Conclusion

On that basis, the article proposes a number of recommendations in choosing a capital structure with the goal of both controlling financial risks well during operation as well as aiming to ensure the improvement of the value of firms listed on HSX and Hose.

The Covid-19 epidemic has severely affected Vietnam's society-economy. However, difficult realities also open up new opportunities with new trends, models and protocols in the production, circulation and consumption of goods globally. That makes Logistics firms have to promote their own internal strength, overcome difficulties, seize opportunities to get a breakthrough in the development process. In addition to inspection, cost reduction, human resource training, information technology investment, the role of capital structure policy is undeniable in raising the scale and reputation of enterprises in the market and increasing firm value. From the research results, the authors make some recommendations to increase firm value for Logistics businesses listed on the Vietnamese stock market as follows:

- Logistics businesses should consider speeding up the payment of short-term debts with long terms and high interest rates.

- For long-term loans, businesses should use that money to invest in large fixed assets because the benefits from those assets can offset the interest rates as well as the debt that the business has to bear.

- A joint-stock Logistics company can increase its charter capital by offering shares. Public offering of shares is a form of raising capital from outside widely because the subjects that can participate in buying shares include investors who are not necessarily professional securities investors. This approach will help increase charter capital, thereby increasing the efficiency, stability and development of the business due to its abundant capital. From there, businesses will have the opportunity to invest in business projects and without additional financial costs to borrow from banks and partners, and at the same time generate net profit to continue reinvesting in the business. However, businesses also need to consider carefully because increasing charter capital costs a lot in censorship as well as issuance.

- Enterprises should pay attention to improving operational efficiency to create large profits, help the capital of enterprises to be expanded, and contribute to limiting borrowing from outside.

Abstract

The article studies the main factors in the determination of transfer pricing of Foreign Direct Investment enterprises (FDI) in Vietnam. The factors investigated in this article include profit management, financial difficulties, exchange rates, effective tax rates and audit quality. All statistics are collected from financial statements of FDI enterprises listed on HNX, HOSE and UPCOM from 2018 to 2021. All collected data were processed by Stata software in the form of a panel data model to conduct descriptive statistical analysis. Next, with the REM and FEM models, we can control for these separate effects. The following steps are conducted, respectively, as F test, Hausman test to select the appropriate model in the Pooled OLS model, REM model or FEM model with the research model. Finally, the research team uses the correction method by FGLS model to overcome the defects, if any, and shows the results of the independent variables that affect the dependent variable in the research model. The results of the study indicate that the enterprise's transfer pricing is negatively impacted by two factors: profit management and financial difficulties. Furthermore, the effectiveness of the audit quality is positively impacted. Additionally, the research has demonstrated that the transfer pricing is unaffected by the effective tax rate or the exchange rate. The article recommends the Vietnamese government, tax authorities and other related parties propose strict regulations to limit businesses from taking advantage of the negative factors of transfer pricing but still ensure to attract foreign investment capital into Vietnam. This application can be applied to the tax authorities of Vietnam and foreign countries in the management of foreign-invested enterprises.

Keywords: *Transfer pricing, Foreign Direct Investment enterprises, Profit Management, Financial Difficulties, Exchange rate, Effective Tax Rate, Audit Quality.*

1. Introduction

The role of investment, especially FDI, is considered as one of the most important contributors to the development of the economy. Since the promulgation of the Foreign Investment Law in 1987, Vietnam has officially opened to FDI and has become a potential destination for foreign investors due to its political stability and abundant human resources with cheap labor cost. FDI in Vietnam plays an important role in contributing to improving the market economy institution, changing the economic structure, forming several key industries and helping Vietnamese enterprises improve their technological capacity, competitive capacity, expanding of foreign relations and international economic integration.

For many years, the State has had preferential policies on tax and finance for enterprises to attract FDI, however, the act of transfer pricing negatively or the declaration and fulfillment of tax obligations of some FDI enterprises have caused losses of tens of thousands of billions to the national budget. Speaking at the seminar "Sharing tax fairness reports from the perspective of multinational corporations and banks" organized by Oxfam, Babeth (2017) said: 100 billion USD is the number that developing countries (including Vietnam) are losing every year due to tax avoidance activities of multinational corporations.

From an academic perspective, since the early 90s of the twentieth century, the determination of transfer pricing has become a hot topic. These studies have essential implications for policy makers, multinational corporations and other stakeholders involved in cross-border trade and investment. The results of these studies underscore the complexity and diversity of the transfer pricing context, as well as the importance of interdisciplinary studies to inform policy decisions and improve the global tax system. In developing countries in general and Vietnam in particular, research on factors affecting the determination of transfer pricing has not been widely mentioned. Moreover, the Covid 19 period is also a new point and there is no research during and after this period.

Stemming from the above theoretical and practical bases, the study on the topic "Research on factors affecting transfer pricing of FDI enterprises in Vietnam" aims to contribute more scientific and practical arguments to partially solve the problems that are posed.

The objectives of the study include (1) Clarifying the theoretical basis of transfer pricing and the transfer pricing situation in FDI enterprises operating in Vietnam, (2) Pointing out the factors affecting the transfer pricing of FDI enterprises in Vietnam, (3) Building a research model to analyze and evaluate the influence of factors on transfer pricing of FDI enterprises, (4) Based on the research results and the collected information, the study will propose some suitable solutions to minimize the negativity of transfer pricing of FDI enterprises and contribute to the development of the economy general economy in Vietnam.

Theoretically, the study has shown the level of influence and confirmed the impact of factors affecting the determination of transfer pricing of FDI enterprises in Vietnam. In addition, the topic has synthesized and accumulated from previous studies but put it in the context of the Covid-19 pandemic, thereby contributing and supplementing the existing theoretical basis of previous studies on the Covid-19 pandemic. factors affecting transfer pricing.

In terms of practice, the study has made a number of recommendations and proposals to the state and stakeholders in order to come up with appropriate strategies and solutions to minimize the reality of implementing transfer pricing that causes loss. exempt from state taxes, contributing to the development of the economy while ensuring the attraction of foreign investment capital into Vietnam.

2. Literature review and Theoretical framework

2.1. Literature review

2.2.1. Research on determination of transfer pricing

The concept of determination of the transfer pricing is no longer a new concept to economists. However, it is difficult to define this concept precisely. There have been many explanations given by previous case studies. As early as the 1900s, concepts of transfer pricing were introduced, typically Williamson's (1996) study that identified transfer pricing classified on the basis of cost, market price, and programming. linearity and profit sharing. While Jamal, Saleh and Karima (2008) classify the above methods based on market and non-market. In other words, transfer pricing is defined as the price charged to transfer a tangible and intangible asset, goods or services, raw materials, know-how and technology to its subsidiaries or affiliates (Aranoff, 2000; Davidmann, 1996; Doğan, 2003).

However, besides determining the transfer pricing in compliance with the law, businesses tend to take advantage of the loopholes in determining the transfer pricing to maximize their profits. Baistrocchi & Roxan (2012) also pointed out that downside and said that the determination of the transfer pricing is a subjective activity and taking advantage of that, multinational corporations intentionally use the loophole to minimize the risk of loss. most tax payable. Along with the views of previous researchers, Tran Xuan Hai (2012) argues that illegal transfer pricing is an act performed by business entities to change the exchange value of goods, services in relation to related parties or simply not at market prices, the main object of such behavior is price. However, Pham Minh Quoc (2019) argues that the issue of combating the illegal elements of transfer pricing has not yet been codified, which means that the concept has not yet been formally defined in Vietnamese law.

2.2.2. Research on transfer pricing control

From the very beginning, the government's help in controlling transfer pricing abusers is essential. In the context that the Vietnamese government is facing difficulties in preventing abuses of illegal transfer pricing and controlling transfer pricing activities at FDI enterprises, Hong Nhat Nguyen et al. (2020) shared that the government needs to come up with specific laws: a good transfer pricing database is also expected; the transfer pricing audit process needs to be stronger; Transfer pricing training courses should be introduced more to businesses. Besides, the research articles suggest that tax is also one of the factors that need to be controlled to ensure the positive in determining the transfer price.

In summary, we can see that controlling the determination of transfer pricing is always a difficult problem posed to enterprises in general and the state in particular. Based

on previous studies, it can be seen that the government needs to focus on defining clear tax provisions and tax incentives. In addition, businesses also need to focus on human resource management, audit process management and need to be trained in the most methodical and effective way.

2.2.3. Research on factors affecting transfer pricing determination

International studies on the factors affecting the intention to exercise transfer pricing of FDI enterprises have been widely developed, from which some remarkable conclusions have been drawn. The researchers focus on finding out the causes that will have a positive or negative impact on FDI enterprises implementing transfer pricing. In the United States, Al-Eryani et al. (1990) examined the influence of environmental variables and company-specific on the choice of international transfer pricing strategy. According to Susan (1992), the variables that are said to have an impact on the determination of the transfer pricing of the enterprise include 5 variables: size (size), conflict (conflict), common transfer pricing implementation target (objective), performance evaluation, and decentralization. Also, from the analysis of organizational, environmental and new factors is financial, Susan (1997) has shown the change in income that can occur between FDI enterprises in the United States and Canada. From there, it can be concluded that if important environmental and organizational factors are missing, transfer pricing methods can be selected by FDI enterprises in Canada to meet tax regulations, favorable conditions for income change. Later, when it comes to determining the transfer pricing in the UK market, Doğan et al (2013) clearly pointed out the influencing factors including legal, political, internal and external factors. outside. Earlier, a study by Sikka & Haslam (2014) showed that improper transfer pricing practice is deeply related to social conflict. A major factor in this is that companies report higher earnings, but as a result many societies become poorer.

2.2.4. Identify research gaps

In recent years, when the Covid-19 pandemic raged, the country's economy encountered many difficulties, domestic enterprises increasingly lost money and were at risk of bankruptcy. Along with that, previous studies can see that there are a variety of methods to take advantage of the negative side of the transfer pricing determination. However, foreign research papers are not suitable because of the location and time of doing research. With domestic studies, only surveying in a locality or small area should not be accurate enough. More specifically, during this period, there has not been any research paper that has really studied the factors affecting the decision to implement transfer pricing, including the period when the Covid-19 pandemic raged and when returning to the state of transfer pricing. new normal. In addition, two factors, which are profit management and financial difficulties in previous studies, are both intermediate and unanalyzed variables that have a direct impact on transfer pricing behavior. Seeing that gap, the research team decided to choose to conduct a research project on "**Factors affecting the determination of transfer pricing of FDI enterprises in Vietnam**" with the research objective: determine the factors affecting the transfer pricing determination of FDI enterprises in Vietnam and consider the correlation of those factors with the transfer pricing implementation of enterprises.

2.2. Theoretical framework

2.2.1. Agency theory

In the current economic climate, running and managing the business is frequently used to divide firm ownership. An agency relationship develops between the two parties when the owner grants the other party decision-making authority. The concept of problem arising from separation of ownership and control in agency theory has been confirmed by Davis, Schoorman & Donaldson (1997). As Jensen & Meckling (1976) stated that agency relationships sometimes lead to problems between managers and shareholders; conflicts arise because people are essentially important players in the economy, and each wants to achieve his or her goals. Agency theory assumes that differing interests between the two parties have resulted in each party trying to maximize its own profits while shareholders expect maximum and instant returns on their investments, while agents expect rewards for their work to be met by providing appropriate incentives. It is clear from the description above that there is a propensity for agents to conduct fraud within the firm, particularly with those with whom they have unique relationships. Agents can manipulate the actual conditions of the company, such as "beautifying" financial statements using creative accounting that deviates from the rules. Applying agency theory to this study, the research team wants to emphasize that these disagreements generally stem from the basis of benefit sharing, so it can be the basis for promoting fraudulent acts in the profession, especially taking advantage of loopholes in tax policy to maximize the amount of tax payable.

2.2.2 Resources - based theory

According to the enterprise resource theory (Wernerfelt, 1984), focus on analyzing: (i) tangible resources such as financial resources which is the capital contributed by the owner and funding; (ii) intangible resources can be knowledge and skills of managers, employees. Through the ability to accumulate strategies and harness those resources, companies can achieve a competitive advantage leading to above-average returns (Barney, 1991; Das & Teng, 2000; Dietrickx & Cool, 1989; Reed & Defilippi, 1990; Rumelt, 1984). Besides that, there is also a theory of business management business, to establish a relationship between home management, shareholders and related parties in order to accomplish the overall goals of the organization, through means of monitoring and control. The effectiveness of control and inspection expressed through the quality of information disclosed in the financial statements increase interest among the parties and are the basis for economic decision making (John, 1992). Resource-based theory focuses on optimizing a firm's resources to gain competitive advantage and to win in business competition. Applying resource theory to the study helps to explain that determining the transfer pricing at each stage based on resources is different. The determination of the transfer pricing can be considered as one of the loopholes due to its subjectivity to serve the self-interest of enterprises in development policies.

2.2.3. Signaling Theory

Signaling theory introduced by Michael Spence in 1973 is used to describe the behavior of parties when dealing with dissimilar information. One party chooses how to

convey (or signal) information, and the other chooses how to interpret the information. The party with a lot of information can faithfully and reliably broadcast signals to the less informed party. On the stock market, companies can choose to make announcements and signal to users about their financial status, good business results, projects with potential for development, the choice of appropriate accounting methods, etc. to convince investors of its business situation. Businesses that provide information about the quality or value of the business to investors by showing signals through loss-making activities but still calling for investors in increasing investment, dividend policy by choosing a reputable auditing company to audit reports finance (Riley, 2001). Applying signaling theory in a research model to interpret the audit quality factor through information sources provided to interested parties to have a basic awareness of the transfer pricing policy in foreign direct investment enterprises.

3. Method

3.1. Research models

Based on the theoretical basis of the premise of previous works, the factors affecting the determination of transfer pricing of FDI enterprises are selected including: 5 factors are Profit management, Financial Difficulties, Exchange Rate, Effective Tax Rate and Audit Quality. From there, the proposed research model is shown in the figure below:

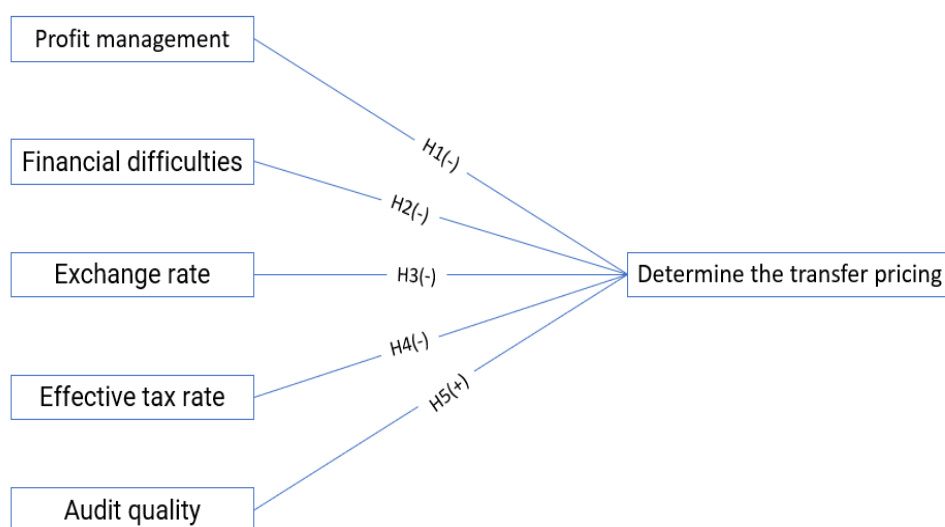

Figure 1. Research models

Source: Compiled by the author

In which:

[H1]: Profit management has a negative impact on the determination of transfer pricing of FDI enterprises

[H2]: Financial difficulties have a negative impact on the determination of transfer pricing of FDI enterprises

[H3]: Exchange rate has a negative impact on the determination of transfer pricing of FDI enterprises

[H4]: Effective tax rate has a negative impact on the determination of transfer pricing of FDI enterprises

[H5]: Audit quality has a positive impact on the determination of transfer pricing of FDI enterprises

3.2. Research Method

3.2.1. Quantitative research

All FDI enterprises listed on the Vietnam stock market are sampled in this study. Sample selection criteria:

- Enterprises publish consistent and complete financial statements from 2018-2021
- The enterprise does not suffer a loss to ensure the objectivity of all indicators in the financial statements and has all necessary information related to the calculated indicators used as variables in this study.

We find a total of 227 enterprises that satisfy the initial condition to be FDI enterprises according to the theory but can only use data from 127 enterprises that meet the criteria in our measurement method. study.

3.2.2. Data collection method

Research data is based on FDI enterprises listed on the Vietnam stock exchange. The data in the study are extracted from the audited consolidated financial statements provided by Vietstock and collected in 4 years 2018-2021 of 127 enterprises with 508 observations. The above data has been verified by auditing companies and the State Securities Commission, consistent across all different websites and information services. Data from the above 127 businesses guarantees no data gaps in any given year and is no exception. Thus, the team obtained a balanced panel data with 508 observations.

3.2.3. Data processing method

Collected data were processed by Stata software in the form of panel data model to conduct descriptive statistical analysis, find Pearson correlation coefficient and regression analysis by Pooled OLS model. However, the OLS model considers firms to be homogeneous, which can often lead to skewed estimates when these separate effects are not taken into account. With the REM and FEM models, we can control for these separate effects. The following steps are conducted, respectively, as F test, Hausman test to select the appropriate model in the Pooled OLS model, REM model or FEM model with the research model. Next, the research team carried out the model defect tests, the multicollinearity test by the VIF coefficient, the test of the variable variance phenomenon by the Breusch-Pagan Lagrangian multiplier test and the test for the phenomenon of non-variance. Correlation by Wooldridge test was used to find defects. Finally, the research team uses the correction method by FGLS model to overcome the defects, if any, and shows the results of the independent variables that affect the dependent variable in the research model.

4. Results

4.1. Descriptive statistics

Descriptive statistics were performed to test the effects of independent variables. The mean of the dependent variable for determining the transfer pricing (TP) is 0.1788. On the other hand, the mean value of the profit management variable (PM) and the financial difficulties variable (FD) are -2.9125 and 2.1671 respectively. The mean value of the impact of exchange rate variable (ER) is -0.0008 and a number also mentioned is the mean value of the effective tax rate variable (ETR) which is 0.2247. The average value of the audit quality (AQ) variable is 0.3445, which means that nearly 35% of enterprises in the sample use audit services of Big 4 auditing firms.

4.2. Pearson's correlation coefficient analysis

The correlation between the determination of transfer pricing (TP) measured through the financial difficulties variable (FD) measured through Christine Maria Monika, Naniek Noviari (2021) is significantly negative at 0.1486 in significance level of 1%. Similarly, the effective tax rate variable (ETR) also has a negative impact on the dependent variable, but at 0.0294. There is a clear negative correlation between the impact variables of the exchange rate (ER) and the audit quality variable (AQ) compared with the determination of the transfer pricing (TP), a significant positive correlation respectively at 0.0261 and 0.1184. Thus, the linear correlation of 5 independent variables including: profit management, financial difficulties, impact of exchange rate, effective tax rate and audit quality all reach the confidence level of up to 99%.

4.3. Check the fit of the model

Lagrange multiplier method (LM) with Breusch-Pagan test and Hausman test shows that the random effects model (REM) gives the best results with the research model. Comparing the three estimation models OLS, REM and FEM, the Breusch and Pagan Lagrangian tests give H₀ rejection results and Hausman results accept H₀, showing that the random estimation model (REM) is the best fit.

4.4. Check for model defects

The research team conducts a multicollinearity test by VIF coefficient and autocorrelation test by Wooldridge method. First, the group tested the phenomenon of multicollinearity using the VIF coefficient. The results of the multicollinearity test using the VIF coefficient show that the mean VIF is 1.03. The VIF coefficient < 2 indicates that the model does not have multicollinearity defects. Next, the research team tested the autocorrelation phenomenon of the series. From the results, p-value = 0.000 < 0.05, rejecting H₀ (with H₀ being the model without autocorrelation of the series). Therefore, the research model has a defect in the autocorrelation phenomenon of the series. To overcome this defect, the research team used a correction method using a practical generalized least squares regression model (FGLS).

4.5. Practical generalized least squares (FGLS) model

Table 1. Regression results by FGLS method

Variables	Normalization Coefficient	Sig
PM	-0,0008*	0,000
FD	-0,0193**	0,089
ER	0,0643	0,340
ETR	-0,0077	0,546
AD	0,0601**	0,068
cons	0,2035*	0,000

Source: Stata analysis results of the research team

*Note: * and ** indicate significance at 1% and 10%.*

After running the new study results, the team found that the profit management variable (PM) has a significant negative relationship with the determination of transfer pricing (TP) ($\alpha < 0.01$). It affects and negatively affects the determination of transfer pricing of FDI enterprises in order to minimize the amount of tax payable, so hypothesis H1 is accepted. The negative and significant association between the financial difficulties variable (FD) and the determination of the transfer pricing (TP) ($\alpha < 0.1$) supports hypothesis H2: Firms in financial difficulty will accept more risk in tax avoidance to keep capital stable. Furthermore, a significant positive association between the audit quality variable (AQ) and the determination of the transfer pricing (TP) ($\alpha < 0.1$) is clearly shown from the test results, so support hypothesis H5. The results for the variables of exchange rate (ER) and effective tax rate (ERT) show that neither of these variables has any effect on the dependent variable Y of this statistic. ($\alpha > 0.1$)

5. Discussion and Conclusion

5.1. Summary of the research results

First, the research team has clearly shown the relationship between the determination of the transfer price and the behavior of profit management. The research team's results show that profit management is a factor that has a negative impact on the determination of transfer price. It can be shown that the behavior of profit management, also known as a set of management decisions to maximize the value of the enterprise through inaccurately reflecting real profits in the short term, will be one of the factors contributing to the transfer of non-compliant prices.

Second, the group has pointed out that the financial difficulties of the enterprise is also a negative factor affecting the determination of the transfer price. The situation when an enterprise has difficulty in paying or inability to pay its due financial obligations will put the enterprise on a path of misery, approaching bankruptcy and dissolution. This can completely promote the negative aspects in determining the transfer price that is not in accordance with regulations.

Third, the authors have found a relationship between the determination of the transfer price and the exchange rate. The results given by the research team suggest that the impact

of the exchange rate does not affect the determination of the transfer price of the enterprise. The third hypothesis is not supported, it is possible that because the financial statements of the sample companies have many differential profits and losses due to exchange rates, the exchange rate is not the focus of the mining trend to determine the transfer price.

Fourth, the research team has found that the effective tax rate factor does not affect the determination of the transfer price of the enterprise. The goal of tax management can be divided into two goals, that is, the correct implementation of tax regulations and business efficiency to achieve the right profit and liquidity. Depending on each development policy and the perspective of each business based on the legal context of different countries will make different results.

Fifth, the authors have pointed out that the audit quality factor positively affects the determination of the transfer price of FDI enterprises. The quality of the audit will control the transparency and quality of a financial report, which promotes the clarity of the declarations as well as the information that the business provides on the report and reduces the risk of the transfer price.

5.2. Recommendations

5.2.1. For the earnings management factor

For *the State*, it is necessary to improve the professional level of inspection and supervision of financial reporting activities of enterprises. The State needs to create favorable conditions to improve the professional level and honesty for the resources of the tax system to carry out the task of supervising, inspecting and examining the transfer pricing performance of Vietnamese enterprises. Moreover, the State should strictly handle enterprises that commit frauds in earnings management. It is not necessary for the State to make excessive concessions to large corporations. In fact, both at the central and local levels, in order to attract large investors, the government or local authorities often have overly condescending attitudes or actions with large corporations, especially FDI enterprises or multinational corporations. This can cause concessions in tax policy for businesses.

In addition, *businesses* need to improve the control of transparency in financial reporting activities. The profit adjustment leads to incorrect accounting information and misunderstanding to information users. Each enterprise, especially FDI enterprises, are required to raise their awareness and responsibility to properly perform their obligations, understand the obligations as well as the close relationship between social responsibility and business activities.

5.2.2. For the financial difficulties factor

For *the State*, it is essential to establish financial policies to promote the development of enterprises. The State needs to be proactive, flexible and urgent in implementing quickly, effectively and comprehensively policies to stabilize the macroeconomy, control inflation, and consider solving difficulties for businesses as an important political task of the authorities at all levels. The purpose is for businesses to adapt and recover quickly after the financial crisis in order to limit, control and combat negativity in the intention to perform transfer pricing behavior. Furthermore, the State needs to supplement and improve its policy on capital market development. The capital market is an effective medium and long-term

capital mobilization channel for the economy in general. The State should continue to improve the legal system to create conditions for enterprises to develop synchronously in the capital market with the principles of respecting market rules, ensuring transparency and consistency with international practices.

Moreover, *businesses* need to focus deeply on production and business activities of products and markets. Businesses should seize opportunities, take advantage of each chance, propose plans to deal with fluctuations and financial difficulties; keep abreast of business trends; continuously improve digital transformation and apply science as well as technology in the production process, promote productivity, quality and efficiency of services and products.

5.2.3 For audit quality factor

For *the State*, it is important to continue to improve Vietnamese auditing standards. In fact, more and more foreign enterprises invest in Vietnam, so the harmonization of domestic and international accounting standards is an important requirement in line with the current trend of deep integration in Vietnam. In addition, The State needs to discuss and propose solutions to improve the quality and efficiency of the audit, especially focusing on attracting healthy foreign investment capital and clarifying the legal basis of the State audits in auditing the promulgation and implementation of the State's policies and management of foreign-invested projects. It is suggested that the State audit agency should integrate the audit of the implementation of foreign-invested projects after being licensed in order to minimize the waste of resources, promptly adjust the foreign investment capital projects that are behind schedule and apply preferential policies in illegal investment.

Besides that, *businesses* must strictly follow the audit process. FDI enterprises need to pay special attention in the preparation of financial statements, collect information and data in a complete and accurate manner, evaluate and review information. In addition, businesses are required to actively coordinate with government agencies and the State in the inspection and assessment of the audit quality of financial statements, contributing to creating a clear and transparent audit environment. FDI enterprises strengthen the responsibility of independent auditors in auditing financial statements.

FACTORS AFFECTING CHALLENGES IN APPLICATION OF ACCOUNTING SOFTWARE: A STUDY OF SMALL AND MEDIUM ENTERPRISES IN VIETNAM

Dr. Ta Thu Trang
trangtt@neu.edu.vn

School of Accounting and Auditing, National Economics University, Hanoi, Vietnam

Abstract

The paper investigates the factors affecting challenges in the application of accounting software in small and medium enterprises (SMEs) in Vietnam. The research object of the paper focuses on small and medium enterprises, which are currently applying a part of accounting software combined with manual accounting. The study carried out a survey of 144 accountants working in SMEs in Vietnam between May 2022 and August 2022. By using SPSS software to conduct exploratory factor analysis (EFA) and linear regression, the paper points out 3 factors including lack of efficiency, insufficient accounting skills and inadequate training that positively affect the challenges in the application of accounting software in SMEs in Vietnam. Based on the research results, the paper gives some recommendations to improve the application of accounting software in SMEs in Vietnam.

Keywords: *Accounting Software, Accountants, SMEs, Vietnam*

1. Introduction

In the era of information technology 4.0, accounting software plays an increasingly important role in assisting in enhancing the efficiency of operations, helping businesses save time and human resources in the operating process (Aziz et al., 2022). Accounting software is a system of computer programs to process information automatically through a software including data entry, processing transaction and reporting on the financial operations of an enterprise. When applying accounting software to help enterprises and accountants solve problems automatically and quickly related to preparing accounting books and financial statements of enterprises. Large-scale companies mainly apply accounting software to support accountants in processing transactions and financial reporting (Kurniawan and Diptyana, 2011). However, SMEs still apply manual accounting or apply a combination of manual accounting and accounting software. In addition, researches in the world and in Vietnam often study the factors affecting the application of accounting software, especially for large-scale enterprises. With the rapid development of technology, SMEs increasingly need technology for enhancing efficiency, accuracy and promptly process information for managers on a timely basis (Putra, 2019). Therefore, the topic "Research on factors affecting challenges in the application of accounting software in small and medium enterprises in Vietnam" is a practical topic and needs to be studied in order to offer solutions to support SMEs' increase in the application of accounting software.

2. Literature Review and Hypothesis Development

2.1. Literature Review

Mohd Sam (2012) studied the factors affecting the application of computerized accounting system (CAS) in SMEs in Melaka. Research results show that the adoption rate of computerized accounting system in SMEs in Melaka is high. The findings indicate that the CEO innovativeness, perceive ease of use and business competitiveness were negatively correlated with CAS adoption, but perceived usefulness was positively correlated with CAS adoption. In addition, the type of business and location of business have impact on the application of CAS. However, size (paid up capital, sales turnover and number of employees) does not affect the adopter.

Syafrudin (2012) analyzing the acceptance of accounting software from the perspective of accounting students when applying the Technology Acceptance Model (TAM). The study used factors including the perceived ease of use, the perceived usefulness, the attitude towards using, the behavioral intention to use, and the actual system usage that affect the acceptance of accounting software. The research results show that the perceived ease of use had a positive significant effect on the perceived usefulness, while the perceived usefulness had a positive significant effect on the behavioral intention to use and the behavioral intention to use had a positive effect on the actual system usage of the accounting software.

Putra (2019) studies factors affecting the interests of SMEs using accounting applications. A deductive approach is used to measure these factors. The findings of the research point out price, performance, stability, flexibility, implementation, customisation, and vendor have influence on the decision to use accounting software.

Aziz et al. (2022) interview 102 managers and IT staff of SMEs in Malaysia about the challenges in the implementation of accounting software system. The findings reveal that insufficient accounting skill and inadequate training affecting significantly implementation of accounting software. However, the lack of efficiency has no impact on application of accounting software.

In Vietnamese researches, there are several studies about factors affecting application of accounting software as following:

Thong et al. (2023) research the factors affecting the accounting software selection process of enterprises in Ho Chi Minh City. The study finds out that there are five factors affecting this selection process including user requirements, software provider, software features, cost of using technical software, and social influence. Long & Lieu (2023) study the factors affecting the use of digital accounting at small and medium-sized enterprises (SMEs) in Tra Vinh province. The study finds out 6 factors consisting of the information technology capacity of accountant, the information security, the role of government, the environment of enterprise, the cost of using digital accounting, and the perception of usefulness which have impact on the use of digital accounting at small and medium-sized enterprises (SMEs).

Through the analysis of international and Vietnamese studies, the main topics are to study the factors affecting the application of accounting software in enterprises in general, in SMEs in particular. There are few studies on the factors affecting the challenges in the application of accounting software in SMEs in Vietnam. From the research gap, the author chooses the topic title “Factors affecting challenges in application of accounting software: Study of small and medium enterprises in Vietnam”.

2.2. Hypothesis Development

Based on previous researches, three factors affecting challenges in application of accounting software in SMEs are established as following:

Lack of efficiency on the application of accounting software

The benefits of accounting software help businesses reflect data more accurately and reduce time in data processing, recording and reporting (Burgess and Paguio, 2016). Rahmawati and Puspasari (2017) point out because SMEs have fewer transactions, manual accounting is more efficient in comparison with application of accounting software. In addition, when the accounting software is deployed, there may be problems in operating the accounting software, it is possible that the accounting software in operation may be unstable, and there may be errors in data processing, leading to negative effects to submitting the entity’s financial statements. Therefore, the inefficiency of efficiency of accounting software is a factor affecting the application of accounting software in SMEs. Thus, the first hypothesis is established as follows:

Hypothesis 1: Lack of efficiency has a positive impact on the application of accounting software in SMEs

Insufficient accounting skills on the application of accounting software

With the development of science and technology, accounting software often supports accountants to process accounting data quickly and effectively. However, accounting software sometimes has errors in the processing because of the instability of the software. Therefore, in-depth accounting knowlegement support for accountants can detect errors in accounting software. The issue of accounting expertise of accountants working for SMEs is also a matter to consider compared to the lack of technical skills in using software (Pulakanam and Suraweera, 2010). Therefore, the lack of accounting skills is a factor that hinders the application of accounting software in SMEs (Aziz et al., 2022). Therefore, the second hypothesis is developed as following:

Hypothesis 2: Insufficient accounting skills has a positive impact on the application of accounting software in SMEs

Indequate training on the application of accounting software

Professional training associated with information technology is one of the important issues in generating resources of enterprises. With the 4.0 technology era, the support of computers including accounting software in processing accounting tasks becomes more

effective. Therefore, professional training in the proficient use of accounting software in SMEs is an important factor to support the successful application of software. Senior management needs attention and annual financial support for training activities related to accounting software, including software updates and support from technical experts in using computers (Ly, 2016). Aziz et al. (2022) point out that the inadequate training for accounting software usage is a challenge in the application of accounting software in SMEs. The final hypothesis is following:

Hypothesis 3: Inadequate training has a positive impact on the application of accounting software in SMEs

Based on hypothesis development, the regression model is established as following:

$$\text{CAS} = \beta_0 + \beta_1 \text{LE} + \beta_2 \text{IAK} + \beta_3 \text{IT} + \mathcal{E}$$

Where:

β_0 : Constant

$\beta_1, \beta_2, \beta_3$: Regression coefficient

LE: Lack of efficiency

IAK: Insufficient Accounting skills

IT: Inadequate training

CAS: Application of software

3. Method

Qualitative and quantitative research methods are two methods used in studying the factors that hinder the application of accounting software in SMEs.

The qualitative method is used in the form of semi-structured interviews with 10 experts such as accountants and chief accountants. Based on the interview results and combined with the previous researches, the author proceeds to build items to measure 3 independent variables and dependent variables. The author carried out the design of the survey questionnaire including 2 main parts. Part 1 is demographic information of interviewees such as gender, working experience, education level, and working position. Part 2 is the design of questions related to the items to measure dependent and independent variables.

The author uses Likert scale according to 5 levels: 1. Totally Disagree, 2. Disagree, 3. Neutral, 4. Agree; 5. Totally Agree to measure the effects of items on the independent and dependent variables. Survey mail is designed in the form of Google form and is sent to accountants and chief accountants working for SMEs. The survey period was conducted between May 2022 and August 2022 with the number of questionnaires sent out was 300. However, the number of responses was 185. After eliminating the invalid responses, the study selected 144 valid responses for data processing. SPSS 22 is used to conduct reliability testing of scales, exploratory factor analysis and linear regression analysis on factors hindering the application of accounting software in SMEs in Vietnam.

4. Results

4.1. Demographic information of responses

Table 1 shows the demographic information of interviewees. The information includes gender, working experience, education level, working position. The results of gender description show that 96 participants are female, accounting for 66.7% and 48 are male, accounting for 33.3%. This result is consistent because the number of women participating in accounting departments usually accounts for a larger proportion than men. Next in terms of working experience, the survey respondents had 5 to 10 years of experience in the accounting profession, including 48 people, accounting for 33.3%, while those with less than 5 years of experience and more than 15 years of experience. The same experiment had the same number of people as 36 people and all accounted for 25% respectively. Next is the group over 15 years old and under 5 years (all 36 people, accounting for 25%). The last is the group from 10 to 15 years with 24 people accounting for 16.7%. In terms of education level, the bachelor degree includes 102 people, accounting for 70.8%, followed by the master degree with 24 people, accounting for 16.7%, the group with at least number who had college degree with 18 people accounting for 12.5%. Regarding working positions, the number of accountants accounted for 61.8%, including 89 people while the chief accountant had 55 people (38.2%).

Table 1. Demographic information of interviewees

Gender	Frequency	Percent
Female	96	66.7
Male	48	33.3
Total	144	100
Working experience	Frequency	Percent
<5 years	36	25
5 years to 10 years	48	33.3
10 years to 15 years	24	16.7
>15 năm	36	25
Total	144	100
Education level	Frequency	Percent
College	18	12.5
Bachelor	102	70.8
Master	24	16.7
Total	144	100
Working position	Frequency	Percent
Chief accountants	55	38.2
Accountants	89	61.8
Total	144	100

Source by Author

4.2. Reliability Analysis - Cronbach's Alpha

The results of testing the reliability of the items for the LE factor show that all 5 observed variables including LE1, LE2, LE3, LE4, LE5 are reliable to measure for the lack of efficiency of accounting software factor (LE). Because Cronbach's Alpha coefficient is 0.912 which is greater than 0.7 and Corrected Item - Total Correlation coefficient is higher than 0.7 which are all greater than 0.3. Therefore, all the items have good explanations for the lack of efficiency of accounting software factor (table 2).

Table 2. Reliability Analysis - Cronbach's Alpha for LE variable

LE	Cronbach's Alpha	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted
LE1	0.912	0.788	0.889
LE2		0.756	0.896
LE3		0.806	0.885
LE4		0.745	0.899
LE5		0.782	0.891

Source by Author

The second independent variable is the Insufficient Accounting skills including 5 items from IAK 1 to IAK 5. The results of testing the reliability of the items with Cronbach's Alpha is 0.884 which is greater than 0.7 and Corrected Item - Total Correlation coefficient greater than 0.3. Cronbach's Alpha if Item Deleted of items are lower than 0.884. Thus, all items are reliable and accepted (table 3).

Table 3. Reliability Analysis - Cronbach's Alpha for IAK variable

IAK	Cronbach's Alpha	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted
IAK1	0.884	0.763	0.865
IAK2		0.665	0.879
IAK3		0.595	0.886
IAK4		0.855	0.833
IAK5		0.855	0.825

Source by Author

The third independent variable is Inadequate training. With 5 items from IT1 to IT5, the Cronbach's Alpha coefficient of the factor 0.805 means that it is greater than 0.7 and the Corrected Item-Total Correlation is greater than 0.3. Therefore, the results show that all items can explain the independence variable. No items are deleted because they are all lower than the Cronbach's Alpha coefficient of the factor (0.805).

Table 4. Reliability Analysis - Cronbach's Alpha for IT

IT	Cronbach's Alpha	Corrected Item - Total Correlation	Cronbach's Alpha if Item Deleted
IT1	0.805	0.676	0.746
IT2		0.671	0.743
IT3		0.385	0.803
IT4		0.614	0.769
IT5		0.739	0.718

Source by Author

4.3. Exploratory factors analysis

The results of the EFA analysis for the independent variables are accepted because the KMO coefficient = 0.666 > 0.5, sig Barlett's Test = 0.000 < 0.05. The total variances of the 3 factors explained is 70.41% > 50%, thus, the 3 factors extracted explain 63.357% of the data variation of the items participating in EFA (table 5).

Table 5. Exploratory factors analysis for Independent factors

	Component		
	1	2	3
IAK4	0.921		
IAK5	0.847		
IAK2	0.801		
IAK1	0.789		
IAK3	0.774		
LE3		0.878	
LE5		0.86	
LE1		0.852	
LE4		0.836	
LE2		0.835	
IT1			0.823
IT5			0.812
IT4			0.755
IT2			0.674
IT3			0.601
KMO		0.666	
Total variance explained		70.41%	

Source by Author

4.4. Correlation analysis

The results of the correlation analysis show that CAS is positively correlated with the independent variables (correlation coefficients are all positive). CAS has the strongest correlation with IAK (0.548), followed by IT (0.457) and LEE (0.397). However, to find out the relationship of the variables to the dependent variable (CAS), the research performs regression analysis in the following step. It is concluded that the independent variables are all correlated with CAS.

Table 6. Correlation analysis

	CAS	LE	IT	IAK
CAS	1			
LE	.397**	1		
IT	.457**	.264**	1	
IAK	.548**	.178*	.381**	1
** Correlation is significant at the 0.01 level (2-tailed).				
* Correlation is significant at the 0.05 level (2-tailed).				

Source by Author

4.5. Analysis of regression model

Regression analysis results show that the model does not have multicollinearity with VIFs being less than 2. Therefore, it is appropriate to include independent variables which are appropriate for this model.

The P-value of the F test = 0.000 indicates that the model is suitable. At the same time, R²=0.436 shows the model explaining 43.6% for CAS.

The results show that the independent variables all have the same effect on CAS (positive regression coefficient Beta (B) and statistically significant P-value are both less than 0.05). Specifically, IAK has the strongest effect on CAS with regression coefficient B = 0.413. The variable (LE) has the second strongest effect on CAS (regression coefficient B = 0.263) and IT has the third lowest impact on CAS with regression coefficient B = 0.231 (table 7).

Table 7. Analysis of regression model

	Unstandardized Coefficients		Standardized Coefficients	T	P-value	VIF
	B	Std. Error	Beta			
(Constant)	-0.742	0.466		-1.593	0.113	
LE	0.181	0.046	0.263	3.978	0.000	1.083
IT	0.265	0.081	0.231	3.28	0.001	1.227
IAK	0.705	0.118	0.413	5.989	0.000	1.179
a Dependent Variable: CAS						
F- statistic (ANOVA)			0.000			
R-square			0.436			

Source by Author

Therefore, the regression equation of CAS is established as follows:

$$\text{CAS} = 0.263\text{LE} + 0.231\text{IAK} + 0.413\text{IT}$$

5. Discussion and Conclusion

Through the results of regression model, three factors including lack of efficiency, insufficient accounting skills, inadequate training positively affect the challenges in application of accounting software of SMEs in Vietnam.

The factor that has the biggest impact on hindering the application of accounting software is inadequate training for the application of accounting software. The results are consistent with the study of Aziz et al. (2022). Qualifications of accountants are limited in operating and using accounting software. Because SMEs are businesses with limited investment in training due to the company's size and inadequate financial resources. Lack of training in software operation leads to difficulties in understanding the use of the software and when errors occur in data extracted from accounting software, it will cause pressure and stress for accountants to detect misstatements. Therefore, the leadership of the enterprises needs to have a specific policy in allocating the annual budget for training on operating accounting software and having a technical team to support when accountants have difficulties in operating accounting software.

The second factor that affects the positive direction to hinder the application of accounting software in SMEs is the lack of efficiency of accounting software. The results of this study point out outputs of the accounting software are also several errors in the system such as accounting errors in recording accounting transactions or transferring information from vouchers to accounting books. Therefore, affecting the progress and timing of issuing financial statements of enterprises. Therefore, SMEs need to have a policy to coordinate with accounting software providers to check and upgrade the quality of accounting software, promptly support and correct errors in the processing data so that the entity's financial statements are issued on time.

The third factor is insufficient accounting skill, which has the positive effect with lowest level to challenge the application of accounting software. The research results are completely consistent with the research results of Aziz et al. (2022). SMEs are often small-scale enterprises, so they often cut down on training costs such as training courses to update changes in accounting policies. However, operating accounting software is always updated according to changes in accounting policies, so it creates difficulties for accountants in applying accounting software. Therefore, businesses need to have policies to support investment in training people not only in IT skills but also in specialized skills related to accounting.

The paper also has several limitations. The study focuses on SMEs in the application of accounting software. Therefore, future research can expand the sample size of SMEs. With the development of information technology, new research will need further study such as application of ERP in SMEs.

Abstract

This study was conducted to investigate the differences in corporate income tax (CIT) in different contexts, including Thailand, the United States of America (USA), Hong Kong and Vietnam. Secondary data are collected from the corporate income tax legal frameworks of the above countries. We employ at-desk review and interviews on different aspects of CIT. The results reveal that there are big differences in the recognition, measurement and reporting of corporate income tax in various contexts. Based on the findings, some recommendations are proposed for minimizing the big gaps of CIT in Vietnam in order to be consistent with the tax legal frameworks in the world.

Keywords: *Corporate income tax; Thailand; USA; Hong Kong; Vietnam; tax framework.*

1. Introduction

A corporate tax, also called corporation tax or company tax, is understood as a type of direct tax levied on the income or capital of firms other similar legal entities. The tax is usually imposed at the national level, but it may also be imposed at state or local levels in some countries. Corporate taxes may be referred to as income tax or capital tax, depending on the nature of the tax.

The objective of corporate tax is to generate revenue for the government by taxing the profits earned by firms. Surprisingly, the tax rate varies from country to country and is usually calculated as a percentage of the firm's net income or capital. Corporate tax rates may also differ for domestic and foreign firms as well.

Many countries have tax laws that require corporations to pay taxes on their worldwide income, regardless of where the income is earned. However, some countries have territorial tax systems, which only require corporations to pay taxes on income earned within the country's borders.

In countries around the world, corporate income tax plays a particularly important role in ensuring stable state budget revenues and income distribution. Tax rates applicable to entities subject to corporate income tax vary from country to country. The tax policies applied to depend on the perspective of income regulation and the goals set in the income distribution of each country in each historical period.

In this study, we conduct an in-depth study on corporate income taxes being applied in Thailand, China, Singapore, and Vietnam. First, the main content of this tax of each country will be explained in detail. In the following, some comparisons are conducted among four countries to discover the differences of CIT.

2. Conceptual Framework

2.1. Framework of corporate income tax of Thailand

CIT rates

Corporate income tax in Thailand is regulated by the Revenue Code. The Revenue Department of the Ministry of Finance is responsible for tax administration. The corporate income tax rate in Thailand is 20% of net profit applied from the 2015 to present accounting period. Depending on the type of taxpayer, this rate is adjusted in Table 1, below:

Table 1. Type of taxpayers

Taxpayers	Tax Base	Rate (%)
Small company (A small company refers to any company with paid-up capital less than 5 million baht at the end of each accounting period.)	Net profit less than 300,000 baht	exempted
	Net profit from 300,000 not exceeding 3 million baht	15%
	Net profit over 3 million baht	20%
- Companies listed in Stock Exchange of Thailand	Net profit	20%
- Company newly listed in Market for Alternative Investment (MAI)		
- Companies newly listed in Stock Exchange of Thailand (SET)		

Source: The Revenue Department (2023)

Taxable income

In the case of enterprises conducting production and business in Thailand, the taxable income is the net profit. The company's net profit is determined by taking all the revenue generated or the result of business activities performed in an accounting period and subtracting deductible expenses according to the conditions prescribed by the Revenue Code.

Some of the following business income is subject to specific business taxes. The tax rate for these activities is 0.1% or 2.5% or 3.0% on income. The specific activities are:

- Banking activities in accordance with the law on commercial banks or specific laws;
- Financial business activities: securities trading, credit business According to the law on financial business, securities trading and credit extension;

- Life insurance in accordance with the law on life insurance;
- Accept pawnshops in accordance with the law on pawnshops;
- Carrying out normal business activities such as commercial banks such as lending money, guaranteeing, exchanging foreign currencies, issuing, buying and selling promissory notes or sending money abroad by various methods;
- Sale of real estate is commercial or profitable;
- Sell securities in accordance with the laws governing the Stock Exchange of Thailand on the stock market;
- Other enterprises according to the provisions of the Royal Decree.

Tax incentives

There are several types of legal entities that are subject to corporate income tax under the Revenue Code but are exempt from corporate income tax including:

- A company or a partnership under the obligations that Thailand has under the economic cooperation contract. or technical between the Thai government and the foreign government;
- Limited liability companies are exempt from income tax under the investment promotion law;
- A limited liability company and a legal entity of the same nature as a limited liability company incorporated under the laws of Thailand or abroad. The country is exempt from corporate income tax under the Petroleum Income Tax Act;
- Companies or partnerships based in countries that have double taxation agreements with Thailand. Subject to the conditions set forth in the Convention

Deductible Expenses and Non-deductible expenses

Deductible expenses are as follows:

- Ordinary and necessary expenses. However, the deductible amount of the following expenses is allowed at a special rate: 200% deduction of Research and Development expense, 200% deduction of job training expense, 200% deduction of expenditure on the provision of equipment for the disabled;
- Interest, except interest on capital reserves or funds of the company;
- Taxes, except for Corporate Income Tax and Value Added Tax paid to the Thai government;
- Net losses carried forward from the last five accounting periods;
- Bad debts;
- Wear and tear;
- Donations of up to 2% of net profits;

- Provident fund contributions;
- Entertainment expenses up to 0.3% of gross receipt but not exceeding 10 million baht;
- Further tax deduction for donations made to public education institutions, and also for any expenses used for the maintenance of public parks, public playgrounds, and/or sports grounds;
- Depreciation: Provided that in no case shall the deduction exceed the following percentage of cost according to regulations.

Non-deductible expenses include:

- Reserves (with some exceptions):
 - Fund except provident fund under the rules, procedures and conditions prescribed by Ministerial regulations;
 - Expense for personal, gift, or charitable purpose except expense for public charity, or for public benefit;
 - Entertainment or service fees;
 - Capital expense or expense for the addition, change, expansion or improvement of an asset but not for repair in order to maintain its present condition;
 - Fine and/or surcharge, criminal fine, income tax of a company or juristic partnership;
 - The withdrawal of money without remuneration of a partner in a juristic partnership;
 - The part of the salary of a shareholder or partner which is paid in excess of the appropriate amount;
 - Expense which is not actually incurred or expense which should have been paid in another accounting period except in the case where it cannot be entered in any accounting period, then it may be entered in the following accounting period;
 - Remuneration for assets which a company or juristic partnership owns and uses;
 - Interest paid to equity, reserves or funds of the company or juristic partnership itself;
 - Damages claimable from insurance or other protection contracts or loss from previous accounting periods except net loss carried forward for five years up to the present accounting period;
 - Expense which is not for the purpose of making profits or for the business;
 - Expense which is not for the purpose of business in Thailand;
 - Cost of purchase of asset and expense related to the purchase or sale of an asset, but only the amount in excess of normal cost and expense without reasonable cause;
 - Value of lost or depleted natural resources due to the carrying on of business;
 - Expense in which a payer cannot identify the recipient;
 - Any expense payable from profits received after the end of an accounting period.

2.2. Framework of corporate income tax of the China

CIT rates

The standard CIT rate is 25%, applicable to resident enterprises and non-resident enterprises with income-generating establishments in China. Special tax rates may apply to businesses in specific industries, businesses established in certain regions of Mainland China and engaging in encouraged business activities, including Small-scale enterprises are entitled to a tax rate of 20%, 10% or 2.5% if certain requirements are met; Western qualified enterprises; or qualified High New Technology Enterprises (HNTE) or Advanced Technology Services Enterprises (TASE); or qualified enterprises in the field of pollution prevention are entitled to the tax rate 15%.

Taxable income

Taxable income includes income from the sale of goods; income from the provision of labour services; income from the transfer of property; benefits from equity investment, such as dividends and bonuses; interest income; rental income; income from royalties; income from donations; and income from other sources.

Tax incentives

The State implements preferential tax policies with respect to the industries and projects which have the major support and the development of which is encouraged by the State.

The following income of an enterprise shall be income exempted from tax: income from interest on government bonds; income from equity investment, such as dividends and bonuses, between qualified resident enterprises; income from equity investment, such as dividends and bonuses, which is received from a resident enterprise by a non-resident enterprise that has institutions or establishments in China, and which is actually relevant to the said institutions or establishments; and income of a qualified non-profit organization.

Tax on the following income of an enterprise may be exempted or reduced: income earned from agriculture, forestry, animal husbandry and aquaculture projects; income from investment in and operation of infrastructure projects which have the major support of the State (tax exemption for the first three years and CIT reduction of 50% for the next three years, starting from the year in which the project generates its first operating income); income earned from qualified projects of environmental protection or energy and water conservation (tax exemption for the first three years and 50% CIT reduction for the next three years, starting from the year in which the project generates its first operating income); and income from qualified technology transfer.

Preferential tax rates

For qualified small and thin-profit enterprises

From January 1, 2019, to December 31, 2021, small and low-profit enterprises can enjoy a 20% CIT rate on 25% of their taxable income amount for the proportion of taxable income not exceeding RMB 1 million; and a 20% CIT rate on 50% of their taxable income amount of more than RMB 1 million but not exceeding RMB 3 million.

From January 1, 2021, to December 31, 2022, for the portion of taxable income not exceeding RMB 1 million, the amount of taxable income can be halved from 25% to 12.5%, and the CIT will be levied at 20%. As a result, the effective CIT rate for the portion of taxable income not exceeding RMB 1 million will be reduced from 5% to only 2.5%.

From January 1, 2023, to December 31, 2024, for the portion of taxable amount of more than RMB 1 million but not exceeding RMB 3 million, the amount of taxable income be halved from 50% to 25%, and the CIT will be levied at 20%.

Companies that qualify as “high-tech” are identified by tax authorities are entitled to a tax rate of 15%.

Specific areas with preferential tax treatments. Preferential tax treatments are provided in specific areas, including: Minority autonomous areas; special economic zones plus Shanghai Pudong New Area; western region; Hengqin New Area, Pingtan Comprehensive Experimental Area and Qianhai Shenzhen-Hong Kong Modern Service Industry Cooperation Zone; Shanghai Pilot Free Trade Zone (SPFTZ); Hainan Free Trade Port (FTP), these companies may be reduced or exempted from taxes or entitled to a tax rate of 15%.

Additional deduction incentives

An additional 50% of research and development costs incurred during the development of new technologies, new products and new technological processes, if not capitalized as an intangible asset, can be deducted from income taxes. If capitalized as an intangible asset, these costs can be allocated based on 150% of the capitalization. 75% of research and development costs can be deducted from taxable income for Technology-based SMEs

An additional 100% of the cost of wages paid to disabled employees can be deducted from taxable income

Deductible Expenses and Non-deductible expenses

Deductible Expenses

When calculating the amount of its income taxable, an enterprise may deduct its reasonable expenses which are actually incurred in relation to its income earned, including, among other items, the costs, fees, tax payments, and losses. In addition, an enterprise may deduct its expenses incurred due to donations for public welfare, provided that the portion involved is not more than 12% of the total amount of its annual profits.

Non-deductible expenses

When calculating the amount of taxable income, the following expenses may not be deducted: monies from equity investment paid to investors, such as dividends and bonuses; payment of enterprise income tax; fines for delaying tax payment; losses caused by penalties, fines, and property confiscation; expenses due to donations other than what is specified in Article 9 of The Law of the People’s Republic of China on Enterprise Income Tax (2007); sponsorship expenses; non-verified reserves; depreciation of fixed assets is not in accordance with regulations and other expenses irrelevant to the income earned.

2.3. Framework of corporate income tax of Singapore

Tax rates

The Singapore government takes a progressive and growth-promoting approach in many of its policies, all to attract foreign investors and entrepreneurs to do business here. Taxes Corporate income tax (CIT) has been continuously decreasing over the years and up to now. More than 20 years ago in 1997, this rate was much higher than the 26% tax rate, which has been continuously cut and is currently fixed at 17%.

Taxable income

Your company has to pay tax in Singapore on taxable income that is: accrued in or derived from Singapore; or received in Singapore from outside Singapore.

For Singapore tax purposes, taxable income refers to:

- Gains or profits from any trade or business;
- Income from investment such as dividends, interest and rental;
- Royalties, premiums and any other profits from property;
- Other gains that are revenue in nature

Income Received in Singapore from Outside Singapore

Under Section 10(25) of the Income Tax Act 1947, income from outside Singapore is considered received in Singapore when it is:

- Remitted to, transmitted or brought into Singapore;
- Used to satisfy any debt incurred in respect of a trade or business carried on in Singapore; or
- Used to purchase any movable property (such as equipment, raw material, etc.) brought into Singapore.

Tax incentives

Singapore is known as a regional startup hub because of its business-friendly environment and policies, and a government policy to promote the growth and expansion of businesses is the numerous tax incentive schemes that provide tax exemptions and/or deductions to eligible companies, there are outstanding tax incentives in Singapore:

Tax exemption scheme for new start-up companies

The tax exemption scheme for new start-up companies was introduced under Section 43 of the Income Tax Act 1947 in the Year of Assessment (YA) 2005 to support entrepreneurship and to grow our local enterprises. It was announced in Budget 2018 that the tax exemption under the scheme would be revised with effect from YA 2020, as other support for companies to build their capabilities have been strengthened.

The tax exemptions for qualifying companies for their first 3 consecutive YAs are as follows: 75% exemption on the first \$100,000 of normal chargeable income and a further 50% exemption on the next \$100,000 of normal chargeable income.

This exemption scheme applies to qualifying companies only for their first 3 consecutive YAs. From the fourth YA onwards, companies can enjoy the partial tax exemption: 75% exemption on the first \$10,000 of normal chargeable income and a further 50% exemption on the next \$190,000 of normal chargeable income.

Productivity and Innovation Credit (PIC) scheme, which grants business owners with businesses that invest in activities involving innovation with a tax reduction. This scheme supports businesses to continuously invest in innovation to improve productivity and operational efficiency. The incentive for activities listed above is a 400% tax deduction, with a maximum of SGD 400,000, of the expenses spent on the activities each year. Companies that qualify for the PIC+ scheme are allowed a maximum of SGD 600,000.

Investment Allowance Incentive. this allows businesses to enjoy a tax exemption of up to 100% on fixed capital expenditure incurred, which is expenditure incurred for qualifying projects within a five-year period and can be extended to a maximum of eight years. The types of expenditure that are covered by the investment allowance include acquiring patents and know-how, building factories in Singapore and new production equipment.

Pioneer Tax Incentive applies to businesses engaging in high-value-added products or services and grants a tax exemption from five to 15 years for each qualifying project or activity.

Development and Expansion Incentive. Once the period for the Pioneer Tax Incentive has ended, businesses can apply for the Development and Expansion Incentive (DEI). This incentive allows businesses that engage in new high-value-added projects, undertake incremental activities or expand or upgrade their operations to be entitled to a reduced rate of not less than 5% of their profits for up to 10 years. The total tax relief period is up to a maximum of 40 years.

Double Tax Deduction Scheme for Internationalisation

Companies that intend to expand overseas can benefit from the Double Tax Deduction Scheme for Internationalisation (DTD_i). The DTD_i supports four key categories of a company's overseas expansion, which include market preparation, market exploration, market promotion and market presence. This scheme grants businesses a 200% tax deduction on the first SGD 150,000 that is made on expenses for international expansion and investment development activities. Expenses that exceed SGD 150,000 require Enterprise Singapore's (ESG) approval.

Deductible Expenses and Non-deductible expenses

Deductible Expenses

Deductible business expenses are those 'wholly and exclusively incurred in the production of income'. They must satisfy all these conditions:

- The expenses are solely incurred in the production of income;
- The expenses are not a contingent liability i.e. they do not depend on an event that may or may not occur in the future. In other words, the expenses must be incurred. An

expense is 'incurred' when the legal liability to pay the expense arises, regardless of the date of actual payment of the money;

- The expenses are revenue, and not capital, in nature;
- The expenses are not prohibited from deduction under the Income Tax Act 1947.

The IRAS allows enterprise to declare the following as deductible business expenses: water and electricity costs; employees' wages; transport and travel costs for business assignments; telephone bills; tax fees, including the service fees that enterprise pay a tax agent, medical expenses (restricted to 1%/ 2% of total remuneration if company is under Portable Medical Benefits Scheme or Transferable Medical Insurance Scheme)",...

Non-deductible expenses

Non-deductible business expenses are activities pay for that do not fulfil the conditions above, include:

- Withholding tax on the interest payments paid by companies on-behalf of non-residents;
- Retrenchment payments such as ex-gratia retrenchment payments and outplacement support costs - in the event of a complete business cessation;
- Provision for obsolete stocks;
- Provision for bad and doubtful debts;
- Private vehicle hire;
- Private and domestic expenses that are not incurred for business purposes;
- Prepaid expenses;
- Penalties;
- Motor vehicle expenses for S-plated and RU-plated cars;
- Legal and professional fees for non-trade or capital transactions;
- Interest expenses on non-income-producing assets;
- The installation of fixed assets;
- Singapore income tax and any tax on income in a country outside Singapore;
- Impairment loss on non-trade debts;
- Goodwill payments;
- Fines;
- Acquiring fixed assets.;
- Bills before the commencement of business;
- Exchange loss (non-trade or capital in nature);
- Donations;
- Dividend payments made on preference shares;
- Digital taxes imposed as income taxes;
- Interest incurred on late CPF contributions;
- Voluntary contributions to CPF;
- Certificate of Entitlement (COE) for motor vehicles;
- Bad debts (non-trade debtors);
- Amortisation.

2.4. Framework of corporate income tax of Vietnam

CIT rates

The normally corporate income tax rate applicable to enterprises in Vietnam is 20% on assessable income (applicable for the accounting period from 2016 to present). However, rates for the oil and gas, and other extractive industries, can vary from 32% to 50%. From July 1, 2023 (when the Petroleum Law 2022 takes effect), the tax rates of petroleum industries and fields, or the search, exploration and exploitation of precious resources will from 25% to 50%.

Taxable income

Taxable income is equal to turnover minus deductible expenses of production and business activities plus other incomes, including incomes received outside Vietnam.

Other incomes include: income from the transfer of capital, transfer of the right to contribute capital; income from the transfer of real estate, transfer of investment projects, transfer of the right to participate in investment projects, transfer of the right to explore, exploit and process minerals; income from property use rights, property ownership, including income from intellectual property rights as prescribed by law; incomes from the transfer, lease or liquidation of assets, including valuable papers; income from interest on deposits, loans and foreign currency sales; receivables from bad debts that have been written off and are now recoverable; receivables from liabilities whose owners cannot be identified; omitted business income of previous years and other income.

Tax incentives

Some businesses enjoy preferential CIT rates. Preferential tax rates are 10%, 15% and 17%. This preferential tax rate applies to businesses operating in fields such as education - training, vocational training, health care, culture, sports and environment, and newly established enterprises from investment projects. Investment in areas with difficult socio-economic conditions or high-tech enterprises. The incentive period can last up to 15 years or for the duration of the business operation.

Income from certain activities is tax-exempt, including:

- Incomes from cultivation, husbandry, farming, processing of agricultural and aquatic products, and salt production of cooperatives; income of cooperatives operating in the fields of agriculture, forestry, fishery and salt production in areas with difficult socio-economic conditions or in areas with extremely difficult socio-economic conditions; incomes of enterprises from cultivation, animal husbandry, farming and processing of agricultural and aquatic products in areas with extremely difficult socio-economic conditions; income from fishing activities.
- Income from performing technical services directly serving agriculture;
- Incomes from the performance of contracts for scientific research and technological development, products under trial production, and products made from new technologies applied for the first time in Vietnam;

- Incomes from the production and trading of goods and services of enterprises with 30% of the average number of employees in the year or more are disabled people, people after detoxification, and people infected with viruses that cause depression syndrome. reduce human acquired immunity (HIV/AIDS) and have an average number of employees in a year of twenty or more, excluding businesses operating in the financial sector and real estate business;
- Incomes from vocational training activities exclusively for ethnic minorities, disabled people, children in extremely difficult circumstances, and subjects of social evils;
- Dividend income from capital contribution, joint venture or association with domestic enterprises, after having paid corporate income tax in accordance with this Law;
- The grant received is used for educational activities, scientific research, culture, art, charity, humanitarian and other social activities in Vietnam;
- Income from the transfer of emission reduction certificates (CERs) of enterprises granted emission reduction certificates;
- Incomes from the performance of tasks assigned by the State of Vietnam Development Bank in the activities of development investment credit, and export credit; income from credit activities for the poor and other policy beneficiaries of the Bank for Social Policies; income from state financial funds and other state funds operating for non-profit purposes as prescribed by law; income of organizations in which the State owns 100% of charter capital, established by the Government to handle bad debts of Vietnamese credit institutions;
- The undivided income of an establishment performing socialization in the fields of education - training, health care and other socialized fields shall be left for investment in the development of that establishment in accordance with the provisions of specialized law on the field of socialization. education - training, health and other socialization fields; part of income forming undivided assets of cooperatives established and operating under the provisions of the Law on Cooperatives;
- Income from technology transfer in the fields of priority transfer to organizations and individuals in areas with extremely difficult socio-economic conditions.

Deductible Expenses and Non-deductible expenses

Deductible Expenses

Except for expenses specified in non-deductible expenses, enterprises may deduct all expenses when determining taxable income if the following conditions are fully satisfied:

- Actual expenses incurred in connection with production and business activities of the enterprise; expenses for vocational education activities; expenditures for performing defence and security tasks of the enterprise in accordance with law;
- Expenses with sufficient invoices and documents as prescribed by law. For goods and service purchase invoices, each time with a value of twenty million dong or more, a non-cash payment voucher is required, except for cases where a non-cash payment document is not required according to regulations of the Law.

Non-deductible expenses

Expenses that are not deductible when determining taxable income include:

- Expenditures that do not fully satisfy the conditions specified in Deductible Expenses, except for the value of losses due to natural disasters, epidemics and other force majeure cases, which are not compensated;
- Fines for administrative violations;
- Expenses to be covered by other funding sources;
- The portion of business administration expenses allocated by the foreign enterprise to the permanent establishment in Vietnam in excess of the amount calculated according to the method of allocation prescribed by Vietnamese law;
- Expenses in excess of the provisions of the law on provisioning;
- The interest payment on loans for production and business of entities other than credit institutions or economic organizations exceeds 150% of the basic interest rate announced by the State Bank of Vietnam at the time of payment;
- Depreciation of fixed assets is not in accordance with the provisions of law;
- The advance deduction for expenses is not in accordance with the provisions of the law;
- Salaries and wages of private business owners; remuneration paid to enterprise founders who are not directly involved in the production and business management; salaries, wages and other expenditures to pay employees but in fact do not pay or do not have invoices and documents as prescribed by law;
- The portion of interest payment on the loan in proportion to the deficit of charter capital;
- The deducted input value-added tax, value-added tax paid by the credit method, corporate income tax;
- Grants, except for grants for education, health care, scientific research, disaster recovery, building houses of great solidarity, houses of gratitude and houses for policy beneficiaries as prescribed by law. legislation, grants under the State's program for localities in areas with extremely difficult socio-economic conditions;
- The deduction and payment to the voluntary retirement fund or the fund of a social security nature, purchase of voluntary retirement insurance for employees in excess of the limit prescribed by law;
- Expenses for business activities: banking, insurance, lottery, securities and some other specific business activities as prescribed by the Minister of Finance.

3. Differences among corporate income tax in four countries

3.1. CIT rates

In Thailand, the corporate income tax rate is 20%. In addition, depending on the type of business, this tax rate is adjusted to be 0% or 15%.

The standard tax rate in Vietnam is also 20%, however for the oil and gas industry and mining industries, this rate can be up to 50%.

In China, the general corporate income tax rate is quite high, this rate is 25%. However, for small and medium enterprises, preferential tax rates can be applied: 2.5%, 5%, 10%, and 20% ; while Singapore is one of the countries with the lowest corporate tax rate in the world, the corporate income tax rate in this country is 17%.

Furthermore, regarding the CIT rate for small and medium enterprises, this rate in Vietnam is 20%, in Thailand is 0% or 15%, Singapore is 17%... it can be seen, in the income tax of small and medium enterprises, Vietnam is higher than most countries in the region.

3.2. Taxable incomes

In all 3 countries including China, Singapore, and Vietnam, taxable income is determined as Taxable income equal to turnover plus other incomes, including incomes received outside the territory minus deductible expenses of production and business activities. Other incomes include income from real estate transfer, income from loans, interest on deposits, and income from the capital transfer.

In the case of Thailand, ordinary business income is determined as taxable income and the CIT rate applies. Meanwhile, other incomes such as income from real estate transfer, income from securities sales, and income from lending are specified as specific business taxable income. The tax rate for these activities is 0.1% or 2.5% or 3.0% on income.

3.3. Tax incentives

In general, tax incentives in the four countries have many similarities such as incentives for new investment projects, and investment expansion; incentives for businesses in difficult economic areas; tax incentives to encourage research and development; incentives for businesses applying high technology. However, there are differences in tax incentives for small businesses and low-profit or newly established businesses, specifically: In Thailand Lan, the government has introduced a preferential tax rate for small and medium enterprises of 0% or 15%, respectively, corresponding to the level of net profit.

Similar to Thailand, the Chinese government also has corporate income tax incentives for small businesses or low-profit businesses, specifically: small and low-profit businesses can enjoy a tax CIT rate of 20% on 12.5% of their taxable income on the portion of their taxable income not exceeding RMB 1 million and a CIT rate of 20% on 25% of their taxable income over RMB 1 million but not exceeding more than 3 million RMB. Singapore also has tax incentives to support start-ups such as 75% exemption for the first \$ 100,000 of ordinary taxable income and an additional 50% exemption for the next \$ 100,000 of taxable income. From the fourth YA onwards, companies can get a 75% exemption for the first \$10,000 in ordinary taxable income and an additional 50% exemption for the next \$190,000 in ordinary taxable income.

Meanwhile, currently, Vietnam does not have specific preferential policies for small and medium enterprises. Although in 2021, the Vietnamese government has a

policy to reduce 30% of the payable corporate income tax amount of the corporate income tax period of 2021 for the case of enterprises mentioned above, having turnover in the tax period. The year 2021 is not more than 200 billion VND and the revenue in the tax period 2021 decreases compared to the revenue in the tax period 2019. The criterion that the revenue in the tax period 2021 decreases compared to the revenue in the tax period does not apply to the year 2019 for the case of newly established, consolidated, merged, divided, or split enterprises in the tax period 2020 and 2021. However, by 2022, this preferential policy is no longer valid.

3.4. Deductible Expenses and Non-deductible expenses

Regulations on deductible and non-deductible expenses in different countries have some similarities. Deductible expenses are actual and reasonable expenses incurred in connection with earned income, including expenses not exceeding the allowable limit, fees, taxes and losses. Expenses that are not deductible according to the regulations of other countries are usually expenses that do not serve business activities, expenses for business management activities but exceed the permissible limits, and fines for violations. administrative violations, the expenses cannot be verified.

In terms of Vietnam, most of the expenses of an enterprise are deductible when determining taxable income if the following conditions are fully met:

(i) Actual expenses incurred in connection with production and business activities of the enterprise; expenditure on vocational education activities; expenses for performing defence and security tasks of the enterprise as prescribed by law;

(ii) Expenses with sufficient invoices and documents as prescribed by law. For goods and service purchase invoices with a value of twenty million dong or more each time, a non-cash payment voucher must be provided, unless a non-cash payment document is not required as prescribed under the law.

In Thailand, rate-controlled expenses include research and development expense, job training expense, expenditure on the provision of equipment for the disabled; Donations; Entertainment expenses. In China, donations for public welfare are also a rate-controlled expense, and the portion involved is not more than 12% of the total amount of its annual profits. In Singapore, medical expenses are restricted to 1% or 2% of total remuneration if company is under Portable Medical Benefits Scheme or Transferable Medical Insurance Scheme. In Vietnam, rate-controlled expenses include The interest payment on loans for production and business of entities other than credit institutions or economic organizations which exceed 150% of the basic interest rate announced by the State Bank of Vietnam at the time of payment.

Salaries and wages of private business owners is non-deductible expense in Vietnam, while in Thailand, Singapore, and China, this expense is deductible.

Provisions if they meet all conditions as prescribed, such as provision for obsolete stocks and provision for bad and doubtful debts will be deductible expenses when

determining CIT in Vietnam, Thailand, China; however, these provisions are non-deductible expenses in Singapore.

In short, through this study, it can be concluded that there are still some major differences between the corporate income tax regulations in Thailand, China, Singapore and Vietnam. The difference lies in the tax rate, taxable income, tax incentives and deductible expenses, and non-deductible expenses. In the near future, further studies will be conducted to explore more corporate income tax items and compare them with different contexts such as Asian countries; or countries with some common characteristics of emerging countries such as Vietnam. Understanding the regulations on corporate income tax not only in Vietnam but also in countries in the region such as Thailand, China, and Singapore are very important for those who will work in the economic field.

The results of this study open up a number of perceptions and ideas for stakeholders. In the coming time, policymakers need to study in detail the international tax legal framework in general and corporate income tax in particular, and actively develop and issue a tax legal framework suitable for the current international framework.

FACTORS AFFECTING THE SUSTAINABILITY DISCLOSURE IN CONSTRUCTION ENTERPRISES LISTED ON THE VIETNAM STOCK MARKET: A BINARY LOGISTIC REGRESSION ANALYSIS

Dr. Dang Thu Hang

hangdt@utt.edu.vn

Dr. Do Thi Huyen

huyendt@utt.edu.vn

Faculty of Transport Economics, University of Transport Technology, Hanoi, Vietnam

Abstract

This study aims to estimate the influence of factors on the publication of sustainability reports in construction enterprises listed on the Vietnam stock market. Data is collected from financial statements of 49 construction enterprises listed on Vietnam stock market from 2012 to 2022. In this study, the dependent variable is the publication of sustainability reports (SR) of construction enterprises listed on the stock market. The independent variables include Firm size Auditing, Growth opportunities, Current ratio variable, Return on total assets, Revenue growth. Variable test cover include Type of business, Firm age. The research results show that the publication of sustainability reports in construction enterprises listed on the stock market is influenced by the size of the enterprise, the type of enterprise and the development opportunities of the enterprise. Meanwhile, the variables of profitability, current solvency, age of the enterprise, and audit do not affect whether the enterprise publishes or does not publish the sustainability report.

Keywords: *Sustainable development Sustainability report, Construction enterprise*

1. Introduction

Most countries in the world are facing imbalance problems when the economy is growing but the environment is increasingly polluted; cultural and moral decline. Unsustainable economic growth increases the gap between rich and poor, leading to instability in society (Sachs (2015)). Therefore, it is necessary to harmonize economic growth with environmental protection and social security. Sustainable development is becoming an urgent requirement for all mankind. (Haines at el. (2012)).

Sustainable development is a development process with a close, reasonable and harmonious combination of three aspects of development, including: economic development, social development and environmental protection (Robert at el (2005)). Economic development focuses on economic growth. The focus of social development is to realize social progress and justice; poverty alleviation and job creation. Environmental protection is concerned with treatment, remediation of pollution, restoration and improvement of environmental quality; fire prevention and deforestation; rational exploitation and economical use of natural resources (Sachs (2015)).

Sustainability reporting is a tool to help businesses publish information on sustainability (Bini & Bellucci (2020)). According to Thijssens et al. (2016), the application of sustainability indicators and the preparation of sustainability reports is one of the necessary and effective tools and platforms. It helps businesses re-evaluate their overall development strategy in the short, medium and long term. From there, businesses can seize new opportunities brought by sustainable development.

There have been many empirical studies on the impact of factors on the publication of corporate sustainability reports.

Trotman & Bradley (1981) conducted a study on factors affecting the publication of sustainability reports with a sample of 191 companies on the stock exchange in Australia. The results show that the size of the enterprise, risks in the enterprise, social pressure, and decisions of managers have an impact on the publication of sustainability reports.

Hackston & Milne (1996) studied with 47 large enterprises on the New Zealand stock market, showing that all 4 factors: business size, profitability, business lines and countries in which the enterprises provide reports are all impacts on environmental and social disclosure in New Zealand in the order of impact.

Hossain and Reaz (2007) through the analysis of the usual least squares regression model, have shown that the size of the firm and the value of the existing assets of the enterprise are the factors that positively affect the level of work. publish a sustainable development report. Jennifer Ho & Taylor (2007) have shown that firms with larger size, lower profitability, lower liquidity and lower number of employees significantly influence the publication of sustainability reports (research conducted with 50 largest companies in the US and Japan). Hidayah et al (2019) examines the factors that influence the sustainability of the company's disclosure has registered at Indonesia Sustainability Award (ISRA). Data were taken from 2012 to 2017 and became a sample of 9 companies featured in the ISRA. Regression analysis was used to examine the effect of factors (Current Ratio, Size, Type Industry, Social Responsibility Committee and meetings of the audit committee) on the disclosure of sustainability reporting. Result of regression explains that the variable Current Ratio (CR), Size and Audit Committee Meetings significant effect, while the governance committee and the type of industry effect are not significant. Therefore, Companies are growing fast in asset and have a large debt must disclose the information in a sustainability report.

Luc & Phuoc (2019) studied the influence of factors on the preparation of sustainability reports in 143 enterprises. These enterprises belong to the group of 500 large enterprises and were listed on Vietnamese stock exchanges in the fiscal year 2017. The results show that in addition to the profit factor, the remaining factors such as size and field activities and development opportunities of enterprises have a positive impact on the publication of sustainability reports. Masum et al (2020): A sample of 40 listed companies of DSE has been considered to examine the effect of board characteristics and organisational characteristics on sustainability reporting. An un-weighted index based on GRI has been developed. Results: It has been found that the age of the company, earning per share and

foreign members on board have a significant positive impact on sustainability reporting while for the other variables we do not found any significant association.

Hai et al (2019) analysed with data from 265 managers from head level upwards working in 60 oil trading companies in the Vietnam National Petroleum Group (Petrolimex) spread across the country to examine factors affecting the disclosure of sustainable development reports. The empirical results show that enterprise size, growth opportunities, legal basis, business sector and profitability are factors that have a varying positive impact on disclosing sustainable development reports. The managerial viewpoint, though influencing the impact, is not statistically significant for disclosing sustainability development reports. The results provide a scientific basis for managers to make appropriate decisions in improving the disclosure of sustainable development reporting information.

Vietnam's perspective on sustainable development is now integrated throughout socio-economic development strategies and plans. At the same time, it is concretized in the National Action Plan for the implementation of the 2030 Agenda with 115 instrumental goals that can be suitable to the country's development conditions and priorities (Government of Vietnam (2017)). However, in the process of implementation, Vietnam faced many challenges in terms of society, environment, response to climate change, difficulties in financial resources. The level of connectivity between sectors and fields, as well as statistical capacity for monitoring and monitoring the implementation of sustainable development, is still limited. Besides, many businesses are not fully aware of the sustainable development goals; even indifferent, seeing sustainability reports as a matter outside of business operations.

The impact of the construction sector on the environment is very large such as emissions, air pollution, water pollution, etc. Construction activities can significantly change the surface of an area because most of it is clearing. The surroundings can be heavily polluted, especially the lakes. Atmospheric pollution generated by the construction industry has both direct and indirect impacts on the general environment. Proper assessment and minimization of environmental burdens from construction activities are urgently needed. There must be a comprehensive assessment of the impacts to environment of all construction activities. During the construction process, gases are released directly into the atmosphere, particulate emissions and other trace gases emitted by machinery and equipment, causing serious impacts on the environment, affecting air quality locally (Dar et al (2022)). However, the above issues are almost not transparently disclosed in the reports of construction enterprises in Vietnam. Currently, a number of construction enterprises have published sustainability reports in parallel with financial statements, which shows that business managers have begun to pay more attention to the supply of goods and services. provide information related to environment and society, but the rate of publication of sustainable development reports is not much. Therefore, research on the factors affecting the publication of sustainable development reports is necessary.

Inheriting previous studies and based on the characteristics of the construction field in Vietnam, the authors put forward research hypotheses about the factors affecting

the publication of sustainability reports at construction enterprises listed on Vietnam stock market as follows:

Hypothesis H1: Firm size positively affects the publication of sustainability reports

Hypothesis H2: Type of business positively affects the publication of sustainability reports

Hypothesis H3: Firm age positively affects the publication of sustainability reports

Assumption H4: Auditing has a positive influence on the publication of sustainability reports

Assumption H5: Growth opportunities have a positive influence on sustainability report publication

Hypothesis H6: Current ratio variable positively affects the publication of sustainability reports

Hypothesis H7: Profitability has a positive effect on sustainability report publication

Hypothesis H8: Revenue growth has a positive effect on sustainability report publication

2. Method

Based on the empirical evidence, the following logistic regression equation is proposed to test the hypotheses: Based on the empirical evidence, The following logistic regression equation is proposed to test the hypotheses:

$$SR = \beta_1 + \beta_2 SIZE_{it} + \beta_3 TYPE_{it} + \beta_4 AGE_{it} + \beta_5 AUDIT_{it} + \beta_6 MTB_{it} + \beta_7 CR_{it} + \beta_8 PRO_{it} + \beta_9 SCR_{it} + \varepsilon_{it}$$

All variables and their measures are described in Table 1. In the context of the individual firm, "t" represents the time period, "β" is the estimated parameter, while "ε" is the error term. The study controls for the type and age effect by using type and age control variables.

The significance of this research is tested using the logistic regression model. The underlying assumptions in the regression model are tested for multicollinearity based on the correlation matrix, Variance Inflation Factor (VIF), and Tolerance. Logistic regression is employed in this study due to the dichotomous nature of the dependent variable-the firm has either issued a voluntary sustainability report or not otherwise. This form of regression is more robust by design as it overcomes the restrictive assumptions of linearity, normality, and equal variances. Logistic regression can predict the best possible value for each coefficient in the model. Finally, the logistic regression is validated by Hosmer-Lemeshow Test and Likelihood Ratio Chi-square (LR Chi2).

The data used in the study are all collected from the financial statements of 49 construction enterprises listed on the Vietnam stock exchange in the period 2012 - 2022. The research sample includes all listed companies that are satisfied conditions have full financial statements for the period 2012-2022, so the study sample is highly representative. The variables in the model are described in the following table:

Table 1. Description of variables in the model

Variable name	Code	Measure
Disclosure sustainability report	SR	A dummy variable, takes 1 if the firm publication sustainability report and 0 otherwise
Firm size	SIZE	Natural logarithm of total assets
Type of business	TYPE	The dummy variable takes on a value of 1 when state-owned capital is present, and otherwise 0
Firm age	AGE	Year of research - year of establishment
Auditing	AUDIT	A dummy variable, takes 1 if the auditor is from big 4, otherwise 0
Growth opportunities	MTB	Market value of a firm's equity divided by its book value
Current ratio variable	CR	Current assets/ current liabilities
Return on total assets	PRO	Ratio of income before tax to total assets
Revenue growth	SGR	(Current period revenue - previous period revenue)/ previous period revenue

3. Results

Table 2 and Table 3 present the descriptive statistics and frequency of each variable. Sustainability report disclosure was used in this study as the dependent variable and SIZE, TYPE, AGE, AUDIT, MTB, CR, PRO, and SGR are explanatory variables. Ratios Current Ratio (CR) to measure the ability of the company in the short term with its current assets have an average of 1.55 means the construction companies have a good ability to repay their debts. Table 2 shows that the AGE ratio shows the minimum value of 3, while the maximum value is 68, and the mean value is 25.54, (S.D is 14.53). The average value of AUDIT is 0.8; the average value of MTB is 16,339.25, of which the highest is 111,666. The mean value of CR, PRO, and SCR ratio are 1.55, 1.47 and 15.06. The indicator reflecting the profitability efficiency of company PRO has the smallest negative value, indicating that at least one company in a year has negative profit after tax, the maximum value is 34.82. This shows that in the period of 2012-2022, the business performance of listed companies is quite different.

Table 2. Descriptive statistical analysis of independent variable

Variable	Obs	Mean	Std.Dev.	Min	Max
SIZE	538	11.69	0.57	10.26	13.28
TYPE	538	0.57	0.50	0	1
AGE	538	25.54	14.53	3	68
AUDIT	538	0.80	0.27	0	1
MTB	538	16,339.25	13,942.96	-7,189	111,666
CR	538	1.55	1.69	0.07	21.23
PRO	538	1.47	9.44	-167.62	34.82
SGR	538	15.06	107.79	-323.63	1,805.95

Source: Results of data processing of the authors

In accordance with Table 3, out of 538 observations, 41.26% of observations have published sustainability reports, whereas 58.74% of observations have not.

Table 3. Descriptive frequency of dependent variable

SR	Freq.	Percent	Cum.
0	316	58.74	58.74
1	222	41.26	100.00
Total	538

Count R2			0.737					
Adj Count R2			0.362					

Source: Results of data processing of the authors

To assess the validity of the logistic regression model and the accuracy of its predicted outcomes, a number of tests are performed. The Hosmer-Lemeshow goodness-of-fit test measures the differences between the predicted and observed outcomes (Meurer and Tolles, 2017). When there is a good agreement, it will not show a statistically significant difference. The likelihood ratio chi-square (LR Chi2) is an omnibus test to ensure the perfect

suit-ability of the logistic regression model to the study data (Girella, Rossi, and Zambon, 2019). The results (Hosmer-Lemeshow $\chi^2(8) = 12.73$; Prob > LR = 0.000) suggest that our model fits the data well. Hence, it provides excellent goodness of fit for logistic regression to study the determinants of corporate sustainability reporting. Moreover, VIF and Tolerance statistics for all variables indicate that collinearity does not appear to create a threat to the interpretation of the regression coefficients (Gujarati and Porter, 2009)

4. Discussion and Conclusion

4.1. Discussion

LR $\chi^2(8)$ is the likelihood ratio (LR) chi-square test. The likelihood chi-square test statistic is 158.57. The number in the parenthesis indicates the number of degrees of freedom. In this model, there are eight predictors, so there are eight degrees of freedom. Prob > χ^2 - This is the probability of obtaining the chi-square statistic given that the null hypothesis is true. In this case, the model is statistically significant because the p-value is less than .000.

Expressed in terms of the variables used in this case, the logistic regression equation is

$$SR = 1.3648 * SIZE + 0.9492 * TYPE + 0.0001 * MTB + \varepsilon$$

Regression model results show: The variables SIZE, TYPE and MTB are the positive factors affecting SR with 1% significance level and the impact level are 1.3648, 0.9492, and 0.001. AGE, AUDIT, CR, PRO, and SGR has no correlation with the disclosure of sustainability report

The first hypothesis investigated the relationship between the company size and the extent of sustainability disclosure. Regression analysis showed that the company size has a positive and significant impact on the extent of the sustainability disclosure. The beta value shows that the coefficient is 1.3648 with p-value of 0.000, which is less than 0.01, suggesting that the relationship is significant at 1% level. Hence it can be concluded that the company size positively impacts the extent of sustainability disclosure. This result leads us to accept the first hypothesis.

The second hypothesis examined the relationship between the type of company and the extent of sustainability disclosure. Table 4 shows that the company type has a significant positive impact on the extent of sustainability disclosure. The beta value showed that the coefficient was 0.9492 with p-value of 0.000, which is less than 1%, suggesting that the relationship is significant at a 1% level. Accordingly, the second hypothesis is accepted. This shows that businesses with diverse state ownership have a propensity to disclose sustainability reports.

The third hypothesis investigated the relationship between the company age and the extent of sustainability disclosure. The age of company has no correlation with the extent of sustainability disclosure (p-value = 0.795 > 0.05) and the third hypothesis is rejected.

The fourth hypothesis investigated the relationship between the company audit and the extent of sustainability disclosure. The factor of audit firm does not have any significant

impact on the disclosure of sustainability reports ($p\text{-value} = 0.677 > 0.05$) and the fourth hypothesis is rejected

The fifth hypothesis examines the relationship between the company growth and the extent of sustainability disclosure. As is shown in Table 5, as per the regression analysis, the company growth has a positive and significant impact on the extent of sustainability disclosure. The beta value shows a coefficient of 0.001 with $p\text{-value}$ of 0.000, which means that the relationship is significant at 1% level. Hence, the fifth hypothesis of the study is accepted.

The sixth hypothesis investigated the relationship between the company current ratio and the extent of sustainability disclosure. The current ratio of company has no correlation with the extent of sustainability disclosure ($p\text{-value} = 0.674 > 0.05$) and the sixth hypothesis is rejected.

The seventh hypothesis investigated the relationship between the company profitability and the extent of sustainability disclosure. The factor of profitability does not have any significant impact on the disclosure of sustainability reports ($p\text{-value} = 0.663 > 0.05$) and the seventh hypothesis is rejected.

The eighth hypothesis investigated the relationship between the company revenue growth and the extent of sustainability disclosure. The revenue growth of company has no correlation with the extent of sustainability disclosure ($p\text{-value} = 0.900 > 0.05$) and the eighth hypothesis is rejected.

4.2. Conclusion

According to the analysis results, the publication of sustainability reports of construction companies listed on stock exchanges is influenced by the following variables: Firm size, Type of business and Growth opportunities.

Sustainability reporting is being used increasingly by businesses as a powerful mechanism in corporate policy and strategy. It covers all areas of economic efficiency, social, responsibility, environmental awareness, ethical culture, and corporate governance. Corporate sustainability reporting is gaining momentum around the globe as a voluntary reporting mechanism to enhance stakeholders' confidence. The findings provide valuable insight to the policymakers by identifying the attributes that require regulatory focus to achieve the public policy objective of sustainable development. In addition, the study suggests that large firms are more likely to issue sustainability reports. Therefore, regulators should encourage small, medium, and younger firms to adopt sustainability practices. The experimental results also indicate that state-owned enterprises are actively involved in reporting on sustainable development. These findings provide useful insight to the state-owned corporate sector to meet the growing information requirements of stakeholders, manage sustainability performance, and address social and environmental risks and opportunities.

This study also has some limitations that need to be considered in the future. The sample size of the study only focuses on construction companies listed on the stock market but not in other fields, so the generalizability is not high. Additionally, based on the aforementioned theories, the research still only includes a small number of independent

factors, which has a partial impact on the sustainability report's assessment of the impact on the dependent variable (the creation of the dependent variable). Future research can therefore broaden the factors influencing sustainability reporting in the sector in which the company is active or perhaps go farther. Businesses operating in the same industry make up the audience who are interested in learning how this sustainability report was prepared.

THE IMPACT OF FINANCIAL STRESS ON INFLATION IN VIETNAM

MA. Pham Thi Lam Anh

lamanh@hvn.edu.vn

Faculty of Banking - Banking Academy, Hanoi, Vietnam

Abstract

After the 2008 global financial crisis outbreak, financial stress - a concept measures the instability and risks in financial markets have attracted more and more attention from the researchers. Various studies have conducted to examine the relationship between financial stress and other economic variables in different economies. Such as other economies in the world, the Vietnamese economy experienced the economic crisis in the period from 2008 to 2012. In this period, besides the downturn in economic growth, uncertainty, and increased risk in the banking sector and financial market, the Vietnamese economy also faced a two-digit inflation issue. Thus, whether there is a link between financial stresses and inflation in Vietnam is a big question. To clarify the question, the study employs threshold vector auto regression for the monthly data from 2008 to 2018. The results suggest that the relationship between financial stress and inflation in Vietnam

Keywords: *Financial stress, inflation, Vietnam, threshold vector auto-regression, TVAR,*

1. Introduction

The impact of financial risks on the economy has been a topic for researchers for a long time. However, according to Roye (2013), before the 2008 financial crisis, the researchers had only considered the risks in the financial market, such as stock market volatility, capital market spreads, variables indicating imbalances on the interbank market as peripheral variables in the economic models. Consequently, these models did not forecast the appeal of the financial crisis in 2008 early. After this crisis, developing new indicators or tools to forecast the financial crisis has become essential. In this situation, the financial stress index- an indicator introduced before 2008 GFC received more attention from academics.

Unlike other financial indexes, the financial stress index includes various variables inside. Thus, different researchers often offer a different definition of financial stress. Illing and Lu (2006) - the pioneer in the studying of financial stress interpreted financial stress as the force affecting economic activity through instability and risk in financial markets and institutions. Hakkio and Keeton (2009) revealed that the increase in uncertainty about the fundamental value of assets and asymmetry of information, and the decline in the demand for risky and illiquid assets were the features of financial stress. While Balakrishnan et al. (2011) defined financial stress as a period of weakened financial intermediation, Aboura and Royeb (2013) showed that financial stress as a combination of uncertainty and risk perception. Hollo et al. (2012) considers financial stress as a state of financial uncertainty,

which was the result of systemic risk. Although the definition of financial stress may vary across the literature, this concept characterizes increasing the instability and risk of financial condition and a sign of financial crisis.

For the period from 2008 to 2012, the Vietnamese economy suffered a double economic crisis- inflation crisis and financial crisis. In both 2008 and 2011, the Vietnamese economy experienced a high inflation period, with the inflation rate rocketing to about 20%. Besides inflation, both in 2008 and in 2011, Vietnam also faced a financial crisis with severe issues in banking sectors and the exchange rate market. In 2008, the interest rate climbed to nearly 20% from the first quarter to the third quarter. The interbank rate also rocketed to nearly 40% in the beginning and middle of 2008. In 2011, the banking sector also faced a crisis regarding liquid risk and the increase in the bad debt of the banking system. Besides, in 2011, the exchange rate market also suffered the big problems that forced the Vietnamese State Bank had to depreciate Vietnam Dong 11%.

The Vietnamese economy's double crisis motivates the authors to investigate the impact of the instability in the financial market on inflation in Vietnam. To reach the findings, firstly, this research will summarize the empirical studies on financial stress and inflation. In the next part, employing the Hansel threshold model, the paper will estimate the threshold of financial stress index to assess the relationship between financial stress and inflation. Lastly, the study gives some recommendations and ends with some concluding points.

2. Literature Review

The impact of financial stress on economic activities was studied in various aspects. One of them is the relationship between financial stress and monetary policy. Baxa, Horváth, and Vašíček (2013) studied the influence of financial stress on monetary policy in five advanced economies: US, UK, Australia, Canada, and Sweden. The result suggested that high financial stress caused the central banks to change policy rates, often cut them. Tnga and Kwek (2015) also found the same result in some ASEAN economies after analyzing the relationship between monetary policy and financial stress in the ASEAN-5 economies (Indonesia, Malaysia, Philippines, Singapore, and Thailand). The authors pointed out that in Malaysia, the Philippines and Thailand, the central banks tended to cut policy interest rates (IRs) when financial stress increased although there is substantial cross-country variation in the magnitude and time dynamics. However, Floro and Roye (2017) suggested a different result. Using panel data of advanced and emerging economies to test for the impact of the increase in overall financial stress on monetary policy, the authors indicated that in the developed economies, the uncertainty of the financial market and banking system affected the monetary policy decision. By contrast, in emerging economies, the threshold effect of financial stress did not influence these central banks' interest rate decisions. These results refer that the impact of financial stress on the monetary decisions is still a controversial topic and needs to continue to study further.

For the relationship between financial stress and inflation, Li and St-Amant (2010) examined the effects of financial stress on the transmission of monetary policy shocks in Canada empirically. They pointed out that the high financial stress regime would lead to weaker output

growth, higher inflation, and higher interest rates. Mallick and Sousa (2013), and Tsagkanos et al. (2018) indicated that a shock the FSI hurts inflation. Galvão and Owyang (2018) used a novel factor-augmented vector autoregressive model with smooth-transition regimes (FASTVAR) for the US economy. They found out that an exogenous deterioration in the financial stress index had strong adverse implications effects on inflation in the stress regime.

As a developing economy, Vietnam usually faces instability and economic issues, particularly inflation. Vietnam has the highest inflation rate in Southeast Asia (over 20 cent year-on-year in 2011) (Pham and Riedel, 2012). Thus, numerous studies focus on finding critical driving of Vietnamese inflation. Nguyen et al. (2012) analyzed the determinants of CPI inflation for Vietnam over the period 2001 to 2009. The findings indicated that the money supply, oil prices, and rice prices present the strongest influences on CPI inflation. Bhattacharya (2014) also referred that the nominal effective exchange rate and credit growth drove Vietnamese inflation in the short run and medium term. Khieu (2014), Nguyen et al. (2017) pointed out that money growth, oil price, and real exchange rate were the main determinants of inflation in Vietnam.

Reviewing the existing papers and articles, the authors found out that the relationship between financial stress and inflation in Vietnam has not been investigated yet, which is the gap for the study to continue to research further.

3. Method

Methodology

The threshold VAR model with two regimes is

$$Z_t = \alpha^1 + A^1 Z_t + B^1(L)Z_{t-1} + (\alpha^2 + A^2 Z_t + B^2(L)Z_{t-1}) I(C_{t-d}, \gamma) + \varepsilon_t \quad (1)$$

Following Nguyen et al. (2012), Khieu(2014), and Nguyen et.al (2017), to find out the factor impact on the inflation in Vietnam, the vector of variables (Z_t) includes the $Z_t = (cpi_t, fsi_t, m2_t, oil_t, gap_t)$. cpi_t is the consumer price index (CPI), fsi_t is the financial stress index (FSI), $m2_t$ is the money supply, oil_t is the monthly oil price, gap_t output gap.

α^i represents the vector of constant, A^i represents the matrix of contemporaneous interaction coefficient, $B^i(L)$ is polynomials created from matrices of coefficients in the lag operator L. ε_t represents the vector of structural innovations.

I is an indicator that equals 1 if the threshold variable C_{t-d} is larger than or equal to the FSI threshold value γ ($C_{t-d} \geq \gamma$) and 0 otherwise. d is lagged periods. When I = 0, the relevant coefficients are α^1 , A^1 , and $B^1(L)$. When I =1, the relevant coefficients are $\alpha^1 + \alpha^2$, $A^1 + A^2$, and $B^1(L) + B^2(L)$.

This paper employs the Tsay (1998) method to test for the threshold nonlinearity of the model. This approach generates the C (d) test statistic following by the estimation of an arranged regression. The null hypothesis that the model is linear $H_0: \alpha^2=0, A^2=0, B^2(L)=0$. C (d) follows a chi-squared distribution with k (pk+qv+1) degree of freedom. In this case, k and v represent the number of endogenous and exogenous variables; p and q are their corresponding lag orders. When the null hypothesis of linearity is rejected, we choose the

delay parameter d as the value, which maximizes the Tsay test statistic. Consequently, this research utilizes a grid search method and finds the value that maximizes the Akaike Information Criteria (AIC).

We utilize the Cholesky ordering for the shock identification in the VAR model. The first order is the CPI since CPI is the slow-moving variable. The second one is the FSI, and the interest rate is placed last. This structure is consistent with the empirical literature, which suggests that financial stress and monetary policy indicators are fast-moving market-based variables (Saldias, 2017). In this study, we use financial stress index data for Vietnam calculated by the Asian Development Bank (ADB), which is based on Park and Mercado (2014) methodology.

Data

We use the monthly data from 2008M2 to 2018M2 on CPI, FSI, money supply, oil price, and output gap. The data sources from the below table

Table 1. Variables and its source

Variables	Source
Financial stress index (FSI)	Asian Development Bank website(www.adb.org)
Consumer price index (CPI)	General Statistics Office of Vietnam website (https://www.gso.gov.vn)
Monthly supply (M2)	State bank of Vietnam (www.sbv.org)
Oil Price (OIL)	Federal Reserve of St Louis (https://fred.stlouisfed.org/)
Out Gap (GAP)	General Statistics Office of Vietnam website (https://www.gso.gov.vn)

Among these variables, the gap represents for the economic activities, as the monthly data of GDP is hard to measure. This variable is calculated through the change of industrial production index and HP filter in Eviews software.

In this study, we use financial stress index data for Vietnam calculated by the Asian Development Bank (ADB), which is based on Park and Mercado (2014) methodology. According to ADB (2019), the FSI for the Vietnamese economy is computed through five variables that come from four sectors: banking sector, equity market, debt market, and foreign exchange market. The variables are used to measure volatility in these sectors including banking sector price index and stock price index, equity market returns, equity market volatility, sovereign debt spreads (long-term (10-year) local government bonds- US Treasuries in basis points), and exchange market pressure index (EMPI).

All series are seasonally adjusted (using the Census X-12 method in Eviews) and then taken in natural logarithm (except for the policy interest rate) before estimation. We also conduct the unit root test by using the Augmented Dickey-Fuller (ADF) test and Phillips-Perron (PP) test (Table 1). The results suggest that all series are stationary at first difference. After that, we set up the VAR estimation in the first difference.

Table 2. Unit root test

Variables	ADF test		PP test	
	P-value	Conclusion	P-Value	Conclusion
CPI	0.0000	stationary	0.0001	Stationary
FSI	0.104	Non-stationary	0.0000	Stationary
FSI at 1 st difference	0.0000	Stationary	0.0000	Stationary
OIL	0.0003	Stationary	0.000	Stationary
M2	0.0001	stationary	0.0000	Stationary
GAP	0.0000	stationary	0.0001	Stationary

Source: Author's calculation

4. Results

Estimation of the inflation threshold

In this section, we employ the method of Tsay (1998) to decide the financial stress threshold for Vietnam. Our objective is to separate the high and low financial stress regime using distinct sets of model parameters. Based on the value of the financial threshold, the times series can be split into two different cases. When the financial stress threshold variable is higher than the critical value, the time points are classified as the high regime. Otherwise, the time points are classified as a low regime.

Table 3 indicates the results of test statistic $C(d)$ rejecting the null hypothesis of the linear relationship in all cases of different starting numbers for recursive estimates ($m_0 = 30$ and $m_0 = 50$). This result implies that FSI is a suitable threshold variable, and that is worthwhile to split into two regimes. We decided the threshold lag delay (d) is 1, corresponding to delay by a month. For two-regime models, we assume the threshold $\gamma \in [-4, .05]$ and use 300 grid points. The interval determination is based on the value of the threshold variable. The estimated threshold value for inflation is 0.44, with the smallest AIC of (345.88504).

Table 3. Result of the threshold test

FSI threshold			
d	m_0	C(d)	p-value
1	30	43.50	0.002
1	50	40.26	0.007
γ	0.44	AIC	345.88504

Note: d is a delay for the threshold variable, m_0 is starting number for recursive estimates, $C(d)$ tests statistic based on the method of Tsay (1998). AIC is the Akaike Information Criterion.

Source: Author's calculation

The low regime is active when the FSI is below the estimated threshold, 0.44. It presents the normal period of the economy, which is described by economic growth and low financial market stress. In converse, the high regime indicates the economy moves to the slowdown situation characterized by high financial market stress.

Figure 1 shows a plot of the estimated inflation threshold value and the threshold variable. The estimated threshold value divides our sample into two regimes that are highly consistent with the economic development in Vietnam. The high episode dominates the period from 2008 to 2009. During this time, the Vietnam economy experienced tremendous inflation, the struggle of the banking system, and the decline in the stock market. The low episode is captured by some period from 2010 to 2015 and the time after 2016. At that time, inflation becomes low and stable; the reconstruction of the banking system has some progress. The empirical model endogenously selects the separation of the sample.

Figure 1. FSI

Note: The solid line illustrates FSI, the dotted line indicates the threshold value (0.44), and the shaded area is the high FSI period.

Source: Author’s calculation

Impulse response analysis

After splitting the sample into a high and low regime, we estimate the VAR model in each regime. We assume two lags in both cases. Figure 2 to 4 indicates the estimated impulse response functions over 12 months horizon in linear VAR, high regime, and low regime.

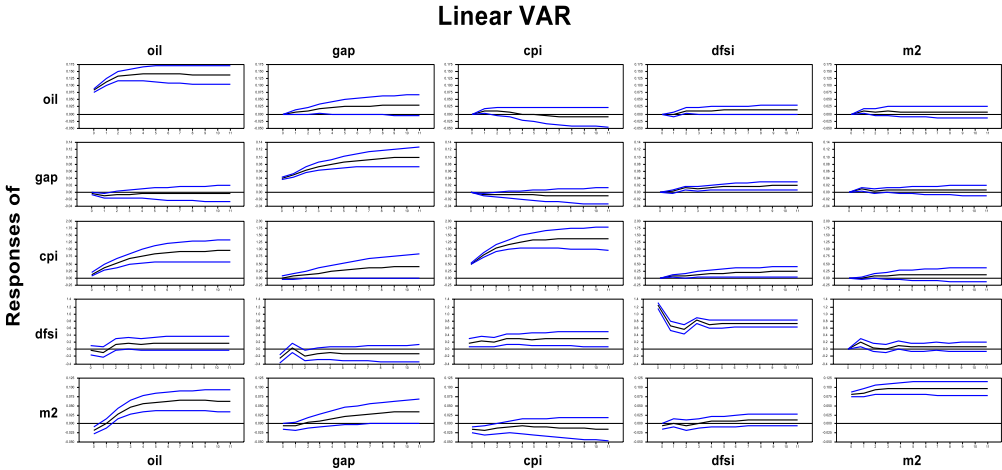

Figure 2: Impulse response functions in linear VAR

Note: The impulse responses (mid-solid line) are presented over a 12-month period along the horizontal axis. 68% confidence intervals based on Monte Carlo simulation are plotted around each response (as per Sims and Zha, 1995).

Source: Author’s calculation

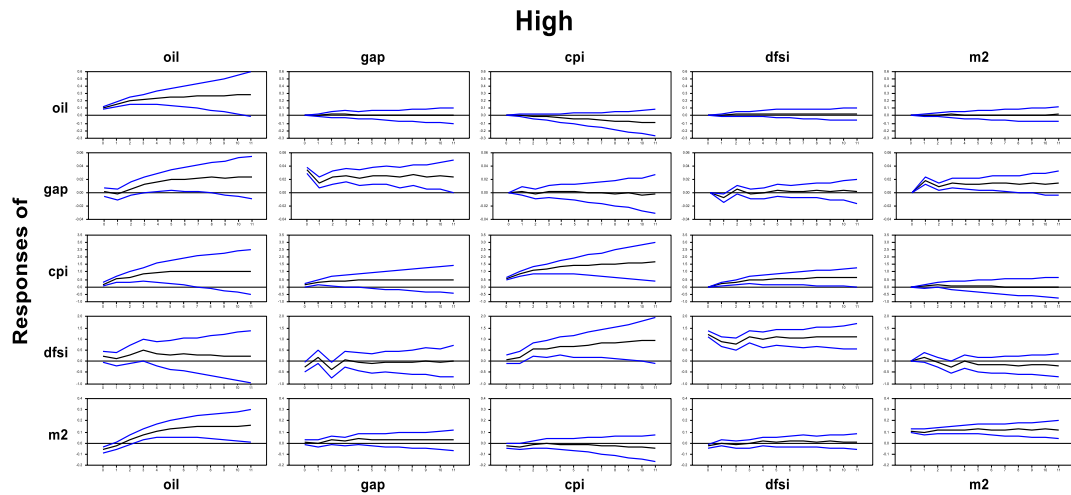

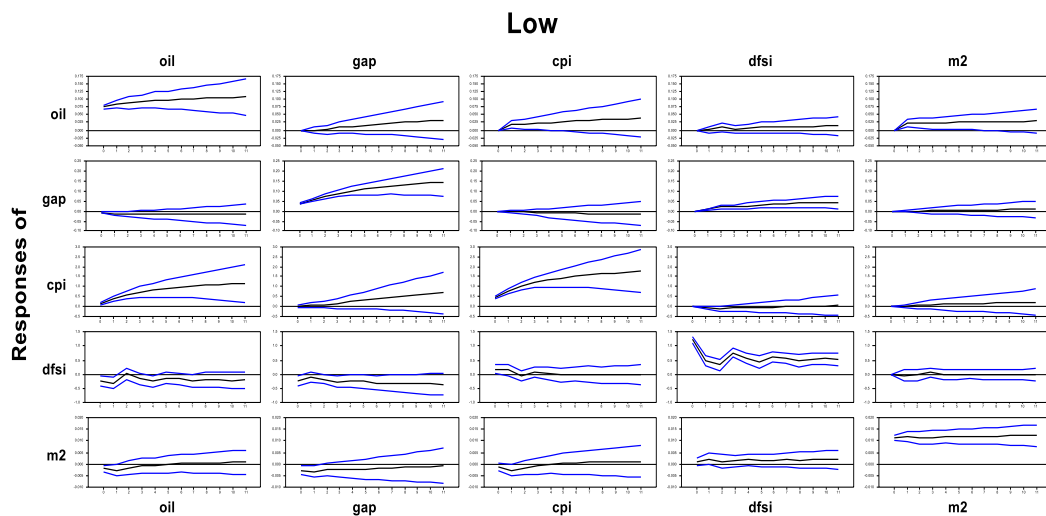

Figure 3: Impulse response functions in high FSI regime

Note: The impulse responses (mid-solid line) are presented over a 12-month period along the horizontal axis. 68% confidence intervals based on Monte Carlo simulation are plotted around each response (as per Sims and Zha, 1995).

Source: Author's calculation

Figure 4: Impulse response functions in low FSI regime

Note: The impulse responses (mid-solid line) are presented over a 12-month period along the horizontal axis. 68% confidence intervals based on Monte Carlo simulation are plotted around each response (as per Sims and Zha, 1995).

Source: Author's calculation

In both low and high regimes, the response of CPI to the shock of oil price is the same and significant, in which the increase of oil price would lead to the rise of inflation in Vietnam. In the case of the GAP variable, the positive shock of GAP would let CPI go up after at least three periods. However, this increase is not significant in the two regimes.

When the economy moves to the high FSI period, the CPI increases in response to the positive financial shock. By contrast, the CPI does not react to the change of FSI in the low regime. This result is consistent with the study of Mallick and Sousa (2013) and Tsagkanos et al. (2018), which suggest that the FSI shocks harm inflation. However, the effect of FSI on CPI in both cases is not apparent.

The response of CPI to the shock of m2 is the same in two regimes. Contradict to Nguyen et al. (2012), Khieu (2014), and Nguyen et al. (2017) this study shows the unclear impact of m2 to CPI in Vietnam.

For the response of FSI to CPI, in the high regime, the increase in CPI immediately would cause FSI to rise. However, the CPI does not show any impact on FSI in the low regime. For OIL, GAP, and M2, these variables seem to have an unclear and insignificant effect on FSI in both low and high regime.

In general, the impacts of shocks in the two regimes are quite different. There is no doubt that the FSI threshold strongly affects the relationship between CPI, FSI, OIL, GAP, and M2 under different states of the economy.

Based on the findings, the study suggests that the State Bank of Vietnam and other policymakers should develop and promote the implementation of effective regulatory, supervisory, and other financial sector policies for the Vietnamese financial market.

5. Discussion and Conclusion

5.1. Limitations

Inspire of proving the impact of financial stress on inflation in Vietnam, and the study still has some limitations that maybe the gap for further research. The first limitation is the financial stress index data. The study employs the ADB financial stress index data based on Park and Mercado (2014) methodology. However, Park and Mercado's (2014) 's method counts the instability in the banking sector through $\beta = \text{cov}(r,m)/\text{var}(m)$. In this case, r and m are the returns to the banking stock price index and the overall stock price index, respectively. The higher the banking sector β , the higher, the greater the banking sector stress. The advantage of this measurement is easy to access the monthly data of the banking sector from the stock market data in Vietnam. However, the number of banking stocks in the Vietnamese stock market for the period of 2008-2014 was quite small compared to the number of banks in Vietnam. Thus, β might not compute the risk and instability in the banking sector comprehensively.

The second limitation of the study is the uncorrelation between M2 and CPI. The reason for this result may come from the lag choice of model. The study chose the lag for the model is only two, while Friedman (1961, 1972) suggests that the effect of monetary policy on inflation would need at least 12 months to show the monetary policy's effectiveness. Otherwise, Bhattacharya (2014) points out that the lag of monetary policy for CPI in developing economies is often from 6 months to 12 months. Thus, two-month lags would not be enough for monetary policy to make an impact on inflation. However, as the

study employs threshold vector auto-regression with 120 observations, 6 to 12 months lags may cause the model to be unable to estimate the threshold.

These limitations may be a suggestion for further research to develop a new method to calculate the volatility in the banking sector, financial stress index in Vietnam.

5.2. Conclusion

This paper extends the literature by analyzing the effect of financial stress on inflation. Through the threshold vector auto-regression, the paper finds that there exists a threshold of financial stress index, which divides the Vietnamese financial stress index into two regimes: high regime and low regime. The study also shows that the FSI threshold firmly influences the relationship between CPI, FSI, OIL, GAP, and M2 under different states of the economy. This studying following Li and St-Amant (2010), Mallick and Sousa (2013), Tsagkanos et al. (2018), and Galvão and Owyang (2018), demonstrates that financial stress impacts on inflation. Additionally, CPI also affects FSI in high regimes. Thus, the authors suggested that the State Bank of Vietnam should implement the macro-prudential supervision policies to control risks in the financial market, which is not only for the security of the financial system but also for the State Bank of Vietnam's controlling inflation target. Although the study demonstrates the impact of financial stress on inflation in Vietnam, it still has a limitation relating to financial stress data which may promote the further researches.

Abstract

This study focuses on the impact of the announcement of changes in the BoD on the abnormal return caused by changes in stock price of Vietnamese listed seaport enterprises in the disclosure period. The authors employed the event study method to find out the fact that the reaction off stock price of Vietnamese listed seaport enterprises even happens before the date of announcement, implying an information leak existence.

Keywords: *Event study, listed seaport enterprises, change of board of directors*

1. Introduction

In today's 4.0 era, information plays an important role in all fields, especially information on the stock market. The disclosure of financial information such as profits, financial statements has an immediate impact on the stock price of companies, and thus provoke abnormal returns on the ex-day (Woolridge, 1983). In addition to financial information, non-financial information also has certain effects on the stock market. Non-financial information can be understood as qualitative or quantitative data or information, not measured in monetary units, usually aimed at groups of long-term information about the business such as information about the environment, society and corporate governance (Ministry of Finance, 2020). Both financial and non-financial information disclose have significant effect on stock market (Dima et al 2010). However, there is an interesting point that the market reaction to the information disclose does not happen at the disclosing date, but it happens before and after that date (Vo Xuan Vinh and Dang Buu Kiem, 2016).

In recent times, there have been many personnel change socks of senior leader of some companies listed on the Vietnam stock market. In some cases, these changes cause dramatic negative consequences to the stock of price of these company, i.e.: FLC group and Louis Holding. Hence, the change in board of directors can be considered as sensitive information, regardless of whether it is positive or negative change.

Vietnam's stock market has been facing up with from fluctuations in the international market in the face of the trend of tightening monetary policy from major countries to curb inflation and the risk of economic slowdown. In that context, the development and recovery of stock price of many seaport enterprises attract researcher's attention. In the context of

personnel changes in Vietnamese companies, this article analyses the effect of announce changes in seaport company's BoD on the company's stock price, leading to abnormal return of the stakeholders.

2. Literature review

There are some studies referring to the effect of information disclose on the company's stock price. Al-Yahyaee (2015) examines the security returns during ex-dividend period for firms listed on the Muscat securities market in study "Security returns during Ex-dividend period". The author finds stock dividends elicit a significant stock market response. The results indicate that the abnormal returns before ex-day are consistently negative. That is, on each of the 10 days before the ex-day, there is a decline in the abnormal returns. Abnormal returns are statistically insignificant in the all ten days prior to the ex-day. On the other hand, the abnormal return is positive a significant on the ex-day. In addition, the abnormal return seems not to be confined to the ex-day in Oman. In particular, the positive abnormal return extends for seven days after the ex-day. In another research, Dima et al (2010) study the effects of financial and non-financial information disclosure on prices' mechanisms for emergent markets. The result shows that both financial and non-financial information disclose have significant effect on Romanian Bucharest Stock Exchange.

In Vietnam, Pham Tien Manh et al (2018) conducts the study on "The impact of dividend and profit disclosure on stock price volatility of companies listed on the Ho Chi Minh Stock Exchange (HOSE)". The author collected information of selected companies on the HOSE stock market in the period 2015 to 2017, to assess the impact of the announcement of dividend and profit information on the company's variables price movements of companies listed on HOSE. The study also uses the event study method, which is one of the quantitative research methods to analyze and measure the level and direction of the impact of information disclosure on the market. The results show that, for news of dividend increase, at the announcement date, the market reacts negatively to that information. In contrast to the news of declining dividends, the market has positive comments on this information. When announcing unchanged dividend, one day before the announcement date, the average abnormal profit dropped sharply 1 day before the announcement date.

In the study on the reaction of the market when disclosing dividend payment information, the authors Vo Xuan Vinh and Dang Buu Kiem (2015) studied the reaction of the market when businesses disclose information about paying dividends in cash and how business-specific factors such as the size of the business, the dividend rate, etc. have affected on the market's reaction. The authors have collected data from non-financial companies listed on Vietnam's stock market from January 2008 to May 2014. The study also uses the event study method, which results in a moderately inefficient market. On the dividend announcement date, the average abnormal return is non-zero, consistent with the theory of moderate efficiency. However, 1 day after the announcement of the event, the average cumulative profit is still greater than 0 and statistically significant, showing that the information is slowly reflected in the price. That means investors are slow to react to dividend announcements, which means that if an investor buys shares on the date of the

dividend announcement, they can still earn extraordinary profits. The results also show that for investors, dividend payment information is considered good information. Meanwhile, firm-specific factors such as firm size have a negative relationship and dividend rate has a positive relationship with accumulated extraordinary profits. So, large companies are more trusted by investors, keep stock prices more stable, and investors will buy stocks with high dividend rates, so the share price will increase, when the company discloses dividend payment information.

3. Method

To examine the market's reaction to information disclosure of enterprises through price or trading volume, people use the event study of MacKinlay (1997). Event study is a method in quantitative research to analyze the extent and direction of the impact of events on the value of a company's stock. Research events using statistical methods, using time as the dependent variable, and analyzing the market's reaction to those events.

According to Al-Yahyaee (2015), in order to consider extraordinary income when disclosing information on changes in the BoD, based on the market model, the **abnormal return** on event day t ($AR_{i,t}$) is the difference between the actual return on that day ($R_{i,t}$) and normal return $E(R_{i,t})$ based on the market model:

$$AR_{i,t} = R_{i,t} - E(R_{i,t})$$

Where $R_{i,t}$ is **the actual return** of stock i on event t calculated by the formula (Al-Yahyaee, 2015):

$$R_{i,t} = \ln(P_{i,t}/P_{i,t-1})$$

Where $P_{i,t}$ is the closing price of stock I on day t , and $P_{i,t-1}$ the closing price of stock I on the previous day $t-1$.

$E(R_{i,t})$ is **the expected return** of stock i on day t , defined as the normal return expected in the absence of events, as measured by the market model:

$$E(R_{i,t}) = \alpha_i + \beta_i R_{m,t} + \varepsilon_{i,t}$$

Where $R_{m,t}$ is **the rate of return** of the market index on the day of the event t . α_i and β_i are the market model parameters. $\varepsilon_{i,t}$ is the random error term.

The average abnormal return ($AAR_{i,t}$) is calculated as the average of N abnormal returns of all studied events at time t :

$$AAR_{i,t} = \frac{1}{N} \sum_{i=1}^N AR_{i,t}$$

The cumulative abnormal return of stock i during the event window, for the period $[T1-T2]$ is the sum of the abnormal return in the event window calculated by the formula:

$$CAR_{i,(T1-T2)} = \sum_{T1}^{T2} AR_{i,t}$$

Cumulative average abnormal profit $CAAR_{i,(T1-T2)}$ is calculated as the average of N cumulative abnormal returns of the sequence of events in the event window $[T1-T2]$:

$$CAAR_{i,(T1-T2)} = \frac{1}{N} \sum_{i=1}^N CAR_{i,(T1-T2)}$$

After calculating abnormal returns and cumulative abnormal returns, similar to those reported by Brown and Warner (1980) as well as Saens and Sandoval (2005) use t-test to test the significance level of them.

4. Results

Data

Currently, there are more than 20 seaport enterprises listed on Vietnam stock market. However, the author uses non-probability sampling method to select 10 typical enterprises representing all three regions of the North, Central and South, listed on all three stock exchanges, namely HNX, HOSE and UPCOM with the size equivalent as the research sample, are shown in the following table:

Table 1. Sample

No.	Name of company	Stock exchange	Stock code
1	Danang Port Joint Stock Company	HNX	CDN
2	DoanXa Port Joint Stock Company	HNX	DXP
3	Port of Hai Phong Joint Stock Company	HNX	PHP
4	Cat Lai Port Joint Stock Company	HOSE	CLL
5	Dinh Vu Port Investment and Development JSC	HOSE	DVP
6	GEMADEPT	HOSE	GMD
7	Hai An Transport & Stevedoring JSC	HOSE	HAH
8	Dong Nai Port Joint Stock Company	HOSE	PDN
9	Quy Nhon New Port Joint Stock Company	UPCOM	QSP
10	Saigon Port Join Stock Company	UPCOM	SGP

Research variables include event date, i.e. date of announcement of changes in management practices, stock prices of enterprises during the research period and market prices during the research period from 2007 to 2022. This data serves to calculate the abnormal returns on the stock market around the announcement date is described as in the following tables:

Table 2. Stock price

Stock code	Obs	Mean	Std. Dev.	Min	Max
CDN	1574	17.91	5.72	11.24	36.90
DXP	2626	13.17	4.10	4.45	27.09
PHP	1732	13.89	5.715	7.68	33.70
CLL	2000	23.02	4.92	15.41	37.02
DVP	1435	39.22	9.09	22.19	58.74
GMD	3869	20.88	11.96	5.15	61.40

HAH	1836	17.32	16.91	5.15	90.00
PDN	1731	13.89	5.71	7.68	33.70
QSP	1450	11.81	5.63	3.26	26.07
SGP	1557	13.52	9.43	5.00	42.40

Table 3. Results of t-test by mean abnormal return

t	-6	-5	-4	-3	-2	-first	0	+1	+2	+3	+4	+5	+6
	41	41	41	41	41	41	41	41	41	41	41	41	41
AAR %	-2.72	0.09	0.3	0.05	-0.07	-2.61	0.58	0.32	-0.73	first	-0.17	0.22	-0.45
t-test	***					***							

Table 4. Results of t-test according to cumulative average abnormal returns

t	[-6,-1]	[-5,-1]	[-4,-1]	[-3,-1]	[-2,-1]	[+1,+2]	[+1,+3]	[+1,+4]	[+1,+5]	[+1,+6]
	41	41	41	41	41	41	41	41	41	41
CAAR %	-4.0	-2.2	-2.3	-2.6	-2.7	-0.41	0.63	0.46	0.68	0.19
t-test	***		*	**	***					

Note: *, ** and *** indicate statistical significance at the 10%, 5% and 1%, respectively

Source: Analytical results from research data

Table 1 shows the results of the t-statistic of the average abnormal return AAR. The average abnormal returns 6 days before the event date have a negative or positive sign but with a very small value. In which the average abnormal return on the 6th and 1st day before the event date with values of -2.72% and -2.61%, respectively, has statistical significance at 1%. Thus, the market reacted before the announcement of the change of the BoD and the average abnormal return was negative, indicating that the stock price has decreased before the news of the change of the BoD. This shows the inefficiency of the market before the announcement of changes in the Board of Directors. In addition, it also shows that the market has leaked information, showing the non-compliance with regulations of businesses and investors in information transparency.

The results in Table 2 show the results of the t-statistic of the CAAR cumulative average return. Cumulative abnormal returns of less than zero in the days leading up to the event show that investors consider the news of board changes to be unfavorable, which leads to a drop in stock prices and a drop in extraordinary earnings. Thus, the market shows weak efficiency for the disclosure of information on changes in the BoD of seaport enterprises listed on the Vietnamese market.

5. Conclusion

By adopting event study method, the study finds out that the announcement of changes in the BoD of Vietnamese seaport enterprises has a negative impact on the companies' stock prices from 6 days before and after the disclosing date. This result is consistent with the result of Phan Tien Manh's research. This can be inferred that the disclosure of information on the BoD of seaport company is sensitive and there may exist leak of information from enterprises.

Abstract

Economic growth has always been the most concerned issue in many countries, but in recent years, the process of economic integration and the industrial revolution 4.0 has had a strong impact on almost all fields in the world. Socioeconomic. Trade openness is considered as a criterion to evaluate the effectiveness of a country's foreign trade. Trade openness is calculated as total import and export turnover divided by GDP. Thanks to open trade, import and export activities of all kinds of goods and services take place more efficiently. Not only that, opening trade also helps that country to absorb more technological quintessence to improve labor productivity as well as knowledge on management and allocation of resources correctly. Many countries around the world are implementing trade opening and trade liberalization policies to improve the competitiveness of domestic enterprises and create a driving force for national economic growth. The process of world economic integration is currently taking place on a global scale; besides, the trade openness of economies will follow the trend of more expansion in the future. Therefore, assessing the role of trade openness in economic growth has a very important meaning in the development of the country as well as receiving much attention from economists. The study focuses on examining the relationship between trade openness and economic growth, especially in the case of Vietnam to clarify the impact of trade openness on Vietnam's economic growth.

Keywords: *economic growth, trade, import and export, impact.*

1. Introduction

Economic growth is always one of the issues that attract the attention of not only policy makers but also economists and the general public. Economic growth can contribute to creating jobs, improving people's incomes, improving quality of life and many other positive effects.

There have been many studies on the factors that can help an economy grow. It can be investment, international trade, technology, geography according to Rick (2009), or institutions, international trade and geography according to Rodrik (2002). And Acemoglu et al. (2005) argue that institutions are the fundamental cause of economic growth in the long run.

Foreign direct investment can help recipient countries access modern technologies and management methods, as well as utilize domestic resources (Hofmann, 2013), thereby contributing to spreading technology, improving operational efficiency and contributing to economic growth.

Meanwhile, according to Barro and Sala-i-Martin (1997) and Rivera-Batiz and Romer (1991), in the long run, trade openness can promote economic growth through the export of goods and services improve efficiency in allocating resources, and improve aggregate factor productivity through the diffusion of knowledge and technology. Thus, this creates an expectation that countries with greater trade openness can achieve higher growth rates. Therefore, in order to promote economic growth, the policies of many countries have aimed to liberalize trade and improve the competitiveness of enterprises, considering them as driving forces for economic growth. of the country (Belloumi, 2014).

However, not all economists agree on the positive role of foreign direct investment, as well as trade openness, in promoting economic growth. Research by Woo (1995) shows that, FDI does not have a positive effect on economic growth while the studies of Foreman - Peck (1995), Williamson and O'Rourke (1999), Vamvakidis (2002) show that that trade openness has no relationship with growth, even has the opposite effect.

2. Method

The article uses the following methods to learn and analyze in accordance with the content and research objectives.

Statistical method: the data in the thesis are compiled from Ministry of Industry and Trade, World Bank, General Statistics Office, General Department of Customs, Asian Productivity Organization (APO), the periodic reports of the relevant agencies, the results from the surveys.

Modeling method: using drawings, tables, charts to clarify the analysis, and make the problems easier to understand, clear and more convincing.

Comparative analysis method: using time-series comparison, cross-comparison from data sources to draw accurate conclusions about the change, current situation, and trend of the research element.

3. Theoretical Framework

The international trade theory of the classical school and modern international trade theories have shown that international trade plays an important role in economic growth because it expands the production and consumption capacity of each country. The development history of the world economy shows that countries that move fast on the path of economic growth and development are those with strong and dynamic foreign trade. International trade development plays an important role in the process of economic growth and development; promoting the social division of labor, re-forming the specialized area, promoting the development of the production force, improving management, and applying new science and technology to production. International trade contributes to expanding

international economic relations, integrating one country's economy into the world economy on the basis of promoting the country's comparative advantages.

The open-door policy and international economic integration through trade liberalization have brought positive results to all economies in the world, in which import-export activities have shown an important role in serving the economy. Effectively develop production, innovate technology, promote the improvement of the quality and competitiveness of goods, and meet the essential needs of life. Trade liberalization both expands the export scale of each country, creates favorable conditions for imports, and opens the door to international goods and services that the country wishes to enter the domestic market easily. Globalization makes the import-export market expand, allowing enterprises to promote their import-export activities. In terms of products, the diversification of products and goods through the liberalization of import and export leads to an increase in labor productivity and, ultimately,

Along with the strategy of international integration and development, international trade is an important part, associated with the international integration process and plays a decisive role in the advantages of a country in the regional and world markets. Therefore, promoting the development of international trade in general and promoting the export of goods and services in particular are the top economic development goals of countries. Export is the basis for expanding and promoting foreign economic relations, enhancing the economic position and competitiveness of each country in the world market. Commodity competitiveness is enhanced, economic growth becomes more stable and sustainable thanks to resources allocated more efficiently. Export also creates a major source of capital for the import of technology, machinery and other necessary raw materials and materials for the cause of industrialization and modernization. Export activities stimulate economic development, contribute to capital accumulation, production expansion, increase in income for the economy, and improvement of living standards of all classes of the population. Foreign currency earned from export activities is a source of increasing foreign currency reserves, thereby creating the necessary conditions to help stabilize the domestic currency and fight inflation.

Export activities not only contribute positively to economic growth but also create important changes to domestic production. Exports contribute to economic restructuring and promote the production of new products because export-producing industries create favorable conditions for other industries to develop. Besides, export creates economic and technical premise to improve and enhance domestic production capacity; because export is an important means of bringing in capital and technology from the outside world to modernize the domestic economy to create new production capacity. Through export, domestic goods participate in the world market competition in terms of price, quality...

Exports have a positive impact on creating jobs and improving people's lives. The impact of exports on livelihoods includes many aspects. First of all, enterprises producing export goods are the place to attract millions of workers to work with high income. Exports create capital to import essential consumer goods to serve the people's lives and meet the increasingly richer consumer needs of the people. At the same time, exporting positively affects the skill level of exporters.

Meanwhile, import is the phenomenon of moving goods from the world market to the domestic market of a country. Along with exports, import activities are an important basis for expanding a country's external economic relations, one of the important factors promoting production and consumption. Import is aimed mainly at serving the export development strategy and meeting the essential requirements of domestic production and consumption. The import market expands, the quality of imported goods is improved, contributing to the renewal of equipment, technical equipment and production processes, improving the competitiveness of goods and services in general, thereby promoting exports. export development. Thus, the structure of imports should be controlled in the direction of prioritizing production for export and meeting domestic demand...

4. Impact of trade openness on economic growth

New theories, including endogenous growth theory, support the view that trade openness has a positive effect on economic growth. For example, within the framework of endogenous growth, one of the ways that trade openness is thought to affect economic growth is technology transfer (Karras, 2003). Therefore, technology transfer and other movements are more possible in an open economy than in a closed economy. Based on arguments from endogenous growth theory, Adhikary (2011) argues that openness to trade can affect economic growth, facilitate international capital flows as well as redirect favorable factors. favor more productive sectors. In addition to facilitating the movement of factors and capital flows, Trade openness can also affect economic growth through its effect on labor productivity and export capacity. In this view, an economy with a high degree of trade openness tends to increase specialization and division of labor, thereby improving productivity and export capacity. In some cases, the link between trade openness and economic growth is tied to the impact of trade openness on foreign investment. In this view, it is believed that a higher degree of trade openness allows for greater inflows of foreign investment. In some cases, the link between trade openness and economic growth is tied to the impact of trade openness on foreign investment. In this view, it is believed that a higher degree of trade openness allows for greater inflows of foreign investment. In some cases, the link between trade openness and economic growth is tied to the impact of trade openness on foreign investment. In this view, it is believed that a higher degree of trade openness allows for greater inflows of foreign investment.

Due to the development of the trade literature and growth, different channels linking trade openness with economic growth have been identified. For example, in some situations, especially in developing countries, the act of opening up trade through alleviating restrictive trade regimes has led to rapid economic growth. This is so because the growth of developing countries is partly based on their ability to import, especially capital goods, investment and other intermediate goods and services (Krueger, 1998). This situation may provide an explanation why a number of developing countries in the past decades have introduced measures to relax restrictions in their trade regimes towards more favorable trade regimes. more open trade.

In summary, the impact of trade openness on economic growth of transmission channels is depicted through the following figure:

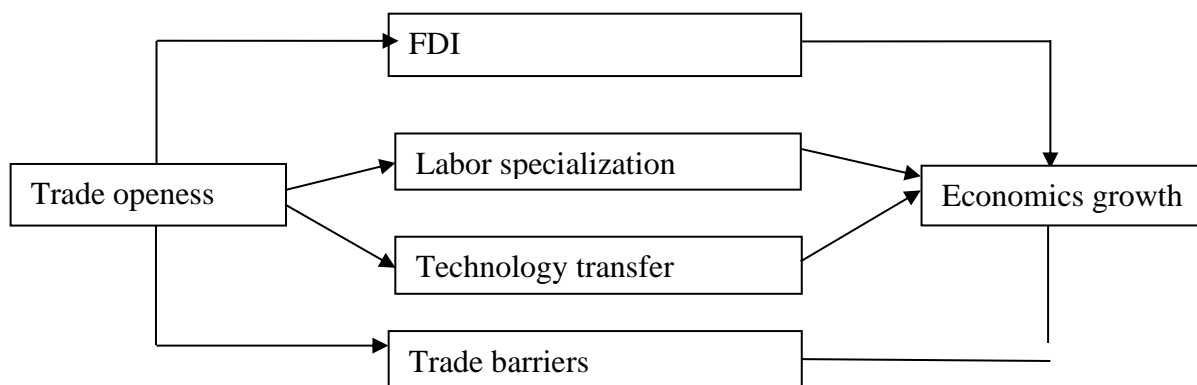

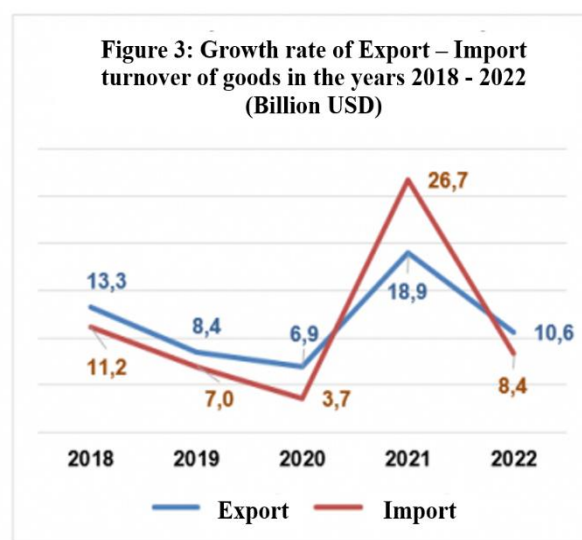

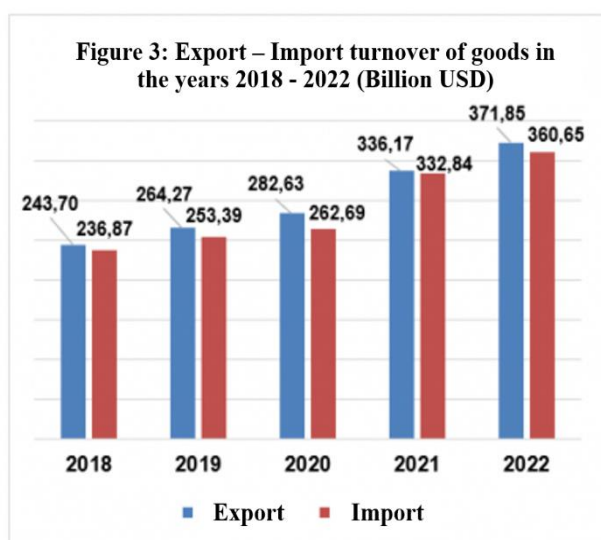

Figure 1. Impact of trade openness through transmission channels

5. Vietnam's import and export situation and trade openness

5.1. Vietnam's import and export situation

The process of opening up and integrating into Vietnam's economy over the past three decades has contributed to promoting economic growth extremely strongly, more especially this impact mainly comes from policies focusing on economic growth. growth in investment and export capital. Economic integration opens up many new opportunities for Vietnam to invest and develop, such as removing tariff barriers, strengthening the signing of bilateral and multilateral trade agreements and removing market restrictions. international commerce. In particular, the evidence also shows that Vietnam is making good use of these opportunities when the export growth has made contributions to the development of the national economy in recent times.

Source: The author compiles data from the General Statistics Office

In the first months of 2022, the Covid-19 epidemic continued to develop complicatedly, causing negative impacts on economic activities, in which the import and

export of goods were severely affected, countries tend to using domestic products instead of imported products, especially agricultural and aquatic products. The year 2022 also takes place in the context of the world economy having many rapid and unpredictable changes, increasing risks to financial markets, currency, energy security, and global food security. However, the second half of the year witnessed a strong recovery of the economy when effective control was started and the pandemic was initially overcome. GDP growth for the whole year 2022 is estimated at 8.02% compared to the previous year, which is the highest increase in years in the period 2011-2022. In the general picture there are many bright spots, one of which is import and export activities with the total export and import turnover of goods reaching a record level exceeding 700 billion USD.

Merchandise export turnover in 2022 is estimated at 371.85 billion USD, up 10.6% over the previous year. In which, the domestic economic sector reached 95.09 billion USD, up 6.5%, accounting for 25.6% of total export turnover; the foreign-invested sector (including crude oil) reached \$276.76 billion, up 12.1%, accounting for 74.4%. In 2022, there are 36 items with export turnover of over 1 billion USD, accounting for 94% of total export turnover (there are 08 export items with over 10 billion USD, accounting for 70.1%).

Import turnover of goods was estimated at 360.65 billion USD, up 8.4% over the previous year, of which the domestic economic sector gained 125.79 billion USD, up 10%; the foreign-invested sector reached \$234.86 billion, up 7.5%. In 2022, there are 46 imported items with a value of over 1 billion USD, accounting for 93.3% of the total import turnover (there are 06 imported items with over 10 billion USD, accounting for 52.1%).

Regarding the export and import market of goods in 2022, the United States is the largest export market of Vietnam with an estimated turnover of 109.1 billion USD. China is Vietnam's largest import market with an estimated turnover of 119.3 billion USD. In 2022, the trade surplus to the EU is estimated at 31.8 billion USD, up 36.8% over the previous year; trade deficit from China was 60.9 billion USD, up 11.5%; trade deficit from Korea was 38.3 billion USD, up 11.5%; trade deficit from ASEAN was 13.6 billion USD, up 10.6%.

From 2016 to now, the trade balance of import and export of goods has been continuously in surplus, with the trade surplus of the following year higher than the previous year. In 2016, our country's trade surplus of goods reached 1.6 billion USD; 2017 reached 1.9 billion USD; in 2018 increased to 6.46 billion USD; in 2019 reached 10.57 billion USD, in 2020 reached 19.94 billion USD, in 2021 due to the heavy influence of the Covid-19 epidemic, the trade surplus reached only 3.32 billion USD.

In 2022, despite many difficulties after the severe effects of the COVID-19 epidemic and the unstable situation in the world, the trade surplus will continue to be maintained. Although in the first quarter, the trade surplus was only nearly 1.5 billion USD, then in the second quarter there was a trade deficit, but with continuous efforts in the third quarter (over 6 billion USD) and the fourth quarter (the trade surplus was nearly 4.5 billion USD). billion USD), by the end of 2022, the trade balance of goods has reached a trade surplus of 11.2 billion USD.

5.2. Vietnam's trade openness status

Since the doi moi, Vietnam has been promoting export-oriented industries and at the same time protecting its nascent industries. Open trade policies are characterized by strong protectionism and interventionism through a series of nominal tariffs and especially non-tariff barriers (quantitative controls, permits, taxes), control outsourcing contracts with foreign partners, etc.).

Trade openness also changes the movement of foreign direct investment because increased foreign investment significantly affects overall exports. After the 1986 reform, Vietnam worked tirelessly to advance its trade and liberalization policies. Vietnam transitioned from a typical agricultural-based economy to an industrial one. The country encourages foreign investors to invest in various sectors such as health and education. Since then, Vietnam has continuously focused on improving its economic position through foreign investment and commercial activities.

Vietnam became a member of the World Trade Organization in 2007, which has further boosted trade and FDI inflows. Vietnam has designed a complete FDI growth plan to attract investors and encourage foreign investment for the sake of local development and growth.

Figure 4. Economic openness of Vietnam from 1986 to 2020

Source: The World Bank

Vietnam's trade reform is not motivated by a belief in the theoretical effects of "free trade" but is carried out with the aim of industrialization of the economy. At the same time, another important condition is maintaining the leadership role of the State in the transition. New liberalization measures have only been implemented since the late 1990s under pressure to prepare for the Asian Free Trade Area (AFTA), other bilateral agreements and the WTO. However, the reform of the trading system is far from its goal, and so far we cannot consider Vietnam to have liberalized its openness.

During the doi moi period, dramatic and dramatic changes in trade volumes and trading partners at the early stages of the transition gave the impression that Vietnam would integrate into international trade.

Figure 5. Vietnam's trade openness in recent years

Source: The Global Economy

Vietnam's trade openness has continuously increased year by year, peaking in 2019 this figure reached 211.5%. In terms of 2016, when the trade openness of the three countries with the largest economies in the world, the US, was only 27%, China was 37%, and Japan was 31%, Vietnam was up to 184.7%. It can be seen that Vietnam is a country with a very high trade openness rating in the world in general and in Asia in particular. Reason:

Firstly, Vietnam mainly has to import machinery components for processing and export back, while the other 3 countries can produce goods themselves in their country.

Second, it can be seen that since the average income of Vietnam is much smaller than the average income of countries with developed economies, it will make the denominator in the formula small, leading to a small trade openness. big trade.

6. Vietnam's economic growth situation

After the doi moi 1986, Vietnam has continuously made efforts to revive policies and strategies aimed at stabilizing economic activities and growth. The economy shifted from agriculture to industry based economy although there are certain differences.

Vietnam's economy has a large openness, production depends a lot on imported raw materials and fuels, and has limited resilience and competitiveness. Only a small change in the world can have a big impact on the domestic economy and society.

Figure 6. GDP growth rate in the years 2018-2022 (%)

Source: The author compiles data from the General Statistics Office

Economic growth in 2022 will reach 8.02% over the same period last year, this is the highest increase in the period 2011-2022, in which the agriculture, forestry and fishery sector continues to be the foundation of the economy. Vietnam's gross domestic product (GDP) in 2022 exceeded 400 billion USD for the first time. According to the General Statistics Office, GDP per capita in 2022 is estimated at 95.6 million VND/person, equivalent to 4,110 USD, an increase of 393 USD compared to 2021. In particular, Vietnam's GDP in 2022 recorded a high increase. in the past 12 years with an increase of 8.02% over the previous year. In which, the field of agriculture, forestry and fishery increased by 3.36%, contributing 5.11% to the growth rate of total added value of the whole economy. Industry and construction, processing and manufacturing industries had a growth rate of 8.10%, contributing 38, 24% to the growth rate of total value added of the whole economy. The service sector recovered and grew strongly with the growth rate in 2022 reaching 9.99%, the highest in the period 2011-2022; contributed 56.65% to the growth rate of total added value of the whole economy. Vietnam's economic position in international trade has been consolidated and confirmed. While global aggregate demand declined, supply chains broke, export producers faced difficulties in input materials and consumption markets, but the export turnover of goods next year was higher than the previous year. , reflecting the dynamism and overcoming difficulties in finding sources of goods and finding markets. Import and export turnover of goods for the whole year exceeded USD 730 billion, with 36 items achieving export turnover of over USD 1 billion; For the first time, seafood export reached 10 billion USD, making Vietnam the third largest seafood exporter in the world, accounting for over 7% of the global market share; trade surplus was at a high level, reaching 11.2 billion USD, helping to reduce exchange rate pressure in the foreign currency market. Foreign direct investment into Vietnam is the bright spot of the economy in the context of declining international trade and investment. In 2022, 1,107 projects registered to increase investment capital with the total additional registered capital reaching nearly 10.12 billion

USD; Implemented FDI capital reached 22.4 billion USD, up 13.5% compared to 2021. In particular, foreign investment attraction has shifted, focusing on high-tech industries and fields, in line with the theme of the project. promoting quality improvement, prioritizing projects that are modern, pervasive in technology, create highly competitive products, and at the same time meet green and sustainable development goals. The results of foreign direct investment and international trade show that investors are placing great faith in the investment environment and Vietnam's economic position in the global supply chain. The world community assesses that Vietnam plays an important role in promoting international trade and commits to expand investment in Vietnam in the coming time.

7. Conclusion

Through the analysis of import-export situation and economic growth, it is found that trade openness has a positive impact on Vietnam's economic growth, plays an important role in long-term economic growth. Therefore, there should be policies to promote import and export in Vietnam. Policymakers can develop political policies and corporate tax strategies by looking at tax structures and financing local products, both across small and large systems. Outline export diversification strategies that can be positively linked to economic growth. Strengthen international cooperation and sign trade agreements. This will help attract foreign direct investment, create more jobs for workers, help alleviate poverty, build a more productive workforce, meet the economic needs of the Vietnamese people. In addition, reasonable trade policies also contribute to the country's ability to absorb the quintessence of technology and techniques as well as knowledge to allocate national resources more effectively, limit prevent wastage of available resources

IMPROVE TAX ADMINISTRATION FOR CAPITAL TRANSFER ACTIVITIES IN VIETNAM

Assoc. Prof. Dr. Nguyen Thi Thuy Duong

duongnt@neu.edu.vn

School of Banking Finance, National Economics University, Hanoi, Vietnam

Abstract

The article synthesizes the types of capital transfer and the content of tax collection management. At the same time, the article also analyses current status of tax administration for capital transfer activities in Vietnam and points out the weaknesses and the reasons that make the tax management become more difficult. Tax administration for capital transfer activities only stops at declaration confirmation. This is mainly done by self-declared businesses or those who need confirmation from tax authorities to complete legal procedures. Vietnam has no basis to verify the transfer price, so it only collects tax on capital transfer activities on the exchange rate difference between the time of transfer and the time of capital contribution, leading to loss of tax collection. For an individual transfer of capital, it is difficult to control the transfer price and related costs. Finally, the article offers some solutions to improve the tax administration for capital transfer activities in Vietnam. Tax authorities need to strengthen measures to effectively implement tax policies for capital and asset transfer activities of foreign enterprises. It is necessary to promote international cooperation in preventing tax base erosion and profit transfer, and perfecting tax laws and policies for capital and asset transfer activities of foreign enterprises. In particular, it is necessary to supplement regulations and guidelines on business restructuring activities. The inspection of capital transfer cases related to M&A activities should be strengthened. tax management for individuals transferring share capital should be focused. It is necessary to build a number of professional manuals to inspect and check capital transfer transactions. Tax authorities need to continue to build and perfect the database to improve the efficiency of information management of capital transfer transactions

Keywords: *Capital transfer, tax administration, tax collection management, transfer price, tax treaty*

1. Introduction

In recent years, the transfer of contributed capital and shares of organizations and individuals in enterprises has taken place quite often with a large transaction value. This is complex financial activities which have many potential tax risks. In fact, the inspection shows that many individuals and organizations have not well performed their tax declaration and payment obligations with tax authorities when transferring capital. Meanwhile, the tax inspection and management for capital transfer activities still face many difficulties. The source of timely information to identify and detect capital transfer activities is limited. In

fact, the change of owner is done between foreign legal entities. When the transfer is completed, the transferee will notify the Vietnamese authorities to adjust the investment certificate (change of owner's name) without declaring the capital transfer. Besides, at present, most foreign organizations, when transferring capital to foreign parties, declare the transfer price equal to the cost price. Meanwhile, Vietnam has no basis to verify the transfer price. Therefore, tax authorities currently only collect tax on capital transfer activities on the exchange rate difference between the time of transfer and the time of capital contribution, leading to tax loss.

The legal provisions related to capital transfer activities have not been fully collected and systematized for tax administration. The Law on CIT does not have specific provisions on the collection of CIT for the case of overseas capital transfer by foreign companies, which changes the ownership and control of the parent company that has direct investment capital. into a subsidiary in Vietnam. The tax law also does not clarify the case where foreign organizations and Vietnamese enterprises have activities to transfer capital in Vietnamese enterprises in order to restructure or reorganize investment management activities but in fact there is no capital transfer activity generating taxable income. In addition, the law stipulates unclear subjects and methods of tax calculation for capital transfer transactions in enterprises outside the territory of Vietnam but indirectly change the owner of capital in Vietnamese enterprises.

The amount of corporate income tax collected from capital transfer activities in recent times is still small. Fraudulent acts in capital transfer are still quite common. Therefore, it is necessary to strengthen tax administration for capital transfer activities in Vietnam. The objective of the report is to analyze and assess the current status of tax administration for capital transfer activities in the period 2016 to present, to clarify the achieved results, limitations and causes. The article proposes solutions to improve tax administration for capital transfer activities in Vietnam to ensure compliance with international practices and practical conditions of Vietnam.

2. Theoretical framework

Capital transfer takes the following forms

- Transfer of capital and shares of owners of limited companies and joint-stock companies: Income from the transfer of share capital of the owner of the company being a legal entity will be subject to corporate income tax at the tax rate specified at the time of transfer. Contributed capital and shares are not consumable goods and services, so the transfer of capital and shares in the company is not subject to the value added tax law.

- Swap of contributed capital and shares: Owners can swap contributed capital and shares between member companies or between member companies and the corporation when there is a need to rearrange industry groups. business or focus on business management in the corporation during the restructuring process. The essence of the equity swap process is a series of capital transfer transactions between owners or between owners and related companies. Therefore, income arising from the swap of contributed capital will be subject to tax in accordance with the law on capital transfer.

- Split, merger, consolidation: When the enterprise is restructured in the form of division, separation, merger, consolidation, but the subsidiaries do not have income arising from the split, merger, consolidation, then the owners will not be subject to income tax. However, the difference due to revaluation of assets to contribute capital, transfer of assets upon division, consolidation, merger, conversion of enterprise type is recognized as another income of the enterprise and must be taxed.

- Contributing capital with land use rights: corporate restructuring may lead to the transfer of land use rights of individuals and organizations contributing capital to serve business activities. The capital contribution through the value of land use rights is not considered a transaction of transferring the value of land use rights. When the parties agree that the value of capital contribution is higher than the initial value, the difference obtained from the capital contribution must be recognized as other income when accounting, so corporate income tax must be paid.

Tax collection management for capital transfer activities is the sequence of steps in tax collection management and the responsibility for performing those steps of the tax authorities. The content of the tax administration process depends on the tax authority's choice of tax administration mechanism. A typical tax management process includes the following basic contents:

- Propagating and educating about tax law: conveying information about tax law to all members of the society by specific forms and measures.

- Taxpayer support: create the best conditions for taxpayers to fulfill their tax obligations such as guiding declarations and solving problems.

- Management of tax declaration and payment: capture the entire situation of tax registration, tax declaration, tax payment and tax debt of taxpayers

- Urging tax collection and payment: reminding taxpayers to fulfill their tax obligations to the state budget

- Inspecting taxpayers: controlling and comparing, assessing the correctness and honesty in tax declaration activities and fulfilling tax obligations of taxpayers.

- Tax coercion: using forms and measures to force taxpayers to fulfill tax obligations and implement tax administrative decisions.

3. Method

The narrative reviews are used in this paper. The research has summarized and synthesized the theory of capital transfer and tax collection management for capital transfer activities. The paper has also analysed Vietnam's tax management of capital transfer and pointed out the limitations. The purpose is to help the readers understand the reality of tax management in Vietnam for capital transfer activities. The scope of the research questions being investigated is broad: (a) What are the types of capital transfer activities and the contents of tax collection management for capital transfer activities? (b) What are limitations of tax management for capital transfer activities. in Vietnam (c) how should the tax collection management for capital transfer activities be improved? To provide clear answers

to these questions, a literature review has been conducted. Secondary data are synthesized from domestic and foreign researches

4. Results

4.1 Legal basis of tax administration for capital transfer activities in Vietnam

The tax legal framework for capital transfer was formed very early, along with the formation of the Personal Income Tax Law and the Corporate Income Tax Law. The legal basis for capital transfer is summarized in the following table:

Table 1. Legal basis for capital transfer

No.	Adjusted content	Legal grounds	Target
1.	Recognizing capital transfer activities	Law on Enterprises: Articles 31, 32, 33, 34, 49 Decree 78/2015/ND-CP on business registration: Article 14	Identify capital transfer activities
2.	Identification of subjects with tax obligations	Circular 78/2014/TT-BTC: Article 14 Circular 111/2013/TT-BTC: Article 2 Circular 25/2013/TT-BTC: Article 27 The provisions of the agreement to avoid double taxation	Determining the right to tax, taxpayers are obliged to declare and pay taxes, resident or non-resident
3.	Basis for analysis of capital transfer activity records	Circular 156/2013/TT-BTC: Article 12, Article 16 Circular 111/2013/TT-BTC: Article 26 Enterprise Law: Article 126 Decree 78/2015/ND-CP: Article 4, Article 45, Article 51, Article 52	Determine whether the taxpayer has declared and has an initial declaration to use for risk analysis and identification. Determining available legal documents when there is a capital transfer, change of capital contributors, change of founding shareholders to study the requirements after analyzing the records
4.	Analysis of capital transfer documents	Circular 78/2014/TT-BTC: Article 14 Circular 111/2013/TT-BTC: Article 11, Article 20	Analyze each tax base of the capital transfer, thereby determining the risk for each element of the tax base, determining the content of the application for additional requirements for the enterprise or immediately determining the basis for tax calculation. to determine tax liability

Source: Author's synthesis

4.2. Current status of tax management for capital transfer activities

Firstly, the tax authority has reviewed the data of the tax industry to make a list of cases where capital transfer activities have been declared but have not generated taxable income or generated low taxable income that is not commensurate with regulations. transaction size. Tax authorities focus on the following cases:

- Selling the entire one-member limited liability company in the form of transferring capital attached to real estate, tax must be paid each time it is incurred.

- Foreign organizations that do business in Vietnam or earn income in Vietnam but do not operate under the investment law or enterprise law shall declare corporate income tax for each time capital transfer activities arise.

- Enterprises engaged in M&A activities do not declare and pay tax to tax authorities. Related parties only carry out the registration procedures to change the name of the legal representative and the names of the members. And the rate of capital contribution remains unchanged as the transfer has never happened.

According to the tax administration database, in the period 2016-2022, there were about 800 cases of declaration of capital transfer according to each time of income generation, mainly concentrated in a few large areas such as Hanoi, Ho Chi Minh City and Hanoi. Ho Chi Minh City, Ba Ria Vung Tau, Dong Nai, Binh Duong. Among them, about 300 cases do not generate taxable income (the transfer price is equal to or lower than the cost price, the transfer price is equal to the cost price plus transfer costs).

Second, the tax authority conducts a review to check the completeness and validity of capital transfer documents. Tax declaration dossiers for income from capital transfer of foreign contractors specified in Circular No. 151/2014/TT_BTC include:

- CIT declaration and capital transfer

- Copy of transfer contract. In case the transfer contract is in a foreign language, the following main contents must be translated into Vietnamese: the assignor, the transferee, the time of the assignment, the contents of the assignment, the rights and obligations of each party, and the value. of the contract, term, method and currency of payment.

- A copy of the competent agency's decision approving the capital transfer

- A copy of the certificate of capital contribution

- Original documents of expenses.

The tax authority has reviewed the capital transfer cases in the locality. Tax officers put at risk to plan inspection, check or conduct specialized inspection and examination for cases where the declaration of transfer price equals the cost price, or the low difference between the transfer price and the cost price, resulting in no or low CIT payable.

Third, the tax authority reviewed some cases of capital transfer declaration with signs of risk. Tax authorities combine the collection and analysis of information from inside and

outside (media information, press, anti-money laundering department, inspection and supervision agency of the state bank) to review cases with signs of fraud. Typical cases can be mentioned are Matro cash & carry Vietnam Co., Ltd., Insurance brokerage Gras Savoye Willis Vietnam Co., Ltd., Samju Vina Co., Ltd. (loss adjustment for taxable income is 11,134 billion VND). Since 2016, the tax authority has immediately inspected enterprises with high tax risks, tax refunds, businesses that have not been inspected for many years (from 3-5 years), enterprises using Illegal invoices and documents on tax incentives, capital transfers, trademarks... By 2022, the tax authorities have focused on analyzing risks, strengthening inspection and checking against tax loss in some areas such as e-commerce, business on digital platforms, capital transfer, purchase and sale, mergers and acquisitions, real estate transfer...

Table 2. Results of inspection (up to the end of December 2022)

Number of inspections	31,095
Amount proposed to be handled (billion VND)	22,680
Increased tax collected through inspection (VND billion)	6,129
Decrease of deduction (billion VND)	892
Loss reduction (billion VND)	15.01
Total tax paid to the state budget (billion VND)	3,852

Source: Ministry of Finance (2022)

Tax authorities have conducted 31,095 inspections, reducing losses of 15.01 billion VND, reducing deductions by 892 billion VND. The increase in tax collected through inspection is VND 6,129 billion. The total amount of tax paid to the state budget is 3,852 billion VND.

In summary, Tax administration for capital transfer activities in Vietnam is assessed as follows:

a. Achievements

Tax law on capital transfer has contributed to clarifying the objects and methods of tax calculation for domestic capital transfers and capital transfers between enterprises outside the territory of Vietnam. Many measures have been taken for the purpose of reviewing and evaluating the declaration and payment of CIT for capital transfer activities of enterprises. The draft Law amending and supplementing a number of articles of the Law on Value Added Tax, the Law on Special Consumption Tax, the Law on Personal Income Tax, the Law on Corporate Income Tax and the Law on Natural Resources Tax focuses on amending, supplement and complete a specific, clear, public and transparent legal framework for capital transfer to avoid disputes over tax collection.

Through reviewing CIT declaration dossiers, tax authorities have taken measures to strengthen supervision and urge enterprises with capital transfer activities to fully declare and pay tax in accordance with the law. For some transactions of great value but incomplete or questionable tax returns, an inspection and inspection plan should be developed to ensure compliance with tax laws as well as to avoid loss of state budget revenue.

b. Limitations

Tax administration for capital transfer activities only stops at declaration confirmation. This is mainly done by self-declared businesses or those who need confirmation from tax authorities to complete legal procedures. In the field of real estate, the popular form of real estate project transfer recently is to buy back 80-90% controlling shares or buy the whole company. However, the transfer usually takes place silently, so it is not easy to know the details of the transaction. There are many forms of capital transfer. However, there is no coordination mechanism between tax authorities and licensing agencies. There is no regulation that the licensing agency only carries out procedures for changing capital contributors when organizations and individuals have fulfilled their tax obligations, resulting in loss of revenue for the state budget.

Capital transfer transactions indirectly change the owners of capital in Vietnamese enterprises. But in fact, the majority of foreign organizations, when transferring capital to foreign parties, declare the capital transfer price equal to the cost price. Meanwhile, Vietnam has no basis to verify the transfer price, so it only collects tax on capital transfer activities on the exchange rate difference between the time of transfer and the time of capital contribution, leading to loss of tax collection. For an individual transfer of capital, it is difficult to control the transfer price and related costs. The vast majority of cases declare the difference of 0 leading to loss of tax revenue. This is unfair to the transfer of capital in the form of securities...

c. Causes of limitation

Firstly, the tax policy and tax calculation methods, tax payment procedures related to capital transfer are not appropriate. Currently, there is no legal document stipulating a mechanism to control cash flow for capital transfer transactions, especially indirect forms of capital transfer. The tax administration database system for capital transfers is not yet capable of capturing the number of transfer activities. Most cases are now detected through inspection.

The personal income tax exemption policy in transferring gifts to relatives has facilitated tax avoidance. Some individuals take advantage of this policy when carrying out the procedure of transferring and gifting real estate with relatives to avoid paying personal income tax. If they did not carry out the step-by-step transfer procedure according to each tax-exempt relationship, they would have to fulfill the obligation to pay personal income tax.

Second, some foreign enterprises and multinational corporations have taken advantage of tax agreements to transfer profits to countries with low tax rates, high tax incentives or no tax collection. These are the countries with which Vietnam has signed a tax agreement. As a result, these businesses will reduce the amount of tax payable, affecting the state budget revenue. Multinational corporations establish many branches and subsidiaries in countries and territories with low tax rates or at tax havens. Then, these branches and subsidiaries invest capital in other countries that have signed tax avoidance agreements with the aforementioned countries, territories or tax havens. Under the Agreements for the Avoidance of Double Taxation, business income (including capital gains) of foreign

enterprises which does not have a permanent establishment in a Contracting State shall be pay taxes only in the Contracting State of residence.

5. Discussion and Conclusion

From the above analysis, the article proposes the following solutions

Firstly, tax agencies should research to complete regulations on tax administration for capital transfer activities. Tax authorities need to strengthen measures to effectively implement tax policies for capital and asset transfer activities of foreign enterprises. It is necessary to promote international cooperation in preventing tax base erosion and profit transfer, and perfecting tax laws and policies for capital and asset transfer activities of foreign enterprises. In particular, it is necessary to supplement regulations and guidelines on business restructuring activities, mergers and acquisitions, joint ventures, alliances in the technology field, intangible asset transfer and cost-sharing agreements in research and development. Tax authorities should consider promulgating a new tax on revenue from transfer transactions in Vietnam of multinational corporations without a presence in Vietnam. at the same time, it is necessary to complete the provisions of the law on corporate income tax for capital transfer activities of foreign investors, ensure transparency, consistency and convenience, enhance training and improve the qualifications of tax officers in the field of tax fraud prevention

Secondly, the inspection of capital transfer cases related to M&A activities should be strengthened. Due to the lack of strict laws, the licensing agency has carried out procedures for changing capital contributors when organizations and individuals have not even fulfilled their tax obligations. There is no coordination mechanism between tax authorities and licensing agencies. Therefore, tax officials have not yet fully collected taxes arising from capital transfer activities. There is a common point that when the tax authority inspects the capital transfer, businesses delay the provision of documents, data explanations as well as data on capital transfer among members of the company. The current situation of tax avoidance from capital transfer activities along with the increasing trend of M&A will be a big challenge for tax inspectors. Therefore, the development of a legal framework on M&A needs to avoid loopholes for tax evasion, especially the issues of managing financial obligations of enterprises carrying out capital transfers.

Thirdly, tax management for individuals transferring share capital should be focused. Individuals are entitled to bring capital, property, real estate, including the right to use land, to contribute capital to establish an enterprise. According to the regulations on personal income tax, the transferred real estate must fulfill the tax obligation of 2% of the value of the real estate. Thus, when the enterprise is transferred, the value of the capital and assets will be returned to the investor. Land use rights of individuals who previously contributed to establish a business and are now transferred will be subject to personal income tax arrears. Similarly, dividends and after-tax profits are subject to personal income tax of 5% on the actual personal income received. If the enterprise uses after-tax profits to

increase capital and has not yet distributed it to individuals, tax has not yet been collected. Therefore, when transferring the capital or shares of the owner being an individual, the transferring enterprise needs to review the tax liability for the capital derived from dividends and profit after tax. Owners of capital or shares of the enterprise must fulfill personal income tax obligations. Personal income tax management needs to tighten and unify the management of deductions at source.

Fourthly, it is necessary to build a number of professional manuals to inspect and check capital transfer transactions. Capital transfer inspection is a complex business. In addition to training, in the coming time, tax authorities need to develop and soon issue an inspection manual for this activity. The development of the manual aims to: (1) ensure supplementing and standardizing the tax inspection process, detailing the process of carrying out an inspection, illustrating specific situations to make it easier for tax officials. easy to apply in the inspection process, contributing to improving the effectiveness and efficiency of tax administration activities and protecting the interests of the state; (2) assisting inspectors in their working process to be convenient, ensuring consistency, efficiency, and compliance with the law, improving the capacity of inspectors. Basically, the contents of the manual of inspection tools for transfer transactions are divided into 3 stages: before conducting the inspection (the basis for selecting the object of inspection, the work to be prepared, the development of a plan). tax inspection plan at the taxpayer's office); conduct inspection; handling inspection results (sanctions, arrears, dialogue, settlement of complaints and denunciations)

Finally, tax authorities need to continue to build and perfect the database to improve the efficiency of information management of capital transfer transactions. In order to ensure that there are enough internal sources of information for tax administration for capital transfer, the tax authority now integrates many sources of information such as the declaration of the transfer of exploited capital from the tax system. industry databases, information data of government agencies, commercial databases, reports of industry economic analysts, exchange of information under double taxation agreements. In the near future, tax authorities may collect information in the form of a survey. Tax officers can ask taxpayers to respond directly to a questionnaire prepared by the tax authority and make a memorandum of understanding. The survey will help tax authorities better understand the current situation of production and business activities of enterprises and have more specific information to assess risks in areas or subjects subject to inspection. Tax authorities need to accelerate the integration of data management applications. The permission to access, search and exploit taxpayer information nationwide needs to be empowered by local tax authorities.

To conclude, in order to effectively manage taxes on capital transfer, the solutions from the tax authorities are not enough. Government and ministries need support for tax authorities. The sense of responsibility of taxpayers needs to be enhanced

Abstract

Intending to identify opportunities and challenges from the free trade agreement (FTA) in the growth of Vietnam's import and export turnover, through data collection, analysis, and synthesis methods, the research team submits Present the research results through 4 parts: Introduction, Method, Results, Discussion, and Conclusion. In the Introduction, the article gives a theoretical basis for export activities, export turnover, and FTA. From the results of analyzing relevant research documents, the article has found research gaps in import and export activities, opportunities, and challenges from FTA to Vietnam's turnover growth in the coming time. The research results also synthesize export data, trade surplus, export turnover growth rate over the years of Vietnam in the period 2012 to 2022, and export data of Vietnam with FTA members. From the overall picture of export activities, the research team identifies opportunities from the FTA to the economy, government, and export activities of enterprises such as affecting the improvement of policies and laws and enjoying preferential tariffs... However, with opportunities comes significant challenges such as ensuring commitments, treaties, and regulations in export activities from the signed FTA terms. In the discussion of the results, the research team proposed some solutions to increase export turnover for Vietnam in the coming time, such as: continuing to improve institutions, policies, and laws in export activities, and strengthening information and regulations on FTA for enterprises to have appropriate production and export orientation in the future. In addition, solutions such as increasing the effective use of FDI capital, helping to change production technology lines, and applying modern production management processes also help exporters to enhance product quality, optimize costs, and create competitiveness in the market and domestic products of the country signing an FTA with Vietnam.

Keywords: *challenges, Export turnover, FTA, opportunities, Vietnam*

1. Introduction

Export turnover is the total value of exports of all goods by a company or a country during a fixed period which can be a month, a quarter, or a year. This portion of the value is

converted and synchronized in a specific currency. Export turnover assesses the economic and financial situation of enterprises and the whole country's economy. The increase in export turnover shows that the financial situation of enterprises or countries is showing positive signs. On the contrary, if the export turnover is low, the amount of foreign currency earned decreases, and the financial economy of enterprises and the country is slow to develop. An FTA is an agreement between two or more countries that agree on specific commitments affecting trade in goods and services, and measures to protect businesses, investors, intellectual property rights, and other areas of the agreement. Under the FTA policy, goods and services can be bought and sold with foreign partners without tax or with very low preferential tax rates. Joining an FTA will reduce trade barriers such as quotas, subsidies, or government bans. In recent years, Vietnam has achieved many important achievements in economic development thanks to its efforts to open, integrate into the global economy, and actively participate in the network of FTAs. According to the WTO center, Vietnam has joined and is negotiating 17 FTAs, of which 15 FTAs have taken effect and fully implemented commitments, and 2 FTAs between Vietnam - EFTA and Vietnam - Israel is in the process of negotiation process [9]. Although FTA agreements bring many opportunities, they also come with significant challenges for the government, management agencies, and export businesses. The research team has synthesized the results of a few studies on economic integration and the impact of trade agreements on Vietnam.

Tra, P. (2022), the study refers to the content of international economic integration, challenges, and opportunities of Vietnamese enterprises in the implementation of FTA agreements. The author focuses on evaluating the positive effects brought by the new generation FTAs. Identify challenges in policy development, legislation, labor, and environmental issues. The author also believes that Vietnamese enterprises have not yet mastered the standards and quality of products from partner countries. However, besides that, the author also mentioned some opportunities for Vietnamese enterprises such as boosting exports to major markets and enjoying tax incentives under FTA agreements [5].

Trang, T.T., & Thanh, D.T.M. (2018), in studying the outstanding impacts of new-generation FTAs on Vietnam's economic growth, the author believes that participating in new-generation FTAs has helped the economy grow impressively, opening many opportunities for economic growth in Vietnam. The author analyzes the impacts of the new generation FTA on Vietnam, emphasizing the impact on promoting economic growth. The study makes several recommendations for businesses and the State to take advantage of the positive impacts to take advantage of tariff preferences in the import and export of goods; increasing the possibility of participating in the newly formed supply chain in the region or perfecting economic institutions and mechanisms, creating momentum to realize the dual goals in the development of economic growth and macro stability [6].

Trang, N.T.H., & Huong, N.T. (2020), Opportunities and challenges from EVFTA for Vietnamese businesses, the study identifies the importance of the EVFTA agreement for the Vietnamese economy and businesses. The study also shows the import and export results

between Vietnam and the EU during the period 2015-2019. Assessment of opportunities and challenges from EVFTA for Vietnamese enterprises [7].

Research by Khiem, T.T.K., et al, (2023) on Vietnam's economy when joining new generation FTAs and some directions for improvement. In this study, the authors identified the current context of Vietnam's economy. The author believes that when our country integrates into the global economy, actively promoting participation in new-generation FTAs will contribute to promoting the strong development of the economy, and at the same time, help Vietnamese businesses create offers great opportunities to bring people's products closer to the global market. Besides the positive aspects, joining the new generation FTAs also poses many challenges to the Vietnamese economy. The article analyzes and assesses the current situation of Vietnam's economy in participating in new-generation FTAs and identifies opportunities and challenges when participating in these agreements, thereby focusing on providing solutions to solve problems difficult [3].

The results of the above studies all have one thing in common, which is the assessment of the impact of the FTA on the Vietnamese economy. Research to identify opportunities and challenges for businesses and support solutions for businesses to overcome difficulties. However, from the synthesis of related studies, the research team also found that there is no specific study on the content of import and export turnover and a comprehensive picture of Vietnam's exports in the last ten years. In addition, the above studies mainly assess the impact of FTAs on businesses without identifying opportunities and difficulties for the government and economic policy when Vietnam joins FTA agreements. Therefore, the research team researches the opportunities and challenges in the growth of Vietnam's export turnover when taking advantage of the effectiveness of FTA agreements to fill the research gap in this issue, making a clear understanding of the opportunities and challenges that FTA brings to the state and businesses. From those challenges, the research team proposes several measures to help increase Vietnam's export turnover to the world market.

2. Method

The article uses two common methods in researching social issues, which are data collection methods and analysis and synthesis methods.

The method of data collection

With the research content Opportunities and challenges in the growth of Vietnam's export turnover when taking advantage of the effectiveness of FTAs, the research team has studied relevant studies on export turnover, data on Vietnam's exports from 2012 to 2022, the trade agreement from the new generation, the State's policies related to the negotiation and implementation of the trade agreement. Overview of research contents on import and export activities, the impact of FTA on Vietnam's exports, and opportunities and challenges for Vietnamese enterprises when participating in FTA agreements. From the contents of these documents, the group has collected information for the proposed research content and objectives.

Methods of Analysis and Synthesis

Summarizing the results of previous research authors on related content, the research team has found a gap to conduct the research and the goal to be achieved of the research.

From the data collected through the method of document research, the authors analyze the results of data on exports and trade surplus over the years, thereby serving as a basis for assessing the benefits of FTAs for activities. Vietnam's exports. Identify difficulties and opportunities for the Vietnamese economy, domestic production, and export enterprises in the coming time.

3. Results

3.1. Vietnam's export turnover

In recent years, there has been a shift in the structure of commodity exports among commodity groups and towards the core of industrialization. In early 2022, industrial products accounted for more than 80%, agricultural and seafood products accounted for over 10%, and fuel and mineral products accounted for just over 1% of total export turnover. The United States is Vietnam's largest export market, accounting for 28.6% of total exports and having the largest export growth rate (up 24.9% over the same period last year). In addition, the United States is also the market where Vietnam has the largest trade surplus with a trade surplus of \$81 billion [2].

Unit: Billion USD

Figure 1. Vietnam's trade surplus in the period 2012-2022

Source: Synthesized data from the Socio-Economic Situation Report (2012-2022), General Statistics Office [1]

Since 1993, after nearly 20 years, Vietnam achieved a trade surplus of 0.3 billion USD in 2012 [1]. In the period from 2013 to 2016, export growth was in a period of decline due to difficulties in industrial production, the consequences of the financial crisis, and the European public debt crisis. At this point, the global economy has not fully recovered. Due to a corresponding decrease in export demand, the increase was smaller than the previous year. In the following years, under the influence of trade agreements that took effect, efforts to open markets, improve goods consumption promotion activities, and support export enterprises, Vietnam continuously achieved a trade surplus although not growing continuously, decreased insignificantly in 2016, and 2018. The highest trade surplus in this period was achieved in 2020 with a trade surplus of up to 19.1 billion USD [1]. However, in 2021, the trade surplus will decrease significantly due to the worldwide outbreak of covid - 19 with 4 billion USD [1]. In 2022, Vietnam's exports have almost recovered and achieved a higher-than-expected increase of 12.4 billion USD [1]. According to the General Statistics Office, Vietnam's exports show signs of recovery in 2022 as Vietnamese enterprises have controlled the Covid-19 epidemic and conducted production and business activities. At the same time, the increase in consumer demand in the export market has boosted Vietnam's export turnover higher than in the same period in 2021.

Table 1. Export turnover of Vietnam in the period 2012-2022

Unit: Billion USD

Year	Total exports and imports	Total exports	Export growth rate
2012	228.9	114.6	-
2013	264.26	132.135	15.4
2014	298.24	150.19	13.7
2015	327.76	165.65	12
2016	349.16	175.9	8.6
2017	425.12	217.02	23.3
2018	480.17	243.5	13.2
2019	517.26	264.19	8.4
2020	543.9	281.5	6.5
2021	668.5	336.25	19
2022	730.2	371.3	10.5

Source: General Statistics Office [1]

Calculating the data of total export turnover, the export growth rate in the period 2012-2022 averaged 15.1 %/year. In 2017, total export turnover increased the highest at USD 217.02 billion (up 23.3%) compared to 2016 at USD 175.9 billion [1].

Unit: Billion USD

Source: General Statistics Office

3.2. Results of Vietnam's export turnover with members in the free trade agreement

Vietnam has participated in the negotiation of 17 FTAs. FTAs have created favorable conditions for Vietnamese enterprises to expand access and establish trade relations with major economies in the world such as Korea, the EU, and the Pacific. Currently, there are four new generation FTA trade agreements with breakthroughs that help export turnover to increase rapidly, namely the Vietnam - Korea FTA Agreement (VKFTA) signed on May 5, 2015 and signed by the Republic of Korea on May 5, 2015. effective from December 20, 2015; The FTA Agreement between Vietnam and the Eurasian Economic Union (UN-EAEU FHA) was signed on May 29, 2015 and took effect from October 5, 2016; Comprehensive and Progressive Agreement for Trans-Pacific Partnership (CPTPP). Signed on September 3, 2018, Effective on December 30, 2018, In Vietnam, the CPTPP Agreement will take effect from January 14, 2019; The Vietnam - EU FTA Agreement (EVFTA) officially ended negotiations on December 2, 2015. This agreement takes effect on August 1, 2020 [9].

Statistics show that, despite the negative impact of the Covid-19 epidemic, Vietnam's export turnover to FTA markets will increase in 2021. Which, the Chinese market will grow by 15%. EU is 14%. South Korea increased by 15.8%. India increased by 21%. New Zealand increased by 42.5% ... By the end of 2019, the total import-export turnover between Vietnam and EU member countries (28 countries) reached US\$56.39 billion, accounting for 11%, according to the number latest data from the General Department of Customs [9]. Export turnover to the EU decreased by 1% compared to 2018, reaching 41.48 billion USD, but still accounted for 15.7% of the total export turnover of the country [11].

In the first five months of 2022, goods exports to the European Union (EU) reached 19.7 billion USD, up 21.7% over the same period; the trade surplus increased by nearly 47%, reaching 13.4 billion USD. In particular, export turnover to new markets with FTAs with Vietnam has grown very impressively. Specifically, export turnover to Canada increased by nearly 30%; Mexico increased by 21%; Peru by 12.2%; New Zealand increased by 24.7% [8].

Unit: Billion USD

Figure 3. Export turnover to the EU and other regions in 2019

Source: WTO Center VCCI [10]

Thus, after FTA trade agreements such as VKFTA, UN-EAEU FHA, CPTPP, and EVFTA came into effect, the total export turnover to these regions increased continuously. Especially in the EU market, exports in 2022 will increase to a record compared to previous years.

3.3. Opportunities and challenges in the growth of Vietnam's export turnover when taking advantage of the effectiveness of FTAs

Opportunity

The signing and joining of a new generation FTA will have a significant impact on Vietnam's economy through the expansion of export markets, which will increase export turnover to partner countries, and consolidate and integrate traditional markets, opening many potential markets. As the basis for promoting relations with important strategic economic partners.

Firstly, the business environment: Participation in new-generation FTAs such as EVFTA and CPTPP creates a driving force for change and improvement of State institutions and legal policies towards transparency, convenience, and conformity with information international rate.

Second, attracting foreign investment (FDI): New-generation FTAs create opportunities for foreign investors to access the Vietnamese market faster. Changing technology and new production lines. Help improve product quality and meet export standards of major markets.

Third, promote export activities: Trade liberalization in general and new-generation FTAs, in particular, will affect export promotion. In the coming time, Vietnam's exports are expected to continue to grow strongly when the implementation of tariff reduction in FTAs enters a significant reduction phase.

Fourth, domestic production: Joining new generation FTAs will lower the cost of many goods as raw materials for domestic production, reduce production costs for businesses, and make goods prices more competitive compared to domestic production with imported goods, become a force and products are promoted domestically production for export.

Challenge

Besides the positive effects, the implementation of new-generation FTAs will bring many challenges to Vietnam's exports in the coming time.

The first is to perfect the system and create a healthy competitive environment. The process of implementing commitments to international integration has had far-reaching impacts on the Vietnamese economy. Institutions and decision-making have been gradually improved, bringing significant changes to the Vietnamese economy. However, compared with international practices, economic systems, and corporate investment, Vietnam still has a big gap. Without efforts to reform and perfect the market economy institution, it will become a hindrance to Vietnam's export growth in the future.

Second, the competitiveness of Vietnamese exporters is still weak. Although Vietnam's economy in general, the competitiveness of enterprises, and Vietnamese products in particular, has improved a lot compared to before, it is still very weak compared to other countries in the region and the world. Outdated technological lines, the origin of exported goods does not comply with the standards [4] and regulations of the FTAs. This is a big challenge for Vietnam when most of the raw materials for the production of goods are imported from China and other ASEAN countries. Besides, at present, many domestic enterprises are not interested in developing products in the direction of improving quality but only focusing on promoting sales and increasing product output.

Third, have not made effective use of FDI capital because the relationship between FDI enterprises and domestic enterprises is still weak. FDI enterprises mainly operate in the field of outsourcing and assembly, using cheap labor as an advantage and are less likely to create spillover effects in terms of technology, leading to goods that are not competitive in quality and price.

Fourth, the FTA legal regime is increasingly demanding with participating countries: The FTA includes strict regulations and rules on investment procedures, customs, trade facilitation, and technical standards, measures to quarantine animals and plants, intellectual property ... require Vietnamese enterprises to understand and apply flexibly and honestly according to regulations. Enterprises themselves have not yet fully grasped information about FTAs, so it is difficult to determine the direct impacts of FTAs on the export activities of enterprises. The lack of understanding of the necessary information makes businesses not have the best preparation in the process of joining the world economy.

4. Discussion and conclusion

Taking advantage of opportunities and removing challenges in the process of implementing the new generation FTA commitments toward the growth of export turnover in the coming time, the government, agencies, and businesses need to create linkages and implement a synergy set of solutions.

On the government side, it is necessary to continue building and perfecting the legal system and policies and fully implementing international commitments according to the roadmap. In amending and supplementing policies, it is necessary to ensure uniformity, and efficiency, and maintain a stable environment for investment and import-export activities. Review, amend and adjust regulations that are inconsistent with FTA commitments in order to fully fulfill obligations in bilateral and multilateral international treaties on import and export activities.

The functional departments strengthen the implementation of providing and consulting activities for businesses, directing businesses to focus on the quality of export products and fully grasp information about the new generation FTAs. Ensure compliance with high standards and requirements for products imported from the EU, as well as other European countries. Vietnamese businesses must be proactive in understanding and fully grasping information, requirements, and strict regulations on new-generation FTAs, as well as import and export regulations of partner countries.

On the export side, it is necessary to innovate corporate governance and information technology activities, improve product quality, and strengthen brand promotion; Along with that, actively develop business strategies, and develop products to be able to compete with goods from other countries in the region even in the domestic market and export market, research to meet the needs of customers criteria on rules of origin to enjoy tariff preferences.

INCLUSIVE INSURANCE: A FINANCING TOOL TO NATURAL DISASTER RISKS IN VIETNAM

Dr. Nguyen Thi Hai Duong

duongnh@neu.edu.vn

ALMI, ANZIIF Snr Assoc. CIP

Faculty of Insurance, National Economics University, Hanoi, Vietnam

Nguyen Nhu Minh Ngoc

miminhngoc.nn@gmail.com

National Economics University, Hanoi, Vietnam

Abstract

Disaster risk management and disaster resilience become more and more importance in the context of climate change in recently years. A financing strategy that enables an appropriate and timely response can reduce the overall human and financial costs incurred in the event of disasters. In which, inclusive insurance as a financial tool can improve Viet Nam's financial preparedness for future catastrophic events. The article uses qualitative analysis and in-depth interviews to clarify the reality of situation of inclusive insurance in Vietnam, its supply capacity and stakeholder needs for coverages. Interviewees are experts in the field of finance and insurance, agencies, representatives of socio-political organizations (representing women, farmers, cooperatives). Recommendations are proposed based on actual assessment of inclusive insurance in Vietnam, supply capacity and needs of stakeholders as well as the direction of the Government.

Keywords: *natural disaster risk, financing risk, inclusive insurance.*

1. Introduction

Viet Nam is located at one of five storm-prone areas in the Asia-Pacific region, the country often faces natural disasters of various types such as typhoons, floods, landslides, drought, and seawater intrusion. In recent years, natural disasters have continually occurred all over the country, causing vast losses to human life, property, and socio-economic and cultural infrastructure, as well as environmental degradation. According to UNDP (2020) natural disaster losses have reduced Viet Nam's GDP growth by more than 1% annually during last decades. World Bank figured that Viet Nam is likely to incur, on average, \$1.4 billion (VND 30.2 trillion) per year in direct damage due to floods, typhoons, and earthquakes. In the next 50 years, it has a 40 percent chance of experiencing economic loss due to these disasters exceeding \$6.7 billion (VND 141.2 trillion) and a 20 percent chance of experiencing loss exceeding \$8.1 billion (VND 171.2 trillion) (WB, 2016).

The insurance and risk financing against natural disasters is still evolving in Viet Nam, yet there are significant gaps to be filled. These gaps are also prevalent beyond disaster losses, resulting in increased expenditure on compensating the avoidable healthcare losses, property losses, and livelihood losses, and agriculture losses.

This study will assess significant areas including the insurance supply-side, demand-side, the gaps and opportunities in creating an enabling environment through government policy and regulatory environment, building regulatory capacities, and suggesting suitable approach towards developing new insurance solutions. The Study will not only highlight challenges and opportunities but will also highlight those areas to improve the enabling environment for inclusive insurance and risk financing and to develop specific solutions relevant to Viet Nam.

2. Method

The article uses qualitative analysis and in-depth interviews to clarify the reality of situation of inclusive insurance in Vietnam, its supply capacity and stakeholder needs for coverages. Interviewees are from stakeholders in the main actors in disaster risk, insurance and risk financing in Vietnam. In-depth interviews will be organized covering experts at the Association, insurance companies, agencies, and socio-political organizations, who are persons with vision, understanding and experience in the field. Interviews concentrate to get expert opinions and assessments on research issues. These will be materials serving for qualitative analysis to assess the development of the insurance agenda in Viet Nam, assess the disaster and climate risk insurance development during previous years, frame and analyze the insurance development priorities, facilitate the stakeholders' dialogue, and develop an action plan based on the findings.

Interviews were conducted from 27 August to 15 September 2021. Interviews were conducting both online and offline. Each day conducted two to three interviews. The questions also sent to some stakeholders and experts by email to interviewees, who will give answers from 27 August to 5 September 2021.

Beside interviews of stakeholders, data on disaster risks and losses, insured losses in construction and installation activities of public properties will be collected. However, this is great obstacle causing by lack of statistic.

3. Results

3.1. Overview of inclusive insurance in vietnam

Vietnam is in an area strongly affected by natural risks and climate change. Areas that are often heavily impacted by disaster risks include agricultural production, assets such as buildings/offices, schools, hospitals, cultural facilities, transportation infrastructures and other properties of state organizations, businesses, small and medium enterprises (SMEs). Those who are heavily affected by disaster risks include poor and rural households, agricultural households, SMEs (UNDP, 2022).

Risk finance and insurance are used as tools to deal with risk. However, in Vietnam, insurance products for disaster risks are very few. In addition to pilot insurance programs covering disaster risks, insurers in Vietnam basically do not have an independent insurance product to protect against natural disasters. Natural disaster coverage is included with property policies.

3.1.1. Agricultural Insurance

Agricultural Insurance Pilot Program under Decision 315/QD-TTg

Disaster risks affecting the agricultural production sector occur every year. The Vietnamese government has paid attention to this area and especially to the disadvantaged group. To ensure social security and protection for agricultural production, in 2011 the Vietnam Government started implementing the Agricultural Insurance Pilot Program under Decision 315/QD-TTg dated March 1st, 2011.

The pilot program was implemented in collaboration among the Ministry of Finance, the Ministry of Agriculture and Rural Development, and the People's Committees of the participating provinces/cities. Specifically, the Ministry of Finance promulgated product regulations, directing selected insurers to deploy the program (include Bao Viet and Bao Minh) to deploy products to the insured; In addition to product distribution, insurers were responsible for disseminating product guidelines to localities and insurance participants. The Ministry of Agriculture and Rural Development participated in the promulgation of farming and livestock production procedures; coordinate with the Ministry of Finance to propagate agricultural insurance to localities. People's Committees in 20 provinces/cities were the units that set up the steering committee, provided a list of pilot implementation locations, and identified participants; made statistics and provided information on risks, insurance value, rice yield for insurers to serve the calculation of insurance premiums and indemnities.

The program deploys three insurance products in different localities: (1) Index rice crop insurance: deployed in Dong Thap, Ha Tinh, Nam Dinh, Thai Binh, Binh Thuan. (2) Livestock insurance (cattle): deployed in Thanh Hoa, Dong Nai, Vinh Phuc, Hai Phong, Binh Dinh, Binh Duong. (3) Fisheries insurance (shrimp): deployed in Ca Mau, Bac Lieu, Soc Trang. Basically, insurance products were distributed to households through the local government system.

Table 1. Results of the Pilot Agriculture Insurance Program (2011-2013)

Criteria	Households by insured object			Sum
	Rice	livestock	shrimp	
Household	236,397	60,133	7,487	-
Insured Value (Bil. VND)	2,151	2,713.2	2,883,7	7,747.9
Written Premium Revenue (Mil. VND)	91,919 (23,33%)	83,906 (21,3%)	218,175 (55.37%)	394,000 (100%)
Indemnity (bil. VND)	19 (20.6%)	13.3 (15,9%)	669.5 (306%)	701.8* (100%)

Source: ISA, 2014

* Total indemnity amount up to June 20, 2014

The insurance pilot program under Decision 315/QD-TTg was evaluated by the participants as a success and a correct policy of the Vietnamese Government in ensuring social security, helping the weak population access to insurance services, dealing with natural risks and climate change. 233,361 poor households, 45,944 near-poor households are

insured. Compensation was 19 billion VND for loss of rice crop, 13.3 billion for loss of livestock, and 669.5 billion for loss of shrimp.

Issues arising from the implementation of the agricultural insurance pilot program under Decision 315/QĐ-TTg included: (1) Insurance products are not suitable for the needs of each locality; insurance products were complicated. (2) There is a shortage of staff with insurance expertise, they were inexperienced in products, these caused difficulties in distribution, risk assessment, inspection and loss adjusting. (3) Risks occurred on large areas; some risks were difficult to reinsure to abroad. (4) In some localities, the cooperation between the local government and insurers was not very close, leading to low results of implementation. (5) In some provinces, or regular households, people were not interested in insurance. The insured were mainly poor households (who were subsidized 100% of premiums), and near-poor households (subsidized by 70% of premiums). (6) The covered subject and areas were limited. Only 20 provinces of 64 provinces in the country are included in the pilot program. In each province, only one or several districts were selected. These lead to low covering, which made it difficult to ensure the principle of large number in insurance, especially in the field of agricultural insurance with frequent disaster risks and catastrophic losses.

The Agriculture Insurance under the Decree 58/2018/ND-CP

Following the success of the pilot program, the Government of Vietnam continues to implement the Agricultural Insurance policy according to Decree 58/2018/ND-CP. Agricultural insurance is carried out on the principle of voluntary agreement, without limiting the organizations and individuals participating in the insurance, the insured objects, the insured risks and the geographical scope. Government provides premium subsidy for some groups. For poor households and near-poor households, subsidy is 90% of premiums; Other households: subsidy is 20% of premium; Agricultural Organizations meet specific conditions for cooperation, alliance, and large-scale with application of technologies and advanced production processes towards clean agriculture, high-tech and eco-environmental: subsidy is 20% premium. The time to implement premium subsidy is from the effective date of Decision No. 22/2019/QĐ-TTg (June 26, 2019) to the end of December 31, 2020 and extending to December 31, 2021 by Decision No. 03/2021/QĐ-TTg.

Regarding the insured object receiving support for agricultural insurance premium: Crops: Rice, rubber, pepper, cashew, coffee, fruit trees, vegetables; Livestock: Buffalo, cow, pig, poultry; Aquaculture: Black tiger shrimp, white leg shrimp, pangasius.

Regarding the insured risks, agricultural insurance premiums are subsidized: For rice and cattle: disaster risks and some diseases; For black tiger shrimp, vannamei shrimp: disaster risks (Disasters and epidemics must be announced or certified by a competent state agency).

Areas where agricultural insurance premiums are subsidized: (1) For rice in 7 provinces (Thai Binh, Nam Dinh, Nghe An, Ha Tinh, Binh Thuan, An Giang, Dong Thap); (2) For cattle in 8 provinces and cities (Ha Giang, Vinh Phuc, Hanoi, Thanh Hoa, Nghe An, Binh Dinh, Dong Nai, Binh Duong); (3) For black tiger shrimp, vannamei shrimp in 5 provinces (Ben Tre, Tra Vinh, Soc Trang, Bac Lieu, Ca Mau).

There are three insurers, including Bao Viet Insurance Corporation, Bao Minh Corporation, and Military Insurance Corporation, which are approved by the Ministry of Finance to provide agriculture insurance in the program. The insurers deployed the program in the named provinces and cities.

At recently, Nghe An has implemented rice crop insurance in 102 communes (in total 246 communes of 8 districts were selected for support areas). There are 7,291 farmer households/production organizations participating in insurance (including 12.6% poor households, 53.4% near-poor households, 34% ordinary households). Total insured value is 39.1 billion VND. Total insurance premium was 2 billion VND. The insurers are completing claim assessment to pay compensation for the summer-autumn crop (UNDP, 2022).

Ha Giang, Binh Dinh have implemented cattle insurance in 36 communes and towns of 5 districts and towns selected. There are 1,863 farmer households/production organizations insurance participating insurance (including 1 ordinary household, the rest are poor and near-poor households); total insured value is VND 39.66 billion; total insurance premium is VND 1.46 billion.

Results of the current agricultural insurance policy is slow due to several reasons. Firstly, guidance of the implementation of Decree 58/2018/ND-CP is late. Secondly, the administrative procedures in confirming the insured are still complicated. Third, subsidy from the budget is slow. Fourth, household's awareness and understanding of insurance products is low, media work is still limited, collaboration among stakeholders is weak. Fifth, household's income is still low, so the budget list for insurance has not been taken seriously.

Recently, agricultural insurance has been implementing since 2018, according to Decree No. 58/2018/NĐ-CP. Covered objects are extended: Crops (rice, coffee, rubber, pepper, cashew, ...), livestock (pigs, chickens, cows), fishing (shrimp, ...). The government reduces the subsidy: for poor and near poor households, Government subsidizes 90% of premium for poor and near poor households, 20% of premium for others (with conditions). Reduction of premium subsidy resulted in farmers could not afford the premium. In other side, administrative procedures also are an obstacle in the performing process of agriculture insurance. To receive subsidy from Government, the list of poor and near poor households must be assessed by different levels: commune, district, and province. In addition, payment of premium from government budget is usually slow.

About indemnity, some people with losses do not understand the principle of insurance, the concept of buying insurance is to be compensated, so the dispute lasts. In addition, in many cases of natural disaster risk causing loss, the loss adjusting takes a long time because it needs confirmation from the local government.

Agriculture Insurance by Insurers

Agricultural insurance activities outside of the Government's Insurance Program are providing by 8 non-life insurers, including Bao Viet, Bao Minh, MIC, Bao Long, VBI, ABIC, BIC, PTU, PVI.

Most agricultural insurance contracts provided by the insurers to policyholders are distributed through banking channel and are associated with credit programs. The insured

objects include industrial plants in the form of property insurance policies, including coffee, rubber, cashew, pepper, etc.), Livestock (cattle).

According to data from the Vietnam Insurance Association¹, the primary agricultural insurance business is positive, but the growth rate of premium revenue is not significant. This shows that although the premium revenue is low, both insurers and policyholders are not too interested in agricultural insurance. In terms of primary compensation, the compensation amount is low (except in 2018 where the compensation amount is high due to adverse weather factors and risks during the year). However, the results of the general agricultural insurance business by net premium revenue and net indemnities are not positive, which is related to the inefficient receipt of reinsurance from the foreign insurance market.

3.1.2. Micro-insurance

Microinsurance by insurers

In Vietnam, there is no microinsurance for disaster risks in Vietnam, microinsurance products focus on life and personal accident insurance.

In 2008, the Ministry of Finance approved the microinsurance pilot program. There are three life insurers (including Manulife, Dai-ichi and Prudential) approved by the Ministry of Finance to provide micro-insurance products for low-income customers aged 18-55, who live in rural and isolated areas, and in industrial zones.

Under the pilot program, Manulife distributes to members of the Vietnam Women's Union between the ages of 20 and 50. Dai-ichi plans to deploy microinsurance through the distribution channel of Vietnam Farmers' Association for members who are low-income farmers and in industrial parks for workers aged 18- 55 years old. Prudential plans to launch this product for low-income people aged 18-55 years old. However, because there is no separate regulation for the implementation of microinsurance, Dai-ichi and Prudential have stopped deploying microinsurance.

Manulife started implementing microinsurance in September 2009 in Hai Phong and Tien Giang provinces. By the end of 2020, Manulife has expanded to 19 provinces and cities across the country. However, premium revenue is very low, by the end of the first 7 months of 2021, the number of valid micro-insurance contracts reached 14,805 contracts, and the premium revenue reached VND 1.6 billion. This was a very modest number compared to the number of poor and near-poor households in Vietnam.

Microinsurance Program by Socio-Political Organizations

The Community Finance Resource Center - CFRC (under Vietnam Learning Promotion Association) and the Vietnam Women's Union deployed microinsurance for the target group since 2008. In 2014 the Government issued Document No. 1981/VPCP-KTTH on the pilot program of microinsurance, officially allowed these organizations providing micro-insurance products to their members. The Ministry of Finance issued Instruction No. 10418/BTC-QLBH on July 29, 2014 guiding to implement microinsurance by CFRC and VWU.

¹ Vietnam Insurance Association (2021)

✓ *Microinsurance by the Community Finance Resource Center (CFRC)*

With CFRC, during the pilot implementation period from 2013 to the end of 2016, due to the realization of limited financial capacity and difficulties in expanding activities, the number of participating members was decreasing, do not ensure the principle of large number in insurance, the Government has stopped piloting this organization from 2017. As of December 31, 2016, CFRC has provided micro insurance products for two social funds and two microfinance projects, the number of members participating in microinsurance were 7,986 people; insurance premium revenue was VND 759 million; paying for 35 cases of death/total and permanent disability with an amount of VND 19.3 million, paying benefits to support hospital fees for 588 cases with an amount of VND 116.7 million and debt forgiveness for 7 cases with the amount of 75.5 million VND; the difference between revenue and expenditure is VND567 million, which is being accumulated at CFRC.

✓ *Micro-insurance by the Vietnam Women's Union (VWU)*

During 2014 to June 2016, VWU has only implemented the pilot program in 77 districts/towns of 12 provinces and cities across the country. Products were distributed by 18 branches and 40 transaction offices owned by VWU, providing micro-insurance products to 100% of TYM's loan members.

The number of members participating in microinsurance by 2019 was 161,254 people, an increase of more than 90,000 customers compared to the end of 2016. Insurance premium revenue increased from VND 4.71 billion (in 2016) to VND 14.4 billion (in 2019). Regarding payment of insurance benefits, from 2016 to 2019, the Association has paid for 296 cases with an amount of more than VND 6.7 billion.

In the first 6 months of 2021, the microinsurance policies reached 130,082 valid policies; insurance premium revenue reached more than VND 8.6 billion, benefits were paid to 52 cases with the payment amount of more than VND 1.8 billion.

To ensure a legal corridor and standardize for microinsurance activities, on July 15, 2021, the Government issued Resolution 77/NQ-CP on stopping the pilot implementation of microinsurance by the VWU, drafts the Decree on microinsurance in Vietnam for the next future.

3.1.3. Property Insurance

Vietnam's insurance market currently has 32 non-life insurers that provide property and casualty insurance policies. The insured objects are properties such as houses, offices, plants/factories, cultural works, construction/erection works, etc.

Insurers have essentially no disaster risk insurance products. Disaster risks are covered under property policies (all-risks or named perils policy including disaster risk) or covered by endorsement/rider of the fire insurance policy.

Customers of property and casualty insurance in Vietnam are mainly enterprises, and non-state organizations. Most of state organizations and properties managed by these organizations (offices, schools, hospitals, cultural facilities, etc.) are essentially uninsured against disaster risks.

3.2. Analyzing critical areas for developing inclusive insurance in vietnam

3.2.1. The Critical Areas

In Vietnam, despite locating in an area seriously affected by annual natural disaster risks, participating in insurance to deal with this risk has not yet been paid attention by individuals and organizations.

Through interviews with representatives of stakeholders, it can be seen that the areas most affected by natural disasters every year are the agricultural sector, small and medium-sized enterprises, and state-owned public assets such as offices, schools, infrastructure works, cultural works. Most of these objects are uninsured. The government as well as enterprises and households annually must spend large financial amount to recover from the risk. The interview results showed the following issues.

- Agriculture

In terms of critical areas for developing the agriculture insurance in Viet Nam, it is important to expand the scope of the coverage and include other high-value, main crops and livestock, like coffee, pepper, etc. Vietnam currently has 16 key fruit trees, including citrus fruit trees such as pomelo, orange, longan, litchi, durian, and mango. Regarding livestock, currently only buffaloes and cows are insured, while poultry and pigs are not yet insured. Currently, Vietnam has about 500 million poultry. Fisheries can extend insurance coverage to fishes beyond shrimps. Offering insurance beyond the simple rice crops will help in diversifying the insurance portfolio of the scheme, develop the market by making it large enough for efficient risk transfer.

- Public Property

For the natural disasters, public properties own by the government - is the group that is regularly impacted every year, which is out of covered from insurance. The government has issued regulations mentioning that they encourage the insurance for public assets. But how, and when, and list of public assets to be insured are still in discussion.

- SME

Only a very small part of SMEs is covered by property insurance policies (in which, natural disaster risk coverage is endorsements/riders), most of SMEs are not covered by insurance.

3.2.2. Affordability

- Agriculture sector

According to the interviewees, households in Vietnam can afford premiums; For the group of poor and near-poor households, it is still necessary to maintain government subsidies in the short term.

In the long term, there should be educational programs and raising people's awareness about insurance and its meaning. In fact, the insurance premium only accounts for 1 to 2% of the cost of agricultural production and if it is included in the cost, it is completely feasible. Of course, it should be associated with commodity production in the agricultural sector.

- Public Property

As mentioned, most public property is uninsured. However, the government can completely pay the insurance. If compared with the financial expenses for losses caused by natural disasters every year, the insurance premium is a negligible amount. For the purchase of insurance to protect against natural disasters, it is not possible or impossible to do because there is no suitable insurance product and there is no regulation on insurance expenditures in the budget plan, at both local and central levels.

- SMEs

Interviewees all believe that when there are suitable insurance products, insurance premiums are included in production costs, SMEs are fully able to pay the insurance premiums.

3.2.3. Participation

In the past, Vietnam has had different programs to educate and raise people's awareness about insurance under different programs (Ex: the pilot program in agriculture). Some insurers relied on authorities such as provincial authorities and community organizations. However, most of approaches in the past were not good.

Challenges and opportunities to increase the demand of insurance are followings:

Firstly, from the public sector, for example of the agriculture project, with the subsidy from the government up to 90% for poor and near poor households, it is still reluctant for farmers to buy. Of course, the main reason is that they do not event willing to pay 10%. There is limit in their budget.

Secondly, a net-cat policy can be issued to all SMEs and farmers. Insurance companies are trying to advocate and promote the government bodies to understand the situation, to promote the product. The product should be quite affordability to them.

Thirdly, another risk to the index or parametric product is the awareness of the farmers/people committee of city and provinces. From experts' experience in insurance, MoF or ISA cannot be the key tackle for education and awareness. People Committee in province level should be the first ones to be educated. Secondly the farmers, people committee in the commune.

4. Discussion and conclusion

Vietnam is one of the countries strongly affected by natural disasters and climate change. However, the action program has not been drastic; Measures to cope with natural disasters and climate change are still fragmented, lack of synchronization, many actions/solutions are carrying out in a passive position. The current financing risk solutions focus mainly on recovering the losses caused by risks. There is no program for risk management in general and insurance to actively deal with disaster risks and climate change. The Disaster Prevention Fund has been established under Document No. 04/VBHN-BNNPTNT merging Decree No. 83/2019/ND-CP dated November 12, 2019, and Decree No. 94/2014/ND-CP dated November 17/ October 2014 of the Government stipulating the establishment and management of the fund for natural disaster prevention and control. However, this legal document does not have regulations on insurance expense for public works and properties.

To develop microinsurance to low-income households and families in rural areas, WU is the unit with the most strengths due to its close connection with the community and households. Some insurance companies with a wide network will be very suitable in distributing these product groups such as Bao Viet, Bao Minh, PTI, ABIC. However, some insurance companies are also not interested in microinsurance.

For property insurance, the legal foundation for public property insurance is basically being gradually improved. Coordination between insurers and reinsurers is required in setting up an insurance plan with suitable index products and reunification plans between insurers and reinsurers. Insurers need to be supported in product design because index insurance products are still very new to the market.

Through the in-depth interviews with stakeholders, and situation of ‘disaster risks, insurance and financing risk’ of Vietnam, this report proposes to develop a comprehensive disaster risk management program. The government takes the lead and involvement of relevant ministries and agencies, advisory support from organizations international. The national program cannot be separated from the joint international effort because disaster risk and climate change are global issues, especially in the context of globalization and integration of current economies.

Regarding areas at high risk of being affected by natural disasters, in-depth discussions and interviews agree that the groups: public assets, agriculture, SMEs are the areas heavily affected by disaster risks. Therefore, Vietnam needs a national insurance program, specifically:

- For public property, local authorities need to determine the list of public works and properties at risk of loss due to natural disaster and put on the priority list of insurance. The cost of buying insurance should be specifically guided and included in the list of expenditures of state agencies.

- For the agricultural sector, it is still necessary to maintain the subsidy on agricultural insurance premiums for the disadvantaged groups for a while longer to create insurance habits and awareness. Technically, there should be clear guidance on index insurance products in the state document. The Government should play the role of guiding and instructing. There is no necessary for sponsor from the government budget in long-term. It must be a cooperation of suppliers, service provider and other intermediary logistic firms. It means that is necessary to develop a master plan along the logistics chain, in which insurance must be considered as a link/link of the supply chain as any other steps to ensure activities are run smoothly.

- The SME sector is assessed to be fully capable of paying insurance. The problem is that insurance awareness in this area is low or nonexistent. To get a sustainability of inclusive insurance, it is needed of different tools/solutions:

- Index-based insurance is the future trend; however, the applicability of this product relies on some factors including:

- It is needed to develop an independent natural catastrophe insurance product. It should be in index parameter product; It is also needed of three level protections: first is insurance companies, second is reinsurance market, and last one the government.

- The index must be (able to) used as the basis for determining the insurance value. Vietnam needs to build an index system, and the first task is build a database system.

- Index-based insurance products must be guided and instructed in policies, Decree.
- The insurance purchaser/buyer must be big enough in terms of production scale.
- Insured objects should be diversified.
- It is necessary to cooperate with organizations such as Farmers' Union, Cooperative Alliance, Women's Union in distributing insurance services to households, especially in rural areas, and agricultural production households.

- Education and training to raise awareness is extremely necessary. The training should be provided to agriculture officials, associations' staffs, they are persons directly having interactions with farmers.

For state management agencies, the Law on Insurance Business is being revised and submitted to the National Assembly. The change of the Law with regulations on insurance business move to management based on risk-based capital, or the change of the financial reporting regime under IFRS 17 are still new issues. Research is urgently needed on these issues.

Trade Union University, Hanoi, Vietnam

Abstract

Vietnam is an increasingly integrated economy, and a significant contribution to this success is the role of the foreign direct investment (FDI) sector. FDI not only has direct contributions, but also has spillover effects on other factors of the economy, such as stimulating domestic investment resources, increasing competitiveness, innovation and technology transfer, improve production efficiency; develop supporting industries, create favorable conditions and environment for domestic enterprises to gradually participate in the global production value chain. These contributions over time have brought great achievements, however, there are still shortcomings that need to be overcome, typically the quality of FDI flows into enterprises in Vietnam. The article clarifies the concepts and characteristics of the quality of FDI flows, the advantages and disadvantages of high-quality FDI flows brings to Vietnamese enterprises, thereby proposing solutions to attract high-quality FDI flows into Vietnamese enterprises in the coming time.

Keywords: *Foreign direct investment, capital flows, high quality, Vietnam.*

1. Introduction

In the context of international economic integration and globalization in all fields, countries need to mobilize all resources for sustainable development. Therefore, attracting foreign investment as a prerequisite for economic development is inevitable for each country. Some studies support that foreign capital will bring benefits to both the investing and the receiving countries, through creating more jobs, cutting costs and improving the efficiency of the use of economic resources, thereby promoting national economic growth. Countries have had many policies to attract external capital sources, including foreign direct investment, foreign indirect investment, import and export of goods and services, remittances and export of labor, support from international organizations and developed countries (Nguyen, 2014).

Among these capital sources, foreign direct investment (FDI) is considered an important resource to help countries develop. Over the past 30 years, Vietnam has attracted billions of dollars of investment capital from many FDI enterprises and this capital source is accounting for an increasing proportion of total investment capital of the whole society (Do, 2017; Government, 2018). Competition to attract FDI takes place not only at the national

level but also among localities in the same country, leading to the fact that foreign enterprises enjoy a lot of incentives when conducting FDI projects. However, the quality of FDI inflows for economic growth has not been given due attention.

Up to the beginning of 2023, foreign investment capital in Vietnam has been disbursed about 2.55 billion USD, down nearly 5% compared to the same period in 2022. In terms of investment fields, this capital was disbursed for 17/21 economic sectors, led by the processing and manufacturing industry with a total investment of more than 2.17 billion USD, followed by real estate activities with a total investment of nearly 397 million USD. In terms of the number of new projects, the manufacturing industry is also the leading industry. Foreign investors are pouring capital into 39 provinces and cities with destinations namely Bac Giang, Ho Chi Minh City, Quang Ninh, and Dong Nai respectively... In 2022, foreign investors registered 27.72 billion USD to invest in Vietnam. The number of new projects increased, the adjusted investment capital also increased compared to the same period in 2021 with an increase of 12.2% in the amount of capital and 12.4% in the number of adjustments in the whole year of 2022 over the same period, according to the number of new projects. Data from the Foreign Investment Department under the Ministry of Planning and Investment (Dang, 2020). Notably, many projects of manufacturing and manufacturing electronic and high-tech products have received large-scale capital increases such as Samsung expanding production scale in Thai Nguyen or LEGO investing in a factory of more than \$1 billion in Binh Duong.

All have confirmed foreign investors' confidence in Vietnam's economy and investment environment. Typically, the Bac Lieu LNG Power project - Investor Delta Offshore Energy (Singapore), strategic partners Bechtel Corporation, General Electric and McDermott (USA) with a total investment of 50 billion USD in 25 years; the Southern Petrochemical Complex project invested by Long Son Refining and Petrochemical Company Limited (SCG Group of Thailand) with a total investment capital of more than 5.1 billion USD; Pegatron's project at Deep C Industrial Park in Hai Phong (Taiwan, China) includes 3 projects worth 1 billion USD; the real estate project LOGOS Bac Ninh Logistics Estate of Logos Vietnam Logistics Venture (Australia) has an investment capital of about 70 million USD, in the initial investment portfolio of the joint venture is about 350 million USD; Samsung's Research and Development Center has an investment of about 220 million USD. LEGO Group (Denmark) signed a memorandum of understanding to cooperate with Vietnam - Singapore Industrial Park Limited Company (VSIP) to build a new factory in Vietnam. This is LEGO's first carbon-neutral factory and has an investment in solar energy production, ensuring no environmental pollution, dust and waste. The project has an investment scale of more than 1 billion USD in a land area of 44 hectares, in Binh Duong province, bringing about 4,000 job opportunities in the next 15 years. It is expected that the factory will start construction in the second half of 2022 and operate in 2024. In addition to new projects, many projects of manufacturing and manufacturing electronic and high-tech products have been expanded with capital scale in the first 3 months of the year.

Figure 1. Foreign direct investment capital implemented in 12 months of 2018 - 2022

Source: VNeconomy, 2022

Vietnam's selective investment attraction policy in the direction of reducing quantity, increasing quality, eliminating small-scale projects with little added value has begun to take effect. The proportion of FDI in industries with high pollution risk and outdated technology such as textile dyeing has gradually decreased. Not only increasing in quantity, FDI inflows into Vietnam also appear high-quality projects, green trends, using renewable energy. High-quality FDI flows not only have high capital scale and technology content, bring about technology spillover effects, competitiveness and high added value of products, but also allow positioning of value supply chains. and a new position for the host country in the production network, technology, as well as financial investment opportunities, tourism, real estate and global services...

2. Literature review

FDI is regarded as the ownership or control of 10 percent or more of an enterprise's voting securities or the equivalent interest in an unincorporated business (Griffin & Pustay, 2015). Farrell (2008) defined FDI as a package of capital, technology, management, and entrepreneurship, which allows a firm to operate and provide goods and services in a foreign market. From a theoretical viewpoint, FDI can be divided into two categories: Horizontal and Vertical. Horizontal FDI (HFDI) is a type of investment which is in the same industry operating abroad as a firm operate, or offers the same services as it does at home, and tends to produce for local or original markets only without exporting much output to host country (Maskus, 2002; Haile & Assefa, 2006). It seeks to take advantages of a new large market, which is considered as traditional motive for FDI. It is widely used by Japanese MNE's in their international expansion because they believe that this model will help to reduce the risk and enable them to share experience, resources, and acknowledgment that already have developed at home (Botrić & Škuflić, 2006). In addition, Mariotti & Marzano (2021) stated

that FDI inflows to advanced countries are usually horizontal investments driven by market seeking strategies.

The International Monetary Fund (IMF, 1993) states that "FDI is a long-term investment whereby an investor directly derives long-term benefits from an enterprise located in another economy. The purpose of the investors is wanting to have a lot of influence in the management of businesses located in that other economy". OECD (1999) argues that FDI reflects the long-term benefits that an entity in an economy (direct investor) obtains through an economic establishment in an economy other than that of the investors (direct investment enterprises). Direct investment involves transactions first, followed by capital transactions between two closely linked entities. In particular, direct investors are understood as those holding control of 10% or more of the capital of an enterprise. UNCTD (2001) states that, FDI is an investment made to obtain long-term benefits in an enterprise operating outside of the investor's economy, the purpose of the investor is to gain an effective in the management of the business. According to the World Trade Organization (WTO), (1996): "Foreign direct investment occurs when an investor from one country (the host country) acquires an asset in another country (the receiving country) with the right to manage that asset". This concept emphasizes that FDI is an asset. The regulatory aspect is what distinguishes FDI from other financial instruments. In this case, the investor is often referred to as the "parent company" and the assets are referred to as the "subsidiary" or "subsidiary company".

High-quality foreign direct investment capital flow is to attract direct investment projects from foreign investors with high quality and efficiency. This type of investment brings many benefits to the host country, including advanced technology, professional management, job creation, production capacity improvement, and export enhancement. High-quality foreign direct investment flows usually have the following characteristics: (1) The interaction with the economy: High-quality FDI inflows often have a positive interaction with the local economy. They are not only an investment but also contribute to creating links, training human resources, transferring technology, and promoting the development of industries, especially the high-tech industry. (2) Quality and Performance: High-quality FDI flows are often accompanied by projects with advanced technology, modern production processes, and professional management. They can provide high-quality products and services, while creating high-paying jobs and career development opportunities for local workers. (3) Technology transfer: High-quality FDI inflows often have the ability to transfer high technology from the investment country to the receiving country. This enhances local competitiveness and technological innovation, and facilitates technological development and innovation in the economy. (4) Contribution to exports and trade balance: High-quality FDI inflows often make an important contribution to the exports of the host country. Foreign enterprises are often large in scale, capable of producing high-quality goods and services, which in turn generate significant exports and help balance the country's trade. (5) Create a spillover effect: High-quality FDI inflows often create a positive spillover effect on local businesses and industries. The investment of foreign companies often leads to an increase in production scale and expansion of infrastructure. This can promote the economic development and diversification of that country, while creating export opportunities and sustainable economic growth.

3. Results

3.1. Potentials to attract FDI inflows of Vietnam

Currently, Vietnam is on the path of strong reform and deeper integration into the world economy. Vietnam has become a middle-income country, with its position and prestige in the international arena constantly improving. The economic restructuring and growth model innovation has achieved initial results. The domestic private economic sector is increasingly developing, forming a number of large private economic groups. These are important factors that create a premise to attract and improve the quality and efficiency of FDI in the coming period.

Firstly, foreign investors highly appreciate the issue of socio-political stability as one of the important contributing factors to the implementation of economic development policies. The socio-political stability in Vietnam has created strong trust with domestic and foreign investors. Investors are willing to raise capital to increase investment and expand production. The infrastructure of industrial parks, export processing zones and economic zones throughout the country continues to be improved and upgraded. The Prime Minister has approved 19 coastal economic zones, with a total area of about 871 thousand hectares. In addition, achieving positive growth in 2020, despite the significant impact of Covid-19 on economic activities, Vietnam becomes a good candidate for value chain transformation in Asia.

Secondly, the quality of Vietnamese human resources has been increasingly improved in recent years due to the Government's focus on investment in public education. Employees are trained in culture, skills training, and professional qualifications have contributed to increasing labor productivity of Vietnam, this is also a competitive advantage in attracting foreign investment. FDI projects taking advantage of trade agreements that Vietnam has signed, promise to continue to enter Vietnam in the near future. To catch up with this wave, the Vietnamese Government has many special investment incentives and supports to encourage the implementation of a number of investment projects with great socio-economic impacts. In addition, Vietnam needs to continue to improve the legal framework, creating all favorable and equal business investment conditions for investors. Although the impact of the Covid-19 pandemic cannot be avoided, Vietnam is still considered a "good land" to attract high-quality FDI capital after the pandemic.

Thirdly, the innovation development speed of Vietnam is very fast, especially the technology market of Vietnam. With the growth rate over the past 10 years and in the coming time, Vietnam will have many opportunities from existing platforms, such as education, science and technology, infrastructure for technology, and processing industry. Some large global technology companies have come and established companies in Vietnam like Google, Intel, Amazone, Samsung... This creates development opportunities for the country, for businesses, for startups industry. Vietnam has a young, vibrant domestic market with great tech talent and constant innovation, making it an attractive destination for start-up investment in Southeast Asia.

Fourth, Vietnam has outstanding advantages, including: bilateral economic relations with more than 230 countries and territories, has joined and signed 17 free trade agreements

(FTAs); ratification of EVIPA - creating a solid legal basis and foundation for Vietnam to integrate deeply and widely into the world economy and join the global value chain... with its geographical position as a bridge between the two economic zones of the sea and the continental economy of Southeast Asian countries and Asian countries have helped Vietnam become a bright spot in attracting FDI inflows and have for the first time entered the group of 20 leading countries in terms of income. In addition, Vietnam holds a leading position in the race for FDI capital with potential rivals such as China, Indonesia, India, and Mexico and is one of the centers to welcome the wave of investment transformation from China. Moreover, the signing of new generation FTAs by Vietnam also creates opportunities for foreign investors to pay attention and interest in the Vietnamese market. FTAs will help them save on transportation costs of intermediate and final products between the parent company in the host country and its subsidiaries located in the receiving country. Develop a strategy to attract Vietnam's FDI from "at all costs" to "selective attraction"; move from "passive attraction" to "active attraction"; moving from "attraction based on financial performance and project size" to "attraction based on socio-economic - environmental performance" in order to increase the national production capacity, the spillover between the FDI sector and the domestic economic sector.

3.2. Barriers to attract FDI inflows of Vietnam

Despite adverse effects from the Covid-19 pandemic, foreign investors still put their faith in the economy and investment environment of Vietnam in the new normal and make investment decisions as well as expansion of existing investment. But there is still a lot of work to be done to accomplish the goal of attracting foreign direct investment (FDI) associated with sustainable development outlined in Vietnam's socio-economic development strategy in recent years.

First of all, attracting FDI into Vietnam faces many difficulties due to international geopolitical instability and domestic investment "barriers". In the international context, many adverse developments such as the Russia-Ukraine military conflict have reduced business confidence and investment, significantly affecting the recovery of global FDI. At the same time, increasing disruptions in production and trade, exacerbating inflation, which is already soaring globally due to the negative impact of the Covid-19 pandemic. In addition, many large economies tend to encourage and promote production and FDI flows back home. Typically, the US with policies such as reducing income tax from 25% to 21%, reforming investment licensing procedures, introducing more flexible standards to improve the competitiveness of some US industries (energy, automobile, aluminum, steel, etc.). The European Union (EU) also promotes economic "strategic autonomy" through controlling capital investment abroad. Even some countries like Germany and Italy have stricter regulations and controls on FDI in strategic industries. In Asia, Japan spends a budget of \$2.2 billion, including \$2 billion to support Japanese businesses to bring their production networks back from China, and \$200 million to support Japanese businesses moved the production network out of China to a third country with a number of priority industries such as medical equipment, auto parts, and electronics. Besides, the competition to attract FDI

among countries in Southeast Asia also gradually "heats up" when Indonesia has issued new preferential policies to welcome foreign investors, such as tax reduction. corporate income will drop to about 22-25% in 2020 and further decrease to 20% in 2022. In addition, the country spends an area of 4,000 ha to build many new industrial zones.

In the domestic context, foreign investors also face some "barriers". For example, the duration of a business visa for some countries is only about 15-20 days, which is not enough for investors to survey the investment and business environment in localities. In addition, the rapid growth of industrial land tax prices in recent years also affects the investment decisions of foreign investors. A CBRE statistic shows that the average industrial land rental price of tier-1 markets in the North is at \$120/m²/term at the end of 2022, an increase of 11% compared to 2021. Notably, Some IPs in Bac Ninh and Hung Yen significantly increased rents when occupancy improved, leading to the highest market rent growth over the past 5 years, when the increase was mainly around 6-7%./year. In the South, the average land rent in the tier 1 market increased by 8-13% year-on-year and reached \$166/m²/remaining lease term by the end of 2022, about 38% higher than the average in the Northern region.

Vietnam is lacking capital for research and development to meet the needs of FDI enterprises. In fact, in the tens of billions of dollars invested in Vietnam every year, it is mainly poured into manufacturing plants, possibly high-tech factories, but there is a shortage of FDI capital for innovative research. Over the years, Vietnam has always expected a new wave of quality investment from Europe, the US, and some developed countries, but the implementation of solutions to clear this flow has not been as expected. The number of high-tech projects entering Vietnam from developed economies is quite small, and the number of enterprises setting up research and development (R&D) centers is still insignificant. The number of projects with modern technology, source technology from the US and Europe only accounts for 5%, medium technology accounts for 80%, and outdated technology accounts for 15%. As for Samsung, when entering Vietnam, it has committed to establish a research and development center, but so far this center has only completed the construction of the rough part, corresponding to the 70% progress. It is not clear when this R&D center can go into operation. The consequence of the lack of creative research centers is the absence of "Made in Vietnam" copyrighted inventions. This results in FDI factories that are still labor-intensive, rather than developed, factories. However, the absence of R&D centers makes Vietnam's industry thrive only in a few areas serving foreign firms such as manufacturing microchips, screens, etc., but seriously lacking in mechanical industries.

One of the important bottlenecks of Vietnam's industrialization in general and the operation of high-quality FDI projects in particular is the lack of a skilled workforce, despite the large population and large workforce. According to the Ministry of Labour, Invalids and Social Affairs, Vietnam's labor market is having a surplus of low-skilled workers and a shortage of high-tech workers. Currently, there are only more than 26% of workers in the country who have been trained, have degrees and certificates, the rest lack professional skills and do not meet the needs of enterprises. The limitation of qualifications makes it difficult for Vietnamese workers to face major fluctuations such as the Covid-19 pandemic, the trend

of job relocation. If training and skills are not changed soon, Vietnam's labor market is at risk of losing its competitiveness. Vietnam is currently the third largest recipient of FDI in the region and is one of the few ASEAN countries that has maintained stable FDI inflow growth over the years. However, FDI enterprises always need high-quality human resources to apply new technologies and high labor productivity. Therefore, if it does not focus on improving the quality of human resources, in the coming time, Vietnam will gradually lose its attractiveness to attract foreign investment.

4. Solutions to attract quality FDI inflows into Vietnam in the coming time

Obviously, in investment activities and investment attraction, there are currently barriers besides advantages and prospects. If the inadequacies can be improved early, the investment attraction will be more quality and effective. In order for the prospect of attracting high-quality investment to become a reality, it is necessary to strengthen the consideration and resolution of many issues, which is to drastically improve soft infrastructure such as public administration, human resources or the business environment, along with many other fundamental issues... Although the scale of global FDI inflows is still difficult to avoid shrinking due to the inevitable influence of world developments since last year and continues to the present, including: geopolitical tensions, Inflationary pressures, falling global demand, recession risk, tightening financial conditions... All of these events put downward pressure on business expansion globally, making the business environment and global investment changed dramatically. In which, it should be repeated, investment - export - consumption is a three-horse carriage, a tripod, a driving force of the economy... Exports and consumption, if declining, will be difficult to attract investment and vice versa. This is not easy in the global context of many fluctuations and uncertainties, so it is necessary to have comprehensive and methodical strategies: At the macro level, it is coordination and direction, and at the enterprise, province, city level, industry is an action program with continuous innovation efforts.

In order for Vietnam to truly become an ideal destination for large enterprises in the wave of global investment displacement, investment policies need to focus on maximizing the benefits of foreign investment so that both attracting FDI helps to restore the economy, promote production and improve domestic capacity, while ensuring national interests, instead of maximizing the amount of capital attracting foreign investment, In addition, the application of Screening mechanisms can limit the presence of FDI in a country. Therefore, FDI inflows should only be prevented in certain sectors, usually those related to national security.

Secondly, it is necessary to synchronously develop criteria for high-quality FDI projects suitable to each stage of the country's development and world science and technology trends; focus on developing infrastructure and improving management of a number of key industrial parks dedicated to receiving important FDI projects. At the same time, review and timely adjust foreign investment policies to suit and keep up with fluctuations of the global economy and changes in strategies to attract FDI enterprises of countries around the world. It is necessary to upgrade policies to attract and use FDI with strong focus on green growth, digital transformation and supply chain connection of Vietnamese enterprises with FDI enterprises, especially transnational corporations. Along

with that, perfecting institutions and laws, including the internalization of the global minimum tax, well handling the relationship between internal and external forces; modernization of socio-economic infrastructure and speeding up national administrative reform... are the main solutions proposed to attract and improve the quality and efficiency of FDI inflows in 2023 and the coming years. At the same time, create a competitive and open business investment environment, remove difficulties and obstacles in policies to create the most favorable conditions for the operation of enterprises and investors.

Thirdly, build lists of projects and fields that need to attract high-quality FDI in the overall national plan; proactively develop and implement specialized, professional and highly specific investment promotion and mobilization plans to approach, invite and research to meet the needs and requirements of investors invest in high-quality FDI projects, especially in terms of intellectual property protection, anti-corruption, improvement of a fair competitive environment, tax incentives, land, labor, infrastructure and related management institutions... Develop supporting industry enterprises that have the potential to meet the needs of joining the production network of multinational companies that are about to invest in Vietnam. Actively building a private economic block with medium-sized enterprises, capable of accompanying FDI enterprises in the value chain. These two areas must go parallel to each other. Forming a strong private sector, especially enterprises in the supporting industry with enough quality to be able to participate in the production stages of foreign investors, make up for the shortage of components, and become an attractive business environment to attract and retain FDI inflows.

Fourth, in addition to promoting public investment projects to improve infrastructure, helping industrial parks to benefit in the long term, it is necessary to transform investment needs to expand and modernize infrastructure of Vietnam into an opportunity to attract high-quality FDI projects in this field. For many years, Vietnam has focused on investing in infrastructure and real estate in industrial zones. In particular, Vietnam has invested and put into use thousands of kilometers of inter-regional highways, helping to promote convenient economic and cultural exchanges between localities in the country.

Fifth, it is necessary to proactively overcome challenges in attracting high-quality FDI, such as the limitation of clean land fund and inadequate infrastructure - seaports, road and waterway transport systems, and water transport systems. warehouse system; the shortage in the number and structure of skilled and specialized labor resources; the increase in competitive pressure and the pressure to be acquired by domestic enterprises...In order not to miss the opportunity to attract high-quality FDI, it is necessary to have a new thinking, with a new way of doing things, to respond correctly, faster, and better. than required by large multinational corporations; Prioritize projects with advanced technology, new technology, high technology, clean technology, modern management, high added value, spillover effects, connection of global production and supply chains. demand and environmental friendliness; overcome projects with thin capital," transfer pricing, "underground and shadow" investment, low technology, and complicated domestic and international disputes and lawsuits.

Sixth, in order to effectively anticipate new FDI inflows, it is necessary to increase the ability to provide a qualified workforce. In the medium and long term, it is necessary to restructure and reorganize the form of training at upper secondary schools, intermediate schools and colleges. These are the levels of study with a large number of graduates, providing both quantity and quality for labor needs. In the era of technology 4.0, talking about middle-class workers and above, it is necessary to make them able to read English, use computers, and get used to accessing the internet. But that is just a basic competency, so training the workforce to add reasoning ability to analyze, solve problems, and have the culture to work responsibly and behave well with others.

Abstract

The management of the Mekong River's flow is crucial for mainland Southeast Asian nations, presenting both economic development opportunities and complex issues concerning security, cultural, societal, environmental resources, and sustainable development. However, the region faces escalating tensions due to China's unpredictable actions and the diverse political behaviors of ASEAN countries. China's growing assertiveness and the South China Sea dispute have emerged as major challenges for ASEAN, creating vulnerabilities within the region. Furthermore, Southeast Asia's power dynamics become evident not only in the South China Sea but also along other vital routes where global powers such as the US and China vie for influence.

While the Mekong River issue may not currently dominate the power play, it holds equal significance to the South China Sea issue and will become increasingly problematic in the long run. Losing control over the management and utilization of Mekong's water resources will have far-reaching consequences for the socio-economic and political security of Southeast Asian nations. While the immediate impacts may not be evident in the short term, their long-term ramifications will be severe.

By addressing these pressing concerns and taking proactive measures, Southeast Asian countries can strive for enhanced Mekong River flow management, safeguarding their interests, promoting sustainable development, and mitigating potential future challenges.

Keywords: *Flow management, Lancang-Mekong Cooperation, mainland Southeast Asian countries, Mekong sub-region*

1. Introduction

Spanning over 4,800km, the Mekong River stands as Southeast Asia's longest river and the twelfth largest globally. Encompassing Vietnam, Laos, Cambodia, Thailand, and Myanmar, the Mekong Sub-region boasts an expansive landmass of nearly 2 million square kilometers.¹

¹ Vietnam+ (October 2016), *Mekong Subregion and History of Cooperation Mechanisms ACMECS, CLMV*, <https://www.vietnamplus.vn/tieu-vung-mekong-va-lich-su-cac-co-che-hop-tac-acmecs-clmv/412150.vnp>

Blessed with the fertile lands nourished by the Mekong River and a favorable tropical climate, this sub-region possesses exceptional strengths in agricultural production, positioning itself as the world's largest granary. Additionally, the region's economic growth has been nothing short of remarkable. In 2015 alone, the average growth rate of the Mekong Sub-region stood at an impressive 6.1%, surpassing the global average of 2.5%. Over nearly three decades of development, from 1992 to 2020, the Mekong sub-region countries have achieved an average economic growth rate of 6.3%, accompanied by a 5% growth in GDP per capita².

The economic growth observed in the Mekong Sub-region extends beyond its agricultural prowess, fueled by a process of economic restructuring that drives industrialization and modernization. With a vibrant and youthful population, the Mekong Sub-region enjoys a significant advantage in terms of human resources and holds immense potential as a consumer market. Boasting a population of approximately 334 million, with 40% under the age of 25³, the Greater Mekong Sub-region emerges as a promising market for growth and development.

The Mekong Sub-region occupies a strategic geographical position, serving as a vital connection to dynamic economies and major markets in Asia, including China, India, and ASEAN member countries. This unique advantage positions the Mekong Sub-region to emerge as a production-consumption center within ASEAN and a significant link in the global value chain. Furthermore, it plays a pivotal role as a transportation, trade, and investment bridge, fostering closer ties among East Asian nations.

The region's development potential has garnered considerable attention from investors and development partners, recognizing the trend of regional and international integration. Various cooperation mechanisms have already been established within the Mekong region, forging strong partnerships between Mekong countries and key players such as the United States, Japan, Korea, India, China, and the European Union.

With sound policies and inherent strengths, the countries of the Mekong sub-region, often referred to as mainland Southeast Asian countries, embody a dynamic economic region that significantly contributes to the overall development of Southeast Asia. Of particular importance is the issue of flow management in the Mekong River basin, which profoundly impacts the economic, security-political, and socio-cultural development of these nations. While it presents opportunities, it also brings forth challenges that necessitate careful consideration and effective solutions.

3. Results

3.1. Collaborative Mechanisms for Effective Flow Management in the Mekong Sub-region

Within the Mekong region, a diverse array of 15 cooperation mechanisms currently exist, categorized into two groups: intra-regional mechanisms fostering collaboration among Mekong basin countries and mechanisms promoting cooperation between Mekong River Basin countries and external partners. These mechanisms play a crucial role in advancing regional integration and sustainable development.

Among the various cooperation mechanisms in the Mekong Sub-region, four notable intra-regional frameworks have been established, namely:

- 1) Mekong River Commission-MRC (1995).
- (2) Cambodia-Laos-Vietnam-CLV Development Triangle Cooperation (1999).
- (3) Cambodia-Laos-Myanmar-Vietnam-CLMV Cooperation (2003).
- (4) Ayeyawady-Chao Phraya-Mekong-ACMECS Economic Cooperation Strategy (2003).

The 9th Ayeyawady - Chao Phraya - Mekong Economic Cooperation Strategy Summit (ACMECS 9), the 10th Cambodia - Laos - Myanmar - Vietnam Cooperation Summit (CLMV 10) and the ASEAN Economic Community (CLMV 10). The 11th Cambodia-Laos Vietnam Development Triangle Area Summit (CLV 11) was held in 2020.

The objectives of the above intra-regional cooperation frameworks are to strengthen mutual and bilateral economic cooperation to exploit and promote comparative advantages among regions and member countries, improve competitiveness and narrow the gap of development between the countries.

3.1.1. Mekong River Commission (MRC)

The Mekong River Committee was established by the United Nations in 1957 with the four countries of Thailand, Laos, Cambodia and the Republic of Vietnam to jointly exploit the Mekong River. However, because of the war, the mining plan was put on hold.

On April 5, 1995, the Mekong River Commission was established with 4 members namely Laos, Cambodia, Thailand and Vietnam. sustainable development of the Mekong River”. The main objective of the Mekong River Commission is to promote cooperation among Member States in the sustainable use, development and protection of water and related resources, for the mutual benefit of the countries. membership and the well-being of the people in the basin. China and Myanmar are not members of the commission and only participate as dialogue partners.

Currently, the Mekong River Commission has achieved many positive results, contributing to promoting development in member countries, strengthening cooperation among member countries and expanding cooperation with the two upstream countries. China, Myanmar and many other international partners. Within the frameworks of

cooperation on the Mekong River basin, the MRC is the only organization with the function of developing legal frameworks, including those that are binding on member countries on equitable sharing, rationalize water resources and jointly protect the ecological environment of the river basin as well as promote joint development projects. The activities of the Commission are not only important to the economic, social development and environmental protection of the region, but also contribute to strengthening the friendly relations between countries in the region.

3.1.2. Cooperation in the Cambodia-Laos-Vietnam Development Triangle (CLV)

The development triangle in the border areas of Vietnam, Laos and Cambodia was established in 2004 by three Prime Ministers, including 10 provinces: Kon Tum, Gia Lai, Dak Lak and Dak Nong (Vietnam); Sekong, Attapeu, Saravan (Laos) and Stung Treng, Rattanak Kiri, Mondul Kiri (Cambodia). In 2009, the three countries agreed to add Binh Phuoc province (Vietnam), Kratie province (Cambodia) and Champasak province (Laos) to the CLV.

CLV's goal is to strengthen solidarity and cooperation of the three countries for socio-economic development, hunger eradication and poverty reduction, contributing to maintaining stability and security of the three countries. Cooperation focuses on the following fields: transportation, trade, electricity, tourism, human resource training and health.

In addition to the Summits, the three CLV countries agreed to establish the Development Triangle Joint Coordinating Committee, consisting of four sub-committees: economic, social-environmental, local, and security-foreign affairs. Each country appoints a Minister to be the Co-Chairman of the Committee and a member of the Coordination Committee consisting of representatives of relevant Ministries, branches and provinces in the Triangle. The Joint Coordinating Committee shall meet annually on a rotating basis. To date, CLV has organized 6 Summits and 7 Coordinating Committee Meetings.

3.1.3. Cooperation of four countries Cambodia, Laos, Myanmar and Vietnam (CLMV)

At the ASEAN-Japan Summit in December 2003, Tokyo, Japan, the leaders of Cambodia, Laos, Myanmar and Vietnam (CLMV) agreed to organize the first CLMV Summit. on the occasion of the 10th ASEAN Summit, at the end of November 2004 in Vientiane, Laos. The conference adopted the "Vientiane Declaration" on "Strengthening economic cooperation and integration among CLMV countries". The Vientiane Declaration affirms the determination of the CLMVs to strengthen economic cooperation with each other and integrate within the frameworks of cooperation in the Mekong sub-region, ASEAN and the region; at the same time, calling on countries and international organizations to strengthen their support to the four countries to narrow the development gap.

Areas of cooperation under the CLMV framework include trade, investment, agriculture, industry, transport, tourism and human resource development. CLMV encourages the participation of the private sector and businesses from all over the world.

CLMV currently has 7 specialized working groups coordinated by member countries, specifically Vietnam coordinates the working group on trade-investment, information

technology and human resource development; Cambodia coordinates the working group on tourism; Laos coordinates the traffic working group; Myanmar coordinates the agriculture and industry-energy working group.

3.1.4. Ayeyawady-Chao Phraya-Mekong Economic Cooperation Strategy (ACMECS)

ACMECS is an economic cooperation framework consisting of five countries Cambodia, Laos, Myanmar, Thailand and Vietnam in order to strengthen joint and bilateral economic cooperation to exploit and promote comparative advantages among regions and member countries, improving competitiveness, narrowing the development gap. ACMECS was established in November 2003 at the Bagan Summit proposed by Thailand.

The ACMECS Summit is held every two years according to the alphabetical rotation of the country's names. Vietnam officially joined ACMECS at the 1st ACMECS Ministerial Conference in Thailand, November 2004.

Up to now, ACMECS has 7 cooperation areas including: (i) trade-investment; (ii) agriculture; (iii) industry - energy; (iv) traffic; (v) tourism; and (vi) human resource development; (vii) medical. ACMECS established 7 Working Groups corresponding to 7 areas of cooperation. Each ACMECS country coordinates at least one cooperation area, of which Thailand coordinates two areas: trade-investment and health; Vietnam coordinates two areas: human resource development and industry-energy; Cambodia coordinates tourism cooperation; Laos coordinates traffic cooperation; Myanmar coordinates agriculture.

3.2. Frameworks for cooperation in flow management between the countries of the Mekong sub-region and major powers

Cooperation mechanisms between Mekong countries and development partners include:

- (1) Greater Mekong Subregion Cooperation-GMS (1992),
- (2) Development Cooperation between ASEAN and the Mekong Basin-AMBDC (1996)
- (3) Ganges-Mekong River Cooperation-MGC (2000),
- (4) Mekong-Japan Cooperation (2007),
- (5) Lower Mekong Initiative (LMI) (2009),
- (6) Mekong-Korea Cooperation (2011),
- (7) Friends of Mekong-FLM (2011),
- (8) Mekong-Lancang Cooperation Lancang-Mekong Cooperation (2016).
- (9) Mekong-US Partnership (2020)

3.2.1. Greater Mekong Subregion Cooperation (GMS)

The Greater Mekong Subregion (GMS) Economic Cooperation Initiative was initiated in 1992 by the Asian Development Bank (ADB). The member countries of the Greater Mekong sub-region include Cambodia, Laos, Myanmar, Thailand, Vietnam, and China (with two representative provinces, Yunnan and Guangxi).

GMS cooperation aims to promote and create favorable conditions for mutually beneficial economic development cooperation between Cambodia, Laos, Myanmar, Thailand, Vietnam and the two provinces of Yunnan and Guangxi (China), turning the rapidly expanding Mekong sub-region into a fast-growing and prosperous region in Southeast Asia.

GMS cooperation is considered to be the most effective cooperation among the sub-regional cooperation mechanisms. Initiatives and activities in the GMS program focus on 9 main areas including: Transport, Energy, Environment, Tourism, Posts and Telecommunications, Trade, Investment, Human Resource Development, Agriculture and Rural Development.

The Greater Mekong Sub-region (GMS) is an important geo-economic, geo-political area in Southeast Asia, where the interests of many world powers intersect. Therefore, with the constant change of the regional and world situation, major countries, especially the United States, China and Japan, increasingly want to expand their influence in the region, especially mainland Southeast Asia.

3.2.2. Mekong - Japan Cooperation

At the 12th ASEAN Summit (Philippines, January 2007), Japan launched the Japan-Mekong Partnership Program for Common Prosperity. After that, the first Mekong-Japan Summit was held in November 2009 in Tokyo. Cooperation has been implemented in many fields such as socio-economic development, infrastructure construction, implementation of the Millennium Development Goals, environmental protection and water security of the Mekong River...

Leaders of the participating countries have approved the Tokyo Strategy, which includes three main cooperation pillars: (i) Strengthening connectivity within the Mekong sub-region and between the Mekong sub-region and the region and the world; (ii) Cooperation for mutual development between Mekong countries and Japan; (iii) Environmental protection and human security. In addition, Mekong-Japan cooperation is also implemented within the framework of the Mekong-Japan Economic and Industrial Cooperation Initiative, the "Green Mekong Decade" initiative and cultural and exchange programs.

3.2.3. Lower Mekong Initiative (LMI) and Mekong-US Partnership

Since its launch in 2009, the U.S. Secretary of State has held annual meetings with five Mekong regional counterparts through the Lower Mekong Initiative (LMI). Over the past decade, LMI's programs have helped Mekong countries better respond to transboundary challenges related to water security, smart hydropower, energy and infrastructure planning, as well as education. Projects under the LMI have brought tangible improvements to the lives of people in the Mekong region.

In September 2020, the United States officially launched the Mekong-U.S. Partnership, upgraded from the Lower Mekong Initiative LMI, reflecting the importance of the Mekong region to the United States. The United States' relationship with Mekong region

partners is an integral part of the Indo-Pacific vision, as is the United States' strategic partnership with ASEAN. With an initial investment of more than 150 million USD in programs in the Mekong region, on the basis of promoting the positive activities of the Lower Mekong Initiative, as well as from the support of 3.5 billion USD⁴ from United States for the region for the past 13 years.

3.2.4. Mekong - Lancang Cooperation LMC

In its approach to Southeast Asia, China aspires to “maintain a stable international environment to support economic modernization” and at the same time strives to “increase China's influence”⁵. Chinese leaders have always expressed the view that China and ASEAN countries should take advantage of their geographical proximity⁶ and complementary industries to promote a high degree of regional economic integration.⁷

A new multilateral cooperation mechanism called Mekong - Lancang (LMC) is shaping the economic and environmental future of Southeast Asia. Since 2016, LMC has been a project under the “Belt and Road” initiative directed by China, managing water resources in a sustainable way.

As soon as the LMC was established, the Chinese foreign minister emphasized the criterion that “countries participating in the LMC should resist the interference of external forces in their internal affairs”.

The LMC mechanism not only helps China improve relations with its neighbors in the lower Mekong, but also serves as a tool to counter the strategic influence of Japan and the United States, which are donors to the Commission of Mekong River Society (MRC).

3.3. Enhancing Flow Management in the Mekong Sub-region: Current Status and Critical Challenges

Among the intra-regional cooperation mechanisms among countries in the Mekong Sub-region, the Cambodia-Laos-Myanmar-Vietnam Cooperation (CLMV) and the Ayeyawady-Chao Phraya-Mekong Economic Cooperation Strategy (ACMECS) were born with the aim of The main purpose is to narrow the development gap, improve competitiveness, promote the growth and economic integration of the sub-regional countries in ASEAN and in the international arena, and support the building of the ASEAN Community. After 20 years of operation, the cooperation between CLMV and ACMECS has achieved positive results, helping to promote economic, trade and investment cooperation

among the countries of the Greater Mekong Sub-region, narrowing the development gap in ASEAN, and at the same time narrowing the development gap in ASEAN. strengthen the voice of members in the process of regional and international integration.

In the new development phase of the Subregion, two cooperation mechanisms, CLMV and ACMECS, will play an important role in helping Subregional countries overcome common challenges, improve competitiveness, and seize new development opportunities. With such a vision, the cooperation between CLMV and ACMECS will focus on specific programs and projects in priority areas such as construction of transport infrastructure; harmonize processes and procedures for cross-border exchange of goods, services and capital; industrial-agricultural development; strengthen the development of culture-tourism and people-to-people exchanges; develop human resources through scholarship and vocational training programs; protect the environment and promote sustainable development. The ACMECS Master Plan 2019-2023 is being implemented on three pillars: comprehensive connectivity, towards building a dynamic and sustainable competitive economy⁸. Progress in the formation of the ACMECS Development Fund as an innovative financing mechanism will support the implementation of cooperative programs.

Flow management in the Mekong River region plays a very important role in smooth and harmonious connectivity in the sub-region for economic recovery. Controlling the Mekong also means controlling much of Southeast Asia's economy. Because this river flows through five Southeast Asian countries, the food security and livelihoods of more than 65 million people in the region depend directly on the Mekong River⁹. For example, fishing on the Mekong River contributes about 10% of Cambodia's gross national product. It is estimated that part of the income of more than 2 million people in Cambodia comes from fishing¹⁰. Freshwater fishing is not only an important economic activity but also a key factor in ensuring food security for Cambodia as fish is an essential source of protein for the majority of the country's population. Much of Cambodia's agriculture relies on the Mekong River because it serves the irrigation needs of many lands, and the silt produced by the river is rich in nutrients thanks to the deposition of sediments. This is partly true of Laos, Vietnam and Myanmar.

Strengthening cooperation and connectivity also helps raise the role and voice of Mekong countries in the process of regional and international integration. These two mechanisms will continue to be the foundation for Mekong countries to coordinate efforts, strengthen trust, and dialogue to find solutions to common challenges such as water resources, climate change, epidemics, etc. on the basis of harmonizing the interests of all parties.

In the East Asian region, “the Mekong sub-region can become an obstacle to regional integration, or it can also become an impetus for East Asian countries to gather forces to

achieve their policy goals”¹¹. However, due to limited financial and human resources, in order for these two mechanisms to be fully effective, the immediate requirement is to improve the method and select the appropriate priority cooperation field. with the new context and development needs of the member countries, while strengthening coordination with other regional and sub-regional mechanisms. In recent years, although GMS cooperation has made significant progress, “the breakthrough speed has not been as expected”¹². The main reason is that the countries participating in the sub-regional cooperation mechanism (with the exception of the main external partners such as China, Japan, and the United States) have modest economic capacity and depend on external support. The implementation efficiency of some mechanisms, initiatives and projects is still low. In addition, there are too many overlapping and cooperation mechanisms in priority areas and contents.

At the Mekong - Lancang Cooperation (LMC) summit in August 2020, Chinese Premier Li Keqiang pledged to share water management data on the section of the Mekong River that flows through China for the whole year. China's change is welcomed by ASEAN countries in the lower Mekong. Especially after the severe drought in 2019 caused the water level in the Mekong River to drop to its lowest level in more than 100 years. Part of that is due to the impact of extreme weather factors, but the core is due to China's 11 hydroelectric dams on the upper Mekong, with 11 other mainstream dams in the lower Mekong and 120 dams on tributaries played a major role in exacerbating this water crisis in the two years from 2017¹³. The devastating impact of these dams on fisheries and rice crops in countries along the Mekong River has also been documented. A report by Fitch Solutions says that dam construction causes severe damage in two industries that are considered the main sources of livelihood for local people, fishing and farming¹⁴, which will force the ASEAN countries must depend on further increased food imports from China.

At the same time as the implementation of the dams, starting in 2017, China created a “superfast waterway” along the Mekong River¹⁵ by dredging and blasting¹⁶. That waterway made it easier to move commercial goods. This brings significant economic and political

benefits in transforming the Mekong River into an industrial water corridor connecting China and the ASEAN countries along the Mekong River. Besides, China's large trade and investment activities in ASEAN countries along the Mekong River and its commitment to support 300 million USD for the LMC Fund¹⁷ make it difficult for these countries to turn away from China. With more than 100 new hydroelectric plants on the Mekong region invested by China in Laos, Laos wants to become a source of hydropower and make a profit by selling clean energy¹⁸ to neighboring countries. However, although the above project has been implemented on the Mekong River sections in China, Myanmar and Laos. But it was met with strong opposition from the resident communities and environmental protection groups in Thailand¹⁹, culminating in the decision of the Bangkok Government to terminate this project in early 2020. Similarly, Cambodia also publicized the project, announced a 10-year ban on dam construction on the Mekong River²⁰.

The difficult problem for the Mekong River has been viewed through the lens of the environment, socio-economic perspective, and political and security considerations. Critics criticize China for narrowing the flow of the Mekong River through dams and reservoir projects upstream²¹. In particular, China has been criticized for applying the LMC mechanism to manage water in the upper Mekong River not only to serve its economic interests but also to implement its own national strategy. When dealing with its smaller neighbors on the Mekong, China often appears to be a generous partner. However, this does not change the fact that China mainly uses the water source upstream of the Mekong River for its own purposes. China's financing of massive dam projects in Laos has made the country increasingly dependent on China. Dam projects in Laos and China are affecting the agriculture and fisheries of downstream countries. This has repeatedly led to conflicts with the interests of downstream countries such as Cambodia and Vietnam in particular.

China actively increases aid to Southeast Asian countries, accompanied by the increase of new Chinese immigrants. Originating from the outward investment policy of Chinese enterprises, as well as the foreign policy of the Chinese government, the Third Wave

of Migration to Southeast Asia began in the 21st century²², mainly to the regions. inland areas such as Northern Myanmar, Laos, Cambodia and Northern Thailand. Typical aid projects such as Lao National Palace of Culture, Wanrong II Cement Plant, Mekong River Embankment Project, Laos-China Friendship Hospital Luang Phrabang, the construction of 1/3 of the Kunming road- Bangkok, Nameng hydroelectric project, Pakse power transformer transmission project²³... Aid projects focus a lot on infrastructure such as roads, railways, ports and large public works. These projects are mainly undertaken by the Chinese with workers brought in from China.

Through forms such as financial aid, infrastructure construction, business, labor, and tourism development, China has skillfully built a large overseas Chinese community in Southeast Asia. subtly and comprehensively increases influence on multiple levels.

With the LMC, China has established an institution called multilateral but on the basis of bilateral agreements, separate negotiation agreements with each country. China deals with each country in the Mekong sub-region so that they cannot unite to deal with them as a regional organization. It is clear that this country is very keen to divide the division between the separate Mekong countries to easily attract into the orbit of influence from China. Similar in another context, the fact that China has made claims about its territorial sovereignty in the East Sea, on the one hand, China is friendly, on the other hand, separates ASEAN through separate negotiations. The way of thinking and behaving on the Mekong River issue with mainland countries, which has inherited the tactics that China has masterfully applied in the South China Sea, is not surprising.

In the context of increased engagement and cooperation, the Mekong-US Cooperation LMI will help fight transnational crimes and enhance water security for partner countries affected by China. China manipulates the Mekong River. Speaking at the Asia-Pacific Transboundary Water Governance Conference (October 2020), US Assistant Secretary of State for East Asian Affairs David Stilwell also condemned China's activities in the South China Sea. upstream of the Mekong River, directly condemning Beijing for “not being transparent,” “not sharing sufficient information about upstream dam activities, limiting the ability of Mekong governments to prepare for or mitigate damage from natural disasters”. Along with direct attacks at official forums, channel 2 mechanisms (sponsored by the US government) also continuously have reports, research and field projects (for example, the "Monitoring" report. monitoring the amount of water flowing through the upper Mekong basin under natural conditions” by Eyes on Earth and the Stimson Center Mekong Dam Monitoring project), press statements, scientific seminars by American scholars, etc.

Both competition and mutual restraint among major countries in the Mekong sub-region are increasingly complicated, and it is likely that there will be direct and indirect competition between cooperation mechanisms.

4. Discussion and Conclusion

In the past few years, the Mekong sub-region has continuously witnessed unusual fluctuations in river water levels, seriously affecting fishing activities, agricultural production and people's lives. Despite the existence of many sub-regional cooperation mechanisms, in practice, water resources in the Mekong sub-region are still poorly managed and governed by energy and food goals, leading to a rapid decline. Among a series of water security challenges, hydropower dams, water diversion and waterway construction are among the activities that stand out and have the most profound impact on water management in the Mekong River.

Entering the 21st century, major countries have increased in both the number and scale of cooperation projects in the GMS region. The involvement of major countries such as China, Japan, the US, and India in the GMS is increasingly strategic competition. A series of cooperation mechanisms between GMS countries and partner countries have been formed, such as Mekong - Ganges Cooperation (2000), Mekong - Japan Cooperation (2008), Lower Mekong Cooperation The Mekong - US (in 2009) was upgraded to the Mekong - US Partnership (2020) and most recently the Mekong - Lancang Cooperation (2016).

Water governance policies and cooperation policies in the Mekong River region are highly valued in the regional policies of other large or mid-sized countries, making the mainland Southeast Asia increasingly becoming a strategic space for these countries to compete for development and influence. Therefore, cooperation mechanisms in the Mekong sub-region were born with the participation of external factors, mostly stemming from political reasons.

Thus, it can be seen that, although water resources have contributed greatly to the development of Mekong countries over the past decades, over-exploitation and unsustainable exploitation are increasingly evident and potentially pose serious challenges to the Sub-Region. These issues are all transnational issues associated with the common interests of all river basin countries, requiring coordination to resolve.

Up to now, most of the large and influential countries in the region have been present in the Mekong sub-region through cooperation mechanisms led by these countries. From a security perspective, the Mekong sub-region is increasingly becoming an area of direct strategic competition among influential countries in the region. This is shown first and foremost through the increased presence and direct confrontation between the US and China on Mekong issues. In particular, China's rapid establishment and implementation of the Mekong - Lancang cooperation mechanism (MLC) with the largest scale and depth of cooperation compared to other mechanisms is posing many security and developments problems for Vietnam and the sub-region in particular as well as for Southeast Asia in general. Meanwhile, other partners have supported and increased their presence in the region, expressing their strong commitment to support the development of the Mekong sub-region, but the actual level of implementation is still modest and ineffective.

THE ROLE OF MYANMAR FOREIGN TRADE WITH GMS COUNTRIES

Dr. Ah Mar

dr.marmar1967@gmail.com

Professor, History Dept, Taungoo University, Myanmar

Abstract

The Greater Mekong Subregion (GMS) program is the result of a 1992 economic cooperation and intergration agreement among Cambodia, the Lao People's Democratic Republic, Myanmar, Thailand, Vietnam and Yunnan province of the people's Republic of China. The GMS submit declaration issued by the GMS leaders in November 2002 enunciated a vision of freeing their people from poverty and providing sustainable development opportunities for all their citizen. The subregion a need to be increasingly intergrated to attain these goals and to compete in a globalized world. The GMS economies achieved the growth during 1992 - 2010 expect Thailand economy during the financial crisis period. Therefore, Myanmar and GMS trade are favorable condition. Myanmar government needs to recognize the significance of Myanmar national industrial development strategy. Part of trade is economic zones or border trade zone that can be established by the future implementation of projects that provide golden opportunities for trade and these projects can support such as East-West economic corridor.

Keywords: *Greater Mekong Subregion, Foreign Trade, Economic development*

1. Introduction

There Greater Mekong subregion (GMS) Assistance plan (GMS-AP) for 2001-2003 presents the strategic trusts and direction of the program of Economic cooperation in the GMS in eight (8) priority sectors, together with the lending and technical assistance pipeline for the period. It updates the Interim GMS-AP for the period 2000-2002 which was the first attempt at presenting in a comprehensive manner, the strategic thrusts of GMS program and priority subregional projects that support these thrusts of the GMS program and priority subregional project that support these thrusts as endorsed by the GMS Ministries conference. Growing bilateral trade raise the income levels of both countries then the countries become richer. The study intends to analyze development of bilateral trade sector of Myanmar by policies influencing trade sector, performance of trade sector and making contributions to trade development in point of view.

Regarding the object of the study, this study has the following objectives: (1) To study the roles markets and governments are being redefined and their economics are becoming more diversified and open; (2) To study volume of trade and balances of the trade of Myanmar with neighboring GMS countries; (3) To analysis trade promotion polices and

strategies of Myanmar with GMS countries; (4) To study the inhabitants may take full advantage of the opportunities that peace provides.

2. Method

This study is mainly based on simple descriptive methods with available statistical data and secondary data sources based on information published from relevant institutions, and research findings. As literature review, textbooks and publications of previous research have been studied, and facts and figures from which are synthesized in order to interpret the trends and historical events of trade relations.

3. Results

In this study Myanmar Foreign Trade with GMS countries, strategically located in the hear of Asia the GMS is a vital land bridge between the dynamic economics of East and South-East Asia. The main hypothesis of the research is that the participation in regional economic cooperation will improve Myanmar-ASEAN Trade, one that recognized in equal measures the public benefits of managing the GMS commons. Broad based economic cooperation and for mobilization of development resources GMS projects complement and amplify national projects. GMS has provided the opportunity for government to develop a shared vision for developing the subregion.

Trade and Investment Facilitation Action Plans of GMS

Background

At the mid-term SOM (Summit of Mekong) held in June 2002, People Republic of China proposed to formulate a plan to promote trade and investment in the Greater Mekong Sub-region. The purpose of the initiative is, through such measure as facilitation, information sharing and capacity building, to achieve the mutual advancement of and sound interaction between GMS economic cooperation and China-ASEAN Free Trade Area. The initiative was endorsed by the mid-term SOM and the 11th GMS Ministerial Conference. The first GMS Summit held in 2002 also called on GMS member states to work out an action plan in this regard. For the past two years, GMS members have made great efforts in trade and investment facilitation by streamlining customs procedures, increasing administrative efficiency and improving legal framework, among others. Progress has also been made in the area of information sharing and capacity building. However, due to the lack of a set of clear guidelines and an action plan, advancement in trade and investment facilitation in GMS countries varies. Greater efforts are therefore needed to tap the full potential of cooperation. Against this background, China proposes that a long-term and systematic action plan on trade and investment facilitation be developed to enable GMS members to reach their goal in a coordinated manner.

The Trade and Investment Facilitation Action Plan involves adopting and implementing concrete action steps in the areas of customs procedures, inspection and quarantine procedures, trade logistics, mobility of business, investment promotion and capacity building. The Action Plan aims at:

(1) Achieving common development and prosperity by creating favorable environment for trade and investment.

(2) Realizing a significant reduction in transaction cost by simplifying procedures and improving efficiencies.

(3) Enhancing the free movement of business people;

(4) Improving administration and management through capacity building.

Priority Areas for Action

(a) Customs procedures

Objective: To promote simplification, harmonization and transparency in customs procedures with a view to reducing trade barriers and minimizing transaction costs.

Actions:

- Align and harmonize the trade and custom laws/regulations with WTO and WCO standards;
- Increase the transparency of customs laws/regulations;
- Accelerate the application of one stop customs inspection;
- Promote the standardized and simplified documentation, including paperless systems;
- Collect and disseminate the information on rules of origin in respective GMS countries.

(b) Inspection and Quarantine Measures

Objective: To promote the utilization of the harmonized inspection and quarantine measures based on the international standards, guidelines and recommendations of relevant international organizations among GMS members, for the sake of the protection of the environment, the quality of export product, the life and health of human, animals and plants, and the prevention of fraud and the disguised restriction on regional trade.

- Enhance the communication and cooperation in the area of WTO TBT/SPS agreement among GMS members, as well as the alignment of the technical regulations, standards and conformity assessment procedures with TBT agreement, the sanitary and phytosanitary measures with SPS agreement among GMS members;

- Strengthen the communication and cooperation in the area of national border health quarantine and establish the regional declaration and monitoring network of epidemic diseases;

- Increase the transparency of inspection and quarantine laws and regulations;

- Strengthen the cooperation of relevant authorities in the area of the sharing and exchange of electronic inspection and quarantine information/data;

- Harmonize the inspection and quarantine clearance mode and simplify the clearance procedures so as to enhance the clearance efficiency;

- Explore the feasibility of one-stop inspection and quarantine mode at the border crossings of GMS members.

(c) Trade Logistics

Objective: To simplify and harmonize of the transport regulations/procedures so as to increase the efficiency in the delivery of goods and reduce transaction costs.

Actions:

- Accelerate the finalization and implementation of the Agreement for the Facilitation of Cross-Border Transport of Goods and People;
- Where appropriate, review and simplify the transport regulations/procedures;
- Improve the trade infrastructure in GMS member countries, such as navigation channels, ports and land roads, including opening temporary airline and railway transport to counter seasonal shortages, in order to establish a more convenient network of trade logistics.

(d) Mobility of businesspeople

Objective: To enhance the mobility of businesspeople who are engaged in the conduct of trade and investment activities in OMS

Actions:

- Streamline the formalities for business travel and temporary stay;
- Increase the transparency of relevant laws/regulations;
- Enhance the use of information and communication technology (ICT) to facilitate the movement of businesspeople across borders.

(e) Investment Promotion

Objective: To improve the GMS investment environment so as to enhance the investment flows.

Actions:

- Increase the transparency of investment laws/regulations;
- Promote investment flows by means of seminars, workshops and investment exhibitions, etc;
- Strengthen the coordination and information sharing between and among the agencies responsible for regulating in GMS member states;
- Encourage one-stop investment services. -

(f) Capacity building

Objective: To strengthen the technical assistance (TA) and improve the human resource development (HRD) with a view to upgrading the professional skills of concerned government officials in implementing trade and investment facilitation measures

Actions:

- Identify the special needs and determine the more appropriate measures for implementation;

- Develop the partnership with private sector, academic community, other international development organizations and interested donors;
- Conduct training programs and workshops to facilitate the sharing of best practices among the concerned officials and leverage their resource to enhance capacity building in trade and investment facilitation.

Framework for Implementation are-

1. The Action Plan was submitted for consideration at the 13th ministerial conference held in December 2004 and approved by the 2nd summit in 2005;
2. The implementation of the Action Plan has been reviewed annually and reported to the Summit biennially;
3. The GMS Trade Facilitation Working Group (TFWG) shall be responsible for the review and implementation of the action plan;
4. The Asian Development Bank has been working with TFWG in stimulating and coordination progress in the above priority areas.

Trade Promotion Policies and Strategies of Myanmar

In order to promote the activities of Foreign Trade, rules, regulations and procedures are essential measures in doing business of export and import with bordering nations. To meet this end, the former rules and regulations that banned the participations of private enterprises in foreign trade were withdrawn by notification No.1/88 released on 29th October 1988. Subsequently, the state allowed private enterprises and firms to participate in manufacturing goods as well as in service sectors. In addition, the state has being offered foreign enterprises and businessmen to invest in Myanmar in very potential sectors. Foreign Direct Investments are also being invited to participate in enhancement of production and marketing.

Myanmar is a signatory country of GMS in which participating actively. Myanmar trade promotion policies are also encouraging to promote trade with neighboring countries as well as with GMS members. Ministry of Commerce has set down three basic economic policies to achieve the economic objectives of Myanmar. They are

- (1) Trading activities must be done aiming at the welfare and benefit of Myanmar people;
- (2) Trading activities must not be burden for people;
- (3) Trading activities must be done to explore long-term sustainable development not for short-term benefit;

I. Basic Trade Objectives

The four basic trade objectives of Myanmar are as follows,

- (1) Both domestic trade and foreign trade must be one of the most reliable forces for the economic development of Myanmar;
- (2) Trade and business organizations must be the most efficient factors;
- (3) To improve value and item of export and to earn more foreign exchange (FE);
- (4) To supply necessary facilities for the private and co-operatives to able to participate in trade sector;

Exporting and importing are legally allowed by 1947 Act of Importing and Exporting. The export / import licenses are permitted to the following personnel and firms;

(1) All companies, joint-ventures, business organizations and enterprises are allowed to carry out importing and importing in accordance with the rules and regulations;

(2) All cooperatives registered by Myanmar Cooperative Act;

II. Procedures for Foreign Trade

Merchants and businessmen then who have export/import license can do exporting and importing legally. They have to submit permission to Ministry of Commerce to carry out exporting and importing. They can trade both through normal trade and border trade.

When they carry out trading activities, they have to abide following rules and regulations;

(1) License application for foreign trade has to be submitted to the Directorate of Trade, Ministry of Commerce;

(2) License application for Border trade has to be submitted to the Department of Border Trade, Ministry of Commerce;

(3) License application for normal trade which has to be done through border line has to be submitted to the Department of Border Trade, Ministry of Commerce;

In an export / import license, licensee is permitted to perform his business of foreign trade within three months. Exporters have to enjoy 100% benefit on exporting profits. The payment system must be done by letter of credit or telegraphic transfer. Shipment of Export is prescribed to do through FOB (Free on Board) system, CFR (Cost Freight Rate) system and CIF (Cost Insurance and Freight) system. The procedures for import are; doing through normal trade, CMP (Consignment Production) system, drawback system, transit trade, barter trade, counter trade, account trade, capital in kind, loan in kind, and many other means of trading.

III. Procedures for Border Trade

The procedures of border export and import are as follows:

- The numerous and large valued commodities must be exported or imported by means of the normal trade method through border. The currencies allowed for transaction are Euro and US dollar and Singapore dollar.

- The commodities for the local consumption and local products in border areas can be exported or imported by means of border trade method. Not only American Dollar but also the currencies of both bordered countries are allowed for the transactions.

- The 8 percent of commercial tax and 2 percent of income tax shall be payable for export.

- The proper customs duty, commercial tax, income tax, imports license fee and bank service charges must be paid for import.

The private sector is permitted to export all commodities except the following prohibited commodities through the border areas:

(a) Agricultural Products

Agricultural Products includes rice Products, white Sugar, red sugar, brown sugar, Ground Nut! Ground Nut Oil, Sesame Oil, Niger Oil, Mustards! Mustard Oil, Sunflower seeds! Sunflower oil, All Sorts of Oil seed Cakes and Cotton and Cotton Products (Cotton Yarn).

(b) Mine and Metals

Mine and Metals include Crude Oil, Precious Sorts of Oilseed Cakes³ Gold, Jade, Pearl, Diamond, Silver and Copper and not allowed metal from Ministry of Mine.

(c) Animals and Animal Products

Animals and Animal Products include Ivory, Buffalos, Cow & Ox, Elephant, Horse and All Rare Animals.

(d) Marine Products

Marine Products include Prawn Shell Dust.

(e) General Materials

General Materials include Arms and Ammunitions, Antiques.

(f) Forest Products

Forest Products include Teak.

The private sector is permitted to import all commodities except the following prohibited commodities through the border areas;

Seasoning Powder (MSG), Soft Drinks, Biscuits Assorted, Cakes, Wafer, Chocolate, Chewing Gum, Tinned Meats and Fruits, all sorts of Instant Noodles, Liquors, Beer, Cigarettes, Plastic Household goods, Restricted Products as par Existing Laws, Affecting products to the domestic Industries.

Encouraging Programs for Trade Promotion

Ministry of Commerce has implemented following steps for smooth flows of trade activities in order to promote volume of trade and to improve flow of goods;

- (1) Inspecting and giving permission export/import licenses;
- (2) Regulating and adjusting rules and regulations for export and import;
- (3) Releasing the information about exporting items through journals, magazines and on websites,
- (4) Facilitating merchants with reliable and updated information,
- (5) Encouraging merchants to produce high-quality value-added goods in order to gain competitive advantages in the international markets,
- (6) Implementing necessary measurements to initiate counter trade,
- (7) Participating in regional cooperation on trade and concluding bilateral trade agreements,
- (8) Encouraging private participation in international trade,
- (9) Organizing merchants and forming business related organizations (UMFCCI)

- (10) Supervising both normal trade and border trade to be the best service,
- (11) Educating the people all about e-commerce system,
- (12) Giving on-job training to the personnel concerned.

Cross-Border Trade with Neighboring Countries

Agreed programmatic economic cooperation among these three GMS countries that share land borders in terms of cross-border trade, investment, tourism, and labor cooperation has been occurred within nearly one decade. In general, cooperation in trade (formal and informal), labor cooperation (Legal and illegal), and tourism are impressive whereas cross-border investment has not yet existed.

Until 1988 when the SPDC took power, border trade was informal, illegal trade or smuggling. Sometime, that occurred as transit trade and barter trade. The Government tried to stop illegal trades and black market along border areas and began to launch legal trade along the border areas. The state leader guided strategies and tactics to implement legal border trade as prior national task⁴ According to the guidance of state leader, the Ministry of Commerce issued an order 1/88 which assigned Myanmar Export and Import Service (MEIS) to implement legal border trade and supervise border trade activities. This program was formalized when bilateral agreements were signed with the PRC and Thailand. Myanmar has since normalized, legalized, and further liberalized trade with these countries base on the provisions of these agreements as well as arrangements in GMS Programs.

The positive impact of cross-border trade for Myanmar has risen substantially in employment and income and improvements in security, transportation facilities, and the social sectors in border regions.

Myanmar's Trade with GMS countries

According to the Ministry of Commerce, during the period 2002-03 to 2011-12 the main trade partners for external trade of Myanmar are ASEAN members, EU members, PRC, Japan, Hong Kong, United States, India and Bangladesh. In the comparison of regions with which Myanmar deal in trade, South East Asia is the main and the largest market for export.

It can be said that the level of cooperation between GMS countries has been considered quit progressive compared to other regional groups. And even be said that it is a super power group in implementing the development of institutional arrangements to promote the border trade among the member countries. By cooperating in trade sector liberation, the region has achieved substantially in poverty alleviation for the Greater Mekong Subregion (GMS). Evidence suggests that carefully implemented trade liberalization could contribute significantly to pro-poor development (Winters, McCulloch, and McKay 2004). The positive impact of cross- border trade for Myanmar has been a rise in employment and income and improvements in security, transportation facilities, and the social sectors in the border region. Under the trade facilitation plan of GMS, trade between Myanmar and other GMS countries increased rather than that was in the past.

4. Conclusion

GMS countries have in different stages of economic developments and Myanmar can have trade cooperation with some of them in all product categories. Myanmar is the largest land area and Cambodia is the smallest area in GMS member countries. Vietnam has the largest population and Lao have the smallest population. Thailand has largest total Agricultural Area and Arable land for Agriculture than Myanmar. Myanmar is Agriculture Area as 17.7% and arable land as 15.7% of total land area. The GMS economics grew 5.3% per year on average during 1992-2010. Greater Mekong subregion will become the most successful and developing group in the world by achieving sustainable economic development in the subregion. The impact of border trade is occurred positively in the political, economic, and social development as substantial extent in poverty reduction as well. The legal border trade with GMS members as well as other neighbors has greatly impacted on the economic development of Myanmar.

GLOBAL VALUE CHAIN AND THE PARTICIPATION OF TEXTILE ENTERPRISES IN VIET NAM

Dinh Thuy Dung

dtdung@neu.edu.vn

National Economics University, Hanoi, Vietnam

Abstract

Since the covid 19 pandemic and its impact on the economy, the global value chain and supply chain have undergone significant changes to the economy around the world. Vietnam and the textile industry are no exception to this change and transformation, expectations of deeper participation in the supply chain of domestic enterprises are also affected by internal factors. and external factors such as institutions, foreign ownership rates, import value of raw materials...By qualitative and quantitative studies, the authors have verified the model and objectively assessed the participation and factors affecting the participation of Vietnamese textile and garment enterprises in the global value chain and then propose practical policies and solutions.

Keywords: *Global value chain, global supply chain, textile enterprise*

1. Introduction

Manufacture enterprise plays an important role of economic increase and bringing job in developing countries (Wang 2016). In Viet Nam, about 96% of the enterprise are SME. They bring about 47% of the employed labor and contribute 36% of the national value added (OECD 2021). SMEs accounting for 88% of enterprises export and about half of the output is exported. However, 70% export volume of SMEs in Vietnam comes from foreign capital SMEs, moving to Vietnam to be closer to large customers who are multinational companies (MNEs) (OECD 2021). In Vietnam, garment enterprises are gradually shifting their participation in the garment supply market from Cut – Make – Trim (CMT) to Free – on – Board (FOB) and ODM because the contribution to the value chain of textile enterprises is now being considered based on the supply of input materials of fabric, which is a limitation to reduce the competitiveness of enterprises. (Le 2017, Fullbright). Vietnam needs to engage in full-service production instead of outsourcing and to do that the Vietnamese textile and garment industry needs move to upstream in the textile value chain, holding the stages in the production segment raw materials and accessories, this is a long-term strategy to maintain and improve competitive advantage in export Vietnamese garment. (Gereffi 2003). However, 70% of textile enterprises in Vietnam are small and medium-sized, the remaining 30% are foreign-invested and large enterprises. So, if they want to participate more deeply in the value chain, SMEs will have to face great competition from the cost of input materials, product distribution as well as the application of technology. Therefore, they still have to consider the development direction of the business. In addition, ancillary enterprises may be put under threat of job loss if textile enterprises form an industrial cluster. To maintain the role and

impetus for enterprises in the economic development of the country, it is important to identify the factors that determine their sustainable development (Kotturu and Mahanty, 2016)

The policies on market opening in recent years in Vietnam have been very well implemented by the government leading to an increase in the participation of small and medium enterprises in the value chain. Despite the focus towards deeper participation and better value creation in production and supply networks, the connection between SMEs and GVCs is still quite low (OECD 2016). Up to now, there has been no research on the motivation for textile enterprises to participate in GVC, how to have the opportunity to participate in GVC as well as improve the competitiveness of textile enterprise in Vietnam, what factors promote SME and enterprises of VietNam can participate in GVC? This gives rise to questions on how to connect local enterprises to GVCs? What are the factors and their dynamics that influence competitiveness in becoming successful partners within GVCs?

As an SME ramps up its participation in the value chain, having to perform complex tasks with ongoing involvement facilitates improving their own capabilities and adding value.

This study was conducted using secondary data of enterprises in the textile and garment industry in Vietnam with using quantitative methods tried to find out the determinants that promote and play an important role to textile enterprise in participate and promote linkages with GVCs.

2. Literature review

2.1. The beginning of free trade area (FTA)

David Ricardo is an advocate of free trade based on comparative advantage. He followed in the footsteps of Adam Smith and contributed greatly to the development of the labor theory of value. His theories significantly influenced the economic thought of Karl Marx. David Ricardo is also a businessman, financial expert, speculator, he is considered to have amassed a large fortune. The formation of free trade zones and the narrowing of barriers between these regions as well as between economies have fueled the globalization of goods production processes. Corporations, multinational companies invest capital and open production facilities in the countries of each free trade area to take advantage of its incentives. Arvind (2002) “whether final or intermediate – be allowed to be traded freely. The proportion of domestic value added in final goods does not enter as a criterion in the rules of origin.”

Beside it, the competitive environment according to Michael Porter is born in a certain setting, like a four-pointed diamond. According to this theory, information, stimulating factors, competitive pressures, key enterprises, institutions, infrastructure, technological capabilities... all have a positive impact on improving productivity. of the national economy. Increasing productivity in a sustainable way requires that each country's economy itself be constantly upgraded. That means businesses must strive to improve productivity, by improving product quality, improving technology and lowering costs. Only in that way can enterprises enter the competitive market. Liberalized trade and investment markets have created productivity-enhancing opportunities for all countries, while also forcing companies to remain highly productive. Therefore, each country can focus on an

industry in which its firm has an advantage and import goods and services produced by foreign competitors if domestic production productivity is lower. . Porter has synthesized his research methods and built a theoretical model of four factors that play a key role initially for successful competition in an industry, which is a combination of factors of production, domestic demand, and competition. domestic competition and supporting industries. According to Porter, if domestic competition is fierce, international competition will be successful.

2.2. Global value chain (GVC)

With a new way of production and trade like today's approach, a finished product is no longer produced by one country. Companies through global production networks supply only part of the final product, but not all of it (Escaith and Inomata 2013). Therefore, when a product is exported and leaves a country, there will be tangible and intangible added values both at home and abroad that cannot be captured by previous trade statistics. Furthermore, the appearance of the Input - Output data table allows to see concrete numbers to measure value-added trade by capturing across bilateral exchanges worldwide. However, the scope of this data is limited to some details such as industry, up-to-date data. Furthermore, from previous studies, the absence of a uniform GVC measure has led to the use of different approaches to capture the concept of GVC entry at the firm level (Amador and Cabral). 2016

The term global production value chain developed by Gereffi (1999) – as distinct from the value chain concept introduced by Porter (1990) – has things in common with the concept of a global production network and is often referred to as a global production network. same. However, there are differences between them. The value chain implies all production activities from the first to the last stage, but the production network implies that there will be two or more value chains that share at least one member - the implication includes both vertically and horizontally linked (Sturgeon, 2000).

Gerrefi (1994) found that global industrialization was the result of system integration in production and trade, thereby clarifying the state's policy role in participating in the global trade chain, especially for with export-oriented countries.

Participating in the global market is one of the important factors, helping to promote economic growth, social progress as well as strengthen a country's position in the world. “When manufacturers of a specific country or regions are not able to embed into global markets, this could make negative impact on their overall economic situation which might be even worth before integration process have began (Ghemawat, 2001).

Value chain research focuses on the nature of the relationships among the various actors in- volved in the chain, and on their implications for development (Humphrey & Schmitz, 2002b)

2.3. How to measure the participation of Vietnamese textile enterprise into global value chain

To better understand the level of participation of enterprises and a country in the global value chain, we use scales to evaluate and have the most general view. In most studies,

assessing participation in global supply chains is often difficult to access as well as comprehensively accurate, but there are tools to help researchers through the stages. can capture and take measurements as a basis for an overview to create a premise for further studies.

Regarding the forms of GVC participation characterized by “vertical specialization,” Hummels et al. (2001) originally suggested the following two modalities: (a) using imported intermediate inputs to produce exports (called “backward participation”) and (b) exporting intermediate goods used as inputs by other countries to produce goods for export (called “forward participation”)

In a 2018 study by Yue Lu, the foreign rate of increase (FVAR) was used to measure participation in the value chain (GVC) and found that firm productivity and financial position will affect their participation in the supply chain. “We calculate the foreign value-added ratio (FVAR) to measure the global value chain (GVC) participation”

Similarly, in a study, two scales have been shown for the participation of a country or more specifically firms in the supply chain through the link before and after “Countries, or more specifically firms, participate”. in GVCs as 'buyers' (also known as backward participation) and/or 'sellers' (also known as forward participation)” where backward participation is the foreign value-added ratio.

With the researches, Foreign value-added content of exports corresponds to the value added of inputs that were imported in order to produce intermediate or final goods/services to be exported. It corresponds to the "Backward GVC participation". It is also referred to as "Vertical specialization" when expressed as a percentage of gross exports. The scale applied to GVC would be the value of imports to produce an export good in an economy which often called backward linkage.

Backward GVC participation refers to the ratio of the "Foreign value-added content of exports" (see definition in Section 1) to the economy's total gross exports. This is the "Buyer" perspective or sourcing side in GVCs, where an economy imports intermediates to produce its exports

2.4. Factor Affecting participation in Global value chain of enterprise in VietNam

Government mechanism and influence

In a country, to promote any activity in the economy or make a breakthrough difference, individual participants are not enough, it will need policy mechanisms suitable to the content. includes many different influences and influencing factors.

The concept of mechanism is explored in depth in studies of new institutions. As scholars will tend to focus on different aspects of this phenomenon, the definitions also represent different ideas. Mechanism is defined as a part of the economy that shows the interrelationship between institutions and actors (Veretennikova & Omonov, 2017); or as a set of rules that determine the player's strategy (Hurwitz, 1994; Veretennikova & Omonov, 2017). It ensures the formation, operation and development of the institutional system or institutional environment (Zaloznaya, 2006). Commons (2017) examines institutional

mechanisms through the lens of value-creating transactions. Kenneth Arrow (1974) presents the institutional mechanism as a framework for allocating resources based on Pareto efficiency. évenot (2007) defined institutional mechanism as a combination of actions occurring in the coherence of its elements to achieve economic equilibrium. Ménard (2014) considers this as the association of partners to establish businesses. According to North (1990), the institutional mechanism is more important than the economic one because it sets the rules of the game by which economic agents behave, and thus determines their behavior and outcomes.

Investment of research and Developmet

Ohno (2013) and Ye et al. (2015) suggests that firms can gain more benefits through GVCs by increasing productivity. However, one of the essential factors to decide to increase productivity and improve the competitiveness of enterprises is innovation. Maximizing the enhanced benefits from participation in GVCs requires domestic firms to enhance their innovation capacity for sustainable and competitive growth. According to the theory, innovation is the ultimate success tool in a highly competitive global market to map opportunities ahead (Rajapathirana & Hui 2018). Indeed, innovation drives productivity, job growth and sustainable business (Akcali & Sismanoglu 2015). Innovation has led to the survival, growth and development of small and medium enterprises (Minniti & Venturini 2017), micro firms (Baumann & Kritikos 2016), and the competitiveness of SMEs. and small (Sipa, Gorzen-Mitka, & Skibinski 2015)

Long-tearm investment in fixed asset

Investment in fixed assets and long-term investments are crucial for enterprises that aim to participate in the global value chain. These investments allow companies to build and expand their production capacity, develop new products and services, and enhance their competitiveness. Improved productivity and efficiency: Investing in fixed assets such as machinery, equipment, and infrastructure can improve productivity and efficiency, which can help companies reduce costs and improve their competitiveness. This can help them to produce high-quality products at a lower cost, making them more attractive to customers in the global market.

Capacity expansion: Long-term investments in fixed assets can also enable companies to expand their production capacity, which can help them to meet the growing demand from the global market. This can help them to increase their market share and revenue, and also reduce their dependence on a single market.

Innovation and new product development: Long-term investments can also help companies to innovate and develop new products and services. This can help them to differentiate themselves from their competitors and create a unique value proposition that can appeal to customers in the global market.

Access to global markets: Investing in fixed assets and long-term investments can also help companies to enter and succeed in global markets. By building a strong production base and investing in new technology, companies can produce high-quality products that meet the demands of customers in the global market.

Import value (Input of materials)

In Thomsen's study (2007), he showed that "barriers to enter the chain" are formed by economic - political factors in Vietnam and this affects market segmentation, access to state systems here, this affects the finding of raw materials for the export process of enterprises.

Labour

Labor and productivity is one of the factors that play an important role in promoting and changing the productivity of the industry, especially in labor-intensive fields such as the textile industry. However, in the textile value chain and supply chain in countries like Vietnam, most products are assessed through the skill level of the workers. Therefore, considering the labor factor through the number and productivity of labor reflected in the revenue can see the current situation of the textile industry today.

3. Method

The development of a framework to study the integration into GVCs requires an analysis of the internal factors in the enterprise combined with the promotion of the state, the determinants and the processes carried out by the enterprises with Various department are involved.

The approaches of previous studies are used to measure the level of participation and assess the factors of wanting to join the supply chain (WTO). These studies investigated cross-country evidence. Therefore, the aim of the present study is to identify the factors that determine the successful inclusion of Vietnamese textile and garment enterprises in GVC.

The significance and impact of factors that were part of the push into GVC were determined through linear regression. The extent of a country's participation in GVCs can be described using an index of the share of manufacturing in export value added, due to Ischuk (2018) or export value through FDI.

A multiple linear regression is constructed reflecting the reciprocal relationship between the share in export value added, which represents the degree of inclusion of Vietnam's textile and garment industry in GVC, and other indicators. reflect the impact on the dependent variable of the enterprise. The model is represented by the following equation

Where:

$$LN(\text{Export value}) = \beta_0 + \beta_1 \text{Foreign ownership} + \beta_2 LN(\text{labour capacity}) + \beta_3 LN(\text{import value}) + \beta_4 LN(\text{basic construction}) + \beta_5 LN(\text{Procurement of fixed assets})$$

The choice of variables can be explained as follows.

Helping businesses to participate in the global supply chain or production chain is recognized with a significant contribution of the role of the State. From factors such as policies, business environment and creating conditions to help enterprises overcome these difficulties and variables are shown in the enterprise survey to assess the level of difficulties faced by enterprises.

- Input import value is also an important factor to evaluate the contribution to GVC by backward linkage. To create final output products, textile enterprises in Vietnam still need to import input materials.

- From the scales, it can be shown that the participation of enterprises in GVC requires foreign capital because exports from Vietnam are supported by foreign enterprises in the form of joint ventures or FDI.

- Investment in fixed assets is one of the key factors because any production operation, whether in breadth or depth, requires essential materials, machinery and infrastructure equipment that will show how capable the business is in terms of materials and fixed capital. (World Bank 2020)

- The number of employees and productivity are indicators to evaluate the human resources of an enterprise. As mentioned in the OECD Skills Outlook (OECD, 2017), there is a bilateral dependence between labor and GVC participation. Correlations have shown that countries with higher productivity growth also significantly increase their presence in GVCs. At the same time, more fragmented industries such as manufacturing also benefit from participating in GVCs and increase productivity as other costs (transportation, packaging, etc.) are lower.

4. Results

Vietnam is leaving a lot of deep imprints in the process of international integration since the time after joining the WTO. By 2020, Vietnam has 30 strategic partners and comprehensive strategic partners; has diplomatic relations with 189/193 countries, has economic relations with 160 countries and 70 territories. However, the risk of falling behind is still possible when according to statistics by the end of 2021, Vietnam will only have more than 300 pure Vietnamese enterprises as suppliers to multinational corporations in Vietnam. The fact that Vietnamese enterprises cannot deeply participate in the production value chain of multinational corporations present in Vietnam poses many problems. and the reasons that can be mentioned when it is not possible to "squeeze" into these supply chains can be mentioned as follows: Firstly, most Vietnamese enterprises are small in scale and have very limited competitiveness. In the current Vietnamese economy, the small and medium-sized enterprise (SME) sector accounts for 98% of the total number of registered enterprises, generates about 60% of GDP, and creates more than 90% of jobs for workers. (white enterprise 2020). Secondly, not only is the TFP in the domestic enterprise sector low, but the growth rate of TFP is also not high. The growth rate of TFP is due to the impact of factors such as: technological innovation, production rationalization, management improvement, improvement of worker's labor skills, etc. Vietnam's enterprises in the sector are very inferior to FDI enterprises. Third, the linkages between enterprises in Vietnam are still limited, it can be said that it is still weak. Business psychology of domestic enterprises often focuses on individual interests. So, if it is possible to strengthen linkages in the value chain and even cross-link in existing industrial zones/clusters in Vietnam, then domestic enterprises will certainly have great benefits.

The results of OLS regression to test independent variable factors are shown as follows:

Coefficients^a

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
	B	Std. Error	Beta			Tolerance	VIF
(Constant)	3.808	1.200		3.174	0.002		
Foreign ownership	0.126	0.059	0.112	2.137	0.036	0.971	1.029
Labor productivity	0.148	0.071	0.122	2.092	0.040	0.919	1.088
Import value	0.427	0.061	0.573	6.953	0.000	0.951	1.052
Basic construction	0.102	0.084	0.107	1.208	0.231	0.820	1.219
Fixed asset	0.319	0.076	0.377	4.181	0.000	0.792	1.263

a. Dependent Variable: Export value

Regression model with selected and explained variables has shown relatively clear results about the effects of factors on export value (Y). The standardized regression coefficient (Beta) allows to evaluate the level of impact of each factor on the dependent variable of export value, according to the results on the order of effects of the factors from strongest to weakest as: import value , fixed asset , labor productivity and foreign ownership.

Labor productivity shows a positive value showing that the workforce in the textile industry still plays an important role in these industries that do not need to use too much capital. In addition, other margins such as the purchase of fixed assets also have a positive impact on the value of exported goods because product quality and productivity depend in no small part on equipment and technology. of that device. and this also shows the financial capacity of the business in its development process with the procurement of equipment.

One of the values showing the scale of entry into the supply chain of those industries is the input material factor. In this study, the author shows by the value of imported raw materials for processing abroad of enterprises and this value is statistically significant at the 3* level, as a stronger proof that the product The output of domestic textile and garment is still highly dependent on imports (ADB). The actual data shows that the import value of raw materials is still at a high level, as can be seen from year-to-year comparisons. the import value of textile materials and accessories in the last 2 years is 4,133 million USD in 2021 and 4093 million USD in 2022 (Vitas). It can be seen that the bottleneck in the issue of raw materials has not been resolved, but to enjoy the FTA advantages, the first priority decisive is the development of raw materials. Therefore, the early synchronous development of supporting industries will bring higher efficiency to Vietnam's textile and garment industry. Up to now, the capacity of the supporting industry is still limited, not as expected.

According to data from the Import-Export Department (Ministry of Industry and Trade) in 2022, the textile and garment industry's export turnover will still reach an impressive figure of about 35 billion USD, up 21% over the same period in 2021. For

example, the current Nowadays, the textile and garment export industry is no longer dependent on only 5 traditional markets as before (USA, Europe, Japan, Korea, China) but started to shift to Russia and some other countries.

Especially, for the EU market, if in the past, Vietnam's textile and garment industry only focused on a few large countries such as Germany, France, Spain, and the UK, but now it has exported to 26/27 countries in the EU. Many businesses have actively shifted their vision and operating models to countries such as Africa, Mexico, etc.

Industry enterprises also adapt very quickly when shifting investment in technology and automation and adapt when the product structure changes.

In addition, when facing a decrease in orders, businesses have rearranged working hours, not organizing overtime or overtime, but only working within office hours or reducing the number of working days in the week to ensure stability for workers.

Besides internal factors of enterprises, external factors are also one of the important factors supporting growth momentum, integration and deeper integration into the supply chain. In many years of research, the authors have shown that the factor that has an indirect influence is from the Government. The World Bank's annual data report also assesses the influence of the government and ranks this index, Vietnam ranks 69th out of 192 countries participating in this ranking and this number also shows signs of increasing. annual period. but whether it accurately reflects the current problem or not. and what does this influence have to do with or support the textile industry in Vietnam and other industries. According to experts, the policy of industrial development to support the textile and garment industry needs to ensure the following issues: industrial parks focusing on the production of raw materials must have convenient roads, and at the same time be associated with seaport system; creating chain links in textile dyeing associated with garment factories in the region, thereby reducing transportation costs and product costs; There should be a financial mechanism and tax incentives for businesses to invest in wastewater treatment systems. In the policy, especially the industry development strategy, it is also necessary to clearly define the key regions and localities in the planning of industrial parks and wastewater treatment plants to call for secondary investors to invest in supply shortage...

5. Conclusion

In general, in order to promote the textile product market and the textile industry to deeply participate in the supply chain, it is necessary to combine many stakeholders. The most important thing is still coming from the inside of businesses, their capabilities, the rest from the outside will lie in the policies and impacts of the government. To be able to add value on the supply chain, the textile product itself will be a combination of factors from the raw material stage to the final product. The state needs to support domestic enterprises in the production of input materials and equipment for the product creation process, negotiate, discuss and take measures to protect the prices of Vietnamese textile and garment products on the international market.

WHY DO SMALL FARM HOUSEHOLDS HESITATE TO PURCHASE INSURANCE TO COPE WITH SHOCKS? EMPIRICAL EVIDENCE FROM VIETNAM USING A SIMULTANEOUS APPROACH

Dr. Trinh Anh Khoa
khoata24@fe.edu.vn

FPT Greenwich Centre, FPT University, Da Nang Campus, Vietnam

Abstract

To protect disadvantaged groups such as farmers and the poor from risks and improve the living standards of these groups, the government in developing countries has issued many subsidized insurance programs, including farmers insurance, free social insurance, and free health care insurance for the poor, among others. Although the importance of insurance in protecting households in general and farmers, in particular, to cope with risks, some types of insurance, such as farmer's and health insurance, fail to attract the participation of households. This paper investigates factors influencing rural households' decision to purchase insurance from a wide range simultaneously. The author uses the Viet Nam Access to Resources Household Survey (VARHS), which concludes a large amount of information about 2,669 households from 2012 to 2016. The multivariate probit regression model (mvprobit) was employed to explore the drivers of households' insurance choices from five types of insurance simultaneously. Empirical results show the significant impacts of natural disasters, income, credit, sources of information, social networks, savings, and insurance providers on the insurance participation of both small farm and non-farm households. Based on the results, some policy implications were suggested to attract the participation of households in the insurance market.

Keywords: *Credit, insurance, natural disasters, poverty, savings, small farm household*

1. Introduction

Poverty is considered negatively influence not only a variety of social and health outcomes (Currie and Stabile, 2003) but also the environment, thereby providing additional motivation for policymakers to lift households out of poverty (Martinez-Alier, 1995; Reardon and Vosti, 1995). Agricultural production is risky because it heavily depends on the weather, diseases, and market fluctuation. The poverty rate of farm households' poverty rate is higher than non-farm households (e.g., Jones et al., 2010; GSO, 2004 - 2014; Ba et al., 2021). To protect disadvantaged groups such as farmers and the poor from risks and improve the living standards of these groups, the government in developing countries has issued many subsidized insurance programs, including farmers' insurance, free social insurance, and free health care insurance, among others. Insurance effectively achieves government goals by separating payment time from health services, using time for buyers (Jütting, 2003). The poor who cannot afford high costs such as crop losses or health treatment costs is particularly

beneficial from insurance based on its mechanism for reallocating the premiums of the vast majority of participants at no risk and at-risk minority.

Although the importance of insurance in protecting households in general and farmers, in particular, to cope with risks, some types of insurance, such as farmer's and health insurance, fail to attract the participation of households (e.g., Cai and Song, 2017; Belanger et al., 2018; Ogundeji et al., 2019; Nguyen et al., 2021). Researchers have carried out many studies to explain insurance purchasing decisions. Knight and Coble (1997) review a series of research conducted on the Multiple Peril Crop Insurance (MPCI) program in the US from 1980 to 1997 and conclude that farm size and income risk increase participation in the MPCI program. Lofgren et al. (2008) find a positive effect of income on health insurance, while age negatively impacts health insurance participation in rural households. Vuong (2016) finds a positive effect of age and income on the willingness to participate in insurance programs. In contrast, Alhassan and Biekpe (2016) find a negative effect of income on the life insurance participation of households in Africa. Using panel data of 34,855 households in the Indian Household Development Survey for the periods of 2004-2005 and 2011-2012, Giri and Chatterjee (2021) find a positive correlation between income and insurance acquisition of both rural and urban households. Giné et al. (2008), based on a sample of 752 rural households drawn from 25 villages in two districts of India find that wealthier households are more likely to purchase insurance while households facing credit constraints are less likely to participate in an insurance program. Moreover, the authors also find a negative correlation between a low level of trust in the insurance provider and household insurance participation. This negative relationship is confirmed by Boyd et al. (2011). The authors analyze a sample of 220 farmers in the Inner Mongolia region of China and show that the higher trust in insurance companies, the higher probability of crop insurance purchases of farmers. Nguyen et al. (2021) analyze a sample of 315 shrimp-growing farmers and conclude that farmers familiar with insurance companies tend to refuse to pay a high insurance premium. In the case of rural commercial health insurance, Li et al. (2021) argue that the insurance industry's improvement obviously promotes the commercial health insurance purchases of rural households.

Although insurance may have more considerable benefits for the poor, they may not purchase insurance with limited financial resources if they cannot see the benefits from insurance that only appear when they suffer risks. For instance, individuals who less frequently experience natural disasters may not be willing to purchase insurance because they do not see benefits from insurance until disasters happen (Cai and Song, 2017). The argument of Cai and Song (2017) is supported by the study of Arshad et al. (2016) in Pakistan, which confirms the positive correlation between disaster experience and the willingness to pay for crop insurance. This is a common misunderstanding about insurance. Insurance should be seen as a tool to partially offset losses due to shocks rather than as a source of income. In other words, the compensation from insurance is unlikely to equal income if the shocks do not occur.

Boyd et al. (2011) find a significant positive correlation between the number of risks taken and crop insurance purchases of farmers. Further, the authors argue that the role of government in providing crop insurance information significantly promotes insurance purchases of farmers. Ginder et al. (2009) are among rare researchers who investigated

insurance choices of farmers following different types of crops (i.e., corn and soybean) and different types of crop insurance (i.e., revenue assurance, group risk income plan, actual production history, catastrophic, group risk plan, and income protection). The results from binary regression models reveal a positive effect of farmed acres on both corn and soybean insurance purchases. Corn-growing farmers prefer actual production history and group risk income plan insurance; meanwhile soybean growing farmers prefer revenue and group risk income plan insurance. Researchers also find significant correlations between the demographic characteristics of rural residents and insurance take-up. Based on a sample of 8,435 women in rural Kenya, Kimani et al. (2014) find that marriage and working in the formal sector are positively correlated with health insurance purchases. Using a randomized experiment, Cai et al. (2015) find a significant correlation between social networks and weather insurance adoption by the rural population in China.

Findings from the previous studies provide a meaningful explanation for insurance take-up decisions. However, those studies primarily focus on crop insurance and ignore other types of insurance available in rural areas (although limited) such as life insurance, education insurance, social insurance, and unemployment insurance, among others. I argue that the explanation for insurance participation in the rural market is incomplete when researchers tend to ignore the coexistence of different types of insurance in rural areas. For instance, the rural insurance market in Vietnam is characterized by the coexistence of subsidized insurance from the government (e.g., farmers insurance, health insurance for children) and insurance from domestic private or foreign companies (e.g., life insurance) (Viet Nam Access to Resources Household Survey - VARHS 2016). The availability of different types of insurance from private companies and subsidized insurance from the government place rural households in general and the poor in particular with limited financial resources in choosing among various insurance types. Therefore, analyzing the determinants of insurance purchases following the coexistence of different insurance types is a promising explanation for households' low insurance take-up rates. In this paper, I employ the data called VARHS and the multivariate probit regression (mvprobit) using the method of simulated maximum likelihood to investigate factors influencing the insurance choices of rural households. The findings are important to researchers and policymakers in understanding factors affecting insurance participation of households in general and rural households in particular and promoting the success of subsidized insurance programs.

2. Method

This paper uses Viet Nam Access to Resources Household Survey (VARHS) 2012, 2014 and 2016 for analysis. My target group is households involved in agricultural production, which consists of 2,015 households. I compare the subsample of households with farm income with the non-farm households subsample (654 households).

There are around ten different types of insurance in the VARHS, including farmers insurance, life insurance, fire insurance, health insurance, education insurance, and social insurance. To investigate determinants of households' insurance choices from a wide range of insurance types simultaneously, I use the multivariate probit approach (mvprobit). The

mvprobit estimates the number of probit models by the simulated maximum likelihood method (SML) (Greene, 2000). The approach uses the Geweke-Hajivassiliou-Keane (GHK) estimator to evaluate the multi-dimensional standard integrals in the likelihood function.

The estimation model is written as follows:

$$EI_i = \alpha_1 + \beta_1 X_i + \varepsilon_{1i} \quad (1)$$

$$LI_i = \alpha_2 + \beta_2 X_i + \varepsilon_{2i} \quad (2)$$

$$SI_i = \alpha_3 + \beta_3 X_i + \varepsilon_{3i} \quad (3)$$

$$HI_i = \alpha_4 + \beta_4 X_i + \varepsilon_{4i} \quad (4)$$

$$OI_i = \alpha_5 + \beta_5 X_i + \varepsilon_{5i} \quad (5)$$

$$\rho_{1i} = 1 \text{ if } EI_i > 0 \text{ and } 0 \text{ otherwise,}$$

$$\rho_{2i} = 1 \text{ if } LI_i > 0 \text{ and } 0 \text{ otherwise,}$$

$$\rho_{3i} = 1 \text{ if } SI_i > 0 \text{ and } 0 \text{ otherwise,}$$

$$\rho_{4i} = 1 \text{ if } HI_i > 0 \text{ and } 0 \text{ otherwise,}$$

$$\rho_{5i} = 1 \text{ if } OI_i > 0 \text{ and } 0 \text{ otherwise}$$

where X represents a matrix of independent and control variables, and ε_{mi} are error terms. ε_{mi} is assumed to follow a joint distribution with expected values are all zero and $\text{var}(\varepsilon_{1i}) = \text{var}(\varepsilon_{2i}) = \text{var}(\varepsilon_{3i}) = \text{var}(\varepsilon_{4i}) = \text{var}(\varepsilon_{5i}) = 1$.

3. Results

Tables 1 and 2 present the results of regression models investigating determinants of insurance choices of households having farm income and non-farm households, respectively. I drop variable farm size out of the estimating model for the non-farm group. Contrary to expectation and the finding of Knight and Coble (1997), farm size is positively and significantly correlated with other types of insurance purchases of households having farm income, meaning that the larger farm size, the higher probability a household purchases other types of insurance (e.g., crop insurance, fire insurance). The finding is consistent with the research result of Knight and Coble (1997). The income of households has a positive and significant correlation with life insurance and other types of insurance participation of both households having farm income and non-farm households. The finding is consistent with the findings of Giné et al. (2008), Vuong (2016), and Giri and Chatterjee (2021).

Regarding the number of day the household head cannot perform normal activities and insurance participation, household heads with more days that cannot work normally are

less likely to purchase education and life insurance but are more likely to buy health and other types of insurance. When the head or any household member has a longer number of days unable to perform normal activities (e.g., because of illness), the household's income and savings will be eroded by the income lost and expenses for treatment. In this case, education, life, social insurance, or other types of insurance (e.g., farmers' insurance, fire insurance) are unlikely to be useful, but health insurance is. This may be why the household wants to buy health insurance afterward.

Households with member(s) serving in the military have a higher probability of owning social insurance. The positive correlation between military participation and other types of insurance purchasing is also found for non-farm households but is insignificant. Interestingly, my models show an insignificant negative correlation between health insurance purchasing and households having a member(s) working in the formal sector on households having farm income, but a positive and significant relationship on a non-farm group that is consistent with Kimani et al.'s finding. Most members who are working in the formal sector have compulsory health insurance. These members will have a positive impact in encouraging their households to buy health insurance. In addition, regulations on health insurance in Vietnam require that eligible individuals who want to buy voluntary health insurance must buy it for all members whose names are listed on the household registration book except those who already own compulsory health insurance. This could be the explanation for my finding.

Savings value at 12 months before the household was interviewed is positively and statistically significantly correlated with the life and social insurance ownership of households having farm income. High savings means that households have idle money to participate in high-value and long-term insurance such as life and social insurance. Surprisingly, my models reveal a positive and significant effect of credit constraint on other types of insurance participation of households with farm income that deviates from Giné et al. (2008). The difference may come from the definition of credit constraint in my research and Giné et al.'s research. Giné et al. define credit constraint as a household wanting to borrow one more loan but cannot. In other words, in the study by Giné et al. (2008), credit-constrained households do not have enough financial resources, and their need is not satisfied by borrowing.

In contrast, the credit-constrained households in my study are those who were able to borrow but at a rate lower than 100 per cent. Of the 768 households having farm income reported that they ever borrowed or are in debt, more than 94.4 per cent have a debt ratio greater than 90 per cent, and only about three per cent have a debt ratio of less than 80 per cent (not shown in the tables). In other words, the credit-constrained households in my study still have enough financial resources to support households' financial needs and purchase social insurance. In the non-farm household group, credit constraint has a negative and significant effect on the life insurance participation of households. The finding is not unexpected because life insurance is characterized by high value and long-term, usually longer than credit term. Thus, households may hesitate to finance life insurance by borrowing. I re-ran the households with farm income models, where I replaced the credit constraint variable with a credit ratio calculated by dividing the drawdown credit amount by

the applied credit amount. Households that do not have debt receive a ratio of zero. The correlation between credit and the probability of purchasing other types of insurance is still positive but insignificant.

Information access positively and significantly affects households' insurance purchasing decisions, regardless of information sources. Information from official sources (e.g., television, radio, loud community speaker, newspaper) and the internet have positive and significant effects on life, social, and health insurance participation. In contrast, informal information sources (e.g., relatives, friends, neighbours) have a positive and statistically significant correlation with the decision to purchase education insurance and other types of insurance. However, they have a negative and significant correlation with social and health insurance. My finding partly confirms the research result of Boyd et al. (2011) who also find a positive impact of governmental information on insurance participation of households. The negative and significant correlation between purchasing history and reimbursement and life insurance participation in households having farm income and non-farm households. The negative and significant correlation between purchasing history, reimbursement and life insurance participation of households having farm income and non-farm households, respectively, can be explained by the two features of life insurance (high value and long-term) that make this type of insurance less likely to be chosen by households if they have purchased or have expired contract. A positive and statistically significant correlation between trust in an insurance agency and life insurance indicates that households having farm income are more likely to choose foreign or private insurance providers than public insurance providers. This may be because the returns on life insurance policies provided by private and foreign insurance agencies are more attractive than those of public insurance providers.

Households whose member(s) have lost or been injured by natural disasters in the last 12 months are significantly and negatively correlated with the decision to participate in social insurance but are positively and significantly correlated with health insurance participation. The finding is inconsistent with the findings of Arshad et al. (2016) and Cai and Song (2017) who find a positive impact of disaster experience on crop insurance purchasing in households. A possible explanation for my finding is that other types of insurance do not show immediate benefits in the event of a household member's loss or injury to disasters. In contrast, health insurance plays an active role in this case. Cai and Song (2017) argue that households are less likely to buy insurance until they see its benefits when shocks occur.

4. Discussion and Conclusion

This article highlights the insurance market for households involved in agricultural production and non-farm households. The study estimates the factors affecting the decision to purchase household insurance simultaneously from various insurance types. To the best of my knowledge, this is the first-ever study investigating drivers of insurance participation of households simultaneously from different insurance types. Descriptive statistics show that households participate in many types of insurance. However, the percentage of ownership of protective and hedging insurance (e.g., life, fire, and farmers insurance) is deficient. Households mainly own low premium and compulsory insurance (e.g., vehicle insurance, health insurance). This can make households vulnerable and make it difficult to recover from significant shocks.

The empirical evidence highlights the role of income, credit, sources of information, social networks, shocks, savings, and insurance providers in the insurance participation of households. The positive and significant correlation between insurance participation and income is attributed to asymmetric information (Mulligan and Philipson, 2003; Giné et al., 2008). This finding and the positive effect of farm size and information on insurance choices of households, especially information from formal sources and the internet, implying that policymakers can utilize many different channels to disseminate knowledge and guide the role of insurance in preventing and responding to risks. Specifically, policymakers can use formal information channels such as television, newspapers, radio, and community loudspeakers to disseminate knowledge about the role and support policies on voluntary social insurance, voluntary health insurance, and other types of insurance to households. This can significantly reduce information asymmetric that impedes households' participation in insurance.

Injury or death of a member(s) due to natural disasters has a negative impact on participation in many types of insurance (except for health insurance) of households, partly confirming the argument of Cai and Song (2017) about a common mistake in households' perception of the role of insurance. In particular, insurance is attractive only regarding how the household receives its immediate benefits in the event of shocks (e.g., households with health insurance do not have to pay for medical expenses if a member is sick or injured). This again implies the role of information orientation about insurance for households. Moreover, the negative impact of experiencing shocks or natural disasters on insurance participation may be because households do not have the financial resources to cope with shocks. Therefore, they cannot buy insurance after experiencing shocks. Helping disadvantaged households to overcome the consequences of shocks and preferential policies to buy insurance can be effective in these cases.

Access to credit can increase the participation of households in short-term and low-premium insurance (e.g., crop insurance, fire insurance, vehicle insurance). Combining insurance contracts with a short-term loan can effectively encourage households with agricultural production to buy insurance (Giné et al., 2008; Giné and Yang, 2009). The positive and significant correlation between the probability of purchasing insurance and private or foreign insurance providers implies that the government should strengthen the insurance market management system while encouraging and facilitating private and foreign insurance providers' extensive access to households. At the same time, public insurance providers should diversify and design more favourable insurance products to attract households' insurance participation.

Abstract

The Vietnamese textile industry is facing challenges in terms of optimizing economic efficiency, improving productivity, and protecting the environment. Therefore, the adoption of circular business models in the textile industry is necessary, and consumers play a key role in this transformation. Based on the results of previous studies, the authors inherited and proposed a research model to identify and evaluate the impact of those factors affecting the purchase behaviour of consumers in Hanoi towards textile products of circular business models. The study used a combination of qualitative and quantitative research methods based on data collected from 358 consumers in Hanoi. The authors came to the conclusion that there are four groups of factors that directly and indirectly affect purchase behaviour towards textile products of circular business models, namely purchase intention, attitude, awareness, and perceived value. The study also proved that there is a difference in the purchase intention towards textile products of circular business models of people in different demographic groups. From there, the authors proposed a number of solutions for state organizations, textile businesses, and consumers to accelerate the purchase behaviour towards those products.

Keywords: *Circular Economy, Circular Business Model, Consumer Behaviour, Textile Products.*

1. Introduction

In recent years, the over-exploitation of resources along with the rise of consumerism has caused serious consequences including ecological imbalance, which negatively affects human life. In that situation, the circular economy model has been introduced as a solution to ensure the efficient use of resources, therefore maintaining the prosperity of the economy and businesses. According to Pearce & Turner (1990), the term circular economy is used to imply a new economic model based on the basic principle that

"everything is an input to something else". According to the Ellen MacArthur Foundation, a circular economy is "an economic model in which planning, sourcing, procurement, production, consumption, and reprocessing are designed and managed to maximise ecosystems functioning and human well-being". In other words, circular economy means turning the waste output of one industry into an input resource of another industry or circulating within an enterprise itself, which is considered as a solution to global problems such as pollution, climate change, and biodiversity loss.

To accelerate the transformation to a circular economy, the adoption of circular business models in enterprises is necessary. According to Frishammar & Parida (2019), "a circular business model is one in which a focal company, together with partners, uses innovation to create, capture, and deliver value to improve resource efficiency by extending the lifespan of products and parts, thereby realising environmental, social, and economic benefits". Simultaneously, the circular business model also "continuously maintains raw materials and products in their useful states, using waste to create new products, thereby providing environmental, social, and economic benefits".

Besides the undeniable benefits, the Vietnamese textile industry is one of the most dangerous culprits leading to serious environmental pollution. Therefore, businesses in the Vietnamese textile industry urgently need a transformation towards circular business models in order to minimise environmental impacts as well as ensure a sustainable and efficient future of the industry. Additionally, previous studies have proven that the complete transformation from a linear business model to a circular business model needs to be based on the needs of consumers (Hankammer et al., 2019) since their choices can support or hamper the circular economy and their decisions determine whether products are consumed through circular consumption processes.

There are various studies in the world that focus on the role of consumers in circular business models as well as their behaviours towards the products of those models. However, studies investigating the role of Vietnamese consumers in circular business models in the textile industry are still limited. Moreover, the existing studies on consumer behaviour towards textile products of circular business models are mainly carried out in developed countries, so it is difficult to apply them in Vietnam, a developing country with low level of awareness about these models. Therefore, the authors decided to choose the topic: *"Factors Affecting Purchase Behaviour towards Products of Circular Business Models of Hanoi Consumers: Examining in Textile Industry"*.

The authors have applied the Theory of Planned behaviour (TPB) of Ajzen (1991) together with extensive studies and the Dual-Processing Model of Chaiken & Maheswaran (1994) to build a model which aims at identifying the influencing factors as well as the relationship between them towards consumers' purchase behaviour.

The research paper is structured into four parts: (1) Introduction; (2) Methods; (3) Results and (4) Discussion, Conclusion and Recommendations.

2. Method

2.1. Proposed research model and hypotheses

Based on the related studies and the qualitative research results, the authors proposed a research model to investigate the influencing factors as shown in Figure 1 below:

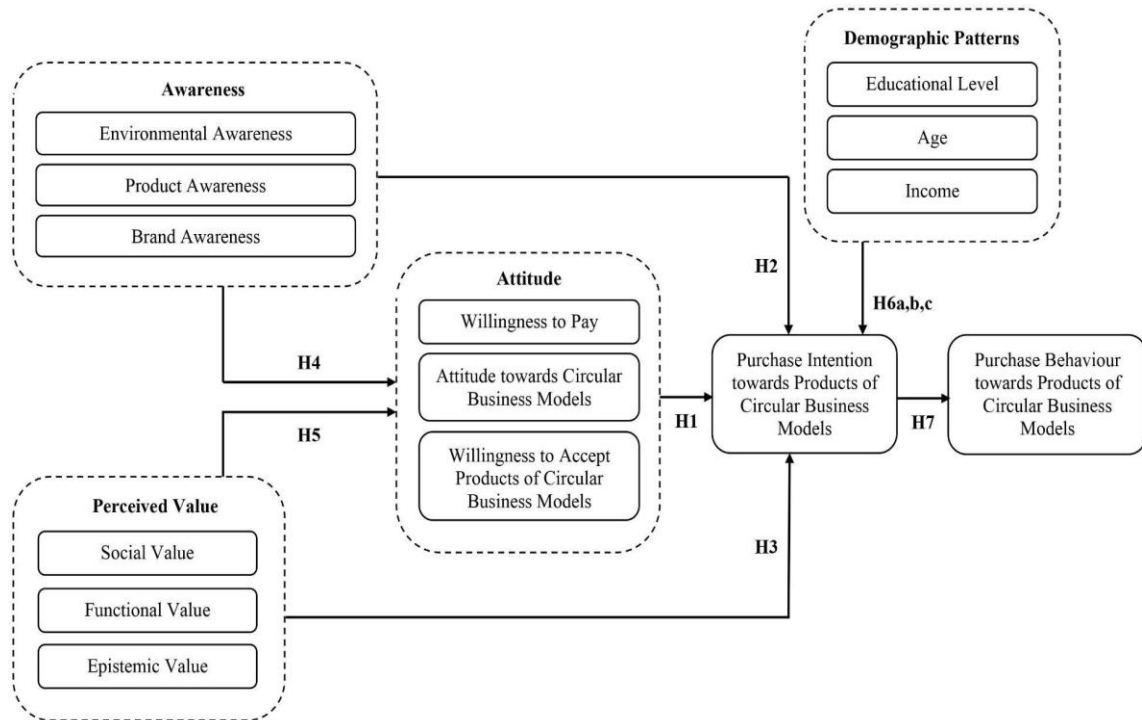

Figure 1. Proposed Research Model

Source: Authors' compilation

The study also proposes the following research hypotheses:

Attitude can be defined as an individual's beliefs or judgments about an outcome caused by a behaviour, or can also be defined as the degree to which an individual shows a particular liking or disliking of a specific behaviour (Ajzen, 1991; Brandão & da Costa, 2021; Fishbein & Ajzen, 1977). Attitude has been shown to affect the intention to perform circular behaviours, thereby indirectly affecting the performance of those behaviours (Muranko et al., 2018; Pisitsankkhakarn & Vassanadumrongdee, 2020).

H1. Consumers' attitude has an influence on the purchase intention towards textile products of circular business models.

Awareness is the collection of information that is collected, processed, and stored in human memory. Rausch & Kopplin (2021) discovered that environmental awareness has a positive impact on the purchase intention towards sustainable fashion products. In addition, brand image and brand credibility also influence circular shopping behaviour (Chamberlin & Boks, 2018).

H2. Consumers' perception has an influence on the purchase intention towards textile products of circular business models.

Zeithaml (1988) stated that perceived value indicates the consumers' total evaluation of a product's utility based on perceptions of what is received and given. Research by Jung & Jin (2016) has proven that consumers who perceive the value of sustainable fashion products have stronger purchase intention. Additionally, more and more people in China are changing their personal consumption behaviour because they have a feeling that purchasing and wearing eco-friendly products helps them to gain social approval and make a good impression on others (Chi, 2015).

H3. Consumers' perceived value has an influence on the purchase intention towards textile products of circular business models.

According to Chaiken & Maheswaran (1994), awareness is an antecedent of attitude. Research by Chen & Lee (2015) indicated that environmental awareness and brand awareness have an influence on consumers' attitudes, while Ko et al. (2013) stated that product awareness also influences them. In addition, many studies proved that consumers who have an understanding of the existence, characteristics or sustainable production methods of a product, even though they have not purchased it, are willing to pay a higher price (D'Amico et al., 2016; Lanfranchi et al., 2019).

H4. Consumers' awareness has an influence on consumers' attitudes towards purchasing textile products of circular business models.

D'Souza et al. (2007) discovered that consumers are willing to pay higher prices for eco-friendly products, as long as their quality is better than conventional products. Similarly, Jung & Jin (2016) also stated that consumers who perceive the value of sustainable fashion products are more willing to pay.

H5. Consumers' perceived value has an influence on consumers' attitudes towards purchasing textile products of circular business models.

Consumers' demographic patterns were also shown to be relevant to their purchase intention. Younger generations tend to pay more attention to the theories of sustainability and circular economy (Gazzola et al., 2020), and this age group is also knowledgeable about eco-friendly products as well as aware of their role in protecting the environment (de Aguiar Hugo et al., 2021). Education level is also a significant factor since research by Chekima et al. (2016) indicated that consumers with a high level of education tend to perform green buying behaviour. Finally, Nenckova et al. (2020) asserted that the high-income group tends to sort their textile waste more than other groups.

H6a. There is a difference in the purchase intention towards textile products of circular business models at different educational levels.

H6b. There is a difference in the purchase intention towards textile products of circular business models in different age groups.

H6c. There is a difference in the purchase intention towards textile products of circular business models in income groups.

Fishbein & Ajzen (1977) suggested that intention indicates the amount of effort an individual must exert to perform a behaviour as well as the degree of willingness to try it. Therefore, a high level of intention will positively influence the performance of circular behaviour (Muranko et al., 2018), which in this study is the purchase behaviour towards textile products of circular business models.

H7. Consumers' purchase intention has an influence on consumers' purchase behaviour towards textile products of circular business models.

2.2. Methods of collecting and analysing data

In qualitative research, the authors conducted in-depth interviews (n = 6) to adjust the factors as well as the scales used in the study. All of the selected subjects have heard about the concepts of circular economy and circular business model before. The qualitative research results show that the initial groups of factors and scales were appropriate and related. In addition, "Willingness to Accept Products of Circular Business Models" was proposed to be added to the Attitude factor and variables related to "Product Awareness" were also added.

The scales included in the quantitative research are (1) Awareness (12 variables), (2) Perceived Value (13 variables), (3) Attitude (10 variables), (4) Purchase Intention (3 variables), and (5) Purchase Behaviour (4 variables). A total of 42 observational variables belonging to 5 groups of factors are included in quantitative research.

In quantitative research, the authors used a survey to verify the model and hypotheses. After collecting data for official quantitative research, the authors selected a sample size of 358 to analyse after removing invalid answers from 363 answers.

Out of 358 respondents, women accounted for 60.1%, men accounted for 38.8% and 1.1% belonged to other gender groups. Results show that the respondents who were Gen Z (born from 1997 to 2012) accounted for the majority with 72.6%, Gen Y consumers (born from 1981 to 1996) accounted for 18.7% and Gen X ones (born from 1965 to 1980) accounted for 8.7%. In terms of education level, the majority of respondents have a university degree with 84.1%, followed by a group of respondents with a postgraduate degree with 8.7%. Respondents with a college degree accounted for 3.1%, and the remaining 4.2% belonged to the group of upper and lower secondary levels. In terms of income, the number of respondents with monthly income from 3 to less than 8 million VND and under 3 million VND accounted for 33.2% and 35.2% respectively. The number of respondents with monthly income from 8 to less than 15 million VND accounted for 17.9%. The

proportions of respondents with monthly income from 15 to under 30 million VND and over 30 million VND were 7.3% and 6.4% respectively. The results also revealed that 64% of respondents have heard of circular business models in the textile industry. Among the respondents who have heard of these circular business models, 171 respondents knew about these models from the mass media and 107 respondents knew about them from academic sources. 69 respondents said they heard of these models from relevant events and 67 respondents reported that they knew about them from reference groups.

The data was processed using SPSS 22.0 and AMOS 20. The data collected was analysed through the following steps: (1) Cronbach's Alpha Scale Reliability Testing, (2) EFA - Exploratory Factor Analysis, (3) CFA - Confirmatory Factor Analysis, (4) Model and Hypotheses Testing using SEM Model and (5) ANOVA Testing.

3. Results

The authors have conducted Cronbach's Alpha Reliability Test for 11 factors including 42 variables. The results show that all factors used in the study have Cronbach's Alpha coefficient greater than 0.7 satisfying reliability and a total variable correlation coefficient greater than 0.4. Thus, it is possible to identify the scales that ensure reliability and are suitable for use in further analysis.

The Exploratory Factor Analysis (EFA) show that $KMO = 0.907 > 0.5$ so the EFA is suitable for the data set. $Sig. (Bartlett's Test) = 0.000 < 0.05$ indicates that observational variables are correlated with each other. There are 9 factors extracted at Eigenvalues = 1.038 and the total variance of 67.161% $> 50\%$ indicating that the model was appropriate. The initial 11 factors were grouped into 9 factors, in which "Environmental Awareness", "Product Awareness", "Brand Awareness", "Social Value", "Functional Value", "Epistemic Value", "Purchase Intention" and "Purchase Behaviour" are preserved. "Willingness to Pay", "Willingness to Accept Products of Circular Business Models" and "Attitude towards Circular Business Models" are grouped into a single factor named "Attitude".

The results of the Confirmatory Factor Analysis (CFA) show that indicators such as $Chi-square/df = 1.778$, $CFI = 0.925$, $GFI = 0.854$, $AGFI = 0.831$, $RMSEA = 0.047$ are all acceptable. The research model could be considered a suitable model for the data set. In terms of quality, all variables have $p-value = 0.000 < 0.005$ and standardized regression weight greater than 0.5, proving that all variables are significant and appropriate. Composite Reliability (CR) > 0.7 , Average Variance Extracted (AVE) > 0.5 , Maximum Shared Variance (MSV) $<$ Average Variance Extracted (AVE) indicate that all variables are appropriate.

Then, the authors conducted SEM Analysis to verify the suitability of the research model. It is found that $Chi-square/df = 1.839$ and $RMSEA = 0.048$ satisfy the model with good fit. Indicators such as $CFI = 0.916$, $GFI = 0.84$, $AGFI = 0.827$ are all acceptable. Thus, the research model is proven suitable.

Figure 2. SEM Results of the Research Model

Source: Authors' compilation from primary data

The results show that the “Awareness” variable has no direct impact on the “Purchase Intention” variable (Sig. = 0.3 > 0.05). The remaining Sig. values are all less than 0.05, so the other relationships are significant. Thus, there are two variables that affect the intermediate variable “Attitude”, namely “Awareness” and “Perceived Value”. There are two variables that directly affect the intermediate variable “Purchase Intention”, namely “Attitude” and “Perceived Value”. The only variable that directly affects the dependent variable “Purchase Behaviour” is “Purchase Intention”. Therefore, hypothesis H2 is rejected and the remaining hypotheses are accepted. The accepted research model is shown in Figure 3 below:

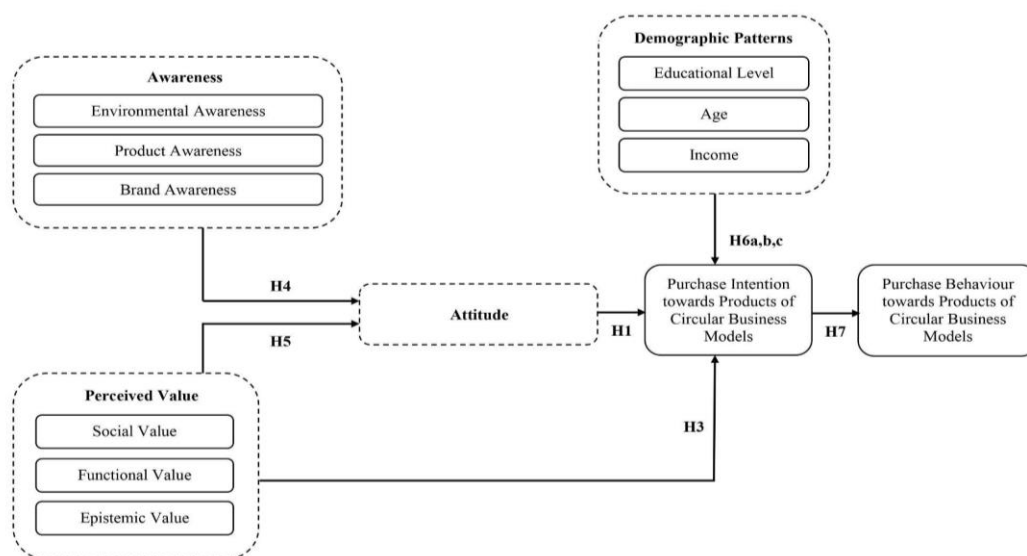

Figure 3. Accepted Research Model

Source: Authors' compilation from primary data

After analysing SEM results, the authors examine the level of influence that each variable have on the others. The results are shown in Table 1 below:

Table 1. Standardized Regression Weights

			Estimate
Attitude	←	Awareness	0.679
Attitude	←	Perceived Value	0.57
Purchase Intention	←	Attitude	0.443
Purchase Intention	←	Perceived Value	0.341
Purchase Behaviour	←	Purchase Intention	0.232

Source: Authors' compilation from primary data

The two factors affecting the intermediate variable “Attitude” in descending order are “Awareness” (0.679) and “Perceived Value” (0.57). The two factors directly affecting the intermediate variable “Purchase Intention” in descending order are “Attitude” (0.443) and “Perceived Value” (0.341). The factor directly affecting the dependent variable “Purchase Behaviour” is “Purchase Intention” (0.232).

Finally, the results of ANOVA testing show that there are differences in purchase intentions of consumers in different educational level groups, age groups, and income groups.

4. Discussion and Conclusion

4.1. Factors affecting purchase behaviour towards textile products of circular business models

After studying the directly and indirectly influencing factors, the authors draw the following conclusions:

Firstly, awareness has a strong impact on consumers' attitudes through three aspects, namely environmental awareness, product awareness, and brand awareness. Previous studies examining the roles of circular economy and circular business models have proposed their undeniable economic, social, and environmental advantages. Because of the apparent benefits and positive outlook that circular models bring to human life, consumers with a rudimentary awareness could form a positive attitude towards them.

Secondly, perceived value has an influence on attitude. If consumers feel that they get more value from the textile products of circular business models, they will form a positive attitude as well as become willing to pay. However, the effect of perceived value on attitude is weaker than that of awareness. This finding could be explained by the fact that perceived value is formed through direct and indirect experiences; however, in Vietnam, the concept of circular textile products is still new. In fact, Vietnamese consumers have already been familiar with a number of circular models in the textile industry such as renting clothes, buying second-hand clothes or re-wearing other people's clothes; but they have not fully recognised the value that these circular products bring to themselves.

Thirdly, perceived value and attitude are the two factors that affect the purchase intention towards circular textile products, while awareness has almost no direct impact on it. This is a noticeable aspect for future researchers to continue investigating. However, in Vietnam, the purchase and consumption behaviour towards circular textile products are still not too popular, so consumers have not really perceived much value from purchasing these products. Therefore, the impact of perceived value on purchase intention is not really strong. Furthermore, attitude has a stronger impact on purchase intention because attitude is a collection of emotions and beliefs of consumers. Studies on mental aspects in consumer behaviour show that consumers are often driven by emotion rather than rationality when forming purchase intentions.

4.2. Some policy implications from the study results

4.2.1. Recommendations to state organisations

Firstly, in terms of education, the Ministry of Education and Training should consider integrating knowledge related to the circular economy and circular business models in the textile industry into the school curriculum. Besides raising awareness, curricula need to educate students that the use of circular textile products is economically beneficial as well as appreciated by society.

Secondly, in terms of communication, state organisations need to develop communication programs about the adoption of circular business models in the textile industry and spread them through mass media such as newspapers, radio and television to improve public awareness. In addition, the government also needs to name and commend typical organizations and individuals that shift their production and consumption behaviour towards textile products of circular business models. Because of public commendations, people will be more motivated to change their behaviour towards purchasing textile products of these models.

4.2.2. Recommendations to Vietnamese enterprises in the textile industry

Firstly, enterprises need to proactively educate and increase consumer awareness of circular business models and their products. Companies could organize seminars as well as develop social marketing campaigns so that customers will have more understanding and knowledge about these models.

Secondly, enterprises need solutions to increase the consumers' perceived value towards textile products of circular business models. Companies could coordinate with state organisations to recognise and commend organizations and individuals that shift their consumption behaviour towards textile products of these models. They also need to provide interesting and useful information for consumers at every touchpoint, for example, by coordinating with influencers to promote the benefits of circular textiles products.

Thirdly, enterprises need to improve credibility, therefore enhancing consumers' accepting attitudes towards textiles products of circular business models. Companies could apply for a certificate from a reputable third party to increase their credibility. Moreover, they could also implement strategies to alleviate consumer concerns about quality and reliability. For example, they can inform consumers about how the product has been used in

the past and specific steps the remanufacturers have taken. Additionally, companies also need to communicate their missions and circular purposes through mass media because positive brand reputation and reliability could affect consumers' circular behaviour.

Fourthly, enterprises should flexibly apply policies as well as customer service activities such as investing in websites and software; organising community groups so that customers can freely exchange and share about products and product applications with other consumers. At the same time, it is necessary to regularly update new sustainable trends, thus increasing customers' acceptance and intention towards purchasing circular textiles products.

Fifthly, it is necessary to invest in modern equipment and facilities in order to bring customers high-quality products. Besides, enterprises also need to constantly update and adopt latest technology trends to produce textile products with "timeless" designs. Suppliers, packaging designers, and local authorities should work together to ensure packaging could be easily recycled.

4.2.3. Recommendations to consumers

For Gen X consumers, they should proactively listen and be open to sustainable development trends. Besides, they also need to make smarter long-term purchase and investment decisions, such as choosing to buy products that have long lifespans and could contribute to adding value even at the end of their life cycles.

For Gen Y consumers, they should proactively learn about sustainable development trends and share them with other family members. Gen Y consumers might also be the main decision-makers in young families, so they need to practice that sustainable lifestyle by purchasing products with reusable, recyclable materials or products with durable materials to prolong their lifespans.

For Gen Z consumers, they need to be more proactive in the process of transforming their shopping behaviour such as contributing new ideas and discussing with companies throughout the process. Moreover, Gen Z consumers should seek circular information through the Internet or by participating in workshops and contests about sustainability. Besides, they should also spread the benefits of using circular products to their parents, who have financial capability and long-term experience in making purchase decisions.

Abstract

This study aims to assess the influence of accounting conservatism on firm performance of listed companies on the stock exchange HNX by testing multivariate regression model through software STATA. The study was completed based on survey results of 325 non-financial companies listed on HNX from 2019 to 2021. Ahmed & Duellman (2007) indicator is used as a benchmark for measuring accounting conservatism. The firm performance indicators used in this study are return on assets (ROA), return on equity (ROE) and return on sales (ROS). The results of the research show that accounting conservatism has a negative influence on firm performance, which indicates that these companies have not fully and properly applied accounting conservatism. Therefore, listed companies on the stock exchange HNX should take action to implement this important principle in the right way.

Keywords: *Accounting conservatism, firm performance, stock exchange HNX, listed companies*

1. Introduction

One of the most important principles in recognition and evaluation of items in accounting is conservatism. According to Vietnamese Accounting Standard No. 01, conservatism is the consideration and judgment necessary to make accounting estimates under conditions of uncertainty. Accounting conservatism requires that accountants do not

make too large provisions, do not overrecognize the value of assets and income, and do not underestimate the value of liabilities and expenses. Thus, conservatism helps investors assure that accounting estimates of the value of resources at a company are reasonable and not overstated. From a conservative perspective, profits will react to bad news more quickly than good news (*Basu, 1997*), meaning that unrealized losses will be recognized earlier than unrealized gains. This indicates that accounting conservatism will directly affect a company's earnings, profits and retained earnings (*Ahmed, 2000*). Therefore, understanding about the effects of accounting conservatism on firm performance become an essential requirement in preparing the financial reports of the companies.

In Vietnam, accounting conservatism is existing in the form of a relatively new concept with few research or studies. This leads to a question: How accounting conservatism influences firm performance of Vietnamese companies?

To answer this question, the authors conducted a study on the influence of accounting conservatism on firm performance of listed companies on HNX, a stock exchange in Vietnam. The article is divided into 5 parts: (i) Introduction, (ii) Research overview and theoretical basis, (iii) Research methodology, (iv) Research results and discussion, (v) Conclusion.

2. Literature Review and Theoretical Framework

2.1. Literature Review

Many previous studies demonstrate a significant correlation between accounting conservatism and firm performance. Charles (1980) showed that accounting conservatism can be a mechanism to balance the interests of management and shareholders and limit the effects of information asymmetry. The researchers also found no link between China's conservative accounting and public sector ownership. Additionally, the study did not find that companies controlled by the private sector produced more conservative reports than those controlled by the public sector.

Applied to Colombian firms, Stephenand finds that firms practice conservative accounting practices that affect the quality of results and form secret or declared reserves, and that conservative indicated that the accounting treatment referred to the Colombian company's reported income for the period from impact 1996-2002. In addition, conservatism influences shareholder expectations of stock returns. The study also shows misunderstandings among investors about how to prepare financial reports according to accounting conservatism, causing investors to question the earnings quality of reported earnings.

Penman & Zhang (2002) argue that companies that employ conservative accounting practices have an impact on the stated income and shareholders' expectations for stock returns. They support their claim with data from Colombian companies between 1996 and 2002. They also pointed out that generating conservative financial statements was misunderstood by investors, thus investors should be questioned about the need to prepare cautious financial statements, and therefore they should be questioned regarding the standard of their generated income.

Chan et al. (2006) looked into how future market returns for non-financial enterprises listed on the London Stock Exchange were affected by earnings quality, which focuses on

accruals accounting. They discovered a substantial negative correlation between accounting accruals and potential equity returns. According to Wang (2013), there is a connection between operational risk and the degree of cautious accounting. Conservatism can also be used to assess the risk of investments and provide more unbiased financial statements.

Biddle et al. (2011) showed that operational cash flows and conservative accounting have a negative relationship. They mentioned conservatism as an organizational tool for managing risks. According to Latridis (2011), conservatism in accounting results in British companies reporting unknown earnings and contractual loans with the lowest interest rates. It also suggested that managers could use conditional conservatism to their advantage.

Eqbal et al. (2014) indicated that Jordanian companies practice accounting conservatism policy when preparing financial reports, which leads to increased reliability of financial reports and related information. Researchers recommend that Jordanian companies continue to practice particularly conservative accounting practices when preparing financial reports - the impact of the global financial crisis is not over yet. Wang (2013) argued that as the level of accounting conservatism increases, the level of organizational operational risk decreases. It is also possible to use conservatism as a tool for analyzing investment risk, and accounting conservatism helps produce more balanced financial reporting.

Najjar (2014)'s study showed that the nature of the financial sector tends to exaggerate forming the provisions and allowances and then accumulating the secret provisions in this sector which increase the conservatism level. Also, conclude the positive effect of conservatism on the market shares value. Also, Jomely (2014) found that industrial companies committed to an accepted conservatism level and the commitment to the average level of conservatism reduces the financial failure risks.

Ramadan (2015) determines the variables affecting the earnings quality of manufacturing firms listed on the Amman Stock Exchange. The continuous independent variables utilized are leverage, corporate performance, investment decisions, accounting conservatism, firm size, and cash holding. The OLS cross-sectional regression model was applied to analyze data from 58 firms during the period 2000-2013. The results showed that corporate performance, leverage, and accounting conservatism significantly positively affect earnings quality.

Sana'a (2016) investigates the impact of accounting conservatism on financial performance indicators in Jordanian insurance firms. The ROA, EPS, and MV are used as performance proxies. Data from 12 Jordanian insurance firms were used for the period (2007-2014). The results showed that accounting conservatism has a significant positive impact on the three performance indicators of Jordanian insurance companies. The results of the study strengthen the necessity of adopting the appropriate procedures to encourage Jordanian insurance firms to commit to an acceptable conservative accounting level.

The relationship between accounting conservatism and bank performance in Nigeria is investigated by Aminu and Hassan (2017). They used panel regression to examine data from 10 banks over a 5-year period (2012-2016). Bank performance is proxied by the ROA. The findings revealed a substantial correlation between Nigerian bank performance and

accounting conservatism. Conservatism in conditional accounting is positively correlated with bank performance, but unconditional accounting has a detrimental effect on bank performance in Nigeria. According to the study, conditional conservatism should be used by bank managers in Nigeria to reduce information asymmetry in financial reporting.

The relationship between accounting conservatism and performance in Nigerian enterprises is examined by Ugwunta and Ugwuany (2019). Data from 12 consumer goods companies in Nigeria were used between 2005 and 2016. The analysis was conducted using a panel. The performance of a company is gauged using the net profit margin (NPM). The findings imply that accounting conservatism positively but negligibly affects company performance. This suggests that consumer goods companies in Nigeria are less likely to be conservative in financial reports that provide low financial reporting quality.

2.2. Theoretical framework

2.2.1. Accounting conservatism

Accounting conservatism is well-established financial reporting rules and practices which require companies to be careful to deal with conditions of uncertainty and risk (FASB 1980; IASC 1989). Basu (1997) explains that accounting conservatism requires a higher degree of verification to recognize positive rather than negative information in earnings. In the context of economic instability and difficulties, caution in accounting is necessary for the financial reporting process. Givoly & Hayn (2000) defined accounting conservatism as the choice of accounting principles that reduces accumulated income by delaying revenue recognition and speeding up expense recognition. Hendriksen (1982) pointed out that in terms of caution, there are more negatives than positives in the financial reporting process.

It is assumed that political expenses are consistent with the principle of accounting conservatism. The politics-related costs hypothesis suggests that firms are more likely to adopt accounting choices that reduce reported earnings to avoid political scrutiny (*Watts and Zimmerman, 1978*). Corporate tax is based on profit that is disproportionately reported and recognized in terms of loss and gain as a result of the prudential principle applied in the financial statements. Companies that already have earnings can reduce or defer taxes from reducing their profits by using accounting conservatism (*Watts, 2003*). García Lara (2009) finds that taxation, regulation, and politically motivated costs can also promote the conditional accounting conservatism. Holthausen & Watts (2001) found out that the regulations and disclosure requirements of the securities commissions enhance the degree of caution in accounting. Although many empirical studies have investigated accounting conservatism, its economic requirements are still under debate. It is noted that decreasing agency problems, strengthening contractual agreements, reducing litigation costs, making good decisions, and avoiding asymmetric information is the result of conservative reporting (*Ahmed & Duellman, 2007; Affes & Sardouk, 2016*). Therefore, in situations of economic uncertainty and difficulty, accounting conservatism is required for the financial reporting process.

2.2.2. Firm performance

2.2.2.1. Definition

Firm performance is a controversial issue among business researchers (*Barney, 1997*). Previous researchers had different opinions about it. For example, according to *Javier (2002)*, firm performance is equivalent to “3E” (economy, efficiency, and effectiveness) of a given program or activity. However, according to *Daft (2000)*, firm performance is the ability of a business to achieve its goals by using resources efficiently and effectively. Quite similar to *Daft (2000)*, *Richardo (2001)* defines firm performance as the ability of a firm to achieve its objectives.

Firm performance is not only a problem of definition, but also an issue of concept (*Hefferman and Flood, 2000*). The term “performance” is sometimes confused with “productivity”. According to *Ricardo (2001)*, there is a difference between performance and productivity. Productivity is a rate that describes the amount of work completed in a given period of time. Performance is a broader metric that can include productivity as well as quality, consistency, and other factors.

Another problem of firm performance is what factors determine the performance of a business. According to *Hansen and Wernerfelt (1989)*, there are two main streams of research on the determinants of firm performance. One draws on economic tradition, emphasizing the importance of external market factors in determining firm performance. Another line of research builds on behavioral and sociological modeling and considers corporate factors and their 'fit' to the environment as key determinants of success.

2.2.2.2. Factors to measure the performance of the business

Previous research has used many indices to measure firm performance. These indices include profitability, gross profit, return on assets (ROA), return on investment (ROI), return on equity (ROE), return on sales (ROS), revenue growth, market share, stock price, sales growth, export growth, liquidity and operational efficiency (*Snow & Hrebiniak, 1983; Segev, 1987; Smith, Guthrie & Chen, 1989; Parnell & Wright, 1993; Thomas & Ramaswamy, 1996; Gimenez, 2000*). There has been considerable debates on both the terminology and the conceptual basis for measuring firm performance (*Ford & Schellenberg, 1982*). No single measurement can fully explain all aspects of firm performance (*Snow & Hrebiniak, 1980*).

There is also an inconsistent measure of firm performance - although most researchers (*Kotter & Heskett, 1992; Marcoulides & Heck, 1993; Denison & Maishra, 1995; Peter & Crawford, 2004; Lee, 2005*) measured the performance of the business using quantitative data such as ROE, ROA, ROI, etc. The definition of performance has included both efficiency-related measurement, related to input/output relationships, and efficiency-related steps which address issues such as business growth and employee satisfaction. In addition, firm performance has also been evaluated by financial and non-financial measures from both objective and perceptual sources. Objective measures include secondary financial measures such as asset return, return on investment, and profit growth. These measures are unbiased and are particularly useful for single-sector studies because of the homogeneity of measurements among all firms in the sample (*Venkatraman & Ramunujam, 1986*).

In this research, the authors use three indicators to calculate firm performance: Return on asset (ROA), Return on equity (ROE) and Return on sales (ROS).

2.2.3. Research hypotheses

2.2.3.1. The relationship between accounting conservatism and firm performance

Many previous studies show a positive relationship between accounting conservatism and firm performance (Ugwunta and Ugwuany, 2019; Ademola and Moses, 2017; Aminu and Hassan, 2017; Sana'a, 2016; Ramadan, 2015). Therefore, the authors propose the following hypotheses:

H1: Accounting conservatism has a positive effect on return on asset (ROA)

H2: Accounting conservatism has a positive effect on return on equity (ROE)

H3: Accounting conservatism has a positive effect on return on sales (ROS).

2.2.3.2. The relationship between firm size and firm performance

Many studies have documented the relationship between firm size and profitability as negative (Goddard et al., 2005; Becker-Blease et al., 2010; Hatem, 2014; Shehata et al., 2017). Large firms often face inefficiency and less profitability due to high bureaucracy, agency costs and other costs associated with managing companies (Jensen and Meckling, 1976; Fama and Jensen, 1983; Goddard et al., 2005; Delcours, 2007; Jónsson, 2007; Ng et al., 2009; Becker-Blease et al., 2010; Pattitoni et al., 2014; Voulgaris and Lemonakis, 2014). Therefore, the authors propose the following hypotheses:

H4: Firm size has a negative effect on return on asset (ROA)

H5: Firm size has a negative effect on return on equity (ROE)

H6: Firm size has a negative effect on return on sales (ROS).

2.2.3.3. The relationship between financial leverage and firm performance

Financial leverage can be described as the degree to which a business or investor is using borrowed money. Many researchers find a positive relationship between financial leverage and firm financial performance (Taub, 1975; Roden and Lewellen, 1999; Champion, 1999; Ghosh and Jain, 2000; Hadlock and James, 2002; Berger and Bonaccorsi, 2006). It is argued that financial leverage has a positive effect on a firm's return on equity when the firm's earning capacity is greater than its interest expense (Hutchinson, 1995). In a study of the banking sector, Berger and Bonaccorsi (2006) demonstrate that high leverage leads to higher returns. Therefore, the authors propose the following hypotheses:

H7: Financial leverage has a positive effect on return on asset (ROA)

H8: Financial leverage has a positive effect on return on equity (ROE)

H9: Financial leverage has a positive effect on return on sales (ROS).

2.2.3.4. The relationship between sales growth and firm performance

Sales growth reflects the company's ability from time to time. The higher the sales growth rate, the more successful the business is in implementing its strategy. According to Fahmi (2016), sales growth is a growth rate that measures a business's ability to maintain its

position in the industry and overall economic development. Growth helps businesses accumulate capital and facilities to invest in expanding production, and at the same time build a reputation for customers as well as for suppliers and investors. According to Zeitun and Tian (2007), growth rate has a positive impact on firm performance. Therefore, the authors propose the following hypotheses:

H10: Sales growth has a positive effect on return on asset (ROA)

H11: Sales growth has a positive effect on return on equity (ROE)

H12: Sales growth has a positive effect on return on sales (ROS).

3. Method

3.1. Methods of data collection and study samples

In this research, the authors use data of non-financial companies listed on the stock exchange HNX from 2019 to 2021 to assess the influence of accounting conservatism on firm performance. The data used is secondary data, collected from the website vietstock.vn, the State Securities Commission and financial statements of these listed companies.

The sample construction in quantitative research is very important because the model will not be reliable if the sample size is not large enough. The minimum sample size to be achieved according to Gorsuch (1983) and Kline (1979) is 100. Meanwhile, Cattell (1978) suggests that the sample size should be 3 to 6 times the number of observed variables. Comrey and Lee (1992) gave a standard scale for sample size in factor analysis including: 100 - acceptable, 200 - moderate, 300 - good, 500 - very good, greater than or equal to 1000 - excellent. In this research, the sample size includes 325 non-financial companies for a period of 3 years (from 2019 to 2021), which is equivalent to 975 observation periods. This is in accordance with the minimum sample size requirement to use the multivariable linear regression model.

Table 1. Structure of observations of the study sample

Sector	Number of firms	Percentage (%)
Manufacturing	111	34.15
Mining	19	5.85
Services and Utilities	31	9.54
Construction and Real estate	79	24.31
Wholesale and Retail	34	10.46
Transportation and Warehouse	28	8.61
Technology and Communication	23	7.08

Source: Synthesized by research team

3.2. Model recommendation and description of research variables

Through approaching the methods used in previous studies, especially the research conducted by Hanaa A. El-Habashy (2019), and basing on the research hypotheses, the authors use multivariable linear model to test the influence of accounting conservatism on firm performance as follows:

$$(1) ROA_{it} = \beta_0i + \beta_1ACCCON_{it} + \beta_2SIZE_{it} + \beta_3LEV_{it} + \beta_4GROWTH_{it} + \epsilon_{it}$$

$$(2) ROE_{it} = \beta_0i + \beta_1ACCCON_{it} + \beta_2SIZE_{it} + \beta_3LEV_{it} + \beta_4GROWTH_{it} + \epsilon_{it}$$

$$(3) ROS_{it} = \beta_0i + \beta_1ACCCON_{it} + \beta_2SIZE_{it} + \beta_3LEV_{it} + \beta_4GROWTH_{it} + \epsilon_{it}$$

Table 2. Description of research variables

	Encryption	Variable	Measurement	Reference
Dependent variables	ROA	Return on asset	Net Income/Total Asset	Hanaa A. El-Habashy (2019)
	ROE	Return on equity	Net profit after tax/Total equity	Hanaa A. El-Habashy (2019)
	ROS	Return on sales	Earnings before interest and taxes/Net sales	Hanaa A. El-Habashy (2019)
Independent variable	ACCCON	Accounting conservatism	$ACCCON_{2019} = \frac{A_{2019} \times 2 + A_{2020}}{3} \times (-1)$ $ACCCON_{2020} = \frac{A_{2019} + A_{2020} + A_{2021}}{3} \times (-1)$ $ACCCON_{2021} = \frac{A_{2020} + A_{2021} \times 2}{3} \times (-1)$ <p>A = (Income before tax and extraordinary items + Depreciation expense - Operating cash flow)/Total Assets</p>	Ahmed & Duellman (2007)

3.3. Data analysis method

This study uses a multivariable regression model, a widely used model in the fields of accounting. The authors analyzed the data according to the following steps: Descriptive statistics, Correlation analysis, Collinearity statistics, Test of normality of residual and Multivariable regression model analysis.

Step 1: Descriptive statistics: The authors analyze the basic characteristics and the implementation of accounting conservatism at listed companies on HNX through four values: Mean, Standard deviation, Minimum and Maximum.

Step 2: Analysis of regression assumptions: The authors test regression assumptions through the following stages: Analyzing correlation, Testing multicollinearity, Testing autocorrelation, Choosing the suitable regression model (OLS, FEM or REM), Testing heteroskedasticity

Step 3: Regression coefficients estimation: The authors use FGLS method to deal with the defects of the model. Then the authors draw conclusions about the influence of the independent variables on the dependent variables, at the same time compare the results with the proposed hypotheses.

4. Resulta

4.1. Descriptive statistics

Table 3. Results of descriptive statistics

Variables	Sample size	Mean	Std. Dev	Minimum	Maximum
ROS	325	8.551	135.874	-1,931.16	3,560
ROE	325	12.604	81.942	-130.76	1997
ROA	325	6.612	57.632	-22.98	1791
SIZE	325	1,156,673	2,717,969	67.35	26,279,277
LEV	325	0.587	3.288	0.011	102.778
GROWTH	325	0.508	3.549	-0.997	47.586
ACCCON	325	-0.175	0.798	-15.042	0.414

Source: STATA processing results, 2022

The Mean value of applying accounting conservatism at listed companies on is -0.175. This value in the study of Ahmed et al (2002) is -0.003, in the study of Ahmed and Duellman (2007) is 0.01. Compared with the above two studies, the mean value of ACCCON of listed companies on HNX is much lower, which indicates that these companies have not fully implemented accounting conservatism.

ROS, ROE and ROA variables have the mean value of 8.551; 12.604; 6.612, respectively; with high standard deviation (135.874, 81.942, 57.632). This shows the big difference in profitability of listed companies on HNX.

The control variables SIZE, LEV and GROWTH have the mean value of 1,156,673; 0.587; 0.508, respectively; with high standard deviation (2,717,969, 3.288, 3.549). This reflects the diversity in firm size, financial leverage and sales growth of listed companies on HNX.

4.2. Analysis of regression assumptions

4.2.1. Correlation analysis

Table 4. Correlation matrix

	ACCCON	SIZE	LEV	GROWTH
ACCCON	1.000			
SIZE	0.061	1.000		
LEV	0.007	0.001	1.000	
GROWTH	-0.107	-0.014	-0.004	1.000

Source: STATA processing results, 2022

After performing the correlation test between the variables in the model, the authors found that there is no strong correlation between the independent variables (no pair has the coefficient greater than 0.5), which avoids the situation that two independent variables have the same effect on the dependent variables.

4.2.2. Test of multicollinearity

Table 5. Results of collinearity analysis

Variables	VIF
SIZE	1.00
LEV	1.00
GROWTH	1.01
ACCCON	1.02

Source: STATA processing results, 2022

The results show that the VIF coefficients of the independent variables are all less than 10, so the model does not have a serious multicollinearity problem.

4.2.3. Test of autocorrelation

Table 6. Results of autocorrelation analysis

Model	p-value
(1)	0.0711
(2)	0.4896
(3)	0.0006

Source: STATA processing results, 2022

The authors used Wooldridge test to investigate autocorrelation in 3 models. It can be seen that p-values of model (1) and (2) are greater than 0.5, so these models do not have autocorrelation among variables. However, p-value of model (3) is smaller than 0.5, showing that autocorrelation exist in the model.

4.2.4. Choosing a suitable regression model

Table 7. Choosing a suitable regression model

Model	Pooled OLS or FEM (F test)		FEM or REM (Hausman test)		Conclusion
	p-value	Chosen model	p-value	Chosen model	
(1)	0.0000	FEM	0.0553	REM	REM
(2)	0.0000	FEM	0.0000	FEM	FEM
(3)	0.0000	FEM	0.0000	FEM	FEM

Source: STATA processing results, 2022

The authors used F test to choose between Pooled OLS and FEM (Fixed Effects Model); then used Hausman test to choose between FEM and REM (Random Effects Model). If p-value of F test is smaller than 0.05, FEM will be chosen instead of Pooled OLS. After that, if p-value of Hausman test is smaller than 0, the authors will opt for FEM rather than REM. The results show that the best regression model for (1) is REM, while FEM is more suitable for (2) and (3).

4.2.5. Test of heteroskedasticity

To test the phenomenon of heteroskedasticity, the authors used Breusch and Pagan Lagrangian Multiplier test for model (1), Wald test for model (2) and (3). It can be seen that p-values of 3 models are all smaller than 0, so these models have heteroskedasticity.

Table 8. Test of heteroskedasticity

Model	Name of test	p-value
(1)	Breusch and Pagan Lagrangian Multiplier	0.0000
(2)	Wald	0.0000
(3)	Wald	0.0000

Source: STATA processing results, 2022

4.3. Regression coefficients estimation

Table 9. Results of regression coefficients estimation

Hypothesis	Dependent variable	Independent variables	Expected impact	Coefficient	p-value	Accepted/Not accepted hypothesis
H1	ROA	ACCCON	+	-0.614	0.025	Not accepted
H4		SIZE	-	-0.000000404	0.000	Accepted
H7		LEV	+	16.734	0.000	Accepted
H10		GROWTH	+	-0.004	0.915	Not accepted
		Cons		-3.128	0.000	
H2	ROE	ACCCON	+	-0.246	0.441	Not accepted
H5		SIZE	-	-0.000000239	0.000	Accepted
H8		LEV	+	14.231	0.000	Accepted
H11		GROWTH	+	-0.096	0.001	Not accepted
		Cons		3.033	0.000	
H3	ROS	ACCCON	+	-10.511	0.000	Not accepted
H6		SIZE	-	0.000000326	0.000	Not accepted

H12		GROWTH	+	0.936	0.000	Accepted
		Cons		-12.013	0.000	

Source: STATA processing results, 2022

Contrary to expectations, accounting conservatism has a negative effect on ROA and ROS; has no effect on ROE but the coefficient is also smaller than 0. Therefore, it can be concluded that accounting conservatism negatively influences firm performance of listed companies on HNX. This may be because these companies have not fully and properly applied accounting conservatism. Although this result does not meet the expectations of the authors, it supports some previous researchers such as Chan et al. (2006), Biddle et al. (2011).

Firm size has a negative effect on ROA and ROE; has a positive effect on ROS. The author cannot conclude about the influence of this variable on firm performance of listed companies on HNX.

Financial leverage has a positive effect on ROA and ROE; has no effect on ROS but the coefficient is also greater than 0. Therefore, it can be concluded that financial leverage has a positive influence on firm performance of listed companies on HNX. The results agree with Taub (1975), Roden and Lewellen (1999), Champion (1999).

Sales growth has no effect on ROA, a negative effect on ROE, and a positive effect on ROS. The author cannot conclude about the effects of this variable on firm performance of listed companies on HNX.

5. Conclusion

Research with the aim of evaluating the influence of accounting conservatism on firm performance at of listed companies on the stock exchange HNX has shown a number of remarkable results.

The results detected that the level of accounting conservatism has a negative influence on firm performance of listed companies on HNX. This shows that these companies have not fully and properly applied accounting conservatism. Therefore, the article suggests that more policies and regulations need to be set for listed companies on HNX so that accounting conservatism levels will be promoted. This will help companies create a competitive position and have profitability for sustainable growth, which is very important in a global and constantly moving economy.

STUDY OF FACTORS AFFECTING THE QUALITY OF FINANCIAL REPORTING INFORMATION OF SMALL AND MEDIUM ENTERPRISES IN HANOI CITY

Pham Huy Hung

phamhuyhung0302@gmail.com

Hanoi University of Natural Resources and Environment, Hanoi, Vietnam

Abstract

This study was conducted to assess the influence of factors on the quality of financial reporting information of small and medium enterprises in Hanoi city. Data collected from the questionnaire was sent to 182 accountants, chief accountants and managers working at small and medium-sized enterprises in Hanoi. Based on quantitative research with quantitative techniques, the results show that there are 5 major factors that affect the quality of financial reporting information in a decreasing order, including: Profit management behavior of business owners; Internal control; Capacity of accounting staff; Application of accounting technology and software; and Independent auditing. Based on the research results, a number of recommendations have been made to stakeholders to improve the quality of financial reporting information for small and medium enterprises in Hanoi in the coming time.

Keywords: *Quality of financial reporting information, financial statements, small and medium enterprises.*

1. Introduction

Quality of financial statements information (QFSI) is used by many interested parties to make economic decisions. However, due to various reasons and the impact of asymmetric information, many businesses disclose untruthful, incomplete and timely financial statements as prescribed. High-quality financial statements reduce information asymmetry (Biddle et al., 2009). On the other hand, when increasing the quality of financial statements, financial activities in enterprises will improve (Nanyondo, 2014).

Small and medium-sized enterprises (SMEs) are enterprises that do not have large scale in terms of capital and labor. According to data published by the General Statistics Office in 2022, the proportion of SMEs classified by labor size accounts for about 97.3% of the total number of enterprises registered for business. SMEs play a very important role in the economy, contributing significantly to the total national output, creating jobs for workers, mobilizing social resources for development investment, contributing to poverty reduction in localities.

However, at present, SMEs in Vietnam are facing many difficulties. In particular, the most important concern is the difficulty in accessing capital of SMEs. In order to attract investment capital or in other words, to borrow capital, businesses must prove a healthy financial situation, ensure the ability to use capital effectively and repay debt on time.

Meanwhile, SMEs often fail to provide verifiable financial information, one of the main causes of the above situation is that the QFSI of these enterprises is limited.

There have been a number of domestic and foreign studies related to QFSI. For example, the study by Maines & Wahlen (2006) states that an auditor's report with a view to full acceptance is a necessary condition to identify reliable or truthful financial accounting information. In addition, Chalaki et al., (2012) conducted a study on the influence of corporate governance attributes on QFSI in companies listed on the Tehran Stock Exchange. The results of the study show that QFSI is not influenced by corporate governance attributes. Or the research of Vo Van Nhi & Tran Thi Thanh Hai (2013) through the research method of synthesizing theory and summarizing from practice, identifying factors that affect the quality of accounting information on the financial statements, such as the organization of management and accountants. However, the QFSI of SMEs as well as the research on factors affecting the QFSI of this business object in Vietnam in general and in provinces and cities in particular, has not received much attention. In particular, Hanoi city is the economic, political and cultural center of the whole country, where there are many SMEs, while the research on the QFSI of SMEs seems to be very limited.

Therefore, this study was conducted as an attempt to compensate for the previous research gap, and at the same time provide empirical evidence in Hanoi city on this issue. The research results contribute to increasing the understanding of the factors and the influence of each factor on the QFSI of SMEs. From there, help these businesses have practical solutions to improve their QFSI. Thereby, meeting the expectations of investors, regulators and other stakeholders.

2. Theoretical basis and Literature review

2.1. Theoretical basis

2.1.1. Small and medium enterprises

In Vietnam, SMEs are defined as enterprises with a small number of employees and a small capital size or limited revenue that meet one of the following criteria: The total number of employees participating in social insurance in the year is not more than 200 employees, the total capital is not more than 100 billion VND or the total revenue of the previous year is not more than 300 billion VND. SMEs are classified by size, including microenterprises, small businesses and medium enterprises determined by the fields of agriculture, forestry and fisheries; industry and construction; trade and services. This study identifies SMEs based on the number of employees and according to Decree No. 39/2018 ND-CP of the Government dated March 11, 2018.

2.1.2. Quality of financial statement information

According to Baltzan (2012), information is of good quality if it is considered to be consistent with the requirements of the information user including: Accurate, complete, relevant, timely and consistent. In addition, the concept of QFSI is very specifically regulated in the form of templates by regulatory organizations such as FASB, IASB... In

addition, QFSI in each country will have its own regulations. In our country, QFSI regulations are also mentioned in Vietnamese accounting laws and standards.

In the FASB's view, QFSI is the attributes that make information useful for business and economic decisions (FASB, 1980). In the IASB perspective, QFSI are attributes that make financial reporting information useful for the decision-making of current and potential investors, lenders, and other creditors (IASB, 2010). Many fundamentalist researchers have also come up with various concepts of QFSI. In particular, Jonas & Blanchet (2000), argue that QFSI manifests itself in the full and clear provision of financial information, avoiding confusing or changing the decisions of users. Vietnamese accountants stipulate that the information presented in the financial statements must meet the following requirements: Honest, reasonable, appropriate, complete, verifiable, timely, understandable, consistent and comparable (Ministry of Finance, 2002). Therefore, in order to suit the research conditions in Vietnam and the research object is the QFSI of SMEs in Hanoi, this study uses the viewpoint according to Vietnam Accounting Standards No. 01 as a basis for evaluating the QFSI of SMEs.

2.2. Factors affecting the quality of financial reporting information of SMEs

Domestic and foreign studies have confirmed the direct or indirect influence of factors on the QFSI of SMEs, specifically as follows:

2.2.1. Accounting staff capacity

Accounting staff competence is an important factor affecting QFSI, because accountants are the people who directly operate accounting at the unit. If the capacity of the accounting staff does not meet the requirements, it will adversely affect the QFSI. According to Setiyawati (2013), accounting staff competence is a factor that is significantly related to QFSI. Vo Van Nhi (2013) through the research method of synthesizing theory and summarizing from practice, determining the factors that affect QFSI belong to the capacity of the accountant. In addition, Chen & Xie (2014) considered the impact of accounting staff capacity on financial reporting fraud, the results of the study showed that more qualified accounting staff are associated with a lower likelihood of financial reporting fraud. The authors concluded that investing in training and development of accounting staff can improve QFSI. Sawalha & Alrawadieh (2019) reviewed financial reporting practices of SMEs in Jordan, focusing on factors affecting QFSI. Research shows that SMEs in Jordan often lack the financial resources and expertise needed to create high-quality financial statements. SMEs prioritize growth and innovation over QFSI, resulting in inadequate or unreliable financial reporting. Therefore, the author argues that:

H1: There is a positive relationship between the capacity of accounting staff and the QFSI of SMEs

2.2.2. Application of accounting technology and software

Information technology and accounting software are important factors contributing to improving the efficiency of accounting work. The use of accounting software will solve

the problems of vouchers, accounting books, and at the same time, accounting software also helps businesses in the preparation and presentation of financial statements. Modern technology ensures technical requirements; accounting software is built in accordance with the operating characteristics of the unit; updated software, less error, user-friendly interface are the decisive criteria to QFSI. Adu (2017) compared financial reporting practices of SMEs in Ghana and South Africa, focusing on factors affecting QFSI. The study shows that SMEs in both countries have limited financial resources for the application of technologies such as modern accounting software to enhance QFSI. The study also shows that the regulatory environment in each country can affect QFSI, with SMEs in South Africa having stricter reporting requirements than SMEs in Ghana. In line with the above studies, similar conclusions have been confirmed in the research of Dechow et al., (2007); Hajiha (2011); Ghasemi et al., (2011) have argued about the relationship between information technology factors and QFSI. Thus, the second hypothesis is formulated as follows:

H2: There exists a directional relationship between the application of technology and accounting software with the QFSI of SMEs.

2.2.3. Internal control

Internal control is an important factor affecting QFSI. Internal control of operations to ensure the reliability of accounting information, ensure the appropriate size and development of the business, serve the information needs of administrators.

Djama (2010) and Iatridis (2011) argue that accounting information is considered a lever of power for managers and can cause damage to partners within the framework of contractual relationships. Through accounting policies, managers can influence the processing of accounting information to provide information that is not true to the reality of the business. So, managers can exploit accounting information to meet the constraints in contracts with investors. However, the exploitation of accounting tools for self-interested behavior on the part of leaders will be limited by the implementation of a monitoring mechanism from inside and outside the business. Based on the above argument, the author argues that the role of internal control has a relationship with QFSI. Thereby, the next hypothesis is given:

H3: There exists a directional relationship between Internal Control and SME QFSI

2.2.4. Independent audit

Bell & Carcello (2000), Ambler & Neely (2007), Djama (2010) argue that the resolution of conflicts of interest of stakeholders in the enterprise has led to the establishment of control systems from inside and outside the enterprise as a mechanism to frame the actions of managers and reduce the costs arising from these conflicts. This is reflected in the role of external supervisors such as independent auditors in ensuring the truthfulness of accounting information. Some studies have also shown that investors have greater confidence in financial statements that have been audited by international auditing firms (Teoh & Wong

1993). In addition, research by Chalaki et al., (2012) showed that auditing is a factor that has a significant impact on QFSI. So, the author assumes:

H4: There exists a directional relationship between the Independent Auditor and the SME QFSI.

2.2.5. Profit management behavior of business owners

The behavior of profit management is stated by Vidal (2008): "The ability of the administrator to direct the information published in favor of himself or for the benefit of the business". Wang & Han (2017) examine the relationship between profit management behavior of corporate managers and QFSI. Research shows that income management behavior negatively affects QFSI. Specifically, QFSI decreases as managers become involved in the management of earnings, resulting in a reduction in the usefulness and reliability of financial reporting. Zheng & Lee (2019) examine the influence of corporate governance on the relationship between corporate managers' profit management behavior and QFSI. The results of the study show that independent boards and audit committees play an important role in monitoring the behavior of managers and impairing their ability to manage income. In addition, research shows that the presence of independent board members and audit committees is associated with higher quality financial reporting information. In addition, the study of Pham Quoc Thuan (2016) said that the profit management behavior of managers in enterprises has an important influence on the QFSI of enterprises. Therefore, the hypothesis is given as follows:

H5: There exists an opposite relationship between the profit management behavior of the enterprise and the QFSI of the SME.

2.2.6. Pressure from taxes

Tax pressure is understood as tax pressure leading to enterprises having to apply tax regulations when processing information presented in financial statements (Pham Quoc Thuan, 2016). Barth et al., (2008) investigate the impact of tax policy on QFSI. They argued that tax policies could provide incentives for regulators to manipulate financial statements in order to reduce their tax liabilities. In addition, Tang et al., (2019) investigated the impact of tax policy on QFSI in a multinational context. The authors argue that tax policies can affect QFSI differently in different countries due to differences in institutional environments and accounting standards. Using a sample of companies from 39 countries, the authors found that companies in countries with higher tax rates had lower QFSI. Furthermore, they found that the impact of tax policies on financial reporting quality was more pronounced in countries with weaker institutional environments and less transparent accounting standards. On the other hand, Vietnamese enterprises when handling accounting work are still under a lot of pressure from tax managers and this hinders the compliance with accounting principles and standards of enterprises and reduces the quality of financial statements (Pham Quoc Thuan, 2016). Therefore, the sixth hypothesis proposed by the author is as follows:

H6: There exists a positive relationship between tax pressure to QFSI of SMEs.

3. Research Method

3.1. Research models and hypotheses

From the above hypotheses, the author proposes a formal research model as follows:

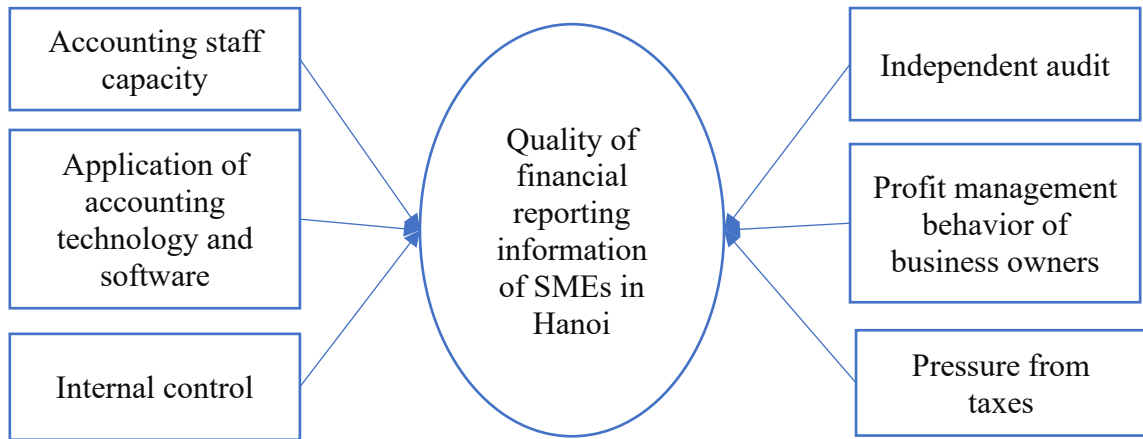

Figure 1. The proposed research models

Source: Suggested Author

With multiple linear regression model as follows:

$$CL = \beta_0 + \beta_1*HV + \beta_2*KS + \beta_3*NL + \beta_4*CN + \beta_5*KiT + \varepsilon$$

In which:

$\beta_1, \beta_2...$ are regression coefficients, β_0 are intercepts, ε are residues.

Dependent variable

CL: Quality of financial reporting information of small and medium enterprises

Independent variable

HV: Profitable Management Behaviour of Business Owners

KS: Internal control

NL: Accounting staff capacity

CN: Application of accounting technology and software

KiT: Independent audit

AL: Pressure from taxation

3.2. Data collection and processing

The author collects data through the use of questionnaires to collect the opinions of accountants, chief accountants, managers in SMEs in Hanoi on the level of influence of factors on QFSI.

Through the literature review process, to evaluate the QFSI of SMEs (dependent variables), the author uses the Likert scale of 5 levels of agreement, from: (1) Strongly disagree to (5) Strongly agree. Evaluating the independent variables, the author uses the Likert scale of 5 levels of influence, from: (1). Very low to (5). Very. The number of measurement scales of variables is presented in **Appendix 1**.

The questionnaire is checked and corrected by sending to 02 people (01 is a senior lecturer, Institute of Accounting and Auditing, National Economics University; the other 01 is the director of SMEs) to assess the level of conformity with research objectives. In addition, to ensure the study sample size, based on the minimum sample size requirement for EFA analysis and regression, in the view of Bollen (1989), the sample size is calculated according to the formula $n = 5 * i$ (i is the number of variables observed in the model).

The author uses a convenient sampling method through sending and receiving questionnaires via Google Doc tool and Email to accountants, chief accountants and managers in SMEs in Hanoi city, from December 2022 to March 2023. With 370 votes sent to 152 SMEs, 190 votes were collected, of which 182 valid votes were included in the research model. Based on the collected data, the author uses quantitative techniques such as checking the reliability of the scale, analyzing the discovery factor, testing the difference in the effectiveness of internal auditing... with the use of SPSS software.²⁵ to summarize and present the basic results of the study.

4. Results and Discussion

Regarding working positions: out of 182 valid answers, 123 came from accountants, accounting for 67.58%; 42 came from chief accountants, accounting for 23.07%; 17 came from managers of SMEs, accounting for 9.35%.

Regarding the field of operation: 68 answers came from SMEs in the field of trade and services, accounting for 37.36%; 34 answers came from SMEs in the field of production, accounting for 18.68%. 22 responses to four SMEs in the field of industry, construction, accounted for 12.08%; The remaining 58 responses came from SMEs doing multi-industry business, accounting for 31.86%.

Regarding the number of employees in the enterprise: 42 answer sheets came from SMEs with less than 10 employees, accounting for 27.63%; 97 answer sheets came from enterprises with the number of employees from 11 to 100 people, accounting for 53.29%; 13 answer sheets came from enterprises with the number of employees from 101 to 300 people, accounting for 19.08%; and none came from enterprises with the number of employees greater than 300 people.

The sample surveyed belongs to many different subjects in terms of working position, field of operation, size of personnel, and quite even distribution. As such, it is possible to ensure the answers are reliable and of quality. The statistical results describing the scale show that the mean of QFSI = 3.71. This shows that the survey subjects have evaluated the QFSI factor with characteristic variables at the level of agreement. The mean of the given independent variables is greater than 3.0. This shows that the effect of the independent variables given is reasonable.

4.1. Quality control results of the scale

Cronbach's Alpha test results:

Quality control results of QFSI scale with 8 observation variables and quality of the scale of factors affecting QFSI (6 scales with 24 observation variables) by SPSS25.0 software are as follows:

Table 1. Results of testing the reliability of the scale of factors in the model

TT	Factor	Cronbach's Alpha	N
1	Accounting staff capacity	0.850	4
2	Application of accounting technology and software	0.863	6
3	Internal control	0.863	4
4	Independent audit	0.903	2
5	Profit management behavior of business owners	0.880	4
6	Pressure from taxes.	0.879	4
7	<i>Quality of financial reporting information of small and medium enterprises</i>	0.734	8

Source: Results of data analysis on SPSS 25

The total variable correlation coefficients of the observed variables are all greater than 0.3. Thus, the variables given are satisfactory. The Cronbach's Alpha coefficient is greater than 0.6. Cronbach's Alpha coefficients of the scales do not have any coefficients that are too large (about 0.95 or more) so there is no duplication of the scales. Cronbach's Alpha coefficient if the type of variables observed is less than the total Cronbach's Alpha coefficient. The model retains 6 scales representing factors affecting QFSI and 01 scale representing QFSI with 32 characteristic variables.

4.2. Explore factor analysis EFA

The EFA exploratory factor analysis process is carried out separately for 02 groups of independent variables and dependent variables by the method of full-angle rotation. The results obtained are as follows:

Results of EFA analysis for independent variable:

Table 2. Table of KMO and Bartlett test results for independent variables

KMO and Bartlett's Test		
Kaiser-Meyer-Olkin Measure of Sampling Adequacy	0.785	
Bartlett's Test of Sphericity	Approx. Chi-Square	10006.806
	df	1186
	Sig.	0.000

Source: Results of data analysis on SPSS 25

The KMO value = 0.785 satisfies the condition $0.5 \leq KMO \leq 1$ so EFA analysis is appropriate for the actual data. Test the correlation between observed variables in Sig scales. (Bartlett's Test) = 0.000 (Sig. < 0.05) showed that the observed variables are correlated with each other in general and that the data used for EFA analysis are appropriate.

Testing the level of interpretation of observed variables with factors: Percent variance = 72.526% > 50% means that the 6 factors extracted in EFA reflect 72.526% of the variation of the data. The Eigenvalue = 1.48 is greater than 1, so the factors are retained in the analysis model.

The rotating factor matrix table will be considered to see what these 6 groups of factors include, and whether the order of the observed variables is disturbed compared to the scale built initially. The results show that the observed variables have a factor load factor greater than 0.5. There is no case of simultaneously uploading two elements with a close load factor. There are 6 factors representing the factors affecting QFSI with 24 characteristic variables arranged as the original model. Based on the results of the rotational matrix table of factors, the research model is maintained.

Results of EFA analysis for dependent variable:

KMO coefficient = 0.887 > 0.5 and Barlett test has Sig.= .000 < .05) shows that EFA analysis is appropriate. The Sig. = 0.000 satisfies the Sig condition. ≤ 0.05 so this test is statistically significant and the observed variables are correlated with each other in the whole, proving that the data used in the analysis is appropriate. Analysis of the total variance extracted for the dependent variable shows that the total variance percentage value of the entire Percentage of variance = 56.234% > 50%, the Eigenvalue value = 3.527 > 1, so the model is eligible for exploratory factor analysis and the load factor of the observed variables is greater than 0.5 so the observed variables are of practical significance. So the dependent variable is between the original independent variable and there are 6 observed variables.

4.3. Results of regression analysis

Pearson Correlation Analysis:

Table 3. Pearson Correlation Analysis Results

		Correlations						
		HV	KS	NL	CN	KiT	AL	CL
HV	Pearson Correlation	1						
	Sig. (2-tailed)							
	N	182

	N	182	182	182	182	182	182	182

** . Correlation is significant at the 0.01 level (2-tailed).

* . Correlation is significant at the 0.05 level (2-tailed).

Source: Analysis results from SPSS 25

Looking at the result in the last row in the correlation matrix table, we see that independent variables are correlated with dependent variables, Sig. values in other variables are < 0.05 . Particularly, the variable "Pressure from taxation" has a Sig. value of $0.126 > 0.05$. Thus, we see that the independent variable "AL" has no correlation with the dependent variable "CL", so this type of variable when analyzing regression. The elimination of the "AL" variable can be explained by the following reasons: (i) SMEs often do not have large funds to create complex tax strategies, so they are not under too much pressure from tax policies; (ii) SMEs often have simple, uncomplicated size and business operations, so there is no need to make too many tax reports, minimizing pressure from tax regulations and policies; and (iii) SMEs often do not have too many business partners, so compliance with tax regulations is not too complicated.

After removing the variable "AL", re-run analysis of the correlation matrix table, we see all Sig. < 0.05 . Thus, the independent variables HV, KS, NL, CN, KiT are correlated with the dependent variable "CL".

Regression analysis:

Based on the results of the EFA analysis, the regression analysis between the dependent variable "CL" and the independent variables: HV, KS, NL, CN, KiT is conducted. The tables below show the regression results, specifically:

Table 4. Linear regression results

Coefficients ^a

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	Constant	-.025	.283		-.086	.934		
	HV	-.499	.300	-.528	-17.259	.000	.979	1.023
	KS	.484	.044	.386	11.346	.000	.916	1.094
	NL	.333	.044	.278	7.766	.000	.905	1.107
	CN	.294	.039	.268	7.819	.000	.967	1.037

Table 6: ANOVA^a model analysis table

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	109.738	5	21.9476	122.650	.000 ^b
	Residual	44.378	240	.185		
	Total	154.116	245			

a. Dependent Variable: CL

b. Predictors: (Constant), HV, KS, NL, CN, KiT.

Source: Analysis results from SPSS 25

Test the relevance of the model:

Testing for multicollinearity phenomenon: The variance magnification factor (VIF) of all independent variables is less than 10, so the multicollinearity phenomenon in the model is assessed as not serious. The Durbin-Watson coefficient used to test the correlation of the residues shows that the model does not violate when using the multiple regression method, because the Durbin-Watson value is reached at 2,166 (in the range of 1 to 3). In other words,

the model does not have the correlation phenomenon of residual parts. The assessment of model suitability is based on the variance analysis table. Results of ANOVA testing with Sig significance level. = 0.000 shows that the multiple linear regression model has been built in accordance with the data set and can be used, or in other words, this model is meaningful to deduce for the whole.

Evaluate the level of interpretation by independent variables in the model:

The corrected R^2 coefficient = 0.634 > 0.5 means that the independent variables explain 63.4% of the change of the “CL” dependent variable, while 36.6% is due to random errors or other factors outside the model.

The results of the regression coefficient determination shown in Table 4 show that the independent variables included in the model have a linear relationship with the dependent variable “CL”, Sig. in the t test are all less than 0.05. So the regression model is statistically significant. The independent variables “KS”; “NL”; “CN”; “KiT” with coefficients $\beta > 0$ prove to have a positive influence on the dependent variable “CL”. Particularly, the independent variable “HV” has a coefficient of $\beta < 0$, proving that the factor “HV” has the opposite effect on the dependent variable. Thus, accept the original hypothesis (H1, H2, H3, H4 and H5), which are independent variables linearly related to the dependent variable and fully consistent with the model. From there, we have a regression equation with a normalized beta as follows:

$$CL = -0.528*HV + 0.386*KS + 0.278*NL + 0.268*CN + 0.184*KiT$$

The results of this study are consistent, consistent with previous studies, specifically:

The factor "Profit management behavior of business owners" significantly and inversely affects QFSI, this result is similar to the results of Wang & Han (2017); Zheng & Lee (2019); Pham Quoc Thuan (2016). The more effective the “Internal Control” factor of SMEs, the higher the QFSI, this result is similar to many previous studies, such as Djama (2010); Iatridis (2011); Pham Quoc Thuan (2016). The factor "Capacity of accounting staff" has a favorable influence on the QFSI of SMEs, the results of this study are similar to the research results of Pham Quoc Thuan (2016); Setiyawati (2013). The factor "Application of accounting technology and software" has the same impact as QFSI, which implies that, when SMEs apply modern technology and quality accounting software, the QFSI of SMEs will be increased, this result is consistent with the results of Pham Quoc Thuan (2016), Dechow et al., (2007); Hajiha (2011); Ghasemi et al., (2011). The factor "Independent Audit" has the same impact on the QFSI of SMEs. Expressing the control role from outside the enterprise to help limit the risks of wrongdoing, the survey results show that SMEs in Hanoi city have a low level of interest in independent auditing. This result is consistent with the results of previous studies, such as: Chalaki et al., (2012).

5. Discussion and Conclusion

Through analysis of 182 survey samples from 152 SMEs in Hanoi city. Regression results show that factors that have a positive influence on the QFSI of SMEs in descending order are: Profit management behavior of business owners; Internal control; Capacity of accounting staff; Application of accounting technology and software; and Independent audit.

The findings from the experimental study are the basis for the author to make some recommendations, specifically as follows:

Profit management behavior of business owners

Profit adjustment behavior is a serious problem for businesses in general and SMEs in particular. In order to limit profit adjustment behavior, SMEs need to implement the following measures: (i) Build an internal control system is one of the most important measures to ensure accuracy and transparency in the accounting and financial statements of the enterprise; (ii) strengthen external independent audits to evaluate the effectiveness of existing accounting policies and processes; (iii) The State needs to have many policies to reduce tax pressures for enterprises, contributing to limiting profit adjustment behavior in practice.

Internal control

Research results show that internal control is the second strongest factor affecting the QFSI of SMEs. In order to promote the role and effectiveness of internal controls, SMEs need to take a number of steps, including: (i) SMEs need to implement appropriate controls to protect their assets and ensure that financial transactions are recorded honestly and adequately. This includes implementing division of duties, which means dividing financial responsibilities among multiple employees to prevent any individual from having too much control over financial activities; (ii) developing an internal control policy that articulates the responsibilities of different employees, control measures to be implemented, and procedures to be followed to ensure compliance with applicable laws and regulations. This policy should be communicated to all employees and reviewed regularly to ensure that it remains appropriate and effective. (iii) SMEs should establish a code of conduct outlining the ethical standards that employees must adhere to, as well as a whistleblower policy to encourage employees to report any suspected misconduct. (iv) SMEs should provide training to employees to ensure that they understand the importance of internal controls and are equipped with the knowledge and skills to implement and maintain effective controls.

Qualifications of accountants

This is the third most powerful of the factors in the standardized regression equation. Therefore, in order to improve the QFSI, SMEs need to recruit accountants with sufficient qualifications, expertise and experience suitable for the job position. Strengthen training to create conditions for accounting staff to participate in training sessions related to accounting, auditing and tax declaration. SMEs can invest in courses, train accountants or hire accounting professionals to train employees. At the same time, SMEs need to ensure that training programs are tailored to the needs and qualifications of their employees. On the other hand, accountants (including external tax accountants) need to cultivate professional knowledge and legal regulations on accounting to actively update fully and promptly.

Application of accounting technology and software

Applying accounting technology and software is a factor that has a significant and similar influence on the QFSI of SMEs. Proposals to increase the application of accounting

technology and software are given as follows: (i) SMEs need to develop plans to develop information systems and apply advanced information technology in the operation, inspection and monitoring of information systems. In addition, enterprises also need to pay attention to training, improving professional skills for employees, selecting accounting software in accordance with the operating characteristics of the unit; (ii) SMEs need to apply information technology such as organizing accounting software to be able to quickly process collected information as well as provide timely responsibility reports and ensure the usefulness of the information; (iii) Choose to use quality accounting software and have it inspected by competent agencies; (iv) for SMEs who regularly use external accounting services, it is necessary to pay attention to choosing reputable services, providing sufficient documents, regularly monitoring and monitoring accounting work for their units, making the most of the support of the service.

Independent audit

In most studies, independent auditing is a factor that affects the QFSI of SMEs in the same direction. Therefore, SMEs in Hanoi city need to be properly aware of the role of independent auditors in improving the financial capacity of enterprises, carrying out periodic audits and selecting reputable auditing services.

THE INDEPENDENCE OF BOARD OF DIRECTORS AND FINANCIAL PERFORMANCE: AN EMPIRICAL EVIDENCE OF PHARMACEUTICAL ENTERPRISES IN VIETNAM

Nguyen Van Chien
chiennv@tdmu.edu.vn

Thu Dau Mot University, Binh Duong, Vietnam

Abstract

The Board of Directors is the heart of the enterprise in order to implement the strategic management approved by the general meeting of shareholders. A study on the independence of the Board of Directors on corporate financial performance is conducted through 30 pharmaceutical companies on the Vietnamese stock exchange. Research results confirm that increasing the board independence is consistent with a greater contribution to the corporate profitability. The study also shows that businesses that depend on debt are often less effective while businesses that operate on their charter capital are often more effective. The study also argues that state ownership plays a significant role in promoting business efficiency. From this study, pharmaceutical companies should improve the efficiency of Board of Directors to greatly enhance its financial performance.

Keywords: *Firm, independence, capital, profit.*

1. Introduction

The equitization process involves capital contributions from individuals, organizations and economic sectors to the enterprise and thereby increase the contribution of the enterprise to the economy of most countries. In particular, the board of directors is considered as the heart of joint-stock companies and demonstrates its leadership role in developing the business through orienting development directions, promulgating policies, and leading the business for the purpose of the owner, shareholders and investors, thereby bringing practical benefits to employees, suppliers, society and the country.

According to Vietnamese enterprise law, the board of directors is a group with the number of members ranging from 3 to 11. The Board of Directors that is the management body of the company, has full power on behalf of the company to decide, exercise the rights and obligations of the company, and except for the rights and obligations of the general meeting of shareholders. Normally, the number of members on the board of directors is regulated by the company's charter. In which, the term of the board members is not more than 5 years and can be re-elected at the end of the term, so the members of the board of directors are usually people with their understanding regarding knowledge, the operation of the business, and to make practical contributions to the development of the business. However, some joint stock companies may have more independent members in order to

increase the critical voice of board members. At the same time, the principle of corporate governance always requires that the BOD structure should be in the direction of balance and harmony between the interests of shareholders and investors and managers (Fuji et al., 2016).

According to the agency theory, the business always exists asymmetric information between the agent and the principal, because each party is running after its own interests and can affect the interests of others. It sets out for managers who are always looking for ways to reduce information asymmetry in order to increase the operational efficiency of the business. Moreover, the current development requires businesses to receive more voices, not only from investors and shareholders, but also independent individuals who have a voice to contribute to the business development.

Research on the independence of the board of directors and the financial performance of the business has been carried out by a number of recent studies such as Fuji et al. (2016), Le et al. (2022), most of the research results showed that there is a positive relationship of the independence of the board of directors on corporate financial performance. However, the socio-economic context has changed in recent years due to the rapid technological revolution, and the country has just been affected by the COVID-19 pandemic, but the pharmaceutical industry still achieves a high level of business results. That is the reason why we conducted the objective of this study as well as the independence of the board of directors on the profitability of pharmaceutical enterprises. Moreover, in this study, we also evaluate the dependent relationship between variables in the industry, usually in the same industry, businesses often have a close correlation with each other, which is the novelty of this study. save this.

This study is divided into 5 main parts. In addition to the problem statement, part 2 discusses previous studies, part 3 discusses data sources and research methods. In sections 4 and 5, the study results and conclusions are discussed.

2. Theoretical Framework and Literature Review

2.1. Theoretical Framework

According to the Cobb-Douglas production function, the output of a firm can be written as:

$$Y = A * K^{\alpha} * L^{\beta}$$

Where,

A represents for the output of the enterprise, or further represents for the business performance as well as the ability to achieve profit in the enterprise.

The coefficient K is a proxy for the business capital. The coefficient L represents for the labour force and is expressed through the number of employees and the qualifications, skills, and working attitudes of the employees.

According to the Cobb-Douglas production function, improving the business performance of the company should be considered, it is possible to improve the quality of employees, for example, labour skills, management skills, and coordination among workers in order to optimize production activities.

2.2. Literature Review

Enterprises play an important role in contributing to the output of the economy in countries. Governments are always looking for ways to improve the investment environment in order to develop the business community and thereby increase the contribution of businesses to the economy. Improving the business can come from improving the board's effectiveness, increasing the board's independence in corporate governance. According to Fuzi et al. (2016), the board of directors is a collective body that should act in the interests of shareholders, investors and the development of the business. As a result, the board of directors is often a mix of executive and non-executive manager in order to maximize firm value and shareholder benefits.

Fernandes (2008) evaluated governance factors on firm performance at the Portuguese Stock Exchange. The governance factor is reflected in the executives and their remuneration and Fernandes (2008) evaluates how the policy implementation process for the board of directors affects firm performance. As the case of Portugal, the board structure is quite similar to other countries in Europe, it is a single-tier system and does not have its own supervisory board. This board includes the chief executive officer, other executive managers, and non-executive directors. In which, the non-executive board members are regulated to protect the interests of shareholders in doing important decisions of the company and they are responsible for conveying the company's activities between shareholders and the management board. Research results in the Portuguese stock market suggest that the effectiveness of independent directors is low. Companies with more non-executive directors pay more for their executives. In contrast, companies without non-executive directors have agency problems and achieve better alignment between shareholder and management interests.

Research by Le et al. (2022) studied at the top 500 listed firms in Australia in the period 2004 to 2019 and found that the firm performance has a positive relationship when the independent director considers their position as reputable board member; vice versa, the relationship is negative when the independent director considers their position as a member of the Board of Directors to be less prestigious. Research confirms that increasing the presence of independent supervisors on a company's board of directors is not necessarily factor to help the firm perform better. In contrast, reputable independent BOD members should be maintained to protect shareholders' interests.

Another possibility, Balz et al. (2023) used data of 383 European portfolio companies to assess the impact of independent investor on firm and firm performance. The authors argued that the heterogeneity of venture capital funds causes a significant decline in performance for venture capital-backed ventures. In contrast, as venture capital independence increased, there was no significant difference in yield compared with ventures receiving independent venture capital backing. However, Thi and Hung (2022) suggested that the independence of the board of directors has not had a positive impact

on the profitability of the enterprise. According to the authors' explanation, if the independence of the Board of Directors is low, the independent voice of the members of the Board of Directors is often of little value, or in some companies, the members of the Board of Directors are not ready to exchange and share the independent voice of the Board of Directors in the meetings of the Board of Directors, therefore, the independence of the Board of Directors has not really brought positive effects to the business activities of the enterprise.

The research of Reguera-Alvarado & Bravo (2017) analysed the tenure and number of independent directors on the performance on listed companies in the United States in the period 2008 to 2012, The authors believed that the independence of the Board of Directors has a positive impact on the performance of the company, however, this relationship only exists during the period of the director's tenure and the positions of external directors. Therefore, the results of this study reflect the personal characteristics of the members of the Board of Directors that affect the decisions, strategies and results of the company and are the basis for selecting members of the Board of Directors to help the Board of Directors operate effectively.

Fuzi et al. (2016) on a study and argued that executives on the board of directors cannot perform their duties effectively if they do not have independence from management so that they cannot make objective business judgments. At the same time, independence helps businesses reduce agency costs. Fuzi et al. (2016) also confirmed that there is a mixed relationship between the proportion of independent BOD members and the company's performance. Therefore, the existence of independent BOD members in the Board of Directors should be monitored to bring positive value to shareholders, because a high number of independent directors does not completely guarantee improving operational efficiency of the company.

Research by Junus et al. (2022) studied on the Indonesian stock exchange in the period 2010 to 2017 to evaluate the relationship between politically connected independent directors and independent directors on firm performance. Research has demonstrated that politically affiliated independents have no impact on firm performance, but politically affiliated independents have a negative impact on firm performance. The study results are explained that the appointment of independent trustees and independent directors based not on expertise and knowledge in the financial sector but solely on previous work experience may adversely affect the firm performance. This research provides public companies and regulators to avoid misunderstandings in the decision-making process of company owners.

3. Method

3.1. Data source

In this study, we evaluate the independence of the Board of Directors and the performance of the company through the data of 30 pharmaceutical companies listed on the

Ho Chi Minh City and Hanoi stock exchanges. The data collection period is from 2010 to 2021. The data is collected from the Audited Financial Statements and the Annual Report which are published annually.

3.2. Research Methodology

Based on previous studies, especially Junus et al. (2022), the proposed regression equation can be written as follows:

$$PROFIT_{it} = \beta_0 + \beta_1 INDEPENDENT_{it} + \beta_2 BOARD_{it} + \beta_3 MEETING_{it} + \beta_4 DEBT_{it} + \beta_5 GOV_{it} + \mu$$

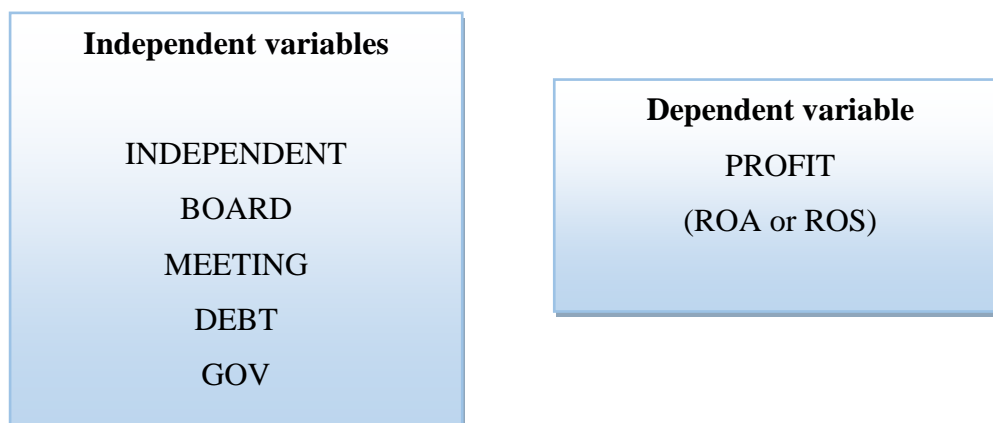

Figure 1. Variables used in the study

Where,

$PROFIT_{it}$, is a parameter representing the profit of firm i , at year t , measured through ROA or ROS;

$INDEPENDENT_{it}$, is the independent variable, represents the independence of the board of directors of firm i , at year t , measured by the number of independent members compared to the total number of members in the board of directors;

$BOARD_{it}$, as an independent variable, represents the size of the board of directors of firm i , at year t , measured by the total number of members in the board of directors compared to the maximum 11 members of the board of directors as required by law;

$MEETING_{it}$, being the independent variable, represents the average number of monthly meetings of the Board of Directors of firm i , at year t ;

$DEBT_{it}$, as the independent variable, represents the capital structure of firm i , at year t , and is measured by total debt to total assets;

GOV_{it} , is the independent variable, represents state ownership in firm i , at year t ;

The study uses the panel data analysis, first evaluates the cross-section dependence test, if this occurs, the panel corrected standard errors should be performed when this method is suitable for these series and T is short and capable of handling defects in the model. In

addition, PCSE regression is capable of handling multicollinearity and variable variance problems which are common defects in regression.

i, t , are respectively firm, and time

4. Results

4.1. Descriptive statistics

Table 1. Descriptive statistics of research variables

Variable	Obs.	Mean	Std. Dev	Min	Max
ROA	349	.0785035	.0711571	-.364934	.3367818
ROS	349	.0875121	.1575914	-2.205607	.603157
INDPENDENT	332	.1355039	.2079429	0	1.0
BOARD	360	.4818182	.1828031	0	1.0
MEETING	360	.5328704	.5627244	0	3
DEBT	349	.4886112	.2246942	.092188	.9706116
GOV	330	.2337335	.2530772	0	.976053

Source: Authors' analysis

Table 1 presents descriptive statistics of the variables used in the regression model. According to the results, we have the financial performance of the business shown in ROA and ROS. For ROA, this index has an average value of 7.85% and there is a large difference between the maximum and minimum values. For ROS, this index has an average value of 8.75% and also has a big difference, which shows that the financial performance of pharmaceutical enterprises is very different. Regarding the independence of the Board of Directors, this index reached 0.135, indicating that 13.5% of BOD members are independent and this ratio is relatively low. Regarding capital structure, 48.8% of corporate capital is financed by debt, the rest 51.2% is equity.

Regarding the size of the board of directors, most enterprises have nearly 6 members in the board of directors, only a few enterprises have a maximum of 11 members as prescribed by the law on enterprises. Regarding the frequency of meetings in the Board of Directors, it shows that the average monthly meeting frequency is 0.53 meetings, however, there are enterprises with a meeting frequency of 3 times / month, and there are also enterprises that do not have any meetings throughout the year, which reflects the extent to which board meetings are maintained, which varies widely across businesses. Regarding state ownership in pharmaceutical enterprises, this ratio is about 23.3% on average, and the rest is non-state capital, accounting for 76.7% on average.

4.2. Correlation Matrix and VIF

Table 2. Correlation matrix between variables

Item	INDPENDENT	BOARD	MEETING	DEBT	GOV
INDPENDENT	1.0000				
BOARD	-0.0491 (0.3729)	1.0000			
MEETING	0.1119** (0.0416)	0.2538*** (0.000)	1.000		
DEBT	-0.0848 (0.1232)	-0.2989*** (0.000)	-0.1726*** (0.0012)	1.000	
GOV	0.0615 (0.2695)	0.0352 (0.5238)	-0.0941* (0.0879)	-0.0081 (0.8829)	1.0000

Source: Authors' analysis

Table 3. The test of VIF

Variable	VIF	1/VIF
DEBT	1.08	0.930131
BOARD	1.07	0.938179
MEETING	1.04	0.965708
INDPENDENT	1.03	0.972546
GOV	1.02	0.982742
Mean VIF	1.04	

Source: Authors' analysis

The correlation analysis in Table 2 shows that the pairs of variables have low correlation, while the VIF analysis in Table 3 shows that the VIF values are all less than 10, which is an indicator for the possibility of the phenomenon occurring the multicollinearity of the regression model. From the above results, we can conclude that there is no possibility of multicollinearity in the regression model.

4.3. Regression results and discussions

Table 4. Cross-section dependence test

Variable	CD - test	p-value
ROA	-0.10	0.917
ROS	0.89	0.374
DEBT	5.23	0.000

Source: Authors' analysis

Table 5. Regression results

Variable	Regression results			
	PCSE ROA	PCSE ROA	PCSE ROS	PCSE ROS
INDEPENDENT	0.0268** (0.026)	0.0087 (0.423)	0.1440*** (0.000)	0.1186*** (0.000)
BOARD		0.0995*** (0.001)		0.0717 (0.144)
MEETING		-0.0022 (0.673)		0.0320*** (0.001)

_cons	0.0762*** (0.000)	0.1011*** (0.000)	0.0675*** (0.000)	0.0413 (0.346)
Prob	0.0000	0.0000	0.0000	0.0000
Adj R-squared	0.0060	0.3961	0.0353	0.1348

Note: **,*** with significance level 5%, 1%. Values in brackets are p-value

Source: Authors' analysis

Table 3 presents the cross-section dependence test and shows that there is a possibility of interdependence among firms in the industry, therefore, the panel corrected standard errors (PCSE) is suitable and should be performed for the estimation because the PCSE regression is suitable for a small T.

Through PCSE regression in Table 5, it shows that the variable INDEPENDENT has regression coefficients for positive values and most of them are statistically significant. Regression coefficients BOARD and MEETING give unclear results. While, the DEBT regression coefficient has negative sign and is statistically significant. The regression coefficient of GOV has a positive sign and is statistically significant. From the results of this regression, the study has the following assessment:

Firstly, the independence of the board of directors has a positive impact on the financial performance of pharmaceutical enterprises. That is, a company in the pharmaceutical industry with a high degree of independence means a higher profit of the business and thus can confirm a higher efficiency of the business. The results of this study confirm the participation role of independent members in the Board of Directors and these members have participated in governance decisions that are beneficial to the development of the business and beneficial to shareholders and investors. This finding is supported by Junus et al. (2022) when the authors argued that the Board of Directors has the ability to

select independent members with high competence, experience and intelligence, it can improve the performance of the Board of Directors and thus contribute to the development of the enterprise, which has the potential to improve returns for shareholders and investors.

Second, the research results confirm that pharmaceutical enterprises operating with external funding have poor business performance, conversely, pharmaceutical enterprises operating with their own capital have good business performance. This confirms that enterprises should consider using equity to finance investment and production activities, especially in the case of pharmaceutical enterprises with large working capital, they should use capital from within the business. This research result is consistent with the pecking order theory when it says that enterprises should prioritize the selection of internal capital before using external capital in production and business activities, thereby helping enterprises to ability to manage risk and increase independence in management decisions. According to the agency theory, there is a difference in information between enterprises and creditors, so enterprises choose equity sources that can help them easily access financial resources than debt sources, especially in the case of high economic growth and stock market growth.

Third, the study confirms that enterprises with a high proportion of state capital operate more effectively, confirming the efficiency of state capital flows in pharmaceutical enterprises. The pharmaceutical industry often requires large investment capital and is an industry that plays an important role in the social economy in ensuring the people's health care tasks. Therefore, effective use of state property resources helps to improve the ability to carry out the health care mission. This suggests for policymakers to continue to improve the efficiency of using upfront capital in pharmaceutical businesses to help pharmaceutical businesses the ability to develop more and more contributions to people's health care.

5. Conclusion

The Board of Directors is considered as the heart of the enterprise and plays an important role in the operation of the enterprise. The Board of Directors represents the enterprise to make governance decisions according to the orientation, strategy and requirements approved by the general meeting of shareholders. Research on the independence of the Board of Directors on business performance through a survey of 30 companies operating in the pharmaceutical industry on the Vietnamese stock exchange. Research results confirm that increased BOD independence will improve corporate profitability, thereby reflecting the effectiveness of independent members on the BOD. The study also shows that enterprises that depend on debt are often less effective, while businesses that operate on the charter capital often bring higher efficiency. The study also confirms the role of state capital in the enhancement the profitability of pharmaceutical enterprises.

Abstract

The research was conducted with the goal of analyzing the changes and challenges that FinTech technologies are creating for the bank's operations, including financial, customer and risk management activities. The article uses secondary data, research methods to synthesize, analyze and compare to evaluate the impact of factors in financial statements on the performance of banks. Research results show that 4 factors affect the research object, including: FinTech, ROA, ROE, NIM. From there, the article identifies the potential for development and proposes solutions to contribute to promoting the financial inclusion of FinTech in Viet Nam.

Keywords: *Commercial banks, FinTech, Impact, Operational efficiency, Viet Nam*

1. Introduction

Financial markets around the world were profoundly impacted by the internet revolution of the early 1990s. Technological advancements driven by the internet have had a profound impact on the banking and finance industry. Given its time-sensitive, information-intensive nature, it is clear that virtually every component of the value chain in a bank's operations benefits from the innovative use of web technologies. In Vietnam, with a young population and widespread use of smart devices, consumers are excited about this innovation. This is a ripe time for the rise of Fintech, which is having unprecedented impacts on the banking and financial industry worldwide. Research articles are being written to help consumers understand this new concept, and the Fintech industry is spreading globally with analysis and praise. The research team has compiled in-depth papers on Fintech from authors in many different countries, and the overview process can be divided into domestic and foreign groups. However, the Fintech industry has taken advantage of technology to launch internet platforms and may have direct competition with traditional financial institutions like

banks. This can be considered a matter of concern when many people mistakenly believe that Fintech only brings positive things to banks in general. Although there have been many studies on the relationship between Fintech and the financial-banking industry, most of them talk about the development of Fintech and the relationship between Fintech and banks.

Fintech is concluded that most are in the field of lending, risk management, consulting for robots and cryptocurrencies (Siddiqui, Z., & Rivera, C.A., 2022). Furthermore, some researchers have identified Fintech as a disruptive innovation, while some have identified it as an industry convergence and others have argued that Fintech is both. Based on these considerations, the authors researched and showed that FinTech's profile is more in line with the disruptive innovation model. In addition, because it is developed on the basis of information technology and telecommunications systems without the need for a wide network of branches and transaction offices like banks, the products and services provided by Fintech enterprises have been attracting more and more attention from a large number of customers (Hoang, H., 2020). The author has suggested that worries about the potential negative impact of banks on FinTech startups have gradually subsided and banks are now actively looking for opportunities to partner with FinTech startups. It can be seen that Fintech really has a strong impact on traditional banks, making a clear difference. Therefore, banks are now having policies to change and develop cooperation with Fintech companies.

However, whether Fintech has a positive or negative impact on the bank's performance, so far, there have been very few studies on this issue. Most studies focus on the Fintech wave and its factors that benefit the world. Therefore, this study was conducted to examine the relationship between Fintech and the performance of commercial banks. From there, making proposals and recommendations for the long-term cooperation and development of the two sides to promote the financial-banking industry of Vietnam.

2. Literature review

2.1. FinTech

FinTech is a company that is using technology to provide financial solutions using the internet and automated processing of information (Gabor & Brooks, 2017; Milian, Spinola, & de Carvalho, 2019; Zavolokina et al., 2016; Alt, Beck, & Smits, 2018; Gomber, Kauffman, Parker, & Weber, 2018; Puschmann, 2017). This innovation in the financial industry has led to cost reduction, high efficiency, rapidity, innovation, flexibility and improvement in the business processes (Zavolokina et al., 2016; Lee & Shin, 2018; Thakor, 2020).

FinTech also embeds innovations in financial education and literacy, investments, retail banking and cryptocurrencies (Gomber et al., 2018). The business models have transformed to provide customized services to the consumers without geographic or time-zone barriers as most of the services are automated. In addition, FinTech has helped in disintermediation (Thakor, 2020) and provided online platforms for trading, lending (crowdfunding and peer-to-peer, P2P) and asset management, for instance, robo-advising (Gomber et al., 2018; Alt et al., 2018; Lee & Shin, 2018; Puschmann, 2017). This intermediation is also achieved by infrastructure development, data analytics, big data and mobile devices (Lee & Shin, 2018)

2.2. Impact of FinTech businesses on banking business

The strong development of FinTech businesses that are existing competitors of commercial banks, the banking business is gradually shrinking along with the explosion of start-up activities in the financial sector. The question is “How does the presence of FinTech businesses affect the banking business?”. Recently, there have been a number of studies looking for answers, in which the study of Phan et al (2019) is noteworthy. By inheriting Consumer Theory and Breakthrough Innovation Theory as well as using quantitative models to assess the impact of FinTech activities on banking business, Phan et al. The analytical framework used to evaluate the impact of FinTech enterprises on the operation of commercial banks is the number of FinTech enterprises participating in the market (the natural logarithm of the number of FinTech enterprises present in the year). And the impact on the operational indicators of commercial banks such as NIM (Net Interest Margin), ROA (return on total assets), ROE (Return on equity). This study shows that the activities of FinTech enterprises have a negative effect on the business performance of commercial banks. Specifically, Aaker & Keller's (1990) Consumer Theory suggests that new services (such as those provided by FinTech businesses) that meet the same consumer needs may replace old services (such as those provided by traditional commercial banks). This theory states that the general attitude of customers towards service expansion is a dependent variable and depends on: The perception of quality is higher for the parent brand when the brand expands its service offerings; the ability to convert values that can be performed between two compatible products; compatibility between the two products; the difficulty of product development. Christensen's disruptive innovation or disruptive innovation theory (1997) suggests that new entrants who apply innovative technology to provide more accessible and cost-effective products and services can generate competition in the market. This theory asserts that disruptive innovation often begins with a product that does not perform as well as the current product, but after a period of improvement, the other product creates a rapid shift in the market. school. There are four stages of disruptive innovation: (1) Disruption; (2) Evolution; (3) Convergence and (4) Regeneration.

The impact of FinTech activities on the characteristics of banking business is not the same between different types of commercial banks (in terms of market value, operating time and ownership nature). Specifically: Firstly, FinTech has a stronger impact on large commercial banks than small commercial banks. The reason is that small-scale commercial banks adapt to technological innovation faster than large commercial banks; secondly, FinTech has a stronger impact on commercial banks that have been operating for a long time than young commercial banks; Third, FinTech affects state-owned banks more strongly than privately owned banks.

2.3. The relationship between FinTech businesses and banking businesses in Viet Nam today

In Viet Nam, the first FinTech enterprises have been licensed by the state bank to operate since 2008, but only operate mainly in the field of payment and money transfer. Although newly appearing, FinTech businesses are growing very quickly in number and

scale. According to the Payment Department - State Bank, the number of FinTech enterprises participating in providing services in the Viet Nameese market has increased by nearly four times, from 40 at the end of 2016 to the end of 2021, has grown to more than 150 businesses, spread across many different fields, however, accounting for a large proportion is in the payment segment (60.526% compared to all areas of operation of FinTech enterprises), followed by are crowdfunding (accounting for 10,526%), Bitcoin/Blockchain (7.895%), POS/mPOS (5,263%), data management (5,263%), personal finance (5,263%), money lending (2,632%) and online price comparison (2,632%).

In addition, as of November 16, 2021, 46 non-banking organizations have been licensed by the State Bank to provide payment intermediary services, including financial switching, electronic clearing, payment gateway, support remittance, support collection/payment, e-wallet.

3. Method

3.1. Data collection

The data in this research includes 25 banks, including state-owned commercial banks and joint-stock commercial banks in Viet Nam. The data for the research is mainly a secondary data Author's Compilation based on audited consolidated financial statements of 25 commercial banks and was selected from official websites. Because the consolidated financial statements summarise the entire financial and business position of the bank. In addition, the research team selected data from 2018 to 2022, the period when FinTech started a strong growth chain.

3.2. Hypotheses

Based on the literature review and theoretical framework relating to the research topic, some hypotheses are designed as below:

Hypothesis 1: FinTech is the opposite of ROA.

Hypothesis 2: There exists a negative relationship between ROE and FinTech.

Hypothesis 3: If FinTech increases, NIM decreases.

2.3. Research model

The research model of the relationship between FinTech and the operational efficiency of commercial banks: $BP_{it} = \beta_0 + \beta_1 FinTech_t + \beta_2 + X_{it} + \beta_3 Z_{it} + u_i + v_t + \varepsilon_{it}$ (1)

In there:

BP: measures the performance of goods, with the bank's representative variables ROA, ROE and NIM.

FinTech: Natural logarithm of the number of FinTech companies present in the year t

X: includes bank-specific variables.

Z: group of macro variables.

U_i is a business performance component that varies across banks and has not been included in the model.

vt is a time-varying component affecting business performance that has not been included in the model and a random error component.

2.4. Research Approaches

According to Thai Van Dai and Tran Viet Thank Tru (2018), there are three basic econometric models commonly used to analyze data tables, including: (1) Pooled Ordinary Least Squares (Pooled OLS), (2) FEM (Fixed Effect Model) and (3) REM(Random Effects Model).

The OLS regression method is commonly used in econometrics because its outstanding advantage is that it is not too complicated but effective. With some initial assumptions, this method will easily determine efficient, unbiased, and robust estimates. The test results are good if they have the following characteristics: (1) the variables are endogenous and do not have multicollinearity; (2) the residuals have no constant variance and are not autocorrelated.

The researchers used panel data, which is a combination of cross-sectional and time-series data, in their study. As a result, some OLS assumptions will violate many sequences. One of the major disadvantages of OLS being too tight on the cross units is that the test results obtained will be distorted and using this result for analysis is a mistake. Therefore, the research team used the fixed effect model FEM (fixed effect model) and the random effect model REM (random effect model) to overcome the shortcomings of the OLS model. A popular panel data model is the fixed-effects model (FEM).

The Random Effects Model (REM) assumes that the model's intercept is a random factor, implying that controlling for each characteristic varies across banks but has no correlation. Model residuals and independent variables are discussed. In this study, a regression equation was built to evaluate the influence of these variables on the bank's performance in order to detect the relationship between independent and dependent variables. The following step is to put the concept to the test. The autocorrelation test computes mean and coefficients in the above equation for each hypothesis.

4. Results

4.1. The impact of FinTech on return on assets (ROA)

We use Hausman testing to compare the FEM and REM. Based on this result, we continue to test the suitability of the OLS and REM model by using Breusch and Pagan Lagrangian multiplier testing.

Table 1. Results of choosing the most suitable model for regression analysis

Test	OLS	REM	FEM
Hausman		Prob>chi2 = 0.2404	
Breusch and Pagan Lagrangian multiplier	Prob > chibar2 = 0.2532		

Source: Author's Compilation

The model using ROA as variable, when comparing the suitability of the FEM and REM model, the Hausman test will be used with the null hypothesis: The preferred model is REM. The value of $\text{Prob} > \chi^2 = 0.2404 > 0.05$, then H_0 is accepted, or the REM model is chosen.

Next, Breusch and Pagan Lagrangian multiplier testing verifies the appropriateness of H_0 : The more suitable model is OLS. The result of $\text{Prob} > \chi^2 = 0.2532 > 0.05$ indicates that the Pooled OLS model is the one to be chosen.

As POOLED OLS is the test to be chosen, the number of errors in the regression model can be less than using FEM and REM to analyse. There are multicollinearity and autocorrelation phenomena

Table 2. Results of multicollinearity and autocorrelation phenomenon

Phenomenon	ROA	
	Multicollinearity	VIF = 6.86
Autocorrelation	Prob > F = 0.0002	Have autocorrelation

Source: Author's Compilation

Table 2 reveals that the model has an autocorrelation phenomenon. To overcome the model's defects, the Feasible General Least Squares (FGLS) estimator will be employed.

Table 3. FGLS regression model

Independent variables	Dependent variable	
	ROA	
	Coefficient	p-value
FINTECH	-0.010025 ***	0.000
SIZE	0.0008889 ***	0.000
LOAN	0.0896977 ***	0.000
LLP	0.0083379 ***	0.000
EQUITY	0.0748911 ***	0.000
COST	-0.0081674 ***	0.000
DEPOSIT	-0.0108168 ***	0.000

*****and * represent statistical significance at the 1% and 10% levels, respectively.**

The equation about the impact of FinTech on return on assets using

$$ROA = 0.0056071 - 0.010025 \text{ FinTech} + 0.0008889 \text{ SIZE} + 0.0896977 \text{ LOAN} + 0.0083379 \text{ LLP} + 0.0748911 \text{ EQUITY} - 0.0081674 \text{ COST} - 0.0108168 \text{ DEPOSIT} + 0.7400288 \text{ INCDIV} + 0.0086964 \text{ HHI} + 0.0980576 \text{ GGDP} - 0.0083343 \text{ SFML}$$

According to Table 3, independent variables have considerable impacts on *return on assets (ROA)* at the statistically significant level of 1%. The results point out that there is a negative correlation between FinTech and ROA; COST and ROA; DEPOSIT and ROA; and SFML and ROA. The negative correlation between FinTech and ROA indicates that commercial banks in Viet Nam are being competed by FinTech companies.

There is a positive correlation of SIZE, LOAN and EQUITY with ROA in statistical significance. Research suggests that banks that use less debt will have lower returns because of the risk-reward relationship, lower risk leads to lower returns.

With the group of variables of bank characteristics, there is a positive correlation of SIZE, LOAN and EQUITY with ROA in statistical significance. Research suggests that banks that use less debt will have lower returns because of the risk-reward relationship, lower risk leads to lower returns.

4.2. The impact of FinTech on return on equity (ROE)

Similar to the model above, the authors continue to choose the most suitable model for the regression analysis. By comparing the FEM and REM model and REM and POOLED OLS model.

Table 4. Results of choosing the most suitable model for regression analysis

Test	OLS	REM	FEM
Hausman		Prob>chi2 = 0.6747	
Breusch and Pagan Lagrangian multiplier	Prob > chibar2 = 1.0000		

The model using ROE as variable, when comparing the suitability of the FEM and REM model, the Hausman test will be used with the null hypothesis: The preferred model is REM. The value of Prob>chi2 = 0.6747 > 0.05, then H0 is accepted, or the REM model is chosen.

Next, Breusch and Pagan Lagrangian multiplier testing verifies the appropriateness of H0: The more suitable model is OLS. The result of Prob>chi2 = 1.0000 > 0.05 indicates that the Pooled OLS model is the one to be chosen.

Table 5. Results of multicollinearity, autocorrelation and heteroskedasticity phenomenon

Phenomenon	ROE	
Multicollinearity	VIF = 3.61	No multicollinearity
Autocorrelation	Prob > F = 0.0059	Have autocorrelation

Source: Author's Compilation

Table 5 reveals that the model has autocorrelation. To overcome the model's defects, the Feasible General Least Squares (FGLS) estimator will be employed.

Table 6. FGLS regression model

Independent variables	Dependent variable	
	ROE	
	Coefficient	p-value
FINTECH	-0.0131265 **	0.023
SIZE	0.0020089 ***	0.000

GGDP	0.2277552 ***	0.000
SFML	-0.0226014 ***	0.000
Cons	-0.0025759	0.837

Source: Author's Compilation

***** and ** represent statistical significance at the 1% and 5% levels, respectively.**

The equation about the impact of FinTech on return on equity using

$$ROE = -0.0025759 - 0.0131265 \text{ FinTech} + 0.0020089 \text{ SIZE} + 0.2351934 \text{ LOAN} + 0.0198848 \text{ LLP} - 0.342351 \text{ EQUITY} - 0.0188455 \text{ COST} - 0.0298587 \text{ DEPOSIT} + 2.351794 \text{ INCDIV} - 0.0246217 \text{ HHI} + 0.2277552 \text{ GGDP} - 0.0226014 \text{ SFML}$$

According to Table 6, all independent variables have considerable impacts on return on equity (ROE) at the statistically significant level of 1% and 5%. The results point out that the negative correlation between FinTech and ROE is 0.0131265 that means the increase of FinTech companies affects ROE. This puts great pressure on the bank managers in maintaining the effective return on investment of shareholders. In Viet Nam. Commercial banks are in the process of restructuring, so there is a high demand in

raising capital and the appearance of FinTech companies can create strong competition not only between FinTech companies and banks but also between FinTech companies and banks. and between banks.

With the effect of the group of bank characteristics, SIZE, LOAN, LLP and INCDIV have a positive relationship with ROE at 1% significance level. In contrast to ROA, the relationship between EQUITY and ROE is inverse. In addition, we also find DEPOSIT and COST have a negative relationship with ROE.

The impact of the group of macro variables on ROE is seen in the experimental results in Table 6 showing that the variable HHI and SFML are negatively correlated with ROE and GGDP has a positive relationship with ROE. All these relationships are statistically significant.

4.3. The impact of FinTech on net interest margin (NIM)

Similar to the model above, the authors continue to choose the most suitable model for the regression analysis. By comparing the FEM and REM model and REM and POOLED OLS model.

Table 7. Results of choosing the most suitable model for regression analysis

Test	OLS	REM	FEM
Hausman		Prob>chi2 = 0.9884	
Breusch and Pagan Lagrangian multiplier	Prob > chibar2 = 0.3499		

Source: Author's Compilation

The model using ROE as variable, when comparing the suitability of the FEM and REM model, the Hausman test will be used with the null hypothesis: The preferred model is REM. The value of Prob>chi2 = 0.9884 > 0.05, then H0 is accepted, or the REM model is chosen.

Next, Breusch and Pagan Lagrangian multiplier testing verifies the appropriateness of H0: The more suitable model is OLS. The result of Prob>chi2 = 0.3499 > 0.05 indicates that the Pooled OLS model is the one to be chosen.

Table 8. Results of multicollinearity and autocorrelation phenomenon

Phenomenon	NIM	
Multicollinearity	VIF = 3.12	No multicollinearity
Autocorrelation	Prob > F = 0.3248	No autocorrelation

Source: Author's Compilation

Table 8 shows that the model has no autocorrelation and no multicollinearity phenomenon. So, based on the research results above, we decide to choose the Pooled OLS as the best suitable model.

Table 9. POOLED OLS regression model

Independent variables	Dependent variable	
	NIM	
	Coefficient	p-value
FINTECH	-0.0049173 ***	0.009
SIZE	0.0006383 ***	0.000
LOAN	0.0649434 ***	0.000
LLP	0.0070191 ***	0.000
EQUITY	0.0934895 ***	0.000
COST	0.0063971 ***	0.000
DEPOSIT	-0.009622 ***	0.000
INCDIV	-0.5128778 ***	0.000
HHI	-0.0066449 ***	0.000
GGDP	-0.0499287 ***	0.000
SFML	-0.0055651 ***	0.002
Cons	-0.0007077	0.861

Source: Author's Compilation

*** represent statistical significance at the 1%.

Results from Table 9 illustrate that the reasonable relationships between all of the independent variables and the dependent one NIM are at the statistically significant level of 1% and 5%.

The negative correlation coefficient between FinTech and NIM is 0.0049173. Compared to ROA and ROE, the impact of FinTech on NIM is less.

The effect of the group of bank characteristics on NIM is shown in Table 9 that DEPOSIT and INCDIV have a negative relationship with NIM. This is completely reasonable, banks diversify products to increase income and banks can reduce interest rates to increase competition in the credit market, so profit margins are lower. SIZE, LOAN, LLP, EQUITY and COST have a positive relationship with NIM at the statistical significance level.

The experimental results in Table 9 show that all three variables in the group of macro variables have a negative relationship with NIM.

5. Discussion and Conclusion

FinTech is a new field with strong growth potential in the future thanks to the universal financial needs of each country. The boom of FinTech has been attracting great attention from financial institutions and regulatory agencies around the world, and Viet Nam is also in that trend. With its preeminent features, FinTech will be an effective tool to help our country move towards the goal of providing comprehensive finance to the people, contributing to national construction.

FinTech is a rapidly growing financial technology field, bringing many opportunities and challenges for banks. To adapt to the development of FinTech, banks can apply some of the following solutions:

First, create a flexible and dynamic working environment: FinTech often has a very fast development speed, so banks need to ensure a flexible and dynamic working environment, to be able to adapt to the changing environment. rapid changes and new product development.

Second, cooperation with FinTech startups: Banks can cooperate with FinTech startups to develop new products and services, helping to strengthen their competitiveness and reposition their position in the market.

Third, create an open technology platform: Banks can create an open technology platform, helping to connect different applications and services, creating favourable conditions for customers to use products. and services of FinTechs.

Fourth, strengthening information security: FinTech is gradually becoming an attack target of hackers and hackers, so banks need to strengthen information security, ensure the safety of customer data and bank.

Fifth, focus on customer experience: Customer experience is an important factor to make a difference and compete in the market. Banks need to focus on customer experience, ensuring convenience and simplicity in using their products and services.

Sixth, developing new products and services: Banks need to develop new products and services, taking advantage of new technologies such as blockchain, artificial intelligence (AI) and data mining (big data) to provide smarter and more efficient financial solutions to customers.

Abstracts

In the context of the stormy development of technology, Blockchain Technology (BC) is considered as a key and influential technology in many fields including accounting and auditing which require accuracy and agility. With the aim of discovering the factors affecting the adoption of Blockchain Technology by accountants and auditors in Vietnam, in this study, we investigate the adoption of BC by accountants and auditors. The importance of BC features and their task needs are the first things we consider. We believe these factors influence BC's adoption in a favorable direction. We also evaluate accounting and auditing knowledge. A survey was conducted by sending questionnaires to accountants and auditors about their feelings about the acceptance of BC and 126 valid questionnaires were obtained. The research results show that both the importance of BC features and task needs-two prerequisites leading to the intention to use BC have a positive influence. Accounting and auditing knowledge directly affect the above two variables.

Keywords: *Accountants, Accounting, Auditing, Auditors, Blockchain Technology, Features, Task needs*

1. Introduction

The increasing automation of accounting information makes it imperative for auditors to collaborate with organizations in the design and implementation of BC-based solutions to facilitate self-actualization and self-monitor business transactions (Dai and Vasarhelyi, 2017; Nehmer and Appelbaum, 2020; Liu, Wu, and Xu, 2019; Fuller and Markelevich, 2020). Unlike centralized databases, BC allows direct transactions between parties (called nodes), eliminating the need for reconciliation, instant asset tracking, fast settlement of

transactions, and translation (Lacity, 2018). It provides a secure infrastructure for transactions between strangers with no central authority. This can reduce transaction costs, speed up payments, improve the audibility of transactions, and increase monitoring efficiency (Dai and Vasarhelyi, 2017; Liu et al., 2019). Other BC features (e.g., data integrity, instant information sharing, and programmable and automated control of processes) facilitate the development of new accounting systems to strengthen internal control and avoid fraud (Dai and Vasarhelyi, 2017; Carlin, 2019; Cai, 2021; Ruckeshauser, 2017). BC can fundamentally change accounting and auditing practices (Kokina, Mancha, and Pachamanova, 2017; Sheldon, 2019; Liu et al., 2019; Moll and Yigitbasioglu, 2019).

Currently, BC must overcome certain challenges to become the mainstream technology in accounting and auditing (Thompson, 2018; Fuller and Markelevich, 2020). As an infrastructure technology, it can be used for specific solutions such as three-item accounting systems or smart contracts (Dai and Vasarhelyi, 2017; Sheldon, 2019; Rozario and Thomas, 2019). However, many solutions are still at the concept stage and important design features have not been validated.

At present, studies on the applications of BC in accounting and auditing focus on the exploration of its technical capabilities, but seldom address how accountants and auditors may adopt this technology. This leaves a gap in the literature as knowledge of the determinants of its adoption may interpret how auditors can use BC. This study addresses the gap by answering the research question: What factors influence the intention of an accountant and auditor to adopt BC?

The adoption of new technology would be influenced by a person's knowledge and experience about it, as well as the context in which it is used, from the standpoint of rational decision-making. As a result, in this study, we examine accountants' and auditors' accounting and auditing knowledge. We consider two factors that directly affect the intention to use BC, which are the importance of BC's features, and the task needs of accountants and auditors. At the same time, we also consider the relationship between these two factors.

2. Literature review and Theoretical basis

2.1. Literature review

We followed the structured approach of Webster and Watson (2002) to guide the review of the literature. First, we set the research scope to the field of accounting and auditing, and use the keywords accounting, auditing, BC, and apply to search documents from databases such as EBSCO Business Source Complete, Science Direct, Wiley Online Library, and American Accounting Association of Electronic Library. Based on the search results, we used forward and backward references (Webster and Watson, 2002) to find additional articles. Next, we conducted a structured review of the articles and used an author-centered approach to summarize the literature by bringing together the diverse factors analyzed in each study. In a thematic study, Dai and Vasarhelyi (2017) use the TOE framework to examine challenges to the adoption and use of BC by accountants and auditors. The highlight of this paper is that the application of BC in accounting and auditing has been

hampered by technical complexity, financial resources and time, difficulty in scaling other partners, and the need to change processes and business when applying technology.

In another article, Woodside et al. (2017) study the main drivers and drawbacks of BC, such as transparency, regulation, cost, volatility, user control, and quality technique. Besides, when designing a BC-based transaction processing system, Wang and Kogan (2018) argue that the trade-off between security and transparency is a major barrier to adoption. In the report of Tang and Tang (2019), they argue that regulatory barriers and global value for emissions subsidies are two challenges to BC solution adoption. Prewett et al. (2020) also conceptually analyze some of the barriers to BC adoption, such as scalability, lack of standardization, and regulatory uncertainty.

The literature provides little justification of blockchain's value to accountants and auditors (Coyne and McMickle, 2017), which limits the application of blockchain in accounting and auditing. Besides, past research has more or less relied on the TOE framework (Tornatzky, Fleischer, and Chakrabarti, 1990) to study factors important to adoption decisions. Although the TOE framework is broad and flexible to accommodate multiple factors, further development is needed. In particular, individual factors and task characteristics should be considered for their impact on innovation adoption (Baker, 2011).

Most of the studies mentioned above are conceptual in nature and they explore a range of factors in the use of BC technology. Therefore, we conduct research on the topic **“Awareness of accountants and auditors on the application of Blockchain Technology in Vietnam”** to learn more about this topic as well as overcome the shortcomings of previous studies.

2.2. Theoretical basis

The theory of task-technology fit (TTF): Task-Technology Fit theory (TTF) (Goodhue and Thompson, 1995; Goodhue, 1998) is the degree of fit between everyday tasks and perceptions with the use of technology. This theory holds that the characteristics and functions of technology will determine the performance of individual tasks and meet the individual requirements of technology users to support the performance of tasks. Since these studies were introduced, TTF theory has been widely applied to understanding how information systems (ISs) are used and the consequences of their use in a variety of personal and professional contexts. The literature suggests that TTF can be conceptualized as a mediating effect (Hoehle and Huff, 2012), that is, consistent with a mediating role (Parker and van Witteloostuijn, 2010; Yu, Chavez, Jacobs, and Wong, 2020). According to Venkatraman (1989), this approach suggests the existence of an intervening (or indirect) effect between a premise and its consequence. For example, when studying the impact of innovative ideas and lean practices on operational performance, Yu et al. (2020) find that innovative ideas affect performance indirectly through the mediation of lean practices, but the regulatory impact of lean practices is not supported. In other words, innovative ideas must align with lean practices to have a significant impact on performance. Likewise, Zhang et al. (2011) suggest the fit between task attributes and technical characteristics as the link between these two factors and they develop a matching matrix to represent the concordance between task attributes.

2.3. Research Model

Based on TTF theory, the authors study the influence of BC features and task needs with the intention to use this technology of accountants and auditors. BC possesses a diverse set of features but not all these features are suitable for accounting and auditing. Before using, accountants and auditors should check those features against their task needs. Grover et al. (2019) have put together a list of 13 BC features, ranging from decentralization and immutability to data integrity and efficiency. Based on this list, we remove some overlapping items (e.g., data integrity, testability, shareability, reliability) and controversial items (e.g., performance efficiency and lack of intermediaries may not be true due to current developments in the BC), and we use the phrase “solution to double spend” to better reflect the audit landscape.

First, a timestamped data structure distinguishes BC from other data storage technologies such as relational databases. One benefit of this structure is to provide a documented timeline of an asset or contract (Tang and Tang, 2019). In addition, the transaction sequence indicates a change in asset ownership or the performance of a contract, such as mortgage payments (Appelbaum and Nehmer, 2017). Auditors can use these timestamps to verify assets and transactions.

Second, data protection refers to the use of hash functions to generate hashes to encrypt and protect data. A hash function has several unique features: (a) it is short and of fixed length; (b) its value is unpredictable, unchangeable, and unique; and (c) it can be combined with other transaction data to create a new hash function (Kokina et al., 2017). These features enhance trust in data and can drive accountants' and auditors' acceptance of the BC.

Third, data immutability adds another layer of protection to data by linking blocks of transactions together, making data only dependable and irreversible. After a block is prepared, hashed, and embedded in the next block, transactions in the block cannot be modified without altering subsequent blocks (theoretically impossible since it is a decentralized and public ledger). This can increase trust in the data. Although efficiency is sacrificed, this problem can be mitigated by using permissioned blockchains and less complex algorithms (Dai and Vasarhelyi, 2017).

Fourth, the decentralized ledger is another important feature of BC. A challenge to traditional auditing is also a single point of failure (Peters and Panayi, 2016): Data can be compromised if the centralized ledger is compromised from the outside or tampered with from the inside (e.g., management violation). The decentralized ledger helps to mitigate this risk as any data tampering would require the collusion of the majority of participants (i.e., an attack of 51% or more participants) (Sheldon, 2019), which is extremely difficult. In addition, the distributed ledger provides an opportunity to check transactions continuously in near real-time (Moll and Yigitbasioglu, 2019), thereby increasing the trust and confidence of the auditors (Kokina et al., 2017). In certain cases, the testing process can be automated using smart contracts (Rozario and Thomas, 2019).

Fifth, user anonymity can be achieved by using the public keys of the transaction participants. One concern about distributed public ledgers is the loss of business secrets and the security of financial data (Wang and Kogan, 2018). In addition to creating a private BC that can enhance tamper resistance, participants can use their public key as a token for transactions to protect some measure of security.

Finally, BC offers a solution to double-spending. Double spending occurs when a company doubles and thus inflates its assets (e.g., selling a product without adjusting its inventory). BC effectively solves this problem by adding traceability and data audibility, providing a double-spend solution, and preventing fraudulent transactions (Moll and Yigitbasioglu, 2019). This characteristic is very important for auditors.

Accountants' and Auditors' acceptance of BC at work is shaped by all of the features discussed above. However, each feature cannot be certain if stand alone. Usually, these features always come together, a blockchain-based solution cannot be developed with only one or some of the above features. In addition, these features reinforce each other. For example, timestamps support traceability and the ability to check data. Anyone trying to interfere with a previously validated transaction must control (control, manipulate) all subsequent blocks in the chain. Meanwhile, the decentralized ledger requires significant computing power to form on the blockchain system. This is not likely to happen so it can reduce the risk of tampering. From a configuration theory perspective (Meyer, Tsui, and Hinings, 1993), these distinct features appear together to form a set that creates synergies for problem-solving. Therefore, we predict that the accountants' and auditors' intention to use BC is generally influenced by them. We hypothesize that:

H1: Accountants' and Auditors' perception of the importance of BC features is positively related to their intention to use.

H2: Accountants' and Auditors' perceived task need is positively related to their intention to use BC.

Many of the promising features that BC offers also pose challenges (Coyne and McMickle, 2017). For example, the fact that BC is essentially a bookkeeping technology, it does not guarantee real-world transactions and still requires manual intervention by accountants and auditors (Schmitz and Leoni, 2019). In addition, not all business transactions must be recorded on the BC: The transactions that are most relevant to the BC are those related to payments and receipts; the remaining transactions must continue to be processed using an existing system such as an Enterprise Resource Planning (ERP) system (Schmitz and Leoni, 2019; Fuller and Markelevich, 2020).

Moreover, it requires the knowledge and expertise of accountants and auditors in the development of blockchain-based solutions such as three-entry systems and smart contracts (Dai and Vasarhelyi, 2017), so its role is growing rather than disappearing. Therefore, the individual, separate features of the BC are not meant to motivate the decision to apply it in work, but instead, how those features meet the needs and tasks of accounting and auditing. of the organization is also a factor that can be relied on to make decisions.

H3: Accountants' and Auditors' perceived the importance of BC features to be positively related to their task needs.

H4 (Settling): The influence of the perceived importance of blockchain features on the intention to use them is mediated by the task needs of the accountants and auditors.

Knowledge and perception of auditors: We study the perceived premise of BC features and how mission-critical needs are. Specifically, accountants' and auditors' knowledge and awareness are key factors for raising their awareness and providing an appreciation for the dynamics, needs, and specifics of new technology (Dinev and Hu, 2007; Bulgurcu et al., 2010). Dai and Vasarhelyi (2017) raised the question of what knowledge managers, accountants and auditors should collect and receive to prepare for the use of ISs blockchain-based accounting? From the innovation diffusion point of view (Rogers, 1995), we argue that accountants' and auditors' knowledge and perceptions regarding new technology influence their intention to apply in their work.

H5a: Accountants' and Auditors' accounting knowledge is positively related to the perceived importance of blockchain features.

H5b: Accountants' and Auditors' accounting knowledge has a positive relationship with perception of task needs.

In addition, we have investigated several factors such as demographics as a control variable, including gender, age, education, professional qualifications, professional experience and preliminary understanding of BC. According to Venkatesh, Morris, Davis, and Davis (2003), the BC adoption literature shows that these factors can influence the intention to use new technology.

The research model is shown in figure 1.

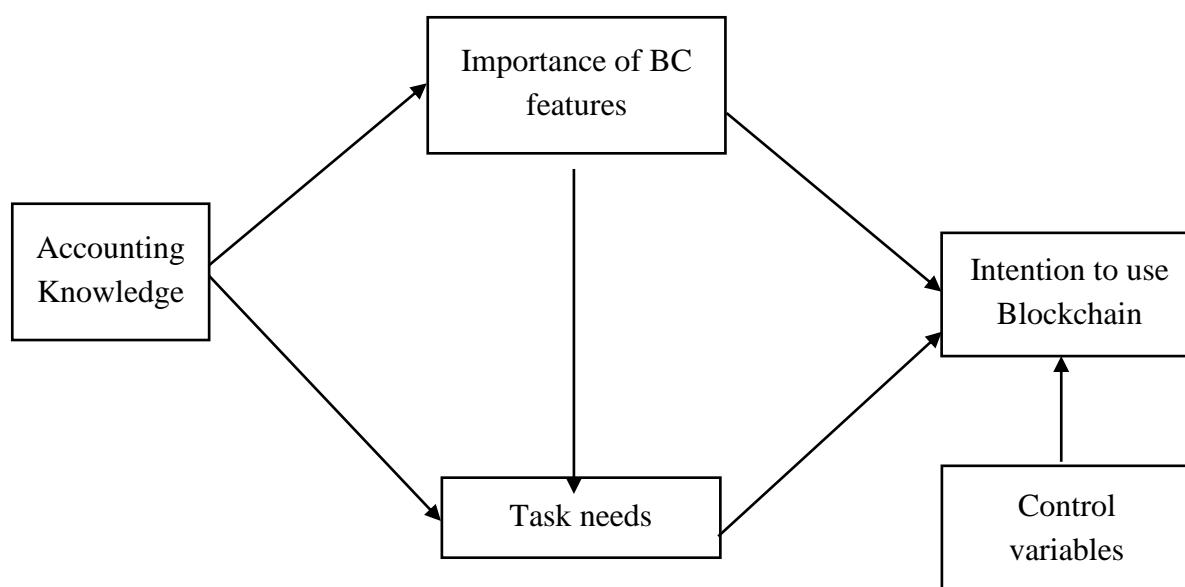

Figure 1. Theoretical model of factors affecting Awareness of accountants and auditors on the application of Blockchain Technology in Vietnam

Source: The research team

3. Method

The study uses qualitative and quantitative method and divided into two processes: Stage 1: Qualitative research: interviewing, collecting expert opinions.

Stage 2: Quantitative research: information collected from questionnaires, analysing, data processing and model testing.

The questionnaire was designed based on the content of the TTF theory mentioned above, as well as consulting from previous studies. Since then, the authors have revised it to suit the Vietnamese context. At the same time, the questionnaire was checked with information from the opinion of the science instructor of the National Economics University and auditor manager and CFO of a manufacturer. The reliability of the survey instrument was tested by statistical methods and partial least squares method PLS (Gefen, Rigdon and Straub, 2011). The PLS method, a component-based structural method model, is more suitable for data analysis. Besides, the purpose of this study is to discover new relationships between the structures, so the PLS method is a suitable choice to explore. The authors used SmartPLS 4 (Ringle, Wende and Becker, 2015) to perform the test.

4. Results

4.1. Reliability and validity test

First, we examined the psychometric properties of the measurements. Reliability was tested using Cronbach alpha and composite reliability, and convergent value was tested using Average Variance Extracted (AVE). The discriminant validity was tested based on the comparison of the square roots of the AVE of the constructs and their correlation with other constructs. The results are shown in Table 1, showing that the psychometric properties of the measurements are appropriate because the reliability is greater than 0.7 except for the control variables whose cronbach alpha is less than 7 and the AVE is above 0.5. Next, we tested the quality of the variables by looking at the load factor and found that there were some variables of poor quality and should be removed from the model. After the removal, noticing any problems, we confirmed the discriminant validity.

In general, the target audience recognizes the need for BC in their work because they believe that their work can be more effective if they adopt BC.

A positive sign is that the mean value of intention to use BC is 51.8%, which indicates that in general the subjects perceive the need for BC.

Table 6: Construct reliability and validity

	Cronbach's alpha	Composite reliability	Average variance extracted (AVE)
Accounting knowledge	0.912	0.939	0.794
Control variables	0.907	0.953	0.911
Task needs	0.932	0.945	0.711
Importance of BC features	0.907	0.928	0.683
Intention to use BC	0.780	0.844	0.536

Source: The research team

4.2. Test the hypothesis

The sample size collected by the authors is $n = 126$, so we used the partial least squares (PLS) method to test the hypotheses. We used SmartPLS 4 software with a warm-up procedure performed with 5000 samples to check the significance of the coefficients. After running the data, the results show that both the importance of BC features and task needs-two preconditions for intention to use BC have a positive influence. The significance of BC features ($\beta = 0.486$, $p = 0.000 < 0.05$) has a significant impact on intention to use BC, thereby accepting hypothesis H1. The task needs of accountants and auditors also has a significant influence ($\beta = 0.246$, $p = 0.026 < 0.05$), so hypothesis H2 is accepted. The association between the importance of BC features and task demand is positive with $\beta = 0.398$, $p = 0.000$), accepting the drop of H3.

Next, we test the intermediate effect (hypothesis H4). From the output of SmartPLS, the authors derive an indirect effect of the importance of BC features on intention to use. The indirect effect is significant, thereby accepting hypothesis H4. In addition, we follow the Baron-Kenny method (Baron and Kenny, 1986) to check whether this is complete or partial reconciliation. If there is no mission need, the importance of BC's features has little impact on intention to use. This suggests that the task needs to completely mediate the impact of technology features on blockchain intentions. This analysis answers RQ1: The technological features of the blockchain have an indirect impact on the intention to use, which is entirely dependent on the needs of the task. In other words, BC features must match the mission needs to drive adoption of the technology.

For indirect variables, accounting knowledge has a positive effect on both the importance of BC features ($\beta = 0.676$, $p = 0.000 < 0.05$) and task needs ($\beta = 0.545$, $p = 0.000 < 0.05$). This result accepts both H5a and H5b.

The result is shown in Figure 2.

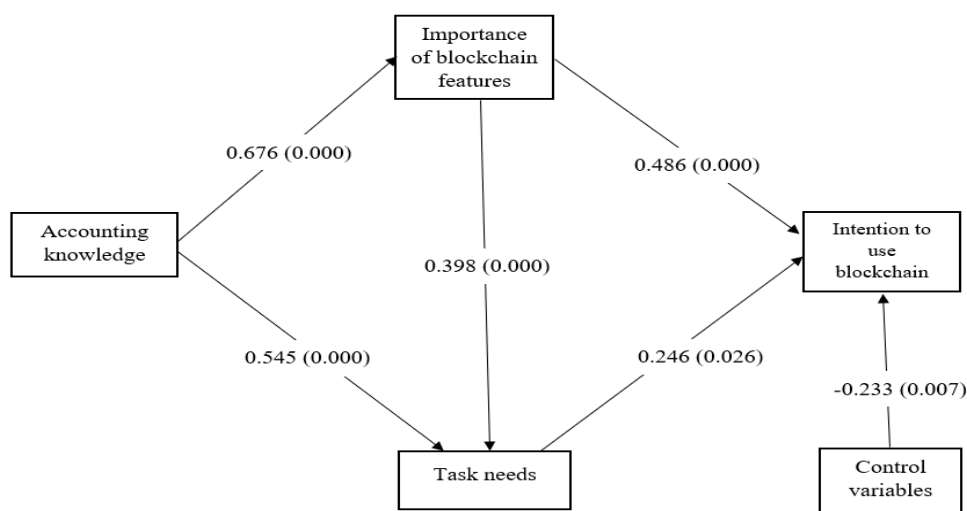

Figure 2. Test of the research model

Source: The research team

4.3. Discussing research results

In this study, we conduct an empirical test on the factors affecting the intention to use BC of accountants and auditors from the perspective of TTF. We find that the task needs of accountants and auditors have a direct influence on their intention to use BC (H2) and the importance of BC features to have an impact indirectly through the mediating role of task needs (H4). This confirms our conjecture about the fit-as-mediation in the use of BC and highlights the importance of using BC to support accounting and auditing tasks. In addition, accountants' and auditors' knowledge of accounting also affects their perception of the importance of BC features and task needs (H5a, H5b), which confirms the importance of accounting knowledge in promoting the intention to use BC.

The importance of the features of BC has the same direction and has the strongest impact on the intention to use BC ($\beta = 0.486$, $p = 0.000$), thereby accepting hypothesis H1. The research team's results are consistent with those of Yuan Li and Ahmad H. Juma'h (2020). This can be easily understood because before putting new technology into use, accountants and auditors must carefully understand its characteristics, features, advantages, and disadvantages, thereby considering whether it is suitable for the environment, conditions, and applications in their work or not. BC features can greatly increase work efficiency and effectiveness.

Task needs has a positive effect on Intent to use BC ($\beta = 0.232$, $p = 0.032$), thus accepting hypothesis H2, but the effect is not as strong as the Importance of BC characteristics. A technology with many outstanding features and characteristics but without suitable performance in work, the application level will also be lower. BC has many features that are applied not only to the Accounting - Auditing industry but also to the Finance - Banking industry, ... Therefore, accountants and auditors must also learn about BC to make a suitable decision for BC with its job needs. In addition, the consideration of job needs also depends on the environment and conditions of the company or business. There are many places that are not eligible to train as well as apply BC in work because of extra costs. If it is not required and necessary, companies and businesses will not adopt it. In Vietnam, many accountants and auditors are still not familiar with the application of new technology, which leads to less influence of task needs to Intention to use BC. However, BC has a great influence and meets many needs in accounting and auditing work, so the task needs factor still has a positive and direct impact on the intention to use BC.

As detailed research results above (including hypothesis H5a, H5b - Accounting knowledge of accountants), auditors have a positive relationship with the importance of BC features with $\beta = 0.473$, $p = 0.000$ and task needs with $\beta = 0.391$, $p = 0.000$). This result is also similar to the research results of Yuan Li and Ahmad H. Juma'h (2020) and Handoko et al. (2020). Reality has proven that to be able to apply any new technology to work, each accountant and auditor must equip themselves with a solid foundation of professional knowledge, to be able to decide for themselves flexibly and define and apply standards in a

reasonable manner. This can assess whether accountants and auditors are really proactive, absorbing new solutions, and applying based on available background knowledge to maximize their professional strengths. The relationship between accounting knowledge is closely related to the importance of BC features and task needs.

5. Solution and conclusion

5.1. Solution

The government needs to finalize legal documents to guide the use of BC technology. In the near future, it is possible to sign a treaty with the governments of other countries regarding the comprehensive innovation of national information technology, thereby contributing to promoting new technologies as well as BC technologies to be strongly developed and applied in more organizations and businesses.

For Ministry of Finance, Ministry of Science and Technology, and Ministry of Information and Communications: Soon finalize legal documents to guide the use of BC technology for businesses as well as accountants and auditors to comply. Besides, after completing the legal institutions related to BC technology, the Ministries can organize training courses on the application of BC in accounting and auditing; thereby, helping businesses, organizations, accountants, and auditors themselves consolidate their knowledge of technology and software, especially BC technology.

For accounting and auditing companies: First of all, those charged with governance, boards of directors and managers of organizations and businesses need to recognize that the application of BC technology in their work will bring great benefits in saving costs and storing and securing information and data. Therefore, accounting and auditing companies need to actively research, learn and understand BC technology, to be able to calculate the costs and benefits of applying this technology in their work. From the analysis results of the research team, it is found that the importance of BC features has a strong impact on the intention to use BC, so businesses need to help accountants and auditors members understand the features of BC in detail. For this to achieve high results, businesses can hire experts to disseminate and train knowledge about BC first for business leaders, then accountants and auditors. They should be aware that BC brings a lot of distinct benefits to businesses. In addition to the importance of BC features, task needs are also a factor that directly affects the intention to use BC. The use of new technology in any business will face many difficulties in the beginning. Therefore, to increase the application of BC in a feasible way, businesses can use KPIs including evaluation criteria for the use and completion of work when applying BC. To be able to apply effectively, the use of BC in enterprises should be considered mandatory for accountants and auditors, therefore, if any individual violates, the enterprise needs to sanction, so that the technology was soon used widely.

For universities: Awareness can be developed from educational and training programs to help accountants and auditors familiar with BC and its application into work. Universities and training institutions should understand the importance and future

applicability of BC and add appropriate educational programs to their curriculum. Although there have been some attempts in academia to provide practical illustrations of BC applications in accounting and auditing, it is not enough. Future accountants and auditors, if they want to apply it in their work, need to prepare themselves with a lot of knowledge, understanding and skills. New educational programs also need to put more emphasis on the features of BC and the main task needs that BC can meet for accountants and auditors. In addition, the school can help students to prepare well before graduation by regularly organizing forums and seminars to give students the opportunity to exchange and understand more about the development of BC and how it will affect the economy.

For Accountants and auditors: They need to be more aware of the importance and meaning that BC brings to work. Since then, accountants and auditors must improve themselves with the requirements of professional knowledge, and knowledge of new technologies in order to thoroughly understand BC technology, in order to use BC effectively and feasible at work.

5.2. Conclusion

BC technology will bring a lot of benefits to the accounting and auditing profession and the country's economic development goals. Therefore, we have investigated and studied the factors affecting the intention to use BC in the work of accountants and auditors in Vietnam based on the task-technology fit perspective, so that they can help accountants and auditors gain a deeper understanding of BC features and consider them suitable for their task needs. And the results we collect are that the importance of BC features and task needs directly affect the intention to use BC of accountants and auditors.

Abstract

The development of social media channels and the trend of e-commerce are changing the consumption habits of customers. In Vietnam, online shopping is gradually becoming a popular choice for consumers, but it also brings about online identity theft. The study discusses the impact of this behavior on the online purchase intention of Vietnamese consumers based on the Technology Acceptance Model theory. Questionnaires were sent directly to the respondents and through the Internet. After 2 months of collection, 368 valid responses were included in the analysis. The data is analyzed according to the process from factor analysis to testing the reliability and fit of the model. The results show that there are 4 main factors that include (1) usefulness, (2) attitude, (3) perceived risk of online identity theft and (4) faith influences online purchase intention. In particular, risk perception has a negative effect on the online purchase intention of consumers. The conclusions and recommendations are proposed to contribute to promoting the business activities of businesses/retailers and raising consumer awareness about the risks of online identity theft.

Keywords: *Purchase intention, perceived risk, online purchase, identity theft.*

1. Introduction

Over the past decade, the dramatic development of information technology and social networks has had a profound impact on the use of technology in almost every aspect of people's daily lives, such as transactions banking, entertainment, merchandising and online shopping or online shopping (Cai et al., 2017; Park and Lee, 2011). Online shopping has become a popular and growing shopping method in the world (Ramachandran et al., 2011; Wu et al., 2011). According to the Department of E-commerce

and Digital Economy, over the past years, Vietnam has continuously recorded a strong growth in both the percentage of people using the Internet as well as the number of consumers shopping online and the shopping value. Besides the positive effects of online purchases, cybersecurity risks and challenges have become a top concern for consumers, especially not to mention identity theft. online. This increase has made consumers worried about online identity theft (Acoca, 2007; Reisig et al., 2009; Wall, 2008). Online identity theft affects not only consumers when shopping online, but also enterprises and the government. Therefore, recognizing the impact of this behavior on online shopping intention is very important and necessary.

With the goal of determining the impact of online identity theft on the intention to participate in online shopping of consumers in Vietnam, especially consumers in big cities such as Ho Chi Minh City, Hanoi, and Da Nang because of the high population density, high shopping demand and high level of Internet usage. The study was conducted from October 2022 to February 2023. Through this study, the author determines the impact of risk perception and factors affecting the online shopping intention of consumers in Vietnam, thereby making suggestions for the government and enterprises involved in e-commerce activities to recognize the influencing factors, in order to have appropriate and effective business strategies.

2. Method

2.1. Participants

The full set of questionnaires was completed by a total of 429 participants. After removing the answer sheets that are missing information, the researchers have made 368 final questionnaires that were used to bring the results into data analysis.

Out of a total of 368 observations, 153 (41.6%) were male and 215 (58.4%) were female. By age, 24 people (6.5%) were under 18 years old, 179 people (48.6%) were 18-25 years old, 76 people (20.7%) were 25-35 years old, 52 people (14 years old) .1% are in the age group of 35-45 and 37 people (10.1%) are over 45 years old. According to the education level of the respondents: 167 people (45.4%) are university students, 106 people (28.8%) are unskilled workers, 71 people (19.3%) are post-graduates. University graduated from vocational secondary school, 24 people (6.5%) are still in high school. By frequency of online purchases, there are 30 people (8.2%) never, 131 people (35.6%) sometimes, 138 people (37.5%) and 69 people (18.7%) very often shop online. According to current place of residence, 183 people (49.7%) live in Hanoi, 48 people (13.1%) live in Hai Phong, 61 people (16.6%) live in Ho Chi Minh City, 21 people (5.7%) live in Da Nang and 55 people (14.9%) live in other provinces and cities.

2.2. Instruments

In order to analyze 11 variables, the authors have referred to 11 different scales from a variety of researchers from Vietnam and different countries.

For “Perceived Usefulness”, there are 3 variables referred from Lin’s scale (2007) and 2 variables referred from Ha’s scale (2015). The scale was used for measuring the consumers’ feeling of the online website’s usefulness.

For “Perceived Ease of Use”, there are 2 variables referred from Lin’s scale (2007). The scale was used for measuring the consumers’ feeling of the online website’s ease of use.

For “Fear of financial losses”, there are 3 variables referred from Hille et al’s scale (2015). The scale was used for measuring the consumers’ fear of losing money while doing online transactions on the E-commerce trading floor.

For “Fear of information being abused”, there are 3 variables referred from Hille et al’s scale (2015) and 1 variable referred from Bui’s scale (2013). The scale was used for measuring the consumers’ fear of information being abused by others when their online data was revealed.

For “Fear of mental damage”, there is 1 variable referred from Yuan et al (2019) and 1 variable referred from Jordan and Lékovar’s scale (2018). The scale was used for measuring the consumers’ fear of mental damage after shopping online.

For “Perceived risk of online identity theft”, there are 3 variables referred from Bui’s scale (2013) and Corbitt’s scale (2003). The scale was used for measuring the consumers’ perception of their information being stolen when shopping online.

For “Faith”, there are 3 variables which are referred from McKnight et al (2002), Ribbink et al (2004), Gefen et al (2003b). The scale was used for measuring the consumers’ belief in the website they are shopping.

For “Popularity”, there are 3 variables referred from Jarvenpaa et al’s scale (2000) and 4 variables referred from Ghada et al’s scale (2018). The scale was used for measuring the consumers’ feeling about the website’s popularity.

For “Scale”, there are 3 variables referred from Ghada et al’s scale (2018) and 1 variable from Doney and Cannon’s scale (1997). The scale was used for measuring the consumers’ feeling about the scale of the website they are shopping.

For “Attitude”, there are 4 variables referred from Pavlou and Fygenson’s scale (2006). The scale was used for measuring the consumers’ attitude towards online shopping.

For “Purchase intention”, there are 3 variables referred from Bui’s scale (2013). The scale was used for measuring the consumers’ possibility of shopping online in the future.

2.3. Suggested model

On the basis of theoretical models and studies related to research object, the authors propose a research model

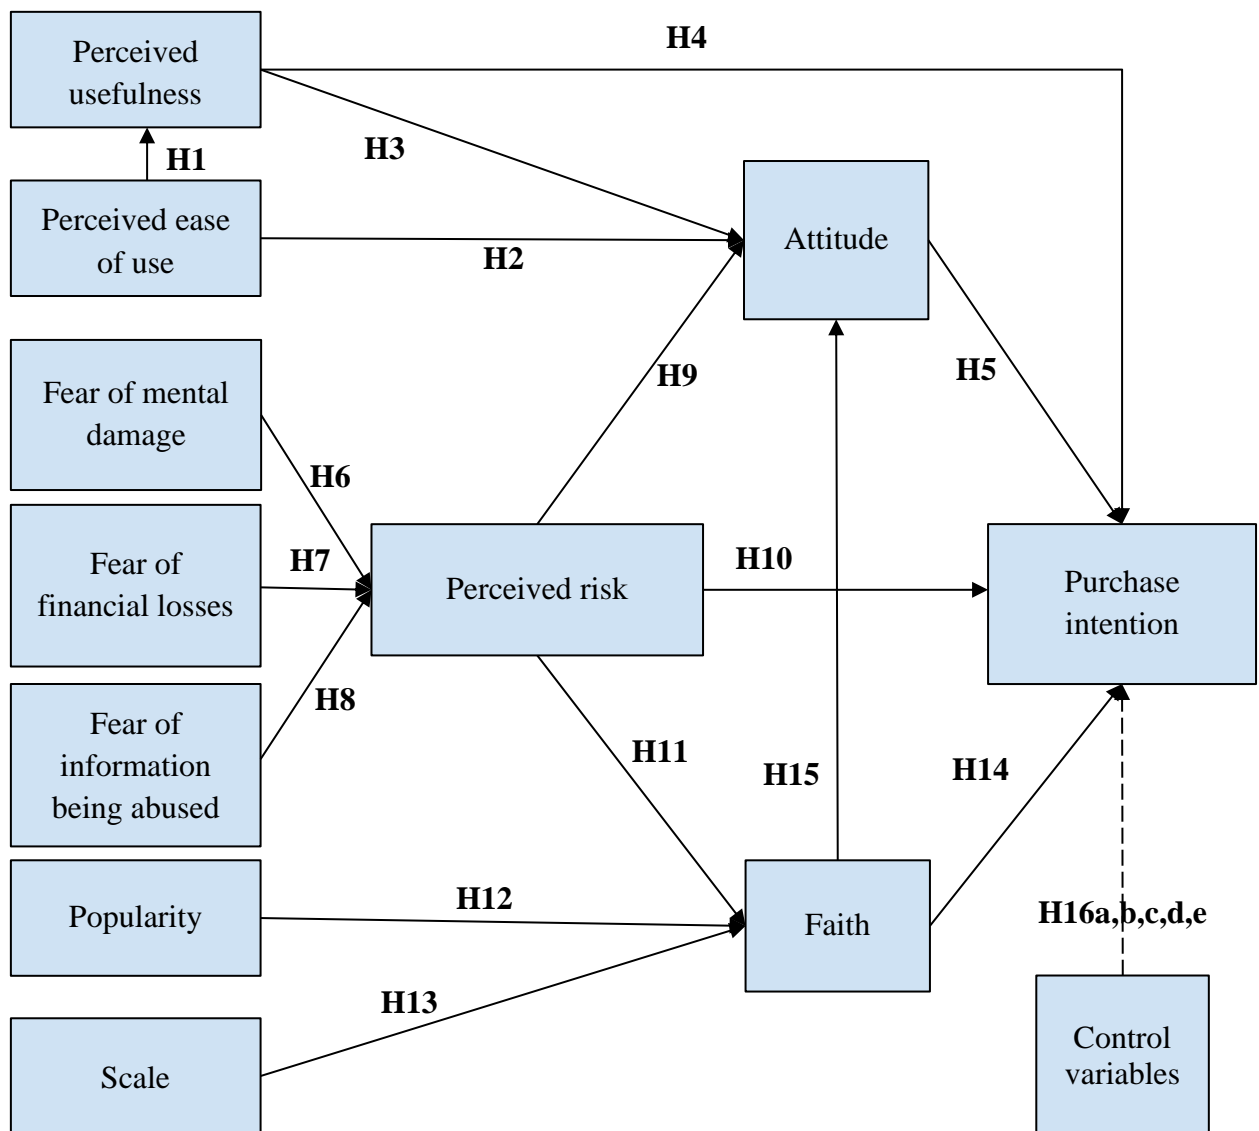

Figure 1. Research Model

Source: Authors' compilations

H1: Perceived ease of use has a positive effect on perceived usefulness

H2: Perceived ease of use has a positive effect on attitude

Perceived ease of use: a construct tied to an individual's assessment of the effort involved in the process of using the system (Davis, 1989). For online purchases, perceived ease of use saves time in purchasing, increases product search engine efficiency, and enhances user awareness. Perceived ease of use helps users have a positive attitude towards the service, thereby increasing the intention to use

H3: Perceived usefulness has a positive impact on attitude

Perceived Usefulness (PU): the degree to which individuals believe that using a particular system will improve their performance (Davis, 1985). When consumers perceive the usefulness of new technological services, their intention to use is greater and vice versa.

H4: Perceived usefulness has a positive impact on consumers' intention to participate in online purchases.

Since behavioral intention depends on perceived choice, a potential Internet shopper may respond positively or negatively to engaging in an online purchase.

H5: Attitude have a positive impact on their online purchase intention.

Attitude: the reactions toward an object or a situation, positive or negative. In terms of online purchasing behavior, attitudes refer to consumers' positive or negative assessments of using the Internet to purchase goods or services from websites.

H6: Fear of mental damage has a negative impact on risk perception of online identity theft.

The fear of mental damage: an emotional response to the perceived threats and distress of victims of online identity theft (Hille et al., 2015). The severity of being an online identity theft victim can remain ambiguous, and victims still rely on fear of psychological harm to make decisions about what to do.

H7: Fear of financial loss has a positive effect on risk perception of online identity theft.

The fear of financial losses: the fear of being appropriated or unethical by an unauthorized entity and using personal and financial data for financial gain (Hille et al., 2015). The financial loss after identity theft contributed significantly to the victim's perception of the risk of this behavior.

H8: Fear of information misuse has a positive effect on risk perception of online identity theft.

The fear of misuse of personal information: the fear of misuse of illegally obtained personal data for the purpose of impersonation that may damage the victim's reputation (Hille et al., 2015).

H9: Perceived risk of online identity theft negatively affects attitude.

H10: Perceived risk of online identity theft negatively affects consumers' online shopping intention.

Risk perception: an influential tool for explaining consumer behavior as they often strive to avoid mistakes rather than maximize efficiency in purchasing (Mitchell, 1999). Most empirical studies show that perceived risk has a negative impact on purchase intention.

H11: Perceived risk has a negative impact on faith when buying online.

Perceived risk: the customer's perception of the potential gain and loss in e-commerce transaction results (Yang et al., 2015). When consumers take the risk of trusting a sales website, they are more likely to become distrustful when things go wrong.

H12: Scale has a positive effect on faith.

H13: Popularity has a positive impact on faith.

Faith in online purchases is directly influenced by the characteristics of the sale, especially the popularity and scale of the seller. Customers' faith in sellers with greater popularity and scale is higher and vice versa.

H14: Consumer faith has a positive impact on online purchase intention.

H15: Consumer faith has a positive impact on consumer attitudes.

Faith: the expectation of individuals or companies that through interaction will behave ethically, reliably, in accordance with social norms, and will deliver on commitments. Faith has a positive relationship with the online purchase intention of customers, the more faith customers have for online shopping sites, the more obvious the customer's purchase intention becomes.

H16a: There is a difference in online shopping intention of Vietnamese consumers of different genders.

H16b: There is a difference in online shopping intention of consumers in Vietnam of different ages.

H16c: There are differences in online shopping intention of consumers in Vietnam at different educational levels

H16d: There is a difference in online shopping intention of consumers in Vietnam at different purchase frequencies.

H16e: There is a difference in online shopping intention of consumers in Vietnam in different current places of residence.

Gender, age, education level, purchase frequency and current place of residence are 5 demographic factors recognized by Tran Thi Thang (2015) as relevant and significant to the intention behavior of humans. Specifically, different levels of the above factors cause differences in behavioral intention.

2.4. Data collection

The empirical research was performed by survey method. To obtain data, the research team designed a questionnaire and survey in two ways: face-to-face and online. After conducting the online research, the primary data was controlled and edited. For processing and analyzing data, the authors have used IBM SPSS 20 and IBM AMOS 20.

3. Results

3.1. Cronbach's Alpha reliability test

After conducting Cronbach's Alpha analysis, the result illustrates that all 11 variables of a model have Alpha coefficient which is greater than 0.7, this justifies that the scale of all variables ensures about the coefficient. Of those, a scale of Perceived Ease of Use factor has the greatest Cronbach's Alpha value (0.886) and fear of mental damage factor has the lowest value (0.732). With each of the scales, the research group realizes that none of the values of Corrected Item - Total Correlation less than 0.3. Therefore, all 41 observed variables on a table of the notions such as the influence of the perceived usefulness, perceived ease of use,

fear of mental damage, fear of financial losses, fear of information being abused, popularity, scale, attitude, perceived risk of online identity theft, faith, purchase intention reach a requirement and continue to be used for analyzing Exploratory factor analysis EFA.

3.2. Exploratory factor analysis EFA

EFA result:

Table 1. KMO Coefficient and Bartlett test

KMO Measure of Sampling Adequacy.		0.831
Bartlett's Test of Sphericity	Approx. Chi-Square	7208.752
	Df	820
	Sig.	0.000

Source: Authors' compilations

According to the result, KMO is equal to 0.831 (satisfying $0.5 \leq \text{KMO} \leq 1$) which indicates the results of analyzing factors that are suitable with the research data. Bartlett's Test of Sphericity has Sig as equal to 0.000 less than 0.05 which illustrates observed variables have a correlation with each other in the whole. Cumulative of variance reaches 68.676%, satisfyingly higher than 50% that justifies the EFA model is appropriate. Besides, the Eigenvalues value of seven factors is 1.051, higher than 1 so all factors are detained.

After researching, the conclusion is all variables have Factor Loading greater than 0.5 on all factors, so this ensures discriminant value. Thus, the authors keep 41 observed variables and continue to be used for analyzing Confirmatory Factor Analysis CFA.

3.3. Confirmatory Factor Analysis CFA

Accordingly, CFA results of the research model gives information about reliability, unidirectional, convergent validity, discriminant validity.

Firstly, Chi-square/df = 1.789 < 2, TLI = 0.903 > 0.9, CFI = 0.915 > 0.9 and RMSEA = 0.046 < 0.08, it is supposed that the model research suits the market data.

Table 2. Model fit result

CMIN/DF	CFI	TLI	RMSEA
1.789	0.915	0.903	0.046

Source: Authors' compilations

Secondly, standardized factor loading are all greater than 0.5, which ranges from 0.597 to 0.932, in addition, the values in the P-value column of the observed variables representing the factors have a valuation equal $0.000 < 0.05$. Hence, the observed variables are confirmed to have good ability to demonstrate factors in the CFA model.

Thirdly, the factors that all have composite reliability (CR) are greater than 0.7 and average variance extracted (AVE) are higher than 0.5 from 0.505 to 0.798. Moreover, when analyzing 11 variables, the maximum shared variance (MSV) valuation are all smaller than the AVE values. All the figures are proving that 11 variables reach the unidirectional, convergent validity, discriminant validity.

Table 3. Model Validity Measures

	CR	AVE	MSV	MaR (H)	DT	TD	HI	TT	RR	NT	QM	TC	YD	TL	SD

Finally, the result shows the CFA model is accepted and appropriate. The authors use this to test the hypothesis, evaluate the relationship between the factors affecting the online purchase intention of consumers and continue to be used for analyzing Structural Equation Modeling SEM.

3.4. Structural Equation Modeling SEM

When evaluating structural equation modeling, the result shows that the research model is consistent with market data. CMIN/df = 2.146; GFI = 0.829; CFI = 0.869; TLI = 0.859; RMSEA = 0.056.

In 15 valuations of the P-value, having 13 values are all less than 5%, so that 13 hypotheses are accepted with 4 hypotheses H6, H9, H10, H11 have negative effects and 8 hypotheses H2, H4, H5, H7, H8, H12, H13, H14, H15 act in positive impacts.

Source: Authors' compilations

This research found that perceived ease of use, attitude and faith have a positive effect on purchase intention. On the other hand, perceived risk does affect purchase intention in a considerable negative way. Especially, perceived ease of use owns a significant positive impact on purchase intention.

4. Discussion and Conclusion

4.1. Discussion

Online purchases are increasing, but there are still doubts and restraints among potential customers. We have therefore explored perceptions of customers and potential customers on which opinions are based. With proposed hypotheses, which were based upon previous research and in-depth study of relevant literature, we have tested the relations between online identity theft and online purchase intention.

The empirical contribution of our research is reflected in the conceptual model. Variables such as perceived ease of use, perceived usefulness positively affect online purchase intention through attitude. Popularity and scale positively affect online purchase intention through faith while faith positively affects attitude. The two constructs representing the fear of financial losses and fear of information being abused are positively and statistically significantly related to perceived risk, as hypothesized, which means that when they increase, so does the perceived risk. In contrast, the fear of mental damage negatively affects the perceived risk, which means that the more it increases, the less customers will purchase online. On the other hand, are the constructs of perceived risk and online purchase intention negatively and statistically significantly related, which means that lower perceptions of risk increase online purchase intentions. Perceived risk also negatively affects faith and attitude, which means that the more perceived risk consumers feel, the less positive their faith and attitude are.

4.2. Conclusion

Online shopping has become a popular and growing shopping method in the world as well as in Vietnam. Because the process is done through the Internet, buying online offers many advantages over traditional purchases. However, this method of shopping also brings a few risks, among them being identity theft when participating in online purchases. Buying online means that consumers have to use their information to make purchases smoothly and in the right order. As the COVID-19 pandemic hit, online shopping has become the preferred method of shopping. Making online purchases on different e-commerce platforms on a more frequent basis leads to a higher likelihood of personal information being stolen.

With these findings, the study provides retailers and related organizations some insights about the impact of identity theft on consumers' online purchase intention to make informed decisions, then it gives several potential ideas to improve security to enhance customer purchase intention. Moreover, the research interest in the impact of identity theft will contribute to stabilizing consumer psychology, thereby building faith and motivating consumers to choose shopping online more often.

Abstract

This study was carried out with the aim of discovering the influence of risk governance structure and effectiveness on bank risk-taking. This study examines three aspects of risk faced by banks: insolvency risk, credit risk and operational risk. The analysis results collected on a dataset from 20 commercial banks within the territory of Vietnam (excluding Vietnam Development Bank, Bank for Social Policies, Joint venture banks and foreign banks) from 2011-2021. This study expands on previous studies by examining other aspects of the bank's risk governance structure, including the structure of audit committee, a stand-alone risk committee and the external audit. This study also analyses the relationship between the overall effectiveness of the risk governance mechanism and bank risk taking. Based on the findings in the study, some implications are proposed to build a risk governance structure suitable to the specific characteristics and environment of banks in order to improve the risk governance efficiency of banks in Vietnam

Key words: *Risk governance, Bank risk-taking, Risk governance structure.*

1. Introduction

In the situation that regulators around the world are generally trying to provide guidelines for banks to improve their risk management mechanism to ensure more effective operation after the financial crisis in 2008, the study of governance structure related to bank risk supervision and its effectiveness has become increasingly important.

Although corporate governance is very important to the banking industry in Vietnam, research on this issue is still limited. To address this research gap, the objective of this study

is to examine the impact of corporate governance factors on the performance of listed and unlisted banks in Vietnam. Although Vietnam's banking system has a short history (Cochran et al., 2018), over the past few years, there has been an expansion in the number, size and quality of services. In addition, competition in the banking industry is increasing, so Vietnamese banks must find ways to increase operational efficiency (Waal, Duong, & Ton, 2014). Taken together, the results of this study suggest that there is a link between audit quality, leverage, state ownership ratio and bank life expectancy and bank performance in the long run. In the Vietnamese context, this has important implications for the corporate governance of banks in emerging economies.

Regarding bank risk, we can see from previous studies that corporate governance plays a particularly important role because the risk-taking behavior of banks affects economic fragility and finance (Calomiris and Mason, 2003; Keeley, 1990). Many regulators, international organizations and academics have argued that excessive risk-taking by banks and inadequate corporate governance are among the main causes of the financial crisis year 2007-2008 (BCBS, 2015; Kirkpatrick, 2009). After that, more and more research on corporate governance was carried out in order to find an appropriate governance mechanism to control risks and maintain the stability of the bank. The discussions in the study are meaningful for bank managers in formulating appropriate risk management strategies to gain competitive advantage in the context of the industry's business environment. That is the problem that runs through the research topic "*Effect of the risk governance structures on bank risk-taking in VietNam*"

2. Method

2.1. Theoretical basis

2.1.1. Structure of risk management and risk acceptance

Galai and Masulis (1976) state that "shareholders actually hold the call options on the firm's value and the exercise price is the total amount of debt outstanding. If the interest rate/deposit rate is not properly priced to reflect this risk, the bank shareholders have an incentive to gain from this call option by increasing the bank's asset risk. Especially, it is more likely to be the case for banks (due to deposit insurance and regulatory rescue)."

Agency theory implies that an individual's behavior is always aimed at maximizing their own expected utility (McCullers et al., 1982). Therefore, in the enterprise there exists a conflict of interest between managers and shareholders as well as with related parties. Bank shareholders always urge managers to accept high risks. Unlike shareholders with diversified investments, managers' value is mainly concentrated in the companies they manage (Jensen & Meckling, 1976). However, bank managers may also have an incentive to take on more risk if their ownership increases, through shares or stock options (Hubbard & Palia, 1995).

Stakeholders theory indicates that a bank's corporate governance mechanisms should rely more on the stakeholder view since banks have a special stakeholder group comprised of regulators, bondholders, depositors, and other stakeholders.

2.1.2. Effective risk management and risk acceptance

According to agency theory, as discussed in Section 3.2, a tight monitoring system prevents managers from making decisions that harm shareholders and stakeholders. Risk management is the most important mechanism for banks to control their risk taking (Aebi et al., 2012; Pathan, 2009; Sun and Liu, 2014). Therefore, we expect that effective risk management can better limit risk taking.

2.2. Research hypothesis

H1A: Audit committee size is positively associated with bank risk-taking.

H1B: Audit committee independence is negatively associated with bank risk-taking.

H1C: Proportion of accounting and financial experts in audit committee is negatively associated with bank risk-taking.

H1D: Audit committee meeting frequency is negatively associated with bank risk-taking.

H1E: Stand-alone risk committee existence is negatively associated with bank risk-taking

H1F: External audit quality is negatively associated with bank risk-taking.

H2: Risk governance effectiveness is negatively associated with bank risk-taking.

2.3. Research Methodology

2.3.1. Research data

The data of this research consists of 30 listed and unlisted banks during the 12 years of 2010 to 2021 quarterly. This research uses this period because corporate governance was paid attention and developed after the financial crisis 2007-2008. Most of the financial data was taken from audited financial statements (including statement of cash flows, balance sheet, income statement and notes to the financial statements) and from other sources published by banks. If any information was missing, we collected it from the database of FiinPro Platform. Corporate governance information was collected manually from annual reports and from other documents published by banks as well as the stock exchanges of the subject countries. However, during the research period, there are several firms with negative business performance and are warned or delisted on HOSE and HNX. Additionally, the financial statements of some corporations are not published continuously and completely leading to insufficient or unrepresentative observations that will be excluded from the sample. Due to the conditions above, the results obtained were 30 listed and unlisted banks with 1440 observations

2.3.2. Research Model

Variable measures and definition is reported in Table 3.1

Table 1. Summary of Definitions, Predicted Sign of Variables for Equations 3.1

Variables	Definitions
Panel A: Dependent variable (risk-taking)	
1. Insolvency risk (<i>Z-score</i>)	$Z\text{-score} = [\text{ROA} + (\text{E}/\text{A})]/\text{Std.}(\text{ROA})$
2. Credit risk (<i>NPLS</i>)	The ratio of nonperforming loans to total loans
3. Operational risk (<i>DROA</i>)	Standard deviation of ROA
Panel B: Risk governance structure and its effectiveness	
1. Audit committee size (<i>ACS</i>)	The total number of member on bank audit committee
2. Audit committee independence (<i>ACI</i>)	The number of independent directors as percentage of the total number of member on audit committee
3. Financial and accounting experts on audit committee (<i>FAE</i>)	The number of financial or accounting experts as percentage of the total number of member on audit committee
4. Audit committee meetings frequency (<i>AMF</i>)	The number of Audit committee meeting in a year
5. Stand-alone risk committee (<i>SRC</i>)	A dummy variable which is 1 if the bank has stand-alone risk committee and 0 otherwise.
6. External audit quality (<i>BIG4</i>)	A dummy variable which is 1 if the bank use external audit service form Big 4 audit companies
7. Risk governance effectiveness (<i>RGDEX</i>)	The total number of 9 characteristics of bank risk governance structure
Panel C: Other control variables	
1. Bank size (<i>SIZE</i>)	The natural logarithm of total assets
2. Diversification index (<i>DIV</i>)	A diversification index
3. Assets quality (<i>ASQ</i>)	The ratio of loan loss provisions to total assets
4. Net interest margin (<i>NIM</i>)	The accounting value of the bank's net interest revenue as a share of its average interest-bearing (total earning) assets
5. Stated-ownership (<i>SOW</i>)	The proportion of state shares to total shares
6. Foreign ownership (<i>FOW</i>)	The proportion of foreign shares to total shares
7. Cash flow right (<i>CFR</i>)	A dummy variable which equals 1 for banks having at least one shareholder which holds a 10% share or more and otherwise is equal to 0

To test hypotheses H1A-H1F and H2, we estimated Equation 3.1 by the System GMM method for seven risk governance structure and risk governance effectiveness variable

$$RISK_{it} = \beta_0 + \beta_1 RISK_{it-1} + \beta_i \sum_{i=2}^7 RGV_{it} + \beta_8 SOWN_{it} + \beta_9 FOWN_{it} + \beta_{10} CFR_{it} + \beta_{11} SIZE_{it} + \beta_{12} DIV_{it} + \beta_{13} ASQ_{it} + \beta_{14} NIM_{it} + \varepsilon_{it}$$

(Equation 3.1)

Where RISK is the vector of the dependent variable—bank risk-taking—including credit, operational, and insolvency risks. RGV is the vector of the variables as a proxy of risk governance structure and its effectiveness (including ACS, ACI, FAE, AMF, SRC, BIG4, and RGDEX)

3. Results

3.1. Descriptive statistics

For bank risk variables, the mean Z-score of 117.88 is much higher with 19.74 for the US samples (Pathan, 2009) or 9.24 for the sub-Saharan African samples (Dwumfour, 2017). That means banks in Vietnam are less risky than banks in some other regions. However, the standard deviation as well as the distance of the minimum and maximum values of the Z-score are higher. The standard deviation (minimum and maximum) of the Z-score in Vietnam is 99.72 (7.50 and 707.97). While that is 14.43 (2.24 and 211.31) in the United States and 6.53 (-12.02 and 43.74) in sub-Saharan Africa. The mean of credit risk as measured by bad debt (NPLS) and operational risk as measured by DROA are 0.021 (2.1%) and 0.11 respectively, and the standard deviations of these two variables are also high.

3.2. Bank risk governance and insolvency risk

The coefficient of ACS is negative and significant at the 10% level with the Z score, showing that the audit committee size has a positive relationship with bank insolvency risk. The sign of this coefficient does not change in regression 8 and remains statistically significant at the 5% level. We find that the results are consistent with studies showing that size reduces the Z-score.

The coefficient of ACI is positive and statistically significant at the 5% level with Z-score, shown in regression 2 showing that a high proportion of independent directors on an audit committee can reduce bank insolvency risk. In other words, audit committee independence has a negative relationship with the bank risk-taking. Similarly, this coefficient remains positive and statistically significant in regression 8.

Regarding hypothesis H1C, the results of regression 3 and regression 8 report that the coefficients of FAE are both positive with Z-score. Therefore, we have evidence that financial and accounting professionals in audit committee can reduce bank insolvency risk.

The results in regression 4 and 8 both show that the coefficient of AMF is negative and not statistically significant. Therefore, we have no evidence that the frequency of meetings of the audit committee can reduce the bank insolvency risk.

Regression 5 shows that the coefficient of SRC is positive and statistically significant at the 1% level in regression 5. This indicates that the existence of a stand-alone risk committee may limit risk-taking. However, the sign of this coefficient does not change and is not statistically significant in regression 8.

The coefficient of BIG4 is positive with Z-score but not significant in both regression 6 and regression 8. This means that the quality of external audit may not reduce the bank insolvency risk. One possible explanation is that external auditors do not play a direct role in the management of the bank.

Similarly, the negative but not statistically significant coefficient of RGDEX (-0.042) with Z score in regression 7 on Table 4.2, after controlling for other governance, bank characteristics could not confirm the relationship between risk governance effectiveness and bank insolvency risk. Thus, hypothesis H2 cannot be tested in this case.

For the SGMM estimation method, the diagnostic tests at the end of Table 4.2 show that the eight models fit well with statistically insignificant test statistics for both Hansen J-statistics of over-identifying restrictions and second-order autocorrelations in second differences (AR2). Accordingly, the results show statistically insignificant AR2 for all bank risk-taking measures. Likewise, the Hansen J-statistics test the null instrument validity, and all the p-values are higher than 10%. This means that the statistically insignificant Hansen J-statistics at the 10% level or lower for all specifications indicates that the instruments are valid in the respective estimations. Overall, the diagnostics tests in Table 4.2 show—as indicated by the Arellano-Bond test, AR (2), and the Hansen J tests—that all the regressions are valid. Finally, the number of instruments used in the model is lower than that in the panel, which makes the Hansen’s J statistics more reliable.

Source: Author's calculation

3.3. Bank risk governance and credit risk

The ACS coefficient is positive and statistically significant at 5% in regression 1 and 10% in regression 8, showing that the audit committee size increases credit risk. As expected, the audit committee size has a positive relationship with the bank risk-taking.

Regarding hypotheses H1B and H1E, Table 4.3 also shows that the coefficients of ACI and SRC are negative and statistically significant at the 5% or higher level in regressions 2 and 5, as well as in regression 8. Audit committee independence has a negative relationship with credit risk, and again it is found that it is an important factor in limiting the bank risk-taking. At the same time, the existence of a stand-alone risk committee may constrain the bank's risk taking.

The coefficients at regression 4 and 8 of AMF are also negative but not statistically significant. Therefore, we have no evidence that the frequency of meetings of the audit committee can reduce the credit risk of banks.

Regression 3 and 6 report the relationship between finance and accounting professionals in audit committee and the quality of external audits. The coefficients of FAE and AMF are both positive but insignificant. Similar results are also found in regression 8. This indicates that accounting and finance professionals in audit committee and external audit quality have no role in constraining bank credit risk-taking.

As expected, the coefficient of RGDEX is negative and statistically significant at the 5% level. It shows that the risk governance effectiveness is negatively associated with bank credit risk-taking. The result provides strong evidence that risk governance plays an important role in the oversight of bank risk-taking. Generally, hypothesis H2 is well-supported

3.4. Bank risk governance and operational risk

The final type of risk used as a proxy for bank's risk taking is operational risk. The first result shown in regression 1 shows a significantly positive relationship ($p < 0.1$) between ACS and DROA. In regression 8, the coefficient sign is constant and significant. This result again provides strong evidence that the audit committee size increases bank risk-taking.

Regression 2 shows a negative relationship between the audit committee independence and operational risk. The ACI coefficient is negative and significant 10% in regression 2 but turns positive and not significant in regression 8. These results do not support hypothesis H1B very well. The audit committee independence may limit the bank's acceptance of operational risks.

Regression results on regression 3 and regression 5 show that the coefficients on FAE and SRC are positive for DROA and not statistically significant on both regressions 3, 5 and 8. This indicates that the results do not support hypotheses H1C and H1E when risk-taking is measured by DROA.

Another important finding, the relationship between the audit committee meeting frequency (AMF) and the banks' operational risk is negative (DROA). The coefficient of AMF is negative and significant at 10% level with DROA in regression 4 and remains negative and significant at 5% level in regression 8. Audit committee meeting frequency reveals the intensity of the labor of the audit committee. This may help banks operate more stably and reduce operational risk.

The coefficient on BIG4 here is negative for DROA and statistically significant at 10% and 1%, respectively reported in regression 6 and regression 8. This result strongly supports the H1F hypothesis. High quality of external audit can make banks reduce operational risk, as well as help them to operate more stably.

Finally, as expected, risk governance plays an important role in limiting a bank's risk-taking. The coefficient of RGDEX reporting regression 7 is negative and statistically significant at the 5% level. This indicates that risk governance effectiveness is negatively associated with operational risk.

4. Discussion and Conclusion

4.1. Discussion

4.1.1. Government

First, there are policies to support increasing charter capital for Vietnamese banks to strengthen financial capacity.

Second, government may have a policy on an appropriate salary mechanism to ensure the attraction of highly qualified human resources to work at Vietnamese banks.

Finally, there should be a regular review of legal documents, regulations and guidelines related to the operation of banks to grasp the difficulties and obstacles when applying, thereby making timely corrections and creating favorable conditions for banks to

operate more effectively in corporate governance and risk contributing to the steady development of the economy.

4.1.2. State Bank

First, they should complete exchange rate and interest rate policy

Second, they should complete the legal framework and regulations on risk measurement and management of banks

Third, they should provide banks with standard risk management practices, support banks in training professional staff

4.1.2. Banks

First, they should advise the SBV to form a legal framework for risk management activities of banks

Second, realizing the impact from “Audit committee size” and “Proportion of accounting and finance experts in audit committee”, we suggest that it is necessary to focus on human resource consolidation. The human factor is very important; it always plays a key role in the sustainable development of businesses. Especially in the context of increasingly improved banking standards, we can see the need for staff to have a deep understanding and understanding of practices, thereby implementing new and innovative solutions.

Third, banks can have seminars, discuss and share knowledge and experience in the process of finding partners, researching and implementing risk management systems.

Fourth, banks study and research the implementation of risk management activities in countries around the world

Fifth, data quality and IT systems are mandatory requirements for risk management in the current digital transformation period. Decision 2655/QD-NHNN 2019 required banks to promptly seize the opportunities of the Industrial Revolution 4.0 (Industry 4.0) to renovate their organizational structure, improve processes and improve the quality of human resources, towards a banking system operating on a modern technology platform, highly adaptable to the fast development speed of the digital economy.

4.2. Conclusion

Our final conclusions are: H1A and H1B and H2 are strongly supported; H1C, H1D and H1E are relatively supported; H1F does not support our conclusion that the risk management structure is found to be related to the bank's risk taking. In addition, as initially expected, the effectiveness of the risk management mechanism has the main function of limiting the bank's risk-taking. In general, with the results of testing the above hypotheses, the answer is “Yes”, there is strong evidence that the bank risk governance structure and its effectiveness affect the bank risk-taking.

Abstract

In recent years, there are many textile and garment enterprises in Vietnam who have been interested in understanding the business performance relevance of ESG practices, especially those related to operational efficiency of the enterprise. The article is researched with the aim of analyzing the relationship between ESG practice and the performance of the textile industry. Particularly, the authors used the intermediate variable is firm value to analyze “The influence of ESG practice on the performance of textile enterprises in the period 2017 - 2022”. The results show a positive influence between ESG practice and business performance through factors such as customer loyalty, corporate reputation and corporate culture. Through these findings, we propose several policy recommendations for enterprises in the textile and garment industry to practice ESG well and make good use of ESG factors to increase business efficiency in the future.

Keywords: *ESG, Textile, Performance, Environment.*

1. Introduction

Today, consumers, domestic and international investors are looking for businesses that uphold the ESG index as a core value in their business operations, paying special attention to issues such as: related to employees, community, customers... Enterprises have a pioneering board of directors and management to apply regulations on ESG information disclosure, integrating ESG into strategic plans to increase operational efficiency, better manage risk, while bringing value to shareholders and increasing the resilience of the business in the context of today's volatile world.

In Vietnam, the textile and garment industry is on track to reduce resource use and pollution, strengthen worker protection and protect the interests of customers. Vietnam's textile and garment industry in recent years has been making efforts to realize green production and emission reduction goals in order to contribute to the implementation of the Government's commitment to net zero emissions by 2050 at the Conference of the Parties. 26th United Nations Climate Change. In the future, the sustainable development of this industry depends entirely on the use of resources, involving water, soil and oil, and recycling of products to reduce waste. That requires the textile industry to operate based on the practice of ESG criteria.

Recognizing the above situation as well as to meet the mentioned objectives, in this study, the authors study the influence of ESG practice on the performance of textile enterprises in Vietnam. The authors choose to use intermediary factors: customer loyalty, corporate reputation, corporate culture to examine the influence of ESG practices on the performance of Vietnamese textile and garment enterprises. On that basis, we propose some recommendations for suitable solutions for textile enterprises in particular and enterprises operating in Vietnam in general.

2. Literature Reviews and Theoretical Frameworks

2.1. Literature Reviews

2.1.1. Water Research outside about ESG

It can be seen that the risks and opportunities that ESG affects and brings to businesses have made ESG an important issue in the business activities of companies globally today.

A research report on ESG factors is " *From the stockholder to the stakeholder* " - Clark, Feiner and Viehs (2015) studied more than 200 articles, books, studies on ESG and came up with the following results: there are more 90% of enterprises that deeply apply ESG reduce capital costs, 88% of enterprises that apply ESG notice an improvement in operational efficiency, and 80% of research indicates that the application of ESG has an impact positive for stock prices. Therefore, it is possible to see the correlation between businesses with sustainable development indexes and the profits received by shareholders. In addition, ESG reporting affects both the financial and environmental performance of a company. Besides, the factors of human rights, social as well as production responsibility also show a positive relationship with return on capital efficiency (Chen, Feldmann and Tang, 2015).

Ali Fatemi, Martin Glaum, Stefanie Kaiser (2017) studied the relationship between Performance and Firm Value: The Moderating Role of Disclosure, they found that ESG strengths add value company.

Research by Almeyda and Darmansyah (2019) shows a significant positive relationship between ESG disclosure and company performance, through the company's ROA and ROC. Research shows a significant positive relationship between environmental

factors according to ROC and stock price. Therefore, research has demonstrated that ESG information transparency can improve financial performance. This result encourages investors, corporate governance and industry regulators to consider the importance of ESG disclosure. In the same vein, Russo and Fouts (1997) also demonstrate that ESG practices are a source of sustainable competitive advantage for firms, so examining issues in ESG may be a consideration for the board. manage a company. Supporting this view are also studies by Lo and Kwan (2017); Ameer and Othman (2012); Choi, Kwak and Choe (2010); Mishra and Suar (2010).

The team of authors Ting-Ting Li, Kai Wang, Toshiyuki Sueyoshi and Derek D. Wang conducted a study on the topic " *ESG: Research Progress and Future Prospects* " (2021) showing that ESG, as a integrated framework and concept of environmental, social and governance factors, demonstrating the interrelationship between its aspects, and much research focusing on the interaction between environmental factors (E), social (S) and governance (G) factors have emerged. In addition, environmental, social and governance factors play an important role in measuring the future financial performance and social impact of an enterprise. Therefore, as an investment principle that integrates environmental, social and governance factors, ESG is an important driving force activating the sustainable development of enterprises and the interrelationship between these three factors as well. is a key point worthy of attention. In order to promote an increasingly high-quality global economy and society, this paper systematically reviews ESG research and looks forward to the future direction of ESG research.

Ganlin Pu (2022) assessed the non-linearity between ESG activities and company performance in the case of emerging markets, namely China. Findings from an analysis of 232 Chinese listed companies show a positive association between ESG activities and corporate performance. However, the relationship is non-linear. In other words, the relationship between ESG activities and firm performance is inverted U-shaped. This shows that the relationship is positive up to a certain threshold and when ESG activities cross that threshold it starts to have a negative effect. In addition, Rupamanjari Sinha Ray (2022) empirically investigates the impact of ESG scores on financial variables that can affect the performance of firms in the Indian context. The results show the fact that the ESG score is an emerging indicator for shaping future financial performance and risk mitigation strategies and is therefore of considerable importance from a policy perspective.

However, research by Ullman (1985) and Lin, Yang and Liou (2009) gives mixed opinions. ESG practices incur costs, which in turn have a negative impact on financial performance leading to reduced competitiveness compared to companies with few ESG practices. Lamberton (2005) points out that companies with an environmental impact can change the information provided to stakeholders, for example, businesses transfer environmental taxes to consumers to partially offset the low prices. of goods and services excluding environmental and social costs at market prices. Several recent studies have

argued in favor of no relationship between ESG activities and firm performance (for example, see Friede et al., 2015; Shakil et al., 2019).

2.1.2. Domestic studies on ESG

Author Phan Hang (2018) affirmed that ESG policies and activities are one of the important factors creating long-term value of enterprises. Integrating ESG into business activities not only helps businesses strengthen and strengthen cooperative relationships with stakeholders, but also helps businesses improve business risk management, improve adaptability and effective competition. This is also the main reason why professional institutional investors look to and ESG quickly becomes a trend, especially when there are studies showing that good corporate governance is related to operating results. Good.

In Vietnam, Phung Thi Thuy (2022) in the study of ESG with the sustainable development of Vietnamese enterprises showed that the ESG indexes evaluate and rank the sustainable development of enterprises. In particular, the ESG indicators and reports of enterprises are very important, are the basis for the selection of financial investors, business partners and are a competitive tool of enterprises in the market to meet customer expectations in modern society.

A recent PwC Vietnam study (2022) surveyed 325 investors from around the world, mainly asset managers and analysts from investment companies, investment banks or brokerage company. Most investors show a commitment to ESG goals as a top priority in the businesses they invest in. For them, businesses with high ESG performance have been shown to have lower risk, higher returns, and better resilience to crises.

Although there have been many studies related to the ESG index and enterprises, there has not been any research that delves into the impact of ESG practices on the performance of textile enterprises. Meanwhile, the textile industry in Vietnam is now generating more and more different types of products, which means an increase in the amount of waste discharged into the environment, and the practice of ESG is extremely necessary. for the activities of these textile enterprises.

2.2. Theoretical Frameworks

2.2.1. ESG - concept

The term ESG first appeared in the United Nations (UN) report, Global Compact (2004) Who Cares Wins. Since the first appearance of the term ESG, many individuals and businesses have come up with concepts in their own way. Song ESG is an acronym for Environmental, Social & (Corporate) Governance, roughly translated as Environment, Society & Corporate Governance. It is a set of standards to measure factors related to sustainable development and the impact of businesses on the community.

Before that, in 1953, the American economist Howard Bowen published a publication, in which he initially introduced the concept of ESG appearing in the form of CSR (Corporate Social Responsibility) - a term for only corporate social responsibility.

However, according to PwC, if sustainable development is a term that covers all efforts of society as a whole to minimize negative impacts on the world around, then ESG (sustainable governance) emphasizes the factors. The most important factors for business today include: environmental, social and governance.

According to the newspaper “*Market Business News*”, they argue that ESG is to measure the sustainability and ethical impact of an investment in a business or company. In addition, the three factors Environmental, Social and Governance are a subset of non-financial performance indicators that cover ethical, sustainability and corporate government issues, such as ensuring systems in place to ensure accountability and manage the company's carbon footprint.

Kyle Peterdy argues that ESG is a framework to help stakeholders understand how an organization is managing risks and opportunities in relation to its three criteria. In addition, ESG takes a holistic view that sustainability goes beyond environmental issues. Although the term is often used in an investment context, those interested in it include not only the investment community but also customers, suppliers, and employees, all of whom increasingly concerned with the sustainability of an organization's operations.

Based on the points mentioned above, the authors believe that ESG is a measure of business performance of companies. This index represents the assessment and concern of enterprises on environmental, social and governance aspects during their operation. In addition, ESG is also used to manage risks and find opportunities for investors, and it also plays an important role in creating a sustainable business world.

2.2.2. Key elements of ESG

At its most basic level, ESG stands for Environmental, Social, and Governance, and it is the disclosure of environmental, social and governance data, which increases stakeholder transparency to mitigate risks and identify opportunities. ESG covers a wide range of business aspects that financial analysts may not traditionally consider but are often relevant to finance for businesses. Failure to measure ESG risk can result in significant financial loss.

ESG standards cover a wide range of issues, originating from international law, local law or agreements and principles in each country. To implement ESG, businesses need to meet 3 main focuses with dozens of specific criteria.

2.2.2.1. Environment

The first aspect is E - Environmental, which measures the extent to which businesses affect the environment and natural resources throughout the process of production, operation, management... Specifically, the organization will be considered for:

Climate Change

Climate change criteria will be assessed based on international and domestic commitments, national policies and local regulations. For Vietnam, at the United Nations Summit in 2021 (COP 26), Prime Minister Pham Minh Chinh made an impression with his announcement of his commitment to responding to climate change.

- Set a target of a total national emissions reduction of 43.5% by 2030, and zero carbon emissions by 2050.
- Reduce methane emissions by at least 30% by 2020, 40% by 2030.

With a pioneering role in creating ESG policies, the government will promote Vietnamese businesses to have a clearer motivation and basis when striving to achieve commitments related to ESG goals.

Energy

Enterprises implementing ESG must ensure efficient exploitation and use of energy resources. In addition to optimization, infinite alternative energies are encouraged such as solar energy, natural wind, etc. This will help the environment to avoid energy depletion, and organizations can also operate anywhere, time without depending on limited resources, speeding up the production process.

Natural resources

Resources here include land, water, trees, minerals, air, etc. To achieve a high ESG score in this section, businesses must ensure that they have full licensing documents when using any resource. In addition, many organizations also score points when actively/contributing to the renovation and restoration of polluted areas.

In particular, instead of minimizing, a part of businesses growing in the 4.0 era also researches and deploys new technologies that can create their own resources, without any impact on the environment.

Waste treatment and recycling

To treat waste to meet ESG standards, businesses need to make statistics and detailed lists of types and volumes of hazardous waste. Then proceed to collect, classify them and store them in a separate place to ensure no pollution. According to the policies, the organization can move and take them to the appropriate disposal site as authorized. If possible, the company can recycle, reuse to reduce waste to the environment, optimize energy.

Businesses can invent their own or use recycling services to ensure waste is disposed of properly. Some substances have ratios and specifications that are, or even regulated, by law.

2.2.2.2. Society

The second aspect in ESG is S - Social, which helps businesses evaluate social-related factors such as the company's business relationship with customers and partners; Working conditions of employees is also known as Labor law in Vietnam.

Privacy and security

As an important criterion, the regulations and laws about them are quite new in our country. The current security law in Vietnam is applied based on the Civil Code, Cybersecurity, Information Technology...

To implement ESG, businesses need permission from their owners before collecting, using, or doing anything with their data. In particular, it is absolutely forbidden to disclose personal information, and must commit to data protection measures.

Diversity, equity and inclusion

The Labor Law will be the basis for evaluating ESG scores in this section. By law, organizations cannot discriminate against employees regardless of their sex, color, race, religion, or any other social or organizational class. Male and female personnel need to be fair in all aspects: work, promotion opportunities, salary and bonus...

Safe working environment

The workplace should ensure occupational safety and health. ESG strictly prohibits cases of forced labor, ill-treatment, exploitation, harassment... Of course, the standard is also strict in the use of human resources under the age of 18, the organization needs to do it on time as well as the public nature. permitted by Labor law.

Working conditions

ESG will follow the provisions of Vietnamese law to consider scores for businesses such as salary, working hours, health check, insurance policy, etc.

2.2.2.3. Corporate governance

The final aspect of ESG is G - Governance, a review group concerned with the organization's activities ensuring efficiency, transparency, business ethics and compliance with local regulations.

Publication of the ESG report

Vietnamese law stipulates that enterprises implementing ESG must disclose information, annual performance results such as resource exploitation and consumption, labor policies, financial statements, contributions to the community, etc. This information needs to be submitted to the State Securities Commission of Vietnam and the Stock Exchange in a public manner.

Anti-bribery and corruption

This is a factor of great concern in governance, which will be assessed in accordance with the Anti-bribery & Corruption Law - Criminal Law of Vietnam.

Diversity and inclusion of the board of directors

This ESG criterion assesses the diversity of backgrounds of board members in terms of gender and background. According to Vietnamese law, in some cases, it is still required to have an independent board of directors, for example, 1/5 of the board members of an unlisted public company must be independent.

Above is a list of criteria that businesses need to meet when implementing ESG. In order to keep up with the trend and successfully complete this set of standards, leaders need

to have an in-depth understanding of ESG and how to properly govern the legal frameworks and current ESG practices.

2. 2.3. Benefits of practicing ESG

Using an ESG framework can bring tangible benefits to both businesses and investors. For businesses, it opens up a pool of capital and promotes a stronger brand identity, and investors can enjoy the low-risk investments associated with an ESG-centric brand. heart.

Some of the benefits of ESG include:

ESG brings competitive advantage

Companies participating in ESG are gaining a competitive advantage. A recent survey by GreenPrint concluded that 64% of Americans are willing to spend extra money to buy from businesses that promote sustainable products.

ESG metrics are also important to consumers, employees, lenders and regulators. Company leaders who strive to improve working conditions, promote diversity, give back to the community, and take a stance on socioeconomic issues play a key role in strengthening the company's brand. company.

Attract investors and lenders

The inclusion of ESG reports in the income statement is a trend of businesses. Investors and lenders are becoming highly attractive to institutions investing in ESGs and using ESG disclosures to shed light on their sustainability efforts. A recent Gallup study found that 48% of investors are interested in sustainable mutual funds.

Public concerns due to the pandemic, climate change and natural resource abuse are forcing lenders to shift their lenses to sustainable businesses and weed out those with outdated practices. - such as unfair wages, investment in fossil fuels, unsustainable agricultural methods and production. of non-recyclable products. By providing a holistic view of their practices, businesses that offer sustainable investments in ESG can influence a lender's decision to choose a competitor that offers a sustainable future. with low risk profile.

Improve financial performance

ESG not only facilitates business for lenders but can also improve the overall financial performance of a business. Even small efforts towards sustainability such as going paperless, recycling or energy-efficient upgrades can improve a business' profits and ROI.

To keep up with ESG programs, companies must track key metrics, such as energy consumption, raw material usage, and waste disposal, which ultimately lead to reduced energy bills and Cut the cost. ESG compliant companies face fewer fines, risks and penalties, which positively affects their bottom line.

In 2020, Nestlé announced it would invest up to \$2.1 billion by 2025 to transition from plastic to food-grade and recycled plastics. This change is expected to help Nestlé reduce its carbon footprint and cut compliance costs, especially in regions with stricter laws on the use of plastic packaging.

Build customer loyalty

In a 2021 survey conducted by Accenture of more than 25,000 consumers across 22 countries, 50% said they have rearranged priorities when shopping for luxury goods due to the COVID-19 pandemic. These consumers are willing to pay more for brands that align with their values and are more loyal to brands that treat people well. Today's socially conscious consumers want to know what the businesses they support are doing for the greater good.

Helping the company operate sustainably

Companies investing in ESG can sustain and adapt to the ever-changing landscape. While ESG is only required for publicly traded companies in some jurisdictions, it appears to be moving in that direction for the rest of the corporate world as well. Companies that choose to ignore ESG policies now may have to deal with them later, in the form of legal, regulatory, reputational, and compliance issues.

Businesses that properly integrate ESG principles to their core identify cost-saving opportunities and enjoy low energy consumption, reduced resource waste, and reduced total operating costs.

2.2.3. Enterprise value

Enterprise values are the values that enterprises achieve when implementing ESG, and thereby help businesses improve their operational efficiency. (The author's point of view).

Enterprise value is a standard measure of value used in business valuation. PMBOK defines enterprise value as the total value of an enterprise; sum of all tangible and intangible elements. Examples of tangible elements include monetary assets, shareholder equity, furniture, and utilities. Examples of intangibles include branding, recognition, goodwill, public interest, and branding.

There are many previous studies that have mentioned the "value of the enterprise" when doing ESG studies. These values are studied and understood from many different aspects such as: improving employee quality and increasing employee loyalty (Tuzzolino & Armani, 1981; Trevino & Nelson, 2004; Valentine & Fleischman, 2008), income improvement (Chih et al., 2008; Hong & Andersen, 2011), customer satisfaction (Nguyen Ngoc Hien, Nguyen Trong Minh Tai, 2018); brand value (Mai Thi Kim Anh, 2015; Nguyen Thi Van, Nguyen Van Phu, Mai Phu Hop, 2018; Le Phuoc Huong, Luu Tien Thuan, 2019; Tran Nguyen Khanh Hai, 2019);...

From the above basis, the authors conduct an analysis of the value of the business on 4 aspects including: customer loyalty, business reputation, corporate culture and size of the business. The concept of these four factors is summarized by the authors as follows:

Customer Loyalty (KH): Customer loyalty is a measure of how likely a customer is to do repeat business with a company or brand. It is the result of customer satisfaction, positive customer experiences, and the overall value of goods or services that customers receive from a business.

Reputation of the enterprise (DT): It is the image of the enterprise in the hearts of customers and employees in terms of product quality, working style, and ability for sustainable development (Roberts and Dowling, (2002)).

Corporate culture (VH): is the values, beliefs, and forms that everyone in an enterprise recognizes and thinks, speaks, and acts as a habit, like the spiritual life and personality of a company and is a decisive part of the long-term success or failure of the business.

The components of corporate culture include 4 main parts: vision, mission and core values, business philosophy. The expression of corporate culture is expressed through two main factors: tangible: Uniforms, slogans, rituals, regulations, company soundtracks, internal journals, activities and intangible: Thai attitudes, styles, habits, and ways of thinking of people in the organization.

2.2.4. The relationship between ESG implementation and business performance

ESG analysis looks at an entity's interactions with the natural and social world, along with the quality of its governance, S&P Global Ratings believes ESG analysis provides a comprehensive view of potential areas hidden environmental and social risks as well as opportunities for companies in rapidly developing markets.

Companies that focus on ESG issues have achieved their goals of reducing costs, improving worker productivity, mitigating potential risks, and creating revenue-generating opportunities. These are just some of the ways that ESG can enhance corporate profitability and long-term sustainability.

But within the scope of this research paper, the authors want to emphasize the relationship between ESG and corporate performance through the intermediary factor of firm value.

a. ESG influences through customer loyalty

This is a factor of strategic significance and a goal that textile enterprises in particular and in all other fields in general always aim for.

The research works that use the customer loyalty factor have shown that a business with high customer satisfaction will lead to increased customer loyalty, thereby helping businesses achieve high performance (Matzler and Hinterhuber. (1998); Anderson, Fornell and Rust (1997); Cronin, Brady and Hult (2000)).

b. ESG influences through corporate reputation

A reputable business is one that achieves high recognition from stakeholders for the quality of services, products provided or working methods, financial transparency, ... (Fombrun (Fombrun (Fombrun) 1996); Deephouse (2000)).

Many studies have shown a positive association between ESG activities and corporate reputation (Fombrun and Shanley (1990); Lai et al (2010); Stanaland, Lwin and Murphy (2011). This will lead to improved sales and profits in the long run.

c. ESG influences through corporate culture

A company's culture is all about a shared vision and ethos - it's about what's done, how it's done, and why; and this is on both formal and informal levels.

The formal changes brought about by the ESG will have a major impact on policies, strategies and developments. Some of these changes may be mandatory, such as new standards, laws and guidelines introduced by third parties and government initiatives; others may be voluntary in the sense that a business is not required to do them - but still necessary due to pressure from industry leaders and consumer expectations.

Culture is something that can be difficult to measure and quantify but can have a powerful impact on the performance of a business. Usman Ali, an ESG partner and analyst at MCP (Mobius Capital Partners is an emerging market asset management firm specializing in ESG), emphasizes the importance of corporate culture to profitability by citing the fact that a portfolio of companies listed on Glassdoor's 2009 Best Places to Work list "have significantly outperformed the S&P 500 with returns in excess of 265%".

3. Method

3.1. Research design and sample

The objective of the qualitative research is to understand the perception and benefits of ESG practice for Vietnamese enterprises in general and Vietnamese textile and garment enterprises in particular, thereby assessing the impact of ESG on performance of a particular business through case studies.

From the above research objectives, the authors conducted the following research:

Stage 1: Get an overview of ESG.

Stage 2: Learn about ESG awareness and practice of Vietnamese enterprises in general and Vietnamese textile and garment enterprises in particular

In the process of implementation, the authors have conducted research and inherited the scientific values of previous articles and research articles that are relevant to the topic, in order to have the most objective view and overall assessment. on the concept of ESG of enterprises, thereby serving as a basis for building an appropriate research model on the influence of ESG practice on corporate performance in Vietnam.

The research team identifies, the research subjects are senior leaders who directly consult on issues related to operational strategies and corporate social responsibility activities such as directors, deputy directors. , chief accountant and staff of the social responsibility department. These officers may belong to enterprises or departments of the Government, large organizations related to Vietnam's textile and garment industry, such as the Vietnam Textile and Apparel Association (VITAS).

3.2. Data collection

The authors collect data on the basis of 5 main contents:

Firstly, the content of certifications related to ESG practices and the relationship between ESG and business performance (Textiles)

Second, the content of ESG implementation (practice) of Vietnamese enterprises

Third, the content related to the perception of the Government and businesses, especially Vietnamese textile and garment enterprises.

Fourth, the benefits of implementing ESG of Vietnamese textile and garment enterprises.

3.3. Data analysis

Based on the results obtained from the data collection, the research team makes objective judgments on the following issues: (1) The results of the perception of ESG practices of enterprises in general and the textile enterprises in particular, (2) The influence of ESG on business performance, and (3) Case study on the influence of ESG practice on the performance of a particular enterprise.

4. Results

Textile enterprises in Vietnam have focused on improving environmental and social standards in their production activities. Large companies such as Vinatex, TNG, May 10, Saitex and countless other textile and garment enterprises are applying standards of environmental management, especially energy and resource saving, waste reduction and harmful emissions.

Faced with increasingly high and mandatory global requirements, many domestic enterprises have begun to transform production in the direction of "greening". Thanh Cong Textile and Garment Investment Trading Joint Stock Company (code TCM) has invested in a Lab to research green materials and apply research to fashion products in the most effective way. Besides, Thanh Cong also established a research and business development center to develop 3 main product lines, including eco-friendly products, seasonal feature products and convenient product lines for daily life. living. According to Thanh Cong's report, in 2020, this business saved more than 8.4 million kWh of electricity and reduced CO₂ emissions by up to 17,428 tons. This group has sponsored 3 billion VND for the program "Green trees for Ho Chi Minh City" to contribute to building a green - clean - beautiful living environment for the community. Thanh Cong Group has invested more than 400 billion VND for waste water and gas treatment works at its textile and garment factories. In particular, these works have reduced more than 90% of SO₂ emissions and more than 70% of NO_x of the plant.

By the end of 2020, Viet Tan Group, one of the largest textile and garment groups in Vietnam, has funded more than 30 billion VND for education, health and other community development activities. Viet Tan Group has invested more than 300 billion VND in improving the quality of wastewater from its textile factory. Especially, from 2015 to now, Viet Tan has reduced more than 90% of COD and more than 70% of BOD in wastewater of the plant.

Vinatex Group has issued specific policies such as: Using reused water and treated wastewater to minimize the impact on the environment, using renewable energy such as sun and wind to reduce CO₂ emissions. , implementing programs to reduce waste, save fuel and optimize the production process, ensure labor protection regimes, including fair wages, ensure labor safety, and ensure health and insurance coverage for employees. According to a report by Vinatex, in 2020, this business used more than 2 million cubic meters of reused

water and reduced at least 19,765 tons of CO₂ emissions. By the end of 2020, Vinatex Group has had 20 projects on community development, including medical support, education and training, agricultural support, construction of roads and bridges, and school equipment. with a total cost of more than 25 billion VND.

However, the application of ESG standards is still a challenge for textile enterprises in Vietnam. The textile and garment industry in Vietnam is facing many challenges from economic and environmental aspects to technology and human resource management. To overcome these challenges, businesses need to invest in improving production skills, increasing the use of technology and effectively managing human resources. Therefore, increasing awareness and practice of ESG will be an important requirement in the future to ensure the sustainability of Vietnam's textile and garment industry.

5. Discussion and Conclusions

5.1. Conclude

The research results of the article show a positive relationship between ESG practice and corporate performance through the role of corporate values: customer loyalty, corporate reputation, corporate culture, etc. Karma. In which, it refers to the positive relationship of ESG practice to corporate reputation, customer loyalty, and corporate culture, and assesses that these three factors all have a positive impact on operational efficiency. enterprise action. Thus, it can be seen that practicing ESG, building customer loyalty, reputation and good corporate culture will lead to positive innovation and thereby increase operational efficiency in each business. enterprises, especially for Vietnamese textile and garment enterprises.

5.2. Propose

Based on the views given and analyzed about ESG above, our research paper makes some recommendations for businesses about ESG implementation as follows:

Firstly, businesses need to be properly aware of ESG as well as the importance and necessity of ESG in the current trend of globalization and international integration to be able to participate in the global supply chain and for the sake of effective operation towards sustainable development.

Secondly, enterprises need to arrange and improve the capacity of personnel specialized in ESG, focusing on and improving production management skills, value chain management and customers; effectively develop and implement the Human Resource Development Support Program in the textile and garment sector, focusing on new and necessary skills in the context of the industrial revolution 4.0.

Third, develop and publish annual regulations and policies of the company on ESG. At the same time, it is necessary to promptly amend and supplement those policies so that they are reasonable with the environmental and social circumstances and bring into full play the positive impact of ESG on economic consequences.

Fourth, businesses need to make efforts to transform, catch up with market trends, invest in machinery and technology, green transformation to adapt to the requirements of brands, and enhance many solutions for development.

Fifth, it is necessary to attract foreign investment selectively, giving priority to investment projects in advanced textile dyeing technology that do not cause adverse impacts on the environment.

Sixth, connecting with domestic garment enterprises, forming linkages throughout the value chain, jointly offering solutions on science - technology to green the textile industry... towards development. sustainable development, while meeting the requirements of major markets in the world.

Abstract

This study focuses on the impact of financial literacy on behavioral intention towards using FinTech services of residents in Hanoi, Vietnam. Structural equation modeling (SEM) results on the dataset collected from 501 survey results show that financial knowledge and financial attitude are closely correlated with the intention to use FinTech. In which, financial knowledge is the factor that has the greatest influence on the intention to use FinTech services. The study also showed that demographic factors such as age, occupation, and education level affect the intention to use FinTech services. Combining Theory of Reasonable Action (TRA) and Technology Acceptance Model (TAM), the study shows that perceived usefulness and perceived ease of use both have a positive influence on attitude towards using FinTech services. Based on these research results, we suggest some solutions for the Vietnam Government, FinTech businesses and residents to improve financial literacy and the adoption of FinTech services.

Keywords: *Financial Literacy, FinTech, Behavioral intention towards FinTech, TAM Model, TRA.*

1. Introduction

FinTech is a term that refers to the application of advanced technologies to improve and enhance the quality of traditional methods of providing financial services (McAuley, 2014). FinTech applications such as mobile banking, e-wallet, and online securities trading services help users easily access financial services without the need for traditional transaction methods. Since 2020, the FinTech sector in Vietnam has not only increased in

the number of companies but also diversified regarding types of services. However, the level of access to FinTech in Vietnam is still uneven, with lower access rates in rural, remote, and isolated areas (Trinh Thi Phan Lan, 2022). There is still very little research that connects financial literacy and the use of FinTech. Those existing studies only consider the direct impact of financial literacy on the intention to use FinTech or only apply the Technology Acceptance Model (TAM) to the study of behavioral intention to use FinTech. Meanwhile, comprehensive research on the impact of financial literacy combined with the TAM model on the intention to use FinTech is currently quite lacking. Therefore, the purpose of the study is to examine the impact of financial literacy, and factors in the TAM model on the intention to use FinTech or the level of user acceptance of FinTech.

The aim of this study is to: Firstly, researching the factors in the model affecting the adoption of FinTech through financial literacy level: Financial Knowledge, Financial Attitude, Financial Behavior, Perceived Usefulness, Perceived Ease of Use, Demographic Factors, Attitudes Towards Using FinTech and Behavioral Intention to Use FinTech; Secondly, building and validating the scale of impact factors suitable to the Vietnamese market context; Thirdly, based on the research results in theory and survey, suggesting strategies and solutions for the government and businesses on increasing the acceptance of FinTech in Vietnam.

2. Literature Review

2.1. FinTech

Chuang, Liu, and Kao (2016) conducted a study to understand the action intention of consumers in using FinTech services, and the results showed that: Brand and service trust, Perceived usefulness, Perceived ease of use, and Attitude toward usage had a significant positive impact on intention behavior. This result has somewhat the same indications as the research of Hang et.al (2018) about online payment in Vietnam. In research about the Innovation of FinTech in Germany, Steward and Jurien (2017) showed that Data Security, Trust, and User interface design influence FinTech adoption.

Covid-19 pandemic is a good lever to access FinTech services, helping users realize the usefulness of the service (Le, 2021). FinTech services have increased user numbers during the COVID-19 lockdown. In the research of Le (2021), during the COVID-19 pandemic, trust, data security and privacy, and especially employee services are factors that enhance intention to use through perceived usefulness. Moreover, also investigating FinTech applications during Covid-19, the finding of Al Nawayseh (2020) states that perceptions of risks did not affect customers' intention to use FinTech applications but it affected their trust in the service. At the same time, users will become loyal to FinTech services because of the usefulness of this service to which they have been applied due to the mandatory condition of the Covid-19 lockdown.

2.2. Financial Literacy

Lusardi and Mitchell (2011a) analyzed financial literacy of people in 8 countries (Germany, the Netherlands, Sweden, Japan, Italy, New Zealand, the United States, and

Russia). They concluded that in most countries, financial literacy of women is lower than men and the figure for more educated people is also higher than those who do not. They also found evidence that ethnic, racial, and regional differences have a significant impact on financial literacy.

Atkinson and Messy (2011) report a questionnaire by the OECD International Network on financial education that is being piloted in 12 countries which takes into account awareness, behavior, and attitudes related to personal finance, in order to assess financial literacy. There is a positive association between financial attitudes and behavior and financial knowledge and behavior. That could infer knowledge leading to more active participation in financial markets and more positive behavior.

2.3. Theory

2.3.1. Studies on financial literacy

Research results of Junger and Mietzner (2019) indicate that the group of subjects with high financial literacy scores tends to accept the use of FinTech. Some prominent studies on the relationship between “Financial Literacy” and “FinTech adoption” also give similar results (Pavlou, 2003; Li et al., 2020; Liébana-Cabanillas et al., 2014; Wu & Wang, 2005; Yeo & Fisher, 2017). From there, the research team proposes the following hypothesis:

H1: “Financial Knowledge” has a positive effect on “Behavioral Intention to Use FinTech”.

H2: “Financial Attitude” has a positive effect on “Behavioral Intention to Use FinTech”.

H3: “Financial Behavior” has a positive effect on “Behavioral Intention to Use FinTech”.

Junger and Mietzner (2019) showed that the group of people who have used financial products will have a positive attitude to use FinTech, reflected in their willingness to evaluate and compare products to choose a superior product, bringing the best results. high performance during use. Agreeing with this view, Elsinger et al. (2018) believe that in order to improve their attitude to use FinTech, users need knowledge to understand the quality and risks of new financial products. From there, the research team proposes the following hypothesis:

H4: “Financial Knowledge” has a positive effect on “Attitude Towards Using FinTech”.

H5: “Financial Attitude” has a positive effect on “Attitude Towards Using FinTech”.

H6: “Financial Behavior” has a positive effect on “Attitude Towards Using FinTech”.

2.3.2. Technology Acceptance Model (TAM)

The Technology Acceptance Model (TAM), developed by Davis (1989), is one of the most influential research models in the study of information systems determinants to investigate the intention to use and adopt technological services of individuals. Two important factors in the TAM model are perceived ease of use and perceived usefulness.

Perceived usefulness is defined as the degree to which a person believes that using a particular system will improve job performance (Davis, 1989). Users will believe that the system is useful if it provides some benefit (e.g. less time and financial loss to increase

efficiency and productivity) to them, thereby increasing their adoption intention (Chong et al., 2010). Some of the features that are considered useful in the adoption of online banking are transaction speed, user-friendliness, and accuracy (Liao & Cheung, 2002). By aggregating the results of TAM theory and previous studies, a hypothesis is suggested as:

H7: “Perceived Usefulness” has a positive effect on “Attitude Towards Using FinTech”.

Perceived ease of use is the degree to which a user believes that in order to use a new system or technology, they need not exert too much effort (Davis et al., 1989). This perception of ease of use is believed to have a strong impact on customer attitudes when shopping in online stores (Palvia, 2009). From these perspectives, the research team suggest a hypothesis:

H8: “Perceived Ease of Use” has a positive effect on “Attitude Towards Using FinTech”.

Pikkarainen et al. (2004) applied TAM in the study in Finland and they found that usefulness is considered as a determinant of customer intention to use, improving trust and readiness, which encourages users to use banks with technology. Many other studies also show positive results between perceived usefulness and intention to use of customers such as Jahangir, N., & Begum, N. (2008), Moses et al. (2013). Hence, by combining the above theories, a hypothesis is put forth:

H9: “Perceived Usefulness” has a positive effect on “Behavioral Intention to Use FinTech”.

2.3.3. Theory of Reasoned Action (TRA)

Davis (1989) defined The Theory of Reasoned Action (TRA) as “Behavior” is determined by a person's intention to perform and the influence of their environment. Empirical studies related to the diffusion of technological innovation have extended the use of the TAM model to include attitudes as defined by the Theory of Rational Action (Davis et al., 1989; Jayawardhena & Foley, 2000; Karjaluoto et al., 2002). Understanding the determinants of consumer attitudes, it is argued that this attitude has a strong, direct, and positive impact on consumers' intention to actually use a new technology or system. (Hernandez & Mazzon, 2007; Jaruwachirathanakul & Fink, 2005; Bobbitt & Dabholkar, 2001).

In addition, this study also confirmed the relationship between attitude and intention to use. From that, the research group came up with the following hypothesis:

H10: “Attitude Towards Using FinTech” has a positive effect on “Behavioral Intention to Use FinTech”.

2.3.4. Studies on demographic factors

Education level

Morgan and Trinh (2020) showed the relationship between education level and behavioral intention to use FinTech, with the target group with a university degree and above accounting for the highest percentage of FinTech usage. The study of Li et al. (2020) and Nguyen Thi Anh Nhu (2022) reached similar conclusions.

Income

The influence of income on the intention to use FinTech has been mentioned in many studies. Morgan and Trinh (2020) indicated that high-income people are more likely to use FinTech than low-income people. The study by Li et al. (2020) also suggests the same result, claiming that high-income households have a high rate of FinTech usage.

Occupation

When studying the influence of occupation factors on the intention to use FinTech, Yoshino et al. (2020) showed that the intention to use FinTech of the employed group is higher than that of the unemployed group, the highest is in students, company employees, government employees, part-time employees, and teachers. Nguyen Thi Anh Nhu (2022) compared FinTech usage trends in two groups of people working in the public sector and the private sector, showing that the intention to use FinTech among people in the public sector is higher than people in the private sector.

Age

The impact of age on FinTech adoption has been found in many studies (Morgan & Trinh, 2020; Nguyen Thi Anh Nhu, 2022; Yoshino et al., 2020). Choudrie & Vyas (2014), Choudrie et al. (2018) concluded that the prevalence of using mobile applications to support electronic transactions among older adults is low.

Gender

Li et al. (2020) argued that there is a difference in FinTech usage between men and women, with a higher proportion of men using mobile payments. Morgan and Trinh (2020), Yoshino et al. (2020) showed the results: men tend to use e-banking services and electronic payments higher than women.

From there, the research team proposes the following hypotheses:

H11a: "Educational level" affects "Behavioral intention to use FinTech".

H11b: "Income" affects "Behavioral intention to use FinTech".

H11c: "Occupation" affects "Behavioral intention to use FinTech".

H11d: "Age" affects "Behavioral intention to use FinTech".

H11e: "Gender" affects "Behavioral intention to use FinTech".

2.4. Framework

Synthesized from the above hypotheses, we propose the following model:

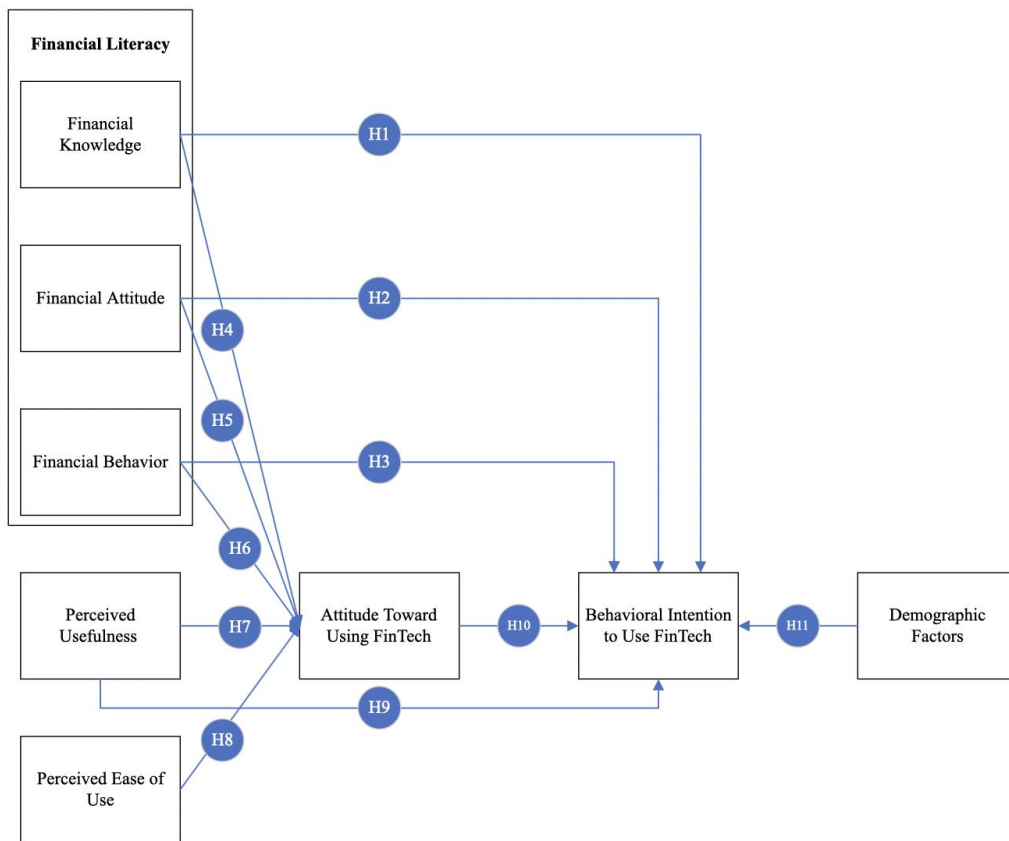

Figure 1. Research Model

Source: Author's proposal

3. Method

3.1. Dataset and Sample Selection

We collected data by sending out online questionnaires. The subjects of this study are people who are living, studying and working in Hanoi. There are 8 career areas we want to research: industry, training, engineering, agriculture, administrative management, finance and banking, healthcare and business. The survey period is from January 2023 to February 2023. After 1 month of conducting the online survey, we had collected 538 surveyed questionnaires. After filtering and removing invalid questionnaires due to unreasonable answers, the final sample number was 501.

3.2. Measurement Variables

In this study, the research scales are constructed by adjusting the questionnaire drawn from previous studies of OECD (2013); OECD (2015); Li-Min Chuang, Chun-Chu Liu and Hsiao-Kuang Kao (2016). The questionnaire is designed on a 5-point Likert scale with meanings ranging from 1 - Totally disagree to 5 - Totally agree.

Behavioral intention to use FinTech services (BI) is a dependent variable, measured by 6 observed variables. The independent variable consists of financial knowledge (K), financial attitude (A), financial behavior (B), perceived usefulness (PU), perceived ease of use (PE) and attitude toward using FinTech (AT). The measurement scale of each variable

includes 3; 4; 5; 4; 3; 5 observed variables, respectively. Control variables are composed of education level, income, occupation, age, and gender. Preliminary quantitative test results show that all items in the questionnaire are statistically significant and fit the model.

4. Results

4.1. Descriptive Results

The total number of samples collected was 501 observations, including 154 males (30.7%) and 344 females (69.3%). The sample concentrated on the age group 18 - 29, accounting for 74.85%, and the age group 30 - 44 accounted for 10.98%. The majority of surveyed subjects are students, so their income is mainly from 0 - 5 million VND a month (63.67%) and 5 - 10 million VND a month (14.17%), the rest are those with income from 10 million VND or more. Regarding employment, students accounted for the highest percentage (59.08%), followed by people with jobs in the field of finance and banking (20.76%), then administrative management, educational and technical fields. In addition, since the study was carried out in Hanoi, the percentage of survey respondents with college and university education was the highest (79.44%), followed by those who have completed a general education program (12.18%), the rest have postgraduate education.

4.2. Confirmatory Factor Analysis Results

Table 1. Composite Reliability, Convergent Validity, and Discriminant Validity Assessment Results

	CR	AVE	MSV	MaxR(H)	PE	A	B	AT	BI	PU	K
PE	0.892	0.735	0.036	0.911	0.857						
A	0.896	0.684	0.062	0.905	-0.056	0.0827					
B	0.909	0.667	0.050	0.910	-0.013	-0.133**	0.816				
AT	0.919	0.694	0.391	0.919	0.189***	0.204***	0.223***	0.833			
BI	0.938	0.714	0.391	0.938	0.085*	0.249***	0.186***	0.625***	0.845

Source: Author's calculation

Confirmatory Factor Analysis (CFA) was used to test the reliability of the research scale. The results show that the measurement model has a value of $\chi^2/df = 1.786 (<3)$; GFI = 0.913 (>0.8), CFI = 0.971; TLI = 0.967; (>0.9); RMSEA = 0.040 (<0.08); PCLOSE =

1.000 (>0.05). The values meet the thresholds suggested by Bagozzi and Yi (1988); Hair et al. (2010).

Hair et al. (2010) used three indicators Composite Reliability (CR), Average Variance Extracted (AVE), Maximum Shared Variance (MSV) to evaluate the reliability, convergence and discriminant of the scale. Based on summary results in Table 1, AVE value of each latent variable is greater than 0.5 and CR value is greater than 0.7, so the convergence and reliability are at a good threshold. AVE values are also larger than MSV values and the square root value of AVE is larger than the correlation coefficients between variables in the model. Thus, the discriminant is guaranteed.

4.3. Structural Equation Modeling Results

Table 2. Hypothesis Testing and Impact Analysis Results

Hypothesis			r	β	S.E.	C.R.	P	Result
BI	←	K	0.438	0.560	0.055	10.266	***	Accepted
BI	←	A	0.115	0.101	0.032	3.183	0.001	Accepted
BI	←	B	0.034	0.034	0.036	0.961	0.337	Rejected
AT	←	K	0.172	0.248	0.063	3.937	***	Accepted
AT	←	A	0.135	0.134	0.042	3.191	0.001	Accepted

BI	←	AT	0.371	0.329	0.043	7.625	***	Accepted

Source: Author's calculation

To test the hypotheses of the research, we used Structural Equation Modeling (SEM). The results show that, based on the fit threshold proposed by Hu and Bentler (1999), Hair et al. (2010), the values are from good to very good and are in perfect agreement with the observed data. Specifically, $\chi^2/df = 1.782 (<3)$, GFI = 0.913 (>0.8), CFI = 0.971 (>0.95), TLI = 0.967 (>0.9), RMSEA = 0.040 (<0.06) and PCLOSE = 1.000 (>0.05).

With statistical significance < 0.05 and correlation coefficient > 0, hypotheses H1, H2, H4, H5, H6, H7, H8, H9, H10 are accepted, hypothesis H3 is rejected. In particular, the major contributing factor to promoting the intention to use FinTech is financial knowledge. Moreover, attitudes towards using are significantly influenced by perceived usefulness and financial behavior. Financial behavior does not affect behavioral intention to use FinTech (P = 0.337). Therefore, H3 is rejected. Lastly, the independent variables explain 60.6%

and 41.9% of the variation of attitude and intention to use FinTech services, respectively. Therefore, the explanatory power of the independent variables in the research model is at a good level.

4.4. One - way ANOVA Results

To test the mean difference in behavioral intention to use FinTech of demographic factors, we used Levene's test. Three Sig-values are lower than 0.05, with heterogeneous variance corresponding to three factors: education level (Sig.=0.000), income (Sig.=0.001), age (Sig.=0.000). Continuing with Welch's test, the Sig-value of education level is Sig.=0,000 (<0.05), age is Sig.=0.002 (<0.05) and income is Sig.=0.528 (>0.05). Therefore, we accept hypotheses H11a, H11d and reject hypothesis H11b. Two factors, employment and gender, under Levene's test have Sig.=0.085 and Sig.=0.398, respectively, greater than 0.05, so there is a uniform variance. Continuing with ANOVA test, employment has Sig.=0.036 (<0.05) and gender has Sig.=0,692 (>0.05). Therefore, we accept hypothesis H11c and reject hypothesis H11e. For three accepted hypotheses H11a, H11c, H11d, those who have college or university degree, those who are students and the age group 18 - 29 have the highest behavioral intention to use FinTech.

5. Discussion and Conclusion

Research has verified the relationship between factors of financial literacy; perceived ease of use and perceived usefulness affect attitudes and behavioral intentions to use FinTech. Through empirical research in this paper, it is found that:

Firstly, financial literacy has a strong relationship with the intention to use FinTech services. Specifically, knowledge plays the most important role in increasing intention to use. Individuals with high Financial knowledge scores have a high tendency to want to use FinTech services. Simultaneously, the financial attitude also has a positive correlation with the intention to use. This result is consistent with previous empirical research of Junger & Mietzner (2019); Nguyen Thi Anh Nhu (2022). However, the data shows that the intention to use is not affected by financial behavior. This may be because the FinTech industry in Vietnam is still young and the legal corridor is loose. Therefore, some individuals will be concerned about security when accepting those types of services.

Secondly, three factors inherent in financial literacy have a positive influence on the attitude toward using FinTech, in which financial behavior has the largest impact on the attitude of people to use FinTech in Hanoi. This result is consistent with the research of Junger & Mietzner (2019), which shows that a group of people with experience in using financial products often decide to use a new financial product through the process of evaluation and comparison.

Third, perceived usefulness and perceived ease of use both positively influence attitudes toward using FinTech. This means: the more useful and easy a user feels a FinTech service is to use, the more determined they are to use it. This result is similar to Palvia (2009) when studying online shopping stores, Liao & Cheung (2002) in studying online payment

on banking applications. In addition, the positive effect of perceived usefulness on behavioral intention to use FinTech is also inferred from the research results. This shows that the greater the awareness of the benefits of FinTech services, the higher the intention to use these services.

Fourth, demographic factors such as age, occupation, and education levels affect the behavior intention to use FinTech. This result is consistent with previous research by Nguyen Thi Anh Nhu (2022), so we can conclude that the people who intend to use FinTech in Hanoi are mostly young and well-educated. However, the analysis data shows that there is no statistically significant difference between gender and income, which goes against the study of Morgan & Trinh (2020) or Li et al (2020). In fact, Vietnam nowadays is less affected by gender inequality than previous generations, women have more voice and status in society, more opportunities to cultivate knowledge and more chances to participate in social and financial investment activities than before. Concurrently, some high-income people may be used to traditional financial services and have little interest in price, so they have no intention of using FinTech. Meanwhile, some low-income people intend to use FinTech to reduce costs and increase convenience.

From the research results, some proposed solutions to improve financial literacy and intention to use FinTech are as follows:

Firstly, for the Government, the development of the digital economy is considered as one of the main driving forces that will allow Vietnam to achieve its goal of becoming a high-income economy by 2045. The trend of digitalization or digital transformation is really strong in all fields, especially in the financial sector. FinTech was born as a powerful technology segment of Digital Finance. In such a context, raising financial literacy by the development of a national curriculum framework on financial education aims to popularize basic financial literacy (financial knowledge, behavior, attitudes) are needed. In particular, the Government should concurrently complete the Financial Technology test mechanism in the banking sector and issue new decrees, supporting policies to help create a healthier operating environment and encourage businesses to actively innovate. In general, in order for the FinTech industry in Vietnam to develop further and reach more users, there needs to be a harmonious combination between raising financial literacy and promoting the FinTech ecosystem.

Secondly, for FinTech businesses, because the majority are start-ups, FinTech businesses in Vietnam need to improve the quality of human resources, accumulate skills and business experience. Moreover, FinTech businesses need to promote links with commercial banks to provide products and services and build a FinTech ecosystem towards the convenience of users. Thereby, businesses can maintain stable operations, improve their reputation and brand with users. They can also create incentives to stimulate use for consumers, while keeping up with the general trend of society and attracting more people to use the financial services they provide.

Third, for residents, each person needs to actively learn, accumulate knowledge and participate in financial teaching programs to improve their financial knowledge. Residents

should also regularly update market trends, catch up with news on Government and Enterprise regulations to use selective FinTech services. Behavioral intentions to use FinTech often require a higher level of risk tolerance than traditional financial products. Therefore, users also need to pay attention to the risks that may be encountered when trading by updating information about policies and programs from official media channels. For users who value safety and want to limit the risks, they are encouraged to choose FinTech applications that have a privacy policy that helps protect their interests when making transaction decisions.

Abstract

Currently, the trend of "greenwash" has generated green skepticism among consumers - skepticism about the green consumer products they have access to. The purpose is to investigate the influence of the "Green skepticism" on the intention to buy green consumer goods of Generation Z in Hanoi. The application of Attitude - Behavior - Context theory is the background for this research. The study was implemented in two phases: preliminary qualitative research and formal quantitative research. The main findings indicated that green skepticism has a direct negative impact on the intention to buy green consumer products and also an indirect influence through environmental concerns. As the result, in order to reduce green skepticism, policies should be in place to help manage and evaluate quality to provide transparency in the information of green consumer products.

Keywords: *Green purchase intention, Green skepticism, Generation Z.*

1. Introduction

Currently, environmental pollution is an existential threat to human and planetary health. Along with that is the maturity of Generation Z which shows a high interest in social issues such as environmental matters. Environmental campaigns are widely deployed and supported; however, some companies have taken advantage of this to adjust their green business strategies by using the idea "greenwashing". The trend of "greenwashing" has aroused skepticism in the consumer community about the green advertising they are exposed to.

With the availability of information on the internet, today's consumers begin to understand how their choices can have a significant impact on the environment. Therefore, in Vietnam, green consumption is becoming more and more popular. Gen Z - the adaptable and changeable generation are the pioneers in responding to the green consumer lifestyle. It can be seen that green skepticism and its influence on the intention to purchase green consumer goods of Generation Z in Vietnam is a critical global issue in today's world, where environmental concern is always at the forefront of public debate.

Therefore, we conduct a study to investigate the relationship between green skepticism, environmental knowledge and environmental concern and the green consumer goods purchase intention of Generation Z in Vietnam. Through a literature review and empirical research on the attitudes and behaviors of this demographic group, it hopes to shed light on the underlying motives and factors affecting green consumer goods purchase intention.

The paper is organized as follows. The research starts with the framework of Attitude - Behavior - Context theory. Then the research presents the Research hypotheses and main findings. It concludes with some managerial implication for state agencies, enterprises and consumers.

2. Literature Reviews and Research hypotheses

Attitude - Behavior - Context theory

Attitude - Behavior - Context theory is a theory of human behavior in which external factors (context) can prevent a person from carrying out their intentions (Guagnano et al., 1995). There is a gap between attitude and behavior, and attitude does not always lead to corresponding behavior; instead, external factors may prevent an individual from carrying out their intentions. This theory proposes that contextual or situational factors must also be considered when trying to understand consumer behavior.

Green Consumers Goods Purchase Intention

In green consumption, green purchase intention refers to the probability and the willingness of the person to give preference to environmentally friendly products compared with conventional products in their considerations of purchase (Nik Abdul et al., 2009). In other words, green purchase intention is the possibility of consumers wishing to purchase environmentally friendly products (Chen and Chang, 2012).

Environmental concern is defined as the degree to which people are aware of problems regarding the environment and support efforts to solve them and/or willingness to contribute personally to their solution (Dunlap et al., 2002). Lavuri, R. et al (2021) indicated a correlation between environmental concerns and green purchase intentions of Generation Y and Z consumers. Eddy S. Yusuf et al. (2021) confirmed that there are direct and indirect effects of environmental concern on environmental purchase intentions. In Vietnam, Hoang Trong Hung et al. (2018) pointed out that environmental concern is one of two main factors affecting green consumption intentions, thereby indirectly affecting sustainable consumer behavior. Therefore, we suggest the first hypothesis:

H1: Environmental Concern has a positive impact on Green Consumer Products Purchase Intention.

Environmental knowledge can be defined as an individual's ability to identify various symbols, concepts and behavior patterns related to environmental protection (Laroche et al., 2001). What consumers know about the environment, perceptions of environmental issues, emotions involved, and the consequences of actions on the environment (Paço and Raposo, 2009; Zhao et al., 2014; Eles, 2017; Yadav and Pathak, 2016). An individual's environmental knowledge is closely related to consumer buying behavior (Bazoche et al., 2008). Other studies also confirmed this result that there is a direct and positive relationship between knowledge and intention (Goh and Balaji, 2016; Joshi and Rahman, 2015; Aman et al., 2012). Therefore, we suggest the second hypothesis:

H2: Environmental Knowledge has a positive impact on Green Consumer Products Purchase Intention.

Consumer skepticism is the tendency toward disbelief of advertising claims (Obermiller and Spangenberg 1998). Green skepticism is defined as a consumer's state of mind, or in other words, a tendency to doubt the environmental claims or related environmental performance of green products (Kwong and Balaji, 2016). Waskito, J., and Wahyono, W. (2017) showed that skepticism has an insignificant influence on green purchase behavior. Similarly, Luo et al. (2020) showed that skepticism towards green advertising has no direct impact on green product purchase intention. While in Vietnam (Nguyen et al., 2019) proved that green skepticism has a direct negative impact on green purchase intention. Therefore, we suggest the third hypothesis:

H3: Green Skepticism has a negative impact on Green Consumer Products Purchase Intention.

Pagiaslis and Krontalis (2014) observed that environmental concerns have direct and indirect effects through knowledge and beliefs on willingness to pay and use biofuels. In addition, Bamberg (2003) demonstrated that customers who are highly concerned about the environment are more informed about green products and green technologies and are more conscious about purchasing products that are harmful to the environment. Therefore, we suggest the fourth hypothesis:

H4: Environmental Knowledge mediates the relationship between Environmental Concern and Green Consumer Products Purchase Intention.

Goh See Kwong and M.S. Balaji (2016) aimed to investigate the role of skepticism in green purchase behaviors. The results showed that environmental concern fully mediates the relationship between green skepticism and green purchase intention. However, the study of Jati Waskito, Wahyono (2017) on consumer green purchase behavior in Indonesia showed that environmental concern did not mediate skepticism and green buying behavior. Therefore, we suggest the fifth hypothesis:

H5: Environmental Concern mediates the relationship between Green Skepticism and Green Consumer Products Purchase Intention.

Goh (2016) found that consumers with a high degree of skepticism tend to ignore information about green claims and thereby affect green purchase intentions. Masayu and

Rifelly (2021) indicated that the indirect effect of green skepticism is more significant than the direct negative effect of green skepticism on green purchase intention. However, this result is in contrast to (Leonidou and Skarmas, 2017) that consumers who are uncertain about eco-friendly labels have the tendency to seek more information to confirm their skepticism, then consider buying or not. Therefore, we suggest the sixth hypothesis:

H6: Environmental Knowledge mediates the relationship between Green Skepticism and Green Consumer Products Purchase Intention.

3. Methods

This research utilizes the qualitative research method combined with a quantitative research method. Qualitative research was used to explore the perspectives and perspectives of Gen Z consumers on the intention to buy green consumer products. Quantitative research to determine the factors affecting the intention to buy green consumer products have been mentioned: Green skepticism, Environmental concerns, and Environmental knowledge.

Research Instruments

For qualitative research, the observation method was used to form relationships between related factors and build initial theoretical models. In-depth interviews are also used to approach interviewees thoroughly and effectively in order to deepen the research topic.

For quantitative research, the survey was conducted through a questionnaire. The questionnaire consists of four parts, with the scale used as a 5-point Likert scale (level 1 corresponds to "strongly disagree" and level 5 corresponds to "strongly agree") to measure the following factors: Green Skepticism, Environmental Concerns, Environmental Knowledge, and Green Purchase Intention.

Research Participants

Generation Z is defined as people who were born between 1995 and 2010 (McCordle và Wolfinger, 2010); between 1996 and 2012 (Schwieger và Ladwig, 2018) or 1997 - 2013 (Schroth, 2019). In this study, we focused on people born between 1997 and 2008. Survey participants are young people, people of Gen Z, from 15 to 26 years old, who are living in Hanoi.

Data Collection and Sample

Method of collecting secondary data: Secondary data was collected based on domestic and foreign articles, available documents, research papers related to the topic, and reliable websites serving for searching and filtering information. Data was collected from October 2022 to December 2022

Method of collecting primary data: Data was collected by distributing online surveys through social networks to Generation Z living in Hanoi using Google Forms. The questionnaire was also printed and sent directly to the respondents, the answers were then entered into the spreadsheet and merged with the answers obtained by online form. For this form of data collection, there were 485 respondents to the questionnaire. After filtering the data, we obtained 451 valid answer sheets.

Data Analysis

All valid samples were processed by SPSS 20 and AMOS 20 to conduct reliability analysis, factor analysis, regression analysis, and hypothesis testing. SEM linear structural model is used to test the proposed research hypothesis to see if it is consistent with the actual data obtained or not.

4. Results

Out of 482 questionnaires collected, 451 answers were valid. The percentage of female respondents was 73% while that figure for male accounted for 26.4%, the remaining 0.6% belongs to the other gender. The number of respondents was divided into three categories, namely from 15 to below 18 years old (11.1%), from 18 to below 22 years old (83.1%) and from 22 to 26 years old (5.8%). Payments for green consumer goods were mostly less than 500,000 VND per month (> 89%). The majority of survey respondents have ever bought green consumer goods (accounting for more than 49%) and answered that they buy green consumer products on a regular basis.

To evaluate the reliability of the scales used in this research, the Cronbach Alpha coefficient was used, and exploratory analysis (EFA) was performed to evaluate the convergent and discriminant values of the scales. Some observed variables (GS4, EK5, EC2 and GPI4) were excluded due to low total correlation coefficients or simultaneous upload of both factors.

The results of CFA analysis showed that the Chi-Square coefficient/df (CMIN/df) was 1.914 (< 3), GFI = 0.872 (> 0.8), CFI = 0.944 (> 0.9), RMSEA = 0.078 (< 0.08). Therefore, the model is suitable for the research data, the values are satisfactory.

The process of analyzing the SEM linear structure model and analyzing the indirect relationship between the variables gave the following results:

Table 7. Hypothesis Testing Results

Hypo	Statement	P - value	Result	Degree of effect
1	Environmental Concern has a positive impact on Green Consumer Products Purchase Intention.	0.000	Accepted	0.414
2	Environmental Knowledge has a positive impact on Green Consumer Products Purchase Intention.	0.000	Accepted	0.423
3	Green Skepticism has a negative impact on Green Consumer Products Purchase Intention.	0.010	Accepted	-0.129
4	Environmental Knowledge mediates the relationship between Environmental Concern and Green Consumer Products Purchase Intention.	0.127	Not Accepted	
5	Environmental Concern mediates the relationship between Green Skepticism and Green Consumer Products Purchase Intention.	0.000	Accepted	-0.213
6	Environmental Knowledge mediates the relationship between Green Skepticism and Green Consumer Products Purchase Intention.	0.666	Not Accepted	

5. Discussion and Conclusion

5.1. Discussion

H1: Environmental Concern has a positive impact on Green Consumer Products Purchase Intention.

Research by Fabiola and Mayangsari (2020), Maichum et al. (2017) in Thailand and Yue et al. (2020) in China showed that Environmental Concern has a significant positive impact on Green Purchase Intention. It is understandable that Generation Z living in Hanoi faces serious environmental pollution which makes them more worried about the environment. This motivates them to make green shopping behavior.

H2: Environmental Knowledge has a positive impact on Green Consumer Products Purchase Intention.

The above results are consistent with the study of Fabiola and Mayangsari (2020) and Pratiwi et al. (2018), that consumers' environmental knowledge can increase their green purchase intention. The study was carried out by Aman et al. (2012) also suggested that there is a positive relationship between Environmental Knowledge and Green Purchase Intention.

H3: Green Skepticism has a negative impact on Green Consumer Products Purchase Intention.

The above results are in contrast to the study of Fabiola & Mayangsari (2020) and Luo et al. (2020), these two studies show that there is no significant relationship between Green Skepticism and Purchase Intention of green consumer goods. However, Kim and Oh (2020) argued that Skepticism has a direct negative impact on Green Purchase Intention. The more skeptical consumers are towards green claims of manufacturers, the lower their intention to buy green consumer products.

H5: Environmental Concern mediates the relationship between Green Skepticism and Green Consumer Products Purchase Intention.

The indirect effect of Green Skepticism on Green Purchase Intention is -0.213, larger than the direct effect of -0.129, this result is similar to Goh's study (2016). When consumers suspect that brands are making false green product claims, they will feel that their use of products that are said to be environmentally friendly is not really beneficial for the environment as they expected. Thereby reducing their intention to buy green consumer products.

H6: Environmental Knowledge mediates the relationship between Green Skepticism and Green Consumer Products Purchase Intention.

The results of testing the intermediate effects between variables show that Environmental Knowledge does not mediate Green Skepticism and Green Purchase Intention. P-value coefficient = 0.666 > 0.05. Thus, when consumers have Green Skepticism, even if they have Environmental Knowledge, it does not affect their Intention to buy green consumer products.

H4: Environmental Knowledge mediates the relationship between Environmental Concern and Green Consumer Products Purchase Intention.

The indirect impact of Environmental Concern on Green Purchase Intention through Environmental Knowledge is also tested as no effect due to the coefficient P-value = 0.184 > 0.05. Environmental Concern does not motivate consumers to accumulate more Environmental Knowledge. Therefore, the mediating role of Environmental Knowledge in the relationship between Environmental Concern and Green Purchase Intention is also rejected.

5.2. Conclusion and Recommendations

The research explored that consumers' concern about environmental issues will motivate them to buy green consumer products. Similarly, the accumulation of environmental knowledge is also one of the factors promoting the behavior of buying environmentally friendly consumer products. In contrast, green skepticism or distrust of consumers in green claims made by manufacturers will reduce their motivation to buy green consumer products.

From the research results, we make a number of recommendations as follows in order to increase the interest and understanding of the environment along with reducing consumer skepticism about green advertising.

Recommendations to state agencies, mass media

- Additional lessons in extra-curricular programs related to the environment in high school and higher education programs. Improve public understanding about green consumption through public advertisements, television programs, social networks, etc.
- Create motivation to promote the formation of green consumption intentions through the organization of green consumption week, green consumption month, building a green consumption network, etc.
- Promoting green production by offering preferential policies such as preferential support, loans for businesses to strengthen and produce green products. Using economic tools to invest in building and developing green networks and green supply chains.
- Promulgating strict inspection regulations and legal frameworks related to green consumption. Create trust for consumers, thereby reducing skepticism for green-labeled products.

Recommendations to companies and enterprises producing and distributing green consumer products

- Using different social networking and communication platforms to raise consumer awareness about green consumption and green products of businesses in particular.
- Comply with the state's regulations on green labeling, not giving false information about the benefits of green products. Regularly report to the authorities on the production and distribution of green consumer goods and demonstrate commitment to "green" through specific actions and results.
- Focus on investing in research and technology development in the production of green products. Diversify, ensure quality, minimize environmental risks to ensure consumer confidence in green products.

- Developing online distribution channels. Create products that co-create with customers about green products. Applying waste recycling and energy saving measures at green product distribution facilities.

Recommendations to consumers buying green products

- Update information from official news sources. Buy green products through reputable e-commerce platforms, official websites of companies and agents in Vietnam.

- Clear awareness of one's responsibilities and consequences of environmental pollution. Spend a portion of spending on green consumer products. Participate in seminars and events on green consumer products to spread the spirit of trust in green products in the community.

- Participating in contributing to environmental protection effectively through specific actions such as: saving electricity, limiting the use of plastic bags, etc. green consumption, thereby promoting the spread of green consumption behavior in the community.

Abstract

In this study, the linear regression analysis method is used to evaluate the direct and indirect relationship between asymmetric information and the intention to participate in the stock market of Hanoi students. The indirect influence relationship is assessed through the factors of the TPB model (attitude, subjective norm, perceived behavior control) and an expanded variable is the financial literacy. The final research results show that: attitude, subjective norms, perceived behavioral control, financial literacy and asymmetric information, all have a direct influence on the intention to participate in the stock market of students in Hanoi. Besides, the indirect correlation of asymmetric information to the intention to participate in the stock market through the variables of attitude, subjective norms, perceived behavioral control, financial literacy is also demonstrated. According to the results of the descriptive statistical method, the demographic characteristics also have a certain impact on the dependent variable.

Keywords: *asymmetric information financial behavior, financial literacy, TPB*

1. Introduction

Vietnam's stock market, in recent years, has experienced a volatile period due to the impact of many different macro factors. In the current period, the stock market in general is experiencing continuous growth. However, it cannot be denied that Vietnam's stock market still has potential unsustainable factors. In particular, the information data on the market is incomplete and lacks transparency, the imbalance of information between individuals and

organizations participating in the stock market causes the phenomenon of "asymmetric information". Although publicly available information is not too reliable, information important to decision-making is scarce (e.g., research and development costs, profitability indicators, inputs...). From the perspective of the whole market, asymmetric information is also considered a factor leading to large fluctuations in the stock market.

For students having background in financial education but little experience, can form investment intentions based on objective reasons rather than personal experience. Under the influence of asymmetric information, too, individual investors who are experienced and have reliable sources of information can know whether this information is reliable enough to make a decision. Some of those investors might know information that is not publicly available, which will reduce the level of information asymmetry among stock market participants. For students, their experience is limited, personal relationships are not strong enough, which can help to verify information as well as collect information, so it is easy to lead to high levels of risk.

Not stopping there, students, with limited experience, limited access to information, their investment intentions will be different from experienced investors. However, even in the case that students' access to information is the same as that of ordinary experienced investors, i.e. the level of information asymmetry is not too high, they may still make different decisions from experienced investors. The reason for this phenomenon may be that students want to apply their financial knowledge in a real-life context, to test their own decisions, or because they have less to lose in the case of wrong decision. In summary, the behavior of students under the influence of asymmetric information on the stock market is different from that of ordinary individual investors in some aspects.

From a theoretical point of view, there are not many studies on the impact of asymmetric information on behavioral intentions in general in Vietnam as well as in the world. When it comes to asymmetric information, studies will often measure the level of asymmetric information in the market (Le, 2008). In terms of research on the factors affecting the intention to participate in the stock market, there are relatively many studies using the planned behavior model (TPB) and the factors in that model have also been shown to have an affect the intention to participate in the stock market. But the direct relationship of asymmetric information to the intention to participate and the indirect relationship of asymmetric information through the factors of the model of planned behavior has not been tested in any studies.

Stemming from the above theoretical and practical requirements, we decided to study the topic *"The influence of asymmetric information on students' intention to participate in the stock market in Ha Noi"*. The article's aims is to help investors invest more effectively, putting the stock market under operation more and more efficiently.

2. Hypothesis Development

Investment decision is the choice to invest in real assets. This is considered the most important decision that increases the value of the business. Typically, managers evaluate the effectiveness of an investment project based on expected cash flows and market forecast

risk. The accuracy of the forecasts depends on the information and the level of reflection of the information in the market. Asymmetric information makes the market inefficient, so prices do not accurately reflect asset values, unable to provide accurate information and indications for investment decision making. The risk-reward relationship is not reliable. It is possible that the market considers the project to be above the market risk-return curve meaning that the cost is relatively low, making the project an investment despite the fact that it has a high cost. Conversely, low-cost projects can be ignored because the market's assessment is below the market risk-return curve. Based on the previous discussion, we propose the following research hypothesis:

H1: Asymmetric information has an impact on financial literacy

H3: Information asymmetry has an impact on attitudes towards behavior

H5: Asymmetric information has an impact on behavioral intentions

H6: Asymmetric information has an impact on subjective standards

H8: Information asymmetry has an impact on perceived behavioral control

According to Brucks, the basic requirement for processing product information and making purchasing decisions is product knowledge. In the case of financial products, product knowledge is expressed in terms of financial knowledge. Financial literacy is defined as a requirement of a person's ability to make important financial decisions or a condition of a person's complete knowledge of the four concepts. fundamentals: calculation, inflation, risk diversification and compound interest. Based on the previous discussion, we propose the following research hypothesis:

H2: Financial literacy has an impact on behavioral intention

Attitude is defined as "an individual's evaluation of the results obtained from performing a behavior". In the first aspect, Attitude is seen as a tool to describe whether a behavior is important, harmful or valuable, and in the second aspect, to determine whether the behavior is pleasant or not. interesting. Therefore, we propose the research hypothesis:

H4: Attitude towards behavior has an impact on behavioral intention

According to Ajzen, subjective norm refers to the norms and social pressures on a person to perform a certain behavior. In Raut's research, in India, investors cannot control their own stock investment decisions because of the lack of investment platform, information related to the stock market; mainly friends, family or colleagues influence their intention to participate in the stock market. Accordingly, an individual can form an intention to perform a particular behavior under the influence of a subjective norm, even if he or she wants to or doesn't want to do it. Based on previous studies, the team proposes the following hypothesis:

H7: Subjective standards have an impact on behavioral intention

According to (Ajzen, 1991), Perceived behavioral control describes an individual's perceived ease or difficulty in performing a particular behavior; perceived behavioral control is influenced by the availability of other behaviors. opportunities or resources that

help the individual perform the behavior. Based on previous studies, the team proposes the following hypothesis:

H9: Perceived behavioral control has an impact on behavioral intention

Based on the hypothesis development, the research model is as follows:

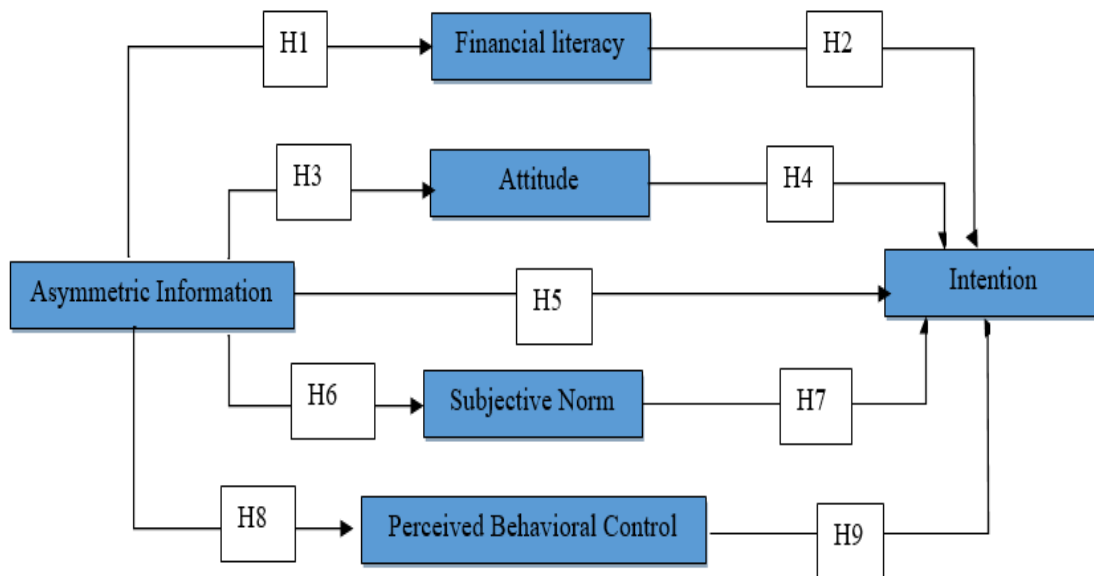

Figure 1. Proposed research model

Source: Research team

3. Method

The formula for determining sample size of Hair et al (2014) is used as follows:

$$N = 5 \times \text{number of observed variables}$$

With the number of observed variables is 30, the minimum sample size must be 150, with the expectation that the valid sample accounts for 30% of the total number of samples collected, the study chooses a sample size of 500 observations to ensure reliability. statistical. Due to the adoption of an online survey and to ensure sample size, the team decided to drop 900 votes via a Google form. After finishing the process of collecting answer sheets, the research team collected a total of 752 votes, of which 695 were valid, accounting for 92.4% to use in this study. The number of valid votes exceeded the initial expectation of the research team thanks to the convenient sampling method that the team used during the survey.

The research team used convenience sampling method to conduct the survey. With this method, the group invited students who were acquaintances of the group to fill out an online survey and asked those acquaintances to continue calling their acquaintances and friends to participate in the survey. In addition, the group also posted surveys on student forums of the schools and at the end of the survey time, the group collected a total of 695 answer sheets that can be used for research.

The research team entered data entry and coded the data. Then, this data will be analyzed and evaluated for reliability and convergence of the scales through the use of data analysis tools of SPSS software version 22.0, AMOS 20.0 combined with Data processing on Microsoft Excel 2016. The research team analyzed and assessed the reliability of the scale through Cronbach's Alpha reliability coefficient, exploratory factor analysis method EFA and confirmatory factor analysis CFA based on CFA. on structural modeling (SEM), and finally linear regression analysis.

4. Results

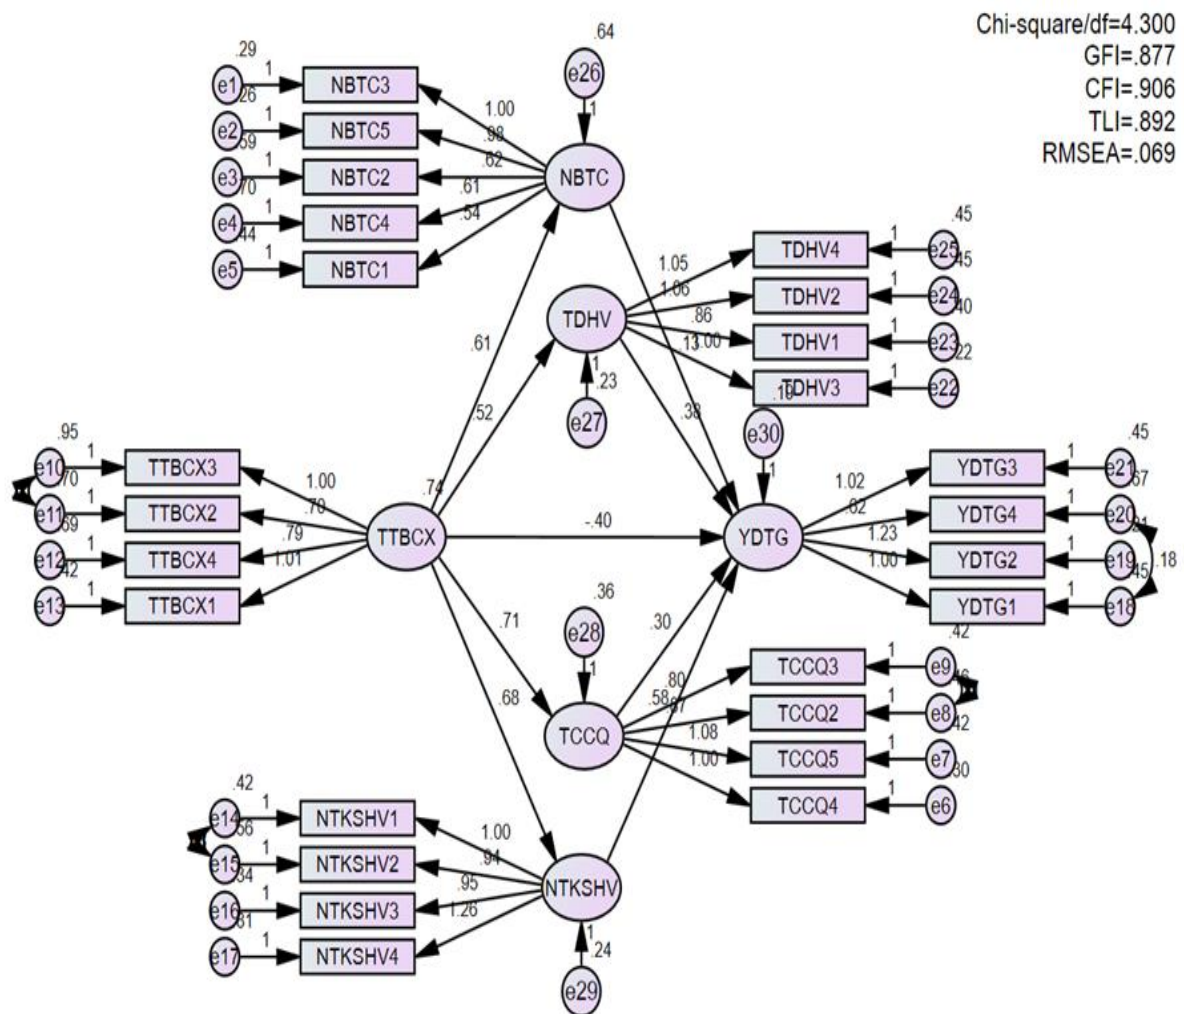

Figure 2. Linear structural SEM model verification

Source: Survey results, 2022

The results of the analysis of the fit of the SEM linear structure model showed that the CMIN/df = 4,300 (Chi-square/df \leq 5); GFI = 0.877 (Goodness of Fit Index \geq 0.8); CFI = 0.906 (Comparative Fit Index \approx 0.9); TLI = 0.892 (Tucker & Lewis Index \approx 0.9) and RMSEA = 0.069 (Root Mean Square Error Approximation \leq 0.08). So. The research model is relatively consistent with market data (Hu and Bentler, 1999).

Table 1. Results of testing the relationship between concepts in the model

			Estimate	S.E.	C.R	P	Hypothesis
NBTC	<---	TTBCX	.613	.052	11.703	***	Valid
TDHV	<---	TTBCX	.519	.039	13.299	***	Valid
TCCQ	<---	TTBCX	.711	.050	14.162	***	Valid
NTKSHV	<---	TTBCX	.675	.049	13.907	***	Valid
YDTG	<---	TTBCX	-.397	.097	-4.097	***	Valid
YDTG	<---	TDHV	.376	.061	6.146	***	Valid
YDTG	<---	NBTC	.128	.031	4.099	***	Valid
YDTG	<---	TCCQ	.304	.049	6.206	***	Valid
YDTG	<---	NTKSHV	.576	.074	7.813	***	Valid

Source: Survey results, 2022

The test results show that, with the confidence standard of 95%, all variables have sig < 0.05 (AMOS sign *** is sig equal to 0.000). therefore. These relationships are all statistically significant. Thus, there are 5 variables that affect YDTG including TTBCX, TDHV, NBTC, TCCQ, NTKSHV. Besides, the variable TTBCX also has an impact on 5 variables namely NBTC, TDHV, TCCQ, NTKSHV, YDTG.

According to the analysis results of the SEM test, it is shown in Table the relationship between perception of asymmetric information and intention to invest is shown to be opposite ($\beta = -0.397$; C.R. = -4,097; $p < 0.001$). Therefore, hypothesis H5 is accepted. On the other hand, the SEM test also shows a clear relationship between asymmetric information perception and behavioral attitude ($\beta = 0.519$; C.R. = 13.299; $p = 0.001$). subjective standard ($\beta = 0.711$; C.R. = 14.162; $p < 0.001$). perceived behavioral control ($\beta = 0.675$; C.R. = 13.907; $p < 0.001$) and financial awareness ($\beta = 0.194$; C.R. = 4.242; $p < 0.001$). From there, the hypotheses H1, H3, H6, H8 can be accepted. On the relationship between intention to invest and financial knowledge ($\beta = 0.128$; C.R. = 4.099; $p < 0.001$), behavioral attitude ($\beta = 0.376$; C.R. = 6.146; $p < 0.001$), main standard ($\beta = 0.304$; C.R. = 6.206; $p < 0.001$) and perceived behavioral control ($\beta = 0.576$; C.R. = 7.813; $p < 0.001$). all show a clear correlation. Thus, it can be concluded that H2, H4, H7 and H9 are acceptable.

Through testing the linear structural model SEM. The impact of factors on the intention to participate in investment is clearly shown. In which, the perceived behavioral control factor has the greatest impact on the intention to invest with $\beta = 0.579$, and the standard error of this relationship is also relatively small with 0.074. Therefore, it can be seen that the perceived behavioral control factor is a factor that has a great influence and is extremely important to the intention to invest.

Financial knowledge is the factor that has the smallest impact on the intention to participate in investment with $\beta = 0.128$. Behavioral attitudes and subjective standards are also two factors that have a large impact after perceived behavioral control, with the

measured impact being $\beta = 0.376$, $\beta = 0.304$, respectively. In addition, the impact of asymmetric information perception on mediating factors is also extremely large with $\beta = 0.613$, financial knowledge, $\beta = 0.519$ with behavioral attitude, $\beta = 0.711$ with subjective standard. and $\beta = 0.675$ with perceived behavioral control.

5. Discussion and Conclusion

Through the research results, the research team concludes that asymmetric information has a negative impact on the intention to participate in the market. This is shown by the results of the SEM test. The relationship between asymmetric information and the intention to enter the market is shown with $\beta = -0.97$. This result is also consistent with the previous research results of Muhammad Munir Ahmad et al (2021). Accordingly, asymmetric information has a negative effect on the intention to participate in the stock market. As the degree of information asymmetry increases, the intention to enter the market also decreases.

In addition, the indicators also show that “Asymmetric information” has a strong impact on 4 variables “Financial knowledge”, “Behavioral attitude”, “Subjective norm” and “Perceived behavioral control”. β when both have Sig coefficients. $= 0 < 0.05$ and the influence coefficient is 0.613, respectively; 0.519; 0.711; 0.675.

The influence of asymmetric information on the intention to participate through the extended TPB model

- Influence through Financial Literacy

The results of hypothesis testing show that the variable “Financial literacy” has a significant impact on the intention to participate in the stock market with the coefficient sig. $= 0 < 0.05$. The influence factor is 0.128. This finding is consistent with the results of previous studies where “Financial literacy” was found to be a determining factor. affects the investment behavior intention of stock investors (Aren and Zengin. 2016; Sivaramakrishnan et al., 2017).

Because the level of understanding is a variable affected by one of the factors is the frequency of reading economic articles. Therefore, besides "financial literacy" has a clear impact on students' intention to participate in the stock market. The factor “Financial literacy” also plays an important role as an intermediary variable to help “Asymmetric information” more clearly influence the intention to participate in the stock market of economics students in Hanoi. Noi and that is also well reflected with the influence factor of 0.613.

- Influence through Attitude

According to research results. It can also be seen that the variable “Behavior attitude” has a strong impact on students' intention to participate in the stock market with the coefficient sig. $0 < 0.05$ and the influence factor is 0.376. This finding is consistent with the results of previous studies. where “behavioral attitude” was found to be a factor affecting behavioral intention (Lim et al., 2018; Ali, 2011).

In addition to directly affecting the intention to participate in the stock market, the Attitude-behavior variable also acts as an intermediary variable to help asymmetric information more clearly affect the intention to participate in the stock market. Economics student in Hanoi. With an influence coefficient of 0.519, it shows that asymmetric information has a positive effect on behavioral intention.

- Influence through Subjective Norms

Based on the survey results of the research team. Subjective norm has a positive effect on students' intention to participate in the stock market. Subjective norm affects the intention to participate in the stock market with $\beta = 0.304$. This is consistent with the model proposed by the team as well as reasonable when compared with previous research on the subject. Many previous studies have demonstrated that Subjective Norm is a significant predictor of behavioral intention such as Ajzen (1991), Phan and Zhou (2014), Phan et al (2019), Huu Phuc Dang & Bang Nguyen Viet (2021). In addition, Subjective Norms also play an important role in the impact of Asymmetric Information on the intention to participate in the stock market. Subjective norm is strongly influenced by Information Asymmetry with $\text{Sig.} = 0 < 0.05$ and the influence coefficient is $\beta = 0.711$. This shows that as the level of asymmetric information increases. The greater the influence of those around the individual. From there, it affects students' intention to participate in the stock market.

- Influence through Perceived Behavioral Control

According to the survey results of the research group. The variable Perceived behavioral control is the variable that has the most significant effect on students' intention to participate in the stock market. The relationship between perceived behavioral control and intention to participate in the stock market is clear with $\beta = 0.675$. This proves the suitability of the proposed research model and at the same time is similar to previous studies of Fishben and Ajzen (1975), East (1993), Huu Phuc Dang & Bang Nguyen Viet (2021). Besides. There are many previous studies that have demonstrated that perceived behavioral control is the most significant predictor of behavioral intention (Maddeb et al. (1992), Tran Trung Dung (2020)).

In addition, according to the results, the research team obtained perceived behavioral control as an intermediate variable in the influence of asymmetric information on the intention to participate in the stock market. With $\text{sig.} = 0 < 0.05$ and the influence coefficient $\beta = 0.675$. perceived behavioral control is the variable most strongly affected by the asymmetric information variable. That means when the level of the greater the asymmetric information, the greater the ability to control behavior.

- Recommendation for student when joining in the stock market

To be able to make accurate decisions, students need to be fully equipped with knowledge of securities, trading regulations, operating principles of the stock market or risk management. Investing in knowledge is always the wisest and most economical investment because the money paid to improve investment knowledge is always cheaper than the

amount that can be lost to a mistake in the stock market. First of all, it is to firmly learn the basic and essential subjects related to financial knowledge. Participating in classes from basic to advanced before participating in the stock market will be a stepping stone to help future investors be more stable and confident in the investment process later. Moreover, not only learning theory, students need to apply what they have learned in practice. In addition to the knowledge acquired in lecture halls and books, seminars and knowledge sharing from experts in the financial field are the perfect complement for students. Through seminars, meetings and exchanges, students have access to practical lessons, accumulate more knowledge and understand more about the financial and securities industry.

However, receiving information is not enough, students who want to participate in the stock market also need to be able to analyze information. Information about macro markets, industries, and companies is often made public, but individual judgments of different data can lead to different results. Accordingly, the analysis and evaluation of information before making decisions will help investors better understand the market, not panic before the fluctuations. If investors only receive information without analysis, it is easy to lead to incorrect judgments about the stock code they choose. As a result, when making investment decisions, students will avoid the impact of crowd psychology, reduce trading according to rumors, and recognize opportunities through signals from the market instead of buying or selling stocks just because of what other people say.

- Recommendations on information management in the stock market

Investment analysis can be very misleading when information is not fully disclosed, dishonest. In the era of revolution 4.0. Knowledge and news about the market and businesses are constantly updated, and information transparency is essential. Therefore, State management agencies need to continue to improve the law on information safety and security and control the flow of information published in the securities sector to ensure authenticity and objectivity.

In addition, handling violations in the field of information disclosure related to the securities market. The State needs to introduce administrative and criminal sanctions against the phenomenon of information manipulation, giving false information, and profiteering. Stock Exchange, Securities Commission need to coordinate with securities companies to carry out the review, have better mechanisms to prevent these activities. There should be strong and deterrent sanctions, ensuring the transparency and coldness of the market; strictly handle the situation of reporting false information. negatively affect investor sentiment.

In summary, improving the quality of information on Vietnam's stock market is an important and necessary trend to create a safe investment environment and sustainable development. Many new policies and regulations have been introduced to address the challenges and inadequacies related to stock market information. However, more efforts are still needed from securities market regulators and supervisors to ensure the transparency and reliability of stock market information.

Abstract

The purpose is to test the performance of a company can be assessed in terms of profitability, capital structure, liquidity, dividend growth, sales revenue, asset base, capital employed, etc. However, there are still debates about how to measure business performance and the factors that affect performance (Liargovas & Skandalis, 2008). Financial performance is a subjective measure of how well a company can utilize assets from its primary mode of business and generate revenue. It is the process of measuring the results of a company's policies and activities in monetary terms (Mwangi, 2016). It identifies a company's financial strengths and weaknesses by establishing relationships between items of financial position and income statements. The term is also used as a general measure of the overall financial health of a company over a given period and can be used to compare similar companies within the same industry or to compare industries or aggregate sectors. Relationship between business performance and factors affecting the business performance of building material firms listed on the Vietnam stock market from 2010 through 2020. The data are obtained from financial statements of 30 Vietnamese building material firms listed on both the Ho Chi Minh stock exchange and Hanoi stock exchanges from 2010 to 2020 in the FiinPro database. The study uses the FGLS regression method to analyze the factors affecting the business performance of building material firms listed on the Vietnam stock market between 2010 and 2020. Analysis results show that the factors positively affecting the business performance of building material firms; include risk, growth rate, and firm size. On the contrary, capital structure, asset structure, and liquidity negatively affect the business performance of building material firms. Furthermore, the study proposes some implications for improving the business performance of construction material firms listed on the Vietnam stock market.

Keywords: *business performance, building material industry, Vietnam*

1. Introduction

The performance of a company can be assessed in terms of profitability, liquidity, liquidity, dividend growth, sales revenue, asset base, capital employed, etc. However, there

are still debates about measuring business performance and the factors that affect performance (Liargovas & Skandalis, 2008). Financial performance is a subjective measure of how well a company can utilize assets from its primary business methods and generate revenue. It is the process of measuring the results of a company's policies and activities in monetary terms (Mwangi, 2016). It identifies a company's financial strengths and weaknesses by establishing relationships between items of financial position and income statements. The term is also used as a general measure of the overall financial health of a company over a given period and to compare similar companies within the same industry or to compare industries or aggregate sectors.

There are different ways to measure business performance, but they should be in aggregate. They are line items such as operating revenue, operating income, cash flow from operations, and total unit sales (Njeru, 2012). Quantitative measures of business performance include profitability measures such as gross profit margin, net profit margin with profit on sales, profit return on equity, economic value added, return on equity less cost of equity, and return on capital employed. Other performance metrics are cash flow measures, such as free cash flow on sales and growth metrics with historical revenue growth. Ideally, forward-looking measures - expected profit, cash flow, and growth - should be used to measure a company's performance (Kiaritha, 2015).

Management researchers prefer accounting variables to be performance measures such as return on equity (ROE), return on investment (ROI), and return on assets (ROA). Other accepted performance metrics include earnings per share (EPS), price/earnings ratio (P/E), and net profit margin (NIM). The NIM variable is net interest income divided by total assets. Okiro (2014) used net profit margin and profit before tax/total assets to measure financial performance. Previous studies mainly used accounting rates of return which are return on investment (ROI), return on capital (ROC), return on assets (ROA), and return on sales (ROS). These metrics assess management effectiveness - how well a company's managers use assets to generate accounting profit per unit of investment, assets, or revenue (Memba, 2011).

Construction materials are products designed to serve different construction works such as houses, apartments, buildings, etc.. Building materials are derived from nature, or developed by humans, for example, bamboo, cork, sand, stone, and clay. Besides natural building materials, many countries have applied modern technology to create new materials. The manufacturing process of building materials is considered a growing industry in many different countries. Building material uses are also divided into some different specialized fields - carpentry, plumbing, roofing, etc. For developing countries like Vietnam, the role of construction and material firms in creating and developing transport infrastructure and physical facilities for units of the economy is indispensable. Increasing the business efficiency of building material firms will help to save social costs and improve the operational efficiency of industries in the economy.

2. Literature Review

Capital Structure

Corporate debt is considered a unified value in empirical research on capital structure. Therefore, almost the literature focused on the relationship between financial leverage and firm performance without accounting differences in debt sources (Margaritis and Psillaki, 2010; Vithessonthi and Tongurai, 2015).). An omitted debt structure can lead to misleading conclusions about the relationship between leverage and business performance because sources of debt can have different effects on the valuation and profitability of the company. Rauh and Sufi (2010) argue that many firms borrow from multiple sources, each of which can have different effects on financing, investment opportunities, and, therefore, performance.

Master and Yong (2014) studied the relationship between capital structure and financial performance by examining 1130 non-financial firms listed on the Shanghai Stock Exchange. The authors built a regression equation with the dependent variable (ROE) and the independent variables, including the debt-to-equity ratio, the growth rate of total assets, and the firm size. The results showed that financial performance is significantly affected by the debt-to-equity ratio and size. However, the growth rate of total assets has no significant impact on financial performance.

Zeitun and Tian (2007) inherited Master & Yong (2014) by not only studying the factors affecting financial performance in terms of book value but also in terms of market value (Tobin's Q). The research data was collected from 167 companies listed on the Jordan Stock Exchange from 1989 to 2003. The independent variables include short-term debt on total assets, growth rate, firm size, business risk, sector, financial crisis, fixed assets, income tax, and a standard deviation of cash flow in the most recent three years. The results showed the factors that have positive impacts on business performance are short-term debts on total assets, growth rate, size, and tax. Among those factors, short-term debt on total assets has the strongest impact on financial performance in terms of market value. The negative effect is the ratio of fixed assets to total assets. The results also showed that business sectors, such as real estate, educational services, chemicals, oil and gas, and tobacco have significant impacts on financial performance.

Firm size

The measurement of firm size can be the number of employees, total revenue, or total assets. In addition, firm size is also understood as the size of capital, asset, consumption network, etc. Firm size has been shown in some studies that have a positive and negative effect, with statistical significance to the financial performance. Most of the studies by Zeitun and Tian (2007), Margaritis and Psillaki (2010), Pouraghajan et al. (2012), Pervan and Višić (2012), Gleason et al. (2000) found that firm size has a positive and significant impact on the performance of the business. It means the bigger the size, the more efficient. In contrast, many other researchers, such as Durand and Coeuderoy (2001) and Tzelepis and Skuras (2004), argued that there is no significant effect between firm size and efficiency. Large-scale enterprises with financial strength, assets, capital, technology, and management

level will easily exploit economies of scale to reduce input costs and increase output efficiency to reduce production costs. The study of Gleason et al. (2000) pointed out that the more revenue the business expands, the higher the business performance.

Assets structure

Mackie (1990) concluded that a company with a high ratio of plant and equipment (tangible assets) as an asset base makes debt selection more possibly and affects its performance. Akintoye (2008) argues that a firm that invests more in tangible assets will have a lower cost of financial distress than a firm that relies on intangible assets. A positive relationship between asset tangibility and business performance is expected. Inheriting the study of Zeitun et al. (2007), Memon et al. (2012) determined that the asset structure measured through the ratio of long-term assets to total assets has a negative impact on operating efficiency. That means it has a negative impact on performance. Because these companies invest too much in fixed assets in a way that does not improve their performance. It shows inefficient use of assets in large companies and thus has a negative impact on performance.

Growth

Existing literature considers the growth opportunities available in a company as an essential determinant of business performance (Chinaemerem & Anthony, 2012). Zeitun and Tian (2007) argued that growth firms can generate returns on investment, thus positively impacting business performance. It is believed that the growth rate and profit margin are related (Coad, 2009, Goddard et al., 2004). There are several theoretical claims that growth rate has a positive effect on profit margins. Corporate growth can lead to an increase in company size so that larger companies can benefit from economies of scale and thus increase profits. Sales growth shows a company's growth in sales per share, based on some recurring periods, and is considered the best measure of how quickly the company's core business (Javed et al., 2015).

Short-term liquidity

Siahaan et al. (2014) concluded a significant positive correlation between short-term liquidity and business performance, which means that the more liquid a company's financial condition, the better its performance. The results are consistent with the previous studies conducted by Huang et al. (2013) and the results identified by Fang, Noe, and Tice (2009), which stated there are positive and strong correlations between short-term liquidity and business performance. However, there is a negligible positive effect of short-term liquidity on business performance, mainly valid in developed countries but not in absolute value in developing countries (Hwang et al., 2012). Reddy (2018) analyzed the relationship in India and showed there is no significant impact.

Business risk

Akintoye (2009) and Do and Wu (2015) confirmed the role of business risk, tax, managerial behavior, or financial flexibility in analyzing business performance. He explains that since the capital structure is based on a trade-off between risk and expected return, these

are important factors in determining the target capital mix. That will object to guiding companies toward an ideal combination of debt and equity to minimize the cost of capital and maximize firm value. Furthermore, any change in the reasonable level of debt or equity will change the company's value. According to tax benefits, it is assumed that a company will borrow more to achieve higher performance under tax burden.

Corporate income tax

Rohaya, Nor'Azem, and Bardai (2010) conducted a study on corporate income tax and showed the relationship between income tax and the profits of organizations. The research regarded the impact of corporate income tax liability on various variables such as gross profit, cost of goods sold, expenses, etc. A sample of 7,306 firms was taken from the hotel and restaurant sector, including 6,594 firms in the services sector and 1,484 firms in the transportation manufacturing sector, for the accounting period 1995-2000. The conclusion is that corporate income tax adversely affects the profitability of corporate entities but has a positive relationship with the size and age of the firms. In addition to these authors, De Mooij et al. (2001) and Meg (2008), Vätavu (2015) both found a negative relationship between corporate tax and financial performance.

From the research overview, the authors propose a research model of the factors affecting the business performance of building material firms listed on the stock market as follows:

$$ROE_{i,t} = \beta_0 + \beta_1 LEV_{i,t} + \beta_2 SZ_{i,t} + \beta_3 TANG_{i,t} + \beta_4 GR_{i,t} + \beta_5 LIQ_{i,t} + \beta_6 VOL_{i,t} + \beta_6 MTR_{i,t} + \varepsilon_i$$

3. Method

The data used in the study are gathered from the financial statements of 30 Vietnamese building material firms listed on both the Ho Chi Minh and Hanoi stock exchanges in the 2010 - 2020 period from the FiinPro database. The research sample includes all listed building material firms that satisfy the condition to have full financial statements from 2010 to 2020, so the research sample is highly representative.

The model variables are in Table 1.

Table 1. Description of the variables

Variable	Symbol	Calculation	Source
Business Performance	ROE	Profit after tax/Average equity	Chinaemerem và Anthony (2012), Do và Wu (2015), Vätavu (2015)
Capital Structure	LEV	Liabilities/Total Equity	Le (2015), Vithessonthi và Tongurai (2015)
Firm size	SZ	Logarit (Total Assets)	Chinaemerem và Anthony (2012), Do & Wu (2015)
Assets Structure	TANG	Fixed assets/Total assets	Chinaemerem và Anthony (2012), Do và Wu (2015), Vätavu (2015).

Variable	Symbol	Calculation	Source
Growth Rate	GR	(Current year's revenue - Previous year's revenue)/ Previous year's revenue	Chinaemerem và Anthony (2012), Do và Wu (2015), Le (2015)
Liquidity	LIQ	Current Assets/Current Liabilities	Do và Wu (2015), Vătavu (2015), Le (2015)
Risk	VOL	%EBIT/%Total Assets	Seetanah và cộng sự (2014), Do và Wu (2015), Vătavu (2015), Le (2015)
Frofit Tax	MTR	Frofit tax/Profit before tax	Vătavu (2015)

Source: The authors' Compilation

In order to analyze the factors affecting the business performance of building material firms listed on the Vietnam stock market, the authors used descriptive statistical analysis, correlation matrix analysis, and regression model estimation. We took tests on multicollinearity, variable variance, and autocorrelation to choose the appropriate model. If the model has variable variance defects and autocorrelation, it is necessary to conduct regression analysis with the FGLS method to overcome the variance defects.

4. Results

Descriptive statistics include the mean, median, standard deviation, and minimum and maximum values of the variables included in the model.

Table 2. Descriptive statistics

Variable	Number of observations	Medium	Standard deviation	Min	Max
ROE	330	1,1515	6,0775	-7,1272	49,303
LEV	330	0,5267	0,1851	0,0713	0,8779

LIQ	330	1,4516	1,0297	0,1542	6,6433
VOL	330	0,3145	0,8767	-2,2911	5,8846
MTR	330	0,2336	0,6982	0	10,401

Source: The author's calculation

The results of the descriptive statistical analysis presented in Table 2 shows there is a big difference in business performance between listed building material firms. ROE of listed building material firms in the period 2010-2020 is in the range of 7,127 to 49.3, which shows that besides businesses with a high return on equity, there are still building material firms making losses.

For the independent variables, capital structure has an average of 0.5267, a minimum of 0.07127, and a maximum of 0.8779. That indicates some firms use debt at an insignificant low level besides firms with very high debt ratios.

Firm size also has an obvious difference between listed building material firms. The average firm size is 27,454, the smallest value is 24,029, and the largest is 32.51. The asset structure at listed building material firms is quite low at an average asset structure of 0.3573. Besides, the building material firms with high fixed asset investment at the biggest value of 0.8993. Some firms have almost no fixed assets. The minimum value of the variable TANG is 0.0071.

The growth rate of the listed building material firms ranges from -0.9971 to 69.7383, with an average value of 0.6684. That shows the growth rate of building material firms a large difference between firms in years. Besides businesses with positive growth rates, there are still many businesses with negative growth in several years.

The liquidity of building material firms is at an average of 1.4516. However, there is a big difference between the firms, the liquidity coefficient is the smallest at 0.1542, and the liquidity ratio is at 0.1542. The biggest calculation achieved is 6.6433.

The business risk variable of building material firms is in the range of -2.2911 to 5.8846, which shows that the business risk level of building material firms is significantly different.

The corporate income tax of the listed building material firms has an average of 0.2335, the minimum value is 0, and the maximum value is 10.4.

Table 3 shows the correlation coefficient between the dependent and independent variables and between the independent variables. The correlation coefficient between the independent variables is not greater than 0.8, so there is no multicollinearity (Cohen, 1988). Capital structure (LEV), firm size (SZ), assets structure (TANG), and corporate income tax (MTR) are negatively related to business performance (ROE). Meanwhile, growth rate (GR), liquidity (LIQ), and business risk (VOL) have a positive relationship with business performance (ROE). The results of the correlation analysis between the independent variables in the model show that the possibility of multicollinearity between the independent variables in the model is not high.

Table 3. Matrix of correlation coefficients between variables in the model

	ROE	LEV	SZ	TANG	GR	LIQ	VOL	MTR
ROE	1,0000							
LEV	-0,3011	1,0000						
SZ	-0,2339	0,5438	1,0000

Source: The author's calculation

Studying the impacts of factors on the performance of building materials companies listed on the Vietnam stock market with panel data is conducted by three methods (Pooled OLS, FEM, and REM). After conducting Hausman and White tests, it has been proved that the FEM method is the best of the three methods above. However, by the Wald test and the Wooldridge test, it has been shown that the results of the regression coefficients of the model according to the FEM method are not effective due to variable variance and autocorrelation. Since then, the FGLS method is used to overcome the above disadvantage of FEM. Regressing the model by FGLS method will help eliminate problems such as variable variance and autocorrelation, so the results of the regression coefficients will be efficient.

The results of the regression model studying the effects of factors affecting the performance of building material firms listed on the Vietnam stock market are shown in Table 4 as follows:

Table 4. Regression results

Variable	VIF	Dependent variable			
		POLS	FEM	REM	FGLS

Source: The author's calculation

Table 4 shows that the regression model by the FGLS method, corporate income tax (MTR) has no impact on the business performance of the listed building material firms.

The research results provide empirical evidence that the business performance of building material firms listed on the Vietnam stock market is affected by capital structure, firm size, asset structure, growth rate, liquidity, and business risk.

The capital structure of the firms has a negative correlation with the business performance with statistical significance at 1%, capital structure increased at 1%, and the business performance of building material firms decreased at 0.237%.

Firm size (SZ) has a positive relationship with the business performance of listed building material firms with statistical significance at 10%. It means firm size increases by 1% and business performance increases by 0.0013%.

With a statistical significance level of 1%, the asset structure has a negative relationship with the business performance of the building material firms. If the asset structure increases by 1%, the business performance will decrease by 0.486%.

The revenue growth rate has a positive relationship with the business performance of the listed building material firms. If the revenue growth rate increases by 10%, the business performance of will increase by 0.0413%.

The liquidity has a negative correlation with the business performance of the listed building material firms at a statistical significance of 1%. If the liquidity increases by 1%, the business performance will decrease by 0.4191%.

Business risk has a positive relationship with the business performance of listed building material firms at a statistical significance of 1%. If business risk increases by 5%, the business performance will increase by 1.714%. The results of the FGLS regression model show that business risk is the factor that has the strongest impact on the business performance of listed building material firms at a regression coefficient of 1,714.

The results of the study determine factors affecting the business performance of building material firms are summarized in Table 5.

Table 5. Summary of research results

Variable	Research Results

MTR	(N/A)

Note: (+) positive effect, (-) negative effect, (N/A) no statistical significance.

Source: The author's calculation

The summary of the results determining the factors affecting business performance in Table 5 shows that the factors that have the same impact on the business performance of building material firms include business risks, growth rate, and firm size. On the contrary, capital structure, asset structure, and liquidity negatively affect the business performance of building material firms.

Capital structure (LEV): The research results show there is a negative relationship between capital structure and the business performance of building material firms. That means businesses using a lot of debt will increase financial risks and reduce business performance. It is a factor that has a large impact on the business performance of listed building material firms. This research result is consistent with the study of Chinaemerem and Anthony (2012), Le (2015), Vătavu (2015).

Firm size (SZ): Size has a positive impact on the business performance of building material firms. That shows large-scale enterprises have advantages in terms of financial resources, experience, and brands to improve business efficiency. Because the size of an enterprise shows the ownership, structure, and quality of assets, these factors will determine the existence and development of an enterprise. This research result is consistent with the study of Chinaemerem and Anthony (2012) and Do & Wu (2015).

Asset structure (TANG): The variable has a negative impact on the business performance of listed building material firms. Enterprises with asset structures leaning towards short-term assets will increase business efficiency. The results of this study are consistent with those of Chinaemerem and Anthony (2012), Do and Wu (2015), and Vătavu (2015).

Growth rate (GR): The GR has a positive impact on the business performance of listed building materials companies, but the impact is small. Enterprises with good revenue growth can increase business performance. This research result is consistent with the study of Chinaemerem and Anthony (2012), Do and Wu (2015), and Le (2015).

Liquidity (LIQ): The LIQ has a negative impact on the business performance of building material firms. The liquidity of an enterprise is the payment solvency. That manifests in the use of current assets such as cash, inventory, accounts receivable, securities, and other current assets to meet current liabilities. Enterprises that reserve a lot of high-liquidity assets will have low profitability, thereby tending to reduce operating efficiency. This research result is consistent with the study of Do and Wu (2015), Vătavu (2015), and Le (2015).

Business risk (VOL): The risk has a positive impact on the business performance of building material firms. It is the variable with the greatest impact on business performance. Business risk represents uncertainty in the income stream from a business's operations. Risk and return have a positive relationship, or high risk, high expected return. In other words, for firms with high-risk appetites, there are many opportunities to increase profits to improve business performance. This research result is consistent with the study of Seetanah et al. (2014), Do and Wu (2015), Vătavu (2015), and Le (2015).

5. Discussion and Conclusion

This study aims to verify the factors affecting the performance of enterprises in the building materials industry in Vietnam. The autocorrelation and variance problems were determined, and the FGLS method was used to overcome them. The research results show that the factors that affect the business performance of building material firms in the same direction include business risk, growth rate, and firm size. On the contrary, capital structure, asset structure, and liquidity negatively affect the business performance of building material firms.

Determine the risk appetite suitable for firms in each period. Risk appetite is considered a relatively important tool in effective decision-making and management of corporate performance. In each period, enterprises need to determine the level of risk tolerance that investors (individuals or organizations) are willing to accept to pursue their goals. Risk appetite represents a balance between potential benefits and the threats it poses. Investors must accept the occurrence of risks along with the benefits that it brings. Things that bring high returns will come with a high level of risk. Safe and sustainable investments will have low returns. The risk appetite framework is built based on the analysis and assessment of external environmental factors such as macroeconomics, business environment, competitive pressure, and internal factors (such as business strategy, financial plan, and expectations of shareholders and stakeholders). The content of the risk appetite framework includes five major issues: Management principles, a Statement of high-level risk appetite, Determining overall risk tolerance, Develop Key Risk Indicators, and Building tolerance for Key Risk Indicators.

Develop a policy to choose a capital structure. When building the optimal one, building material firms listed on the Vietnam stock market should focus on the following factors:

First, corporate risks and corporate income tax: Risks incurred on the company's assets even if the company does not use debt. The higher the corporate risk, the lower the optimal debt ratio. Since interest is a pre-tax cost factor, using debt helps the company save on tax. However, this will no longer make sense when businesses are favored or for whatever reason income taxes are low.

Second, financial proactivity: Using a lot of debt reduces financial autonomy and worsens the balance sheet situation, making capital providers hesitant to lend or invest capital into the company.

Third, industry standards: it is necessary to compare the financial risks, as measured by the ratios of interest payment ability, ability to pay fixed financial expenses, and leverage ratio with other industry standards or norms.

Fourth, the effect of signals: When company issues new securities, this event can be considered as providing a signal to the financial market about the future outlook of future activities. The future is planned by the directors of the enterprise. The signals provided by capital structure changes are reliable because if future cash flows do not occur, the firm incurs penalties, maybe possibly bankruptcy costs.

Abstract

Environmental protection plays a significant role in the process of economic development in Viet Nam. The firms implement an environmental strategy to reduce environmental pollution. However, the lack of legal and environmental accounting is why information Environmental accounting (EA) has a few items in financial statements. Enterprises in Viet Nam only disclose general environmental information in compliance with the guidance of Circular 155/2015 / TT-BTC. The article aims to evaluate the impact of the Attitude of top management (ATM) and Pressure of Stakeholders (PS) on the implementation of environmental accounting (EA) and disclosure of environmental accounting information (DEAI) in the context of the Mekong Delta enterprise Viet Nam. The author employed PLS-SEM to test the hypothesis. The findings indicate a positive association between ATM and EA, ATM and DEAI, and PS and EA. However, the result of the study showed no significant PS on DEAI and EA on DEAI. Nevertheless, the role of the regulation (REG) as a mediator in the link between EA and DEAI has statistically significant.

Keywords: *Attitude top manager, Environmental accounting; Disclosure of environmental accounting information, Pressure of Stakeholders.*

1. Introduction

Yakhou et al. (2004) suppose that Environmental accounting (EA) identifies, measures, and allocates environmental costs, combines environmental costs in economic decisions, and discloses information to stakeholders. A stakeholder in an organization is defined as any group or individual who can influence or is influenced by the achievement of that organization's goals (Freeman, 1984). They are shareholders, creditors, employees, customers, suppliers, and regulators. Another group includes the media, consumer and environmental lobby groups.

Firms will disclose environmental accounting information (DEAI) when they practise environmental accounting (Cho et al., 2008). In prior studies, DEAI published mainly through the annual report, and the disclosure may be voluntary or mandatory. Voluntary environmental information in the annual report is how organizations convey a specific message about the activities and measures for environmental protection (Deegan et al., 2000; O'Donovan, 2002). Besides, publishing the enterprises' environmental information is considered in response to the pressure of the stakeholders such as environmental regulators, providers, and communities, business management (Cormier et al., 2004; Neu et al., 1998). Lobby groups are paying more attention to the environmental sensitivity of the industry in which a corporation operates. This implies they impose costs on them because of their environmental impact (Deegan & Gordon, 1996).

The firm must adapt to the interest of stakeholders, primarily environmental strategy, given the regulator's ability to impose high costs on the firms. Firms previously convicted for unlawful and environmental regulations are more likely to make better environmental disclosures than corporations that have not been prosecuted (Kent & Chan, 2009). Environmental disclosure refers to all corporate disclosures concerning their responsibility against environmental issues. Usually, this information is part of the company's usual reports, such as the annual report, the integrated report, the annual information form and the sustainability report (Cormier et al., 2018). Three categories of information must be disclosed: environmental expenses, environmental assets, environmental liabilities on the balance sheet, the income statements, and notes of financial statements (Senn, 2018)

The Top manager is vital in implementing and disclosing environmental accounting information. Stakeholders' pressure imposes on Top managers to implement a proper environmental strategy. In developing countries, the rules regarding implementing environmental laws are stringent. When companies do not implement environmental laws and cause pollution, the firm's reputation is seriously reduced. Therefore, the customer was urged to boycott the country's products. Hence, these problems are the reason why the company must implementation of EA and DEAI to reduce environmental impact (Bismark Kusi Appiah et al., 2020)

DEAI bring up more benefit for the company through the optimal utilization of energy and inputs (Saleh et al., 2020). Environmental awareness of management has a role important in the company application DEAI. Therefore, they must have environmental knowledge and convey it to an employee. The company implements an environmental strategy to reduce environmental pollution. However, the lack of legal environmental accounting and an accountant's qualification is a barrier. The Investor is also interested in qualifying for DEAI, but it has a few items in the financial statements.

Information on implementation and effectiveness from environmental issues should be clear, public and transparent for stakeholders because the accounting information assists managers in decision-making (Frekat et al., 1996). Nevertheless, these enterprises only disclose general environmental information in compliance with the guidance of Circular 155/2015 / TT-BTC or GRI but have yet to publish information from the implementation of environmental accounting (Lam Thi Truc Linh, 2017).

Previous research has found that pressure from policymakers, managers, environmental management agencies, and the general public (Neu et al., 1998; Li, 2014) and the attitude of Top managers (Meng et al., 2013; Rao et al., 2016; Post et al., 2011; Post et al., 2015; Cucari et al., 2018) affect to the disclosure of environmental accounting information but in developed countries. Environmental accounting is still new in Vietnam, a developing country with no environmental accounting norms. This study investigates the interaction between top management's attitude, stakeholder pressure, and regulation to implement and disclose Environmental Accounting information.

2. Literature Review and Hypothesis Framework

2.1. Attitude Top Manager (ATM) with Environmental accounting (EA) and disclosure of Environmental accounting information (DEAI)

There is a difference between the Attitude of Top managers toward stakeholder groups, so the decision disclosure of EAI provides a perspective on how a firm respond to the other stakeholders to whom it must be accountable. The action to achieve social legitimacy and agreement of stakeholders (Cormier et al., 2004; Li et al., 2018).

Different environmental strategies were implemented to cope with this pressure (Lewis et al., 2014). Environmental awareness of the manager has a positive on DEAI. The previous research discussed the influence of board members' preferences such as gender, age, and level of education on DEAI. A greater degree of education will influence board members' environmental consciousness. More, Female board age has a positive effect on DEAI (Meng et al., 2013; Rao et al., 2016; Post et al., 2011; Post et al., 2015; Cucari et al., 2018)

The manager has an MBA educational background with higher environmental awareness of capital investment application modern techniques to reduce emissions (Cucari et al., 2018). They have more professional company management training, extraordinary management abilities, and better evaluation approaches for addressing rising global concerns (Graham et al., 2001). Therefore, they are more adaption to new things and more responsive to business environmental change. The MBA educational background of top managers has a favourable link with DEAI. Facing environmental issues, MBA education managers are better at making flexible actions. Besides, top managers' age also positively impacts DEAI (Ma et al., 2019). This result shows that the actual operation of the firm influences the disclosure decision; environmental performance is the assessment by top managers. Businesses with exceptionally strong or bad environmental performance are more likely to actively disclose environmental information, indicating that DEAI is a management tool for corporations to capitalize on external opportunities (Merkl-Davies et al., 2011; Hermalin et al., 2012). It should be emphasized that there is evidence that MBAs cheat more than other majors on self-reported assessments (McCabe et al., 2006). Management must carefully publish environmental accounting information to attract stakeholders while meeting their demands (Hermalin et al., 2012; Bondy et al., 2012)

Because innovation plans are established at the top management level, the impact of senior management teams should be significant (Talke et al., 2011). An organization can

only become environmentally friendly if its senior management is dedicated to changing its business strategy to be more environmentally friendly and reallocating resources to improve organizational and environmental performance (Latan et al., 2018). Human resources are fundamental to environmental sustainability (Daily & Huang, 2001; Jackson et al., 2011). Therefore, Top managers must implement Environmental accounting (EA) and environmental management systems. EA practices need qualified accountants for the best performance to apply a better environmental strategy. An EMS involves commitment and policy documentation, planning, execution, measurement and evaluation, review and improvement. The establishment and maintenance of an EMS can be costly and time-consuming. Therefore, the implementation should be carefully structured to ensure success (Daily & Huang, 2001). Top managers establish the regulation of the management control system; they set up how management control systems are implemented (Bamber et al., 2010). When top management is less committed or less effective, the firm fails to provide quality services and overall performance will also be affected. Management systems ensure employees improve decision-making (Poksinska et al., 2003).

Therefore, it has been hypothesized as follows:

Hypothesis 1: There is a positive relationship between ATM and EA

Hypothesis 2: There is a positive relationship between ATM and DEAI

2.2. Pressure of Stakeholders with Environmental Accounting and Disclosure of Environmental accounting information

Implementation of Environmental accounting (EA) is the step for the company to practice sustainable development and more and more gaining of pay attention to the researcher (Burritt & Schaltegger, 2014). This explains why stakeholders are much-paying attention to environmental issues. They pressure the managers to consider environmental performance evaluation (Burritt & Schaltegger, 2010; Rodrigue et al., 2013). These companies should have environmental management systems that gain an environmental certificate to improve their product quality. That is how they meet to reply to customers' concerns about environmental problems. Stakeholders such as customers, government, and creditors are concerned about environmental performance for different purposes, but they always need the information to decide. Chithambo et al. (2020) found that pressure such as regulatory, creditor, supplier, customer, and board control positively impacted disclosure information. However, creditor pressure had a significant negative relationship with disclosure. This pressure includes the implementation or not an environmental strategy and how the company practice to reduce environmental pollution (Yunus et al., 2020; Cornell & Shapiro, 1987). Creditors are essential stakeholders whose influences should be managed as part of the firms' stakeholder strategy. Because they supply financial resources for the firm. So, the environmental risk increases the risk of the creditors. The result (Milne & Chan, 1999) showed that investors draw capital if firms have nondisclosures environmental and social. The company must disclose information on environmental activities, including monetary penalties under legislative enactment and regulations (Deegan & Rankin, 1996).

Volunteer disclosure DEAI is a strategic tool when the companies hope to receive stakeholders' perceptions (Chen, Cho, & Patten, 2014). This is confirmed because the most environmentally conscious companies have not filed the most significant disclosures (Cho & Patten, 2007). The implementation of EA aims to improve corporate environmental performance. DEAI will be connected and strengthen stakeholder relationships. But, the environmental awareness of stakeholders has an impact on the practice of EA and DEAI (Seifert, C., & Guenther, E.,2020)

Environmental disclosures by firms are one means of communicating such information to these stakeholders' pressure. Attitude management affects the decision to disclose environmental information (Lee et al., 2005). External stakeholder and Internal stakeholder groups pressure firms to disclose environmental information. Besides, the environmental lobby group also influences managerial choices regarding environmental disclosure strategies (Huang et al., 2010).

Hypothesis 3: There is a positive relationship between PS and EA

Hypothesis 4: There is a positive relationship between PS and DEAI

2.3. Environmental accounting with disclosure of Environmental accounting information

Application DEAI will boost financial performance. The corporation produces competitive products while lowering marketing costs. According to this study, the firm's reputation will be built through providing environmentally friendly items and utilizing practical resources. To increase the quality of DEAI, the author proposes altering financial accounts (Saleh et al., 2020). The environmental accounting information must be disclosed in annual reports (Senn, 2018). This is supported by these researchers because annual reports as the document are reliable. The annual report is meant to communicate to investors. The presentation within one document includes environmental information that will reduce the costs of disclosure (Gray et al.,1995a). Moreover, stakeholders found this information in the annual report, which the report had completed editorial control (Guthrie & Parker, 1989).

External stakeholder pressure is a determinant of DEAI but not the qualified completeness of emissions disclosure. (Liesen et al., 2015). The lack of guidance from regulatory authorities negatively affected DEAI in an annual report (Gamble et al.,1995). The companies willingly provide information favourable to their image, even after being prosecuted, so disclosure regulations are essential for application (Deegan & Rankin, 1996). DEAI is required, but there needs to be specific guidance on the published, so the quality of DEAI is not suitable for deciding the decision of stakeholders. Even countries that comply with IFRS have different characteristics of politics, markets and social issues (Barbu et al., 2012). The standards of DEAI should be developed to create consistency in the disclosure and adaption of quality information (Deegan & Rankin, 1999; Barbu et al., 2012; Jamil et al., 2015).

In the context of Vietnam, Guidance for EA has not been published; Therefore, the regulation of EA has a positive effect on the implementation of EA and DEAI (Lam Thi Truc Linh, 2018; Nguyen Thanh Tai, 2019).

Hypothesis 5: There is a positive relationship between EA and DEAI

Hypothesis 6: There is a positive relationship between EA and DEAI through REG

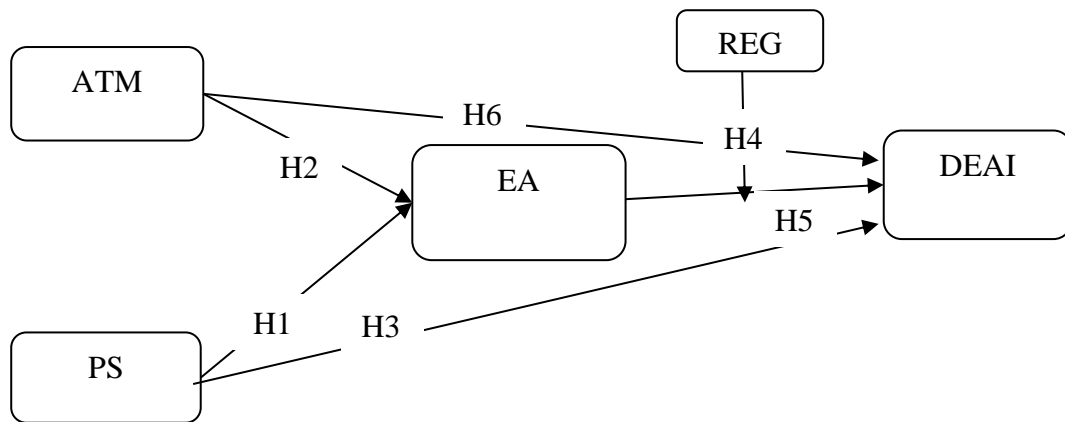

Figure 1. Research model

3. Method

This study collected the data through a survey of the Mekong Delta Fishery enterprise in Viet Nam. The questionnaire was designed from the measuring scales adopted from the literature showing consistent results. All items were scored on a 5-point Likert scale, with 1 being strongly disagreed and 5 strongly agree. Five variables include ATM, PS, EA, REG, and DEAI.

Two methods collect the sample. First, the researcher directly sent the questionnaire to firms through support members. The second email survey was then distributed to top managers from the business. This study chooses the top manager because they should be responsible for environmental issues and require the accounting department to implement EA and DEAI. This study received 211 feedbacks from the survey.

The study employed a quantitative research method; Smart PLS Version 4 software was used to test the research hypotheses through a Partial Least Square Structural Equation Modelling (PLS-SEM) technique.

The measurement model assessed two types of validity: convergent and discriminant. The measurement model ascertains convergent validity by examining factor loadings, average variance extracted (AVE), and composite reliability (CR) (Hair et al., 2017). Composite reliability is used to evaluate the internal consistency, and the reliability of individual observed variables. The AVE was used to assess convergence validity. In addition, the measurement model evaluation also includes discriminant validity. Heterotrait-Monotrait (HTMT) criterion, load factor, was used to check discriminant validity.

4. Results

4.1. Measurement Model assessment

Reliability and validity

Hair et al. (2014) suggest that the outer loading factor needs to be greater than or equal to 0.708 observed quality variables. One item, EA1, with a factor loading less than

0.7, was deleted. As results shown in Table 1, the outer loadings and Cronbach's alpha were all greater than 0.7, which Hair, Ringle, and Sarsterd (2011) supported. Hair et al. (2017) suggested that the AVE and CR obtained were all higher than 0.5 and 0.7, respectively. AVE also had a value higher than 0.50 or close to 0.70, which met a threshold of convergent validity. The result is presented in Table 1. All the factor loadings presented are greater than their cross-loadings, which indicates good discriminant validity. The collinearity issue was assessed using the variance inflation factor (VIF) with a cut-off value of 5, as suggested by Hair et al. (2017). The VIF values, as presented in Table 1, were all less than 5, indicating no collinearity problems.

Table 1. Reflective Measurement Model: Factor Loading, Alpha, CR, and AVE

	Outer loading	Cronbach's alpha	Composite reliability	Average variance extracted (AVE)	VIF
ATM1	0.797	0.867	0.897	0.648	1.964
ATM2	0.832				1.842
ATM3	0.781				2.162
ATM4	0.824				2.403
ATM5	0.789				1.979
DEAI1	0.819	0.896	0.901	0.706	2.138
DEAI2	0.789				1.825
DEAI3	0.853				2.619
DEAI4	0.879				2.801
DEAI5	0.858				2.857
EA2	0.85	0.778	0.794	0.596	2.049

PS5	0.791				1.977
REG1	0.774	0.865	0.907	0.707	1.92
REG2	0.874				2.408
REG3	0.854				2.393
REG4	0.858				1.853

Source: Authors' estimation

Discriminant validity

Heterotrait-Monotrait (HTMT) techniques were used to check the discriminant validity. Garson (2016) suggested that the discriminant validity between the two latent variables is guaranteed when the HTMT index is less than 1. Henseler et al. (2015) indicate that the discriminant value will be guaranteed if this value is below 0.9. Meanwhile, Clark & Watson (1995) and Kline (2015) use a more stringent threshold of 0.85. SMART PLS prioritises a threshold selection of 0.85 in the evaluation. Specifically, in Table 2, HTMT values are less than 0.85. Therefore, discriminant validity was ascertained.

Table 2. Represents the Heterotrait-Monotrait ratio (HTMT) of discriminant validity for the study

	ATM	DEAI	EA	PS	REG
ATM					
DEAI	0.285				
EA	0.232	0.317			
PS	0.189	0.281	0.272

4.2. Structural model assessment

The structural model was performed using a bootstrapping procedure with a resample of 5,000 to improve the accuracy level of the estimation. The structural model assesses all the relationships between the constructs. The results are shown in Table 3.

Table 3. Structural Model Results

Hypothesis	Original sample (O)	Sample mean (M)	Standard deviation (STDEV)	T statistics (O/STDEV)	P values	Remarks
H1 ATM -> EA	0.175	0.182	0.069	2.54	0.011	Accepted
H2 ATM -> DEAI	0.188	0.19	0.056	3.335	0.001	Accepted
H3 PS -> EA	0.208	0.22	0.075	2.762	0.006	Accepted
H4 PS -> DEAI	0.073	0.078	0.072	1.013	0.311	<i>Rejected</i>
H5 EA -> DEAI	0.035	0.036	0.073	0.483	0.629	<i>Rejected</i>
H6 REG x EA -> DEAI	0.141	0.139	0.048	2.945	0.003	Accepted

Source: Authors' estimation

Table 3 clearly shows a significant positive relationship between ATM and EA ($\beta=0.175$; $P=0.011 < 0.05$), supporting hypothesis H1. Similarly, the result has been recorded that ATM has a significant favourable influence on DEAI ($\beta=0.188$; $P=0.001 < 0.05$); Also,

the PS factor saw an impact on implementation EA ($\beta=0.208$; $P=0.006 < 0.05$). Therefore, this study's hypotheses H1, H2, and H3 were accepted.

However, in Table 3, there was no significant effect of PS on DEAI and EA on DEAI. This relationship is not supported at P_value greater than 0.05 at 0.311 and 0.629, respectively. Therefore, these hypotheses H4 and H5 in this study were rejected. H6 is accepted where this study has discovered the mediating impact of REG on the relationship between EA and DEAI ($\beta=0.141$; $P=0.003 < 0.05$). It was found that firms that have implemented EA then disclosed environmental information when it was compulsory from regulation.

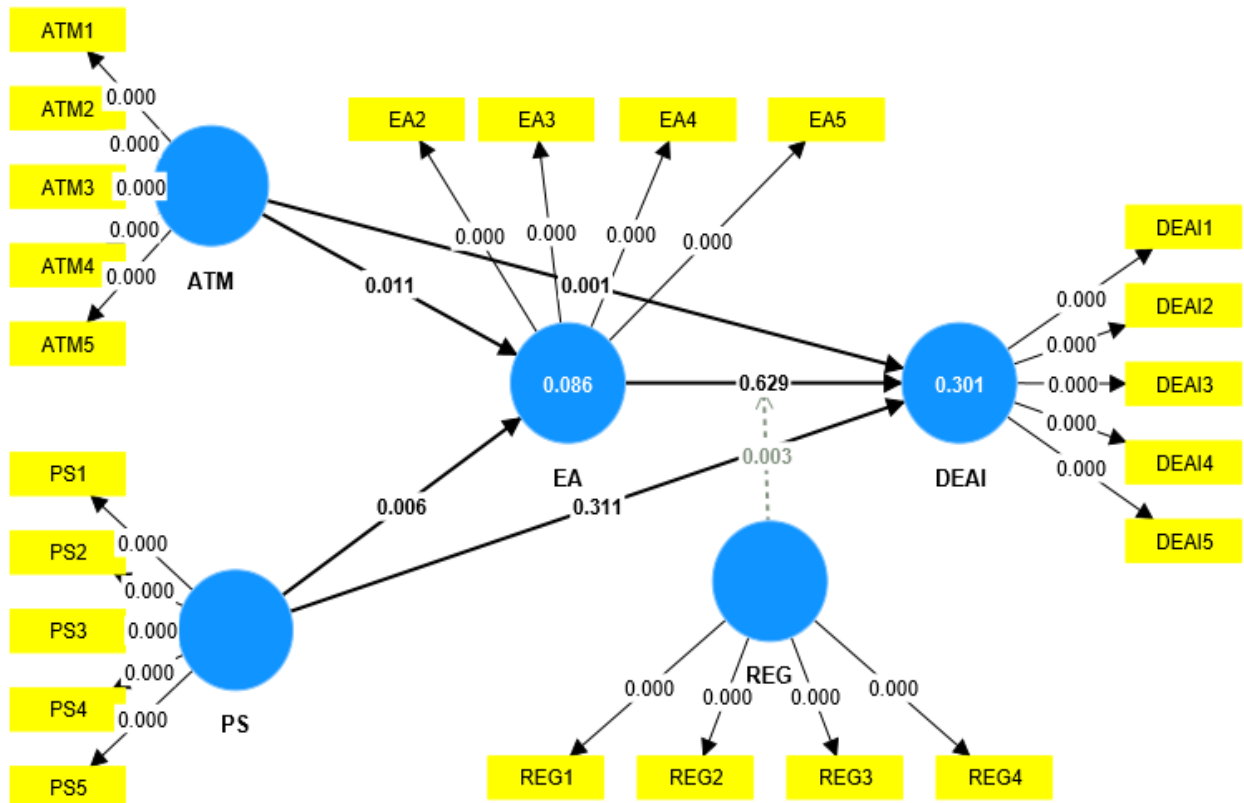

Figure 2. Structural model

5. Discussion and Conclusion

The study aims to identify ATM and PS impact on implementing EA and DEAI. The PLS-SEM result confirms ATM's statistical significance on EA and DEAI. ATM values on EA and DEAI are 0.175 and 0.188, respectively. This result shows that the manager will take action to solve the problem environmentally. They must improve firm performance to satisfy the requirements of stakeholders.

The empirical previous study confirmed that the implementation of EA positively impacts DEAI. However, in Table 3, this relationship is not supported at $P_value\ 0.629 > 0.05$. Also, there was no significant effect of PS on DEAI. In contrast, the role important of REG in the relationship between EA and DEAI is confirmed. This implication needs to be a policymaker in the context of Vietnam, where environmental and sustainable development issues are paid more attention.

This study has some contributions. First, this study continuously confirms that PS positively impacts environmental accounting; the firm must be responsible for explanation issues by disclosing environmental information. Second, in making decisions, EA and DEAI rely on top managers, so it is necessary to know adequate to benefit environmental strategy and sustainable development corporate. Third, this study implicates regulation for EA should be researched and mandatory application soon.

However, this study has several limitations. First, this study took into enterprise Mekong Delta, Viet Nam. Second, there is limited knowledge of the EA of a top manager. Therefore, the feedback for the survey is small. In the future, similar research should be implemented in the industrial differences in Vietnam.

THE IMPACT OF SOCIAL MARKETING ON CUSTOMER INTENTION AND PURCHASE DECISIONS: A RESEARCH OF THE FMCG INDUSTRY IN VIETNAM

MBA. Nguyen Thanh An

ntan@tdmu.edu.vn

Faculty of Economics, Thu Dau Mot University, Binh Duong, Vietnam

Abstract

In the socio-economic development of each country, increasing the development of enterprises while maintaining social responsibility is an urgent issue to ensure sustainable development. In the context of increasing pressure on businesses to be socially responsible, cause-related marketing (CrM) strategies are increasingly used by businesses around the world. This study systematically implements the impact of socially significant marketing on customer retention and purchase decision through domestic and international studies. Through this study, we discuss the research gaps that need to be filled by a research model in the FMCG industry in Vietnam.

Keywords: *Cause-related Marketing, corporate social responsibility, purchase behaviour*

1. Introduction

In the context of the dynamic market landscape nowadays, consumers expect more value from the products in the market. Besides the pure value of the product such as use value and quality, consumers also expect other values towards social responsibility. When the quality and price of products in the market are similar, most consumers tend to choose brands that have practical support for society. In addition, the consumers not only consider quality and price in their purchasing decisions, but also consider factors related to the social contribution of brands of the products. In the context of increasing pressure on businesses to be socially responsible, Cause-related marketing (CrM) strategies are increasingly been popular around the world. Therefore, CrM strategy is considered as an important essential trend in the competitive environment. Because of the above reasons, a systematic review on consumer behaviour associated with its corporate social responsibility and marketing associated with its social responsibility is necessary in the current context.

Expectations of positive consumer behaviour responses to companies perceived as socially responsible have inspired academics in management and marketing. However, the findings drawn from most studies are one-sided, unconvincing and sometimes controversial about the nature and extent to which corporate social responsibility (CSR) is concerned and directly affects consumer response (Al Jarah & Emeagwali, 2017; Gürlek et al., 2017; He & Li, 2011). Several studies have confirmed the positive impact of perceived CSR on consumer responses, including loyalty and repurchase/post-patronisation behaviour (Khan et al., 2015; Mandhachitara & Poolthong, 2011; Pérez & Rodriguez del Bosque, 2015). On the other

hand, some research findings suggest that the influence of CSR on consumer outcomes is not always direct and clear, and in fact it may depend on a number of other factors (S Castaldo & Perrini, 2004; Sandro Castaldo et al., 2009; Tingchi Liu et al., 2014).

The practice of corporate social responsibility in marketing communications is often referred to as cause-related/socially meaningful marketing (CrM). The socially meaningful marketing is defined as the process of formulating and implementing marketing activities characterized by contributing a specific amount of money to a designated non-profit effort, thus, making customers engage in revenue-generating exchanges (Mullen, 1997). In the United States, CrM is used as a corporate term to refer to 'financial partnership with a charitable organization in order to tie a company and its products to one goal' (Ptacek & Salazar, 1997). It is an 'impressive way to build brand equity because it generates the most added value and directly enhances financial performance' (Mullen, 1997). The socially meaningful marketing can create the lasting value needed for a company to survive and gain competitive advantage (Collins, 1993).

When implemented properly, CrM will sell products, enhance image and create the motivation for employees. However, CrM can be a very dangerous area for companies if it is not implemented properly. According to Duncan et al. (1997), it is consistent with linking the cause with the organization's mission, making it permanent, and not using it as a short-term tactic to increase sales, and understanding that it's not always effective, easy to measure, and through reputation enhancement, is long-lasting. For example, most Americans think of CrM as a reliable and effective way to improve the country's social problems and it can influence what and where they buy.

However, Hawkins (2012) believed that CrM continues to be the trend of the world because of its practical and ideal meaning. However, achieving success in CrM can require businesses to understand consumers in terms of awareness, attitude and behaviour. According to Littrell et al. (1993), economic and cultural context can influence consumer attitudes and behaviour towards CrM. Therefore, differences in economic and cultural contexts can be an important variable affecting CrM performance (Emslie et al., 2007). This suggests that CrM efforts in different contexts may yield different results (Choi et al., 2016).

From the above arguments, it is necessary to conduct a research review on marketing with its corporate social responsibility associated with consumer consumption behaviour in the context of Vietnam. A systematic literature review will likely provide a clear picture of what has been studied and current research gaps that need further research to increase understanding in the field of the research area.

2. Method

The systematic literature review method used can provide a clear picture of what has been studied and current research gaps in the field of research area. In this approach, the aim of this paper is to provide the research topics of socially significant marketing and customer behaviour. First, we comprehensively review the research of socially significant marketing

and identify key research areas involved. Then, research topics in each of these areas are reviewed. Finally, the potential directions of future research are explored.

To analyse the research on the topic of socially significant marketing and customer behaviour, we conducted a literature review. Literature reviews help synthesize knowledge and determine the research directions (Xia et al., 2018). The research process consists of three stages: Stage 1_Document search; Stage 2_Preliminary assessment; Stage 3_Content analysis as follows:

Figure 1. The research process

Figure 1 shows the research process about the topic of socially significant marketing and customer behaviour. The study collects data from pre-published studies at local and abroad, then the study does the initial assessment and analysis, and finally the study clarifies the research gap.

3. A systematic review

The current scientific literature shows that the relationship between CrM, brand, perception and consumer behaviour towards CrM is diversely approached by previous studies with different conceptual models in different contexts. Besides, the mediating relationships of different variables in the above relationships have contributed to diversifying the findings of previous studies. In this case, we conduct a systematic review and identify the research gaps as follows:

Table 1. List of studies by topic group

Study topic	Previous studies
(1) Brand image with customer satisfaction, loyalty intentions and customer retention.	Hellier et al. (2003); Shahroudi and Naimi (2014); Chatterjee et al. (2018); Palto et al. (2018); Veloso et al. (2018); Darzi and Bhat (2018); Subaebasni et al. (2019); Nguyen et al. (2020); Indarto et al. (2018); Le (2021); Hosseini and Behboudi (2017); Özkan et al. (2019); Mehta and Tariq (2020); Rusmahafi and Wulandari (2020)
(2) Consumers' perception of products and purchasing decisions	Wee et al. (2014); Nhu et al. (2019); Özkan et al. (2019)
(3) CrM with customer retention and purchase decision.	Santoro et al. (2019); Suriyanto et al. (2020); Srivastava (2020); Patel et al. (2017); Ferraris et al. (2019); Nguyen Anh Tuan (2020); Chaabouni et al. (2021)

Source: Authors' compilation

3.1. Descriptive statistics

The previous studies have been done in different regions and countries around the world, showing that research topics about corporate social responsibility and the socially meaningful marketing that is associated with consumer behaviour is very broad, and covering Asia, Australia, Europe, America and Africa. In particular, Asia accounted for the majority of studies on the above topic in the period from 2003 to 2021, showing that this region can show many differences and diversities in consumer culture and corporate social responsibility. Further, we believed that conducting a study on corporate social responsibility, specifically marketing activities with social significance in Vietnam, is an appropriate research direction in today's context.

Figure 1. Distribution of studies by geographical area

Source: Authors' compilation

Australia, a study by Hellier et al. (2003).

Europe (Portugal), a research by Veloso et al. (2018).

Africa (Consumer Council of Zimbabwe), a study by Makanyeza et al. (2021).

Asia (Veloso et al.), a study of Shahroudi and Naimi (2014), Hosseini and Behboudi (2017); a study of Wee et al. (2014) in Malaysia; India with its studies as Patel et al. (2017), Darzi and Bhat (2018), Chatterjee et al. (2018), and Srivastava (2020); a study of Indarto et al. (2018) in Indonesia; Palto et al. (2018) in Bangladesh; Mehta and Tariq (2020) in Pakistan; Subaebasni et al. (2019), Rusmahafi and Wulandari (2020), and Suriyanto et al. (2020) in Indonesia; Nhu et al. (2019), Nguyen et al. (2020), Nguyen Anh Tuan (2020), Le (2021) in Vietnam.

In addition, there are studies done in 2 markets, as Santoro et al. (2019) in Italy and Japan; Ferraris et al. (2019) in Brazil and Italy. Further, Özkan et al. (2019) with their studies in Türkiye when this country has 97% of its area in Asia and 3% in Europe.

3.2. Discussions on the research gap

There have been a few previous studies done from 2014 to the present. Table 2 indicates that there have been assessments of the topic of the cause related marketing, customer intention, and purchase decisions as follows:

Table 2. Some relevant studies

No.	Author	Method	Sample	Results	Area
1	Shahroudi and Naimi (2014)	Quantitative method, Using questionnaires	384 people	<ul style="list-style-type: none"> - Brand image does not directly affect loyalty intention but indirectly affects loyalty intention. - Brand image directly and positively affects customer satisfaction. - Customer satisfaction directly and positively affects loyalty intention. - Satisfied customers have a positive influence on repeat purchase intention. 	<ul style="list-style-type: none"> - Group of hygiene products - Iranian market
2	Patel et al. (2017)	Quantitative method, Using questionnaires	424 people	<ul style="list-style-type: none"> - CrM has a key role in creating a positive influence on purchase intention. - Purchase intention is significantly influenced by customers' perception of CrM. 	<ul style="list-style-type: none"> - FMCG industry of PG brand - Indian market

No.	Author	Method	Sample	Results	Area
3	Palto et al. (2018)	Quantitative method, Using questionnaires	202 people	<ul style="list-style-type: none"> - Service quality, customer relationship, customer trust, and customer satisfaction have a positive influence on customer loyalty, leading to customer retention. - Service quality has a positive and significant relationship to customer trust and customer satisfaction. - Customer relationships positively and significantly influence customer trust, customer commitment, and customer satisfaction. - Customer relationship is very important in maximizing customer satisfaction. 	<ul style="list-style-type: none"> - Retail area - Bangladesh market
4	Santoro, Bresciani, et al. (2019)	Quantitative method, Using questionnaires	154 Italian people 116 Japanese people - The age of survey respondents is mostly under 35 years old	<ul style="list-style-type: none"> - CrM is perceived to have a positive relationship with brand loyalty. - Customer perception of CSR does not moderate the relationship between CrM and brand loyalty. - There are similarities between Italian and Japanese consumers in terms of CrM awareness, CSR awareness and brand loyalty. 	<ul style="list-style-type: none"> - Subjective consumer feedback - CrM initiatives can vary between businesses in different contexts
5	Surianto et al. (2020)	Quantitative method, Using questionnaires	150 people	<ul style="list-style-type: none"> - CrM does not directly affect repeat purchase intent. - Socially meaningful marketing campaigns have an indirect effect on repeat purchase intention with brand awareness, customer attitude. 	<ul style="list-style-type: none"> - Bottled mineral water industry - Big brand, large scale - Indonesian market

Source: Authors' analysis

From the above-mentioned overview documents, we conduct the analysis according to three main groups of topics related to the research problem, including (1) Brand image with customer satisfaction, loyalty and retention intentions. customer retention; (2) Consumers' perception of products and purchasing decisions; and (3) Cause-related marketing (CrM) with customer retention and purchase decisions.

(1) Research topic on “Brand image with customer satisfaction, loyalty intention and customer retention”

The study of Hellier et al. (2003) evaluates the process related to consumer's repeat purchase intention. The findings of this study suggest that sense of quality and equity, sense of value, customer satisfaction, expected switching costs, and brand preference affect repeat purchase intention. In which, the relationship between customer satisfaction and repeat purchase intention is related to the relationship between “customer satisfaction” and “loyalty intention” (Chatterjee et al., 2018; Shahroudi & Naimi, 2014) and “customer retention” (Darzi & Bhat, 2018; Palto et al., 2018; Subaebasni et al., 2019; Veloso et al., 2018). In addition, the relationship between brand preference and repeat purchase intention is associated with the relationship of “good impression of brand image” to “customer satisfaction” (Indarto et al., 2018; Shahroudi & Naimi, 2014), between “loyal intentions” (Shahroudi & Naimi, 2014) and “customer retention” (Indarto et al., 2018; Subaebasni et al., 2019; Veloso et al., 2018). Although the literature review shows that the relationships between the factors as customer satisfaction, brand image, and loyalty intention, customer retention are approached by current studies quite varied, but there are few in-depth studies on the comprehensive relationship of these factors. Meanwhile, this is a complex relationship that reflects customers' impressions of how brand image affects their satisfaction, and the intention to stay loyal and keep them engaged with the business. Therefore, understanding this process is very important for businesses and brands to have the right strategy towards improving customer retention rates.

(2) Research topic on "Consumer perception of products and purchasing decisions"

Research by Wee et al. (2014) evaluates the process related to the actual buying behaviour of consumers. Research results indicate that this process starts from consumers' perceptions of product aspects (value, safety, environmental friendliness, and quality) to purchase intention and ultimately the actual buying behaviour. This process refers to the relationship between the "consumer perception of the product" and the consumer's "purchase decision". The current literature suggests that very little current research on the purchasing decision-related process other than the study by Wee et al. (2014). Meanwhile, customers' purchasing decisions are very important for all marketing activities of businesses and brands. Moreover, it is even more important to understand the specific process that affects a customer's purchasing decision in the specific context, and to help businesses operate with the most appropriate strategy to optimize the effectiveness of related marketing activities leading to an increase in actual purchase rate.

(3) Research topic on "CrM with customer retention and purchase decision"

Research by Santoro et al. (2019) evaluates the relationship between CrM and brand loyalty with the regulatory mechanism of perceived social responsibility. The results of this study determine that consumer perception of CrM has a positive relationship with brand loyalty, regardless of country of origin. This finding suggests a relationship between "perceived socially significant marketing" and consumers' positive attitudes about "brand image" (Suriyanto et al., 2020). Besides, the study of Srivastava (2020) found that "perceived social meaningful marketing" positively affects purchase intention and intention to recommend products to others. Similarly, the study by Srivastava (2020) and Suriyanto et al. (2020) relates the relationship between "perceived socially significant marketing" and "loyalty intentions", "customer retention". Although these important relationships have been approached in different contexts by previous studies, it is rare to find studies that integrate the factors of consumer attitudes towards brands and customer satisfaction in this relationship.

In general, most of previous studies indicated the CrM and its influence on brand indicators and customer behaviour approached with different conceptual models in different contexts. Besides, studies related to the relationship between brand, consumer perception of products, customer satisfaction, customer loyalty, purchase decision, customer retention have also been presented by previous authors. The findings of the above studies indicate the influence of the relationships between the above factors, thereby, highlighting the role of each factor in the process of creating value. However, a comprehensive review of the influence of CrM on purchase decisions and customer retention through the two-layer mediating mechanism of brand image and consumers' perception of products, customer satisfaction, customers and loyalty intentions have not been covered in previous studies.

Based on the synthesis of the above-mentioned domestic and international research directions, the study points out the following research gaps:

First, the relationship between CrM and customer retention should be considered through a two-layer mediated mechanism of brand image and customer perception of the product, customer satisfaction and loyalty intention, especially from consumer perception perspective has not been covered in previous research. Therefore, new research is needed to fill this gap.

Second, CrM affects brand and customer behaviour (customer retention, purchase decision), however there are few studies evaluating this comprehensive relationship. Therefore, new research is needed to fill this gap.

Finally, CrM efforts in different contexts may produce different results. Therefore, new studies for different contexts are needed to test the effects of CrM.

4. Building the research model

Based on the previous studies and a few documents on CrM and its implications for businesses, consumers and society, especially in the context of a competitive and changing market, it is necessary to have a deep understanding of consumers' behavioural responses to enterprise's CrM activities. Besides, the authors found that brand image, consumers' perception of the product, customer satisfaction, loyalty intention, all are related to CrM, purchase decisions and customer retention. At the same time, purchasing decisions and customer retention are two very important factors that affect the existence and development of businesses (Chatterjee et al., 2018). Therefore, we propose the research model to comprehensively evaluate the influence of CrM on purchase decisions and customer retention through a two-layer mediation mechanism of brand image and consumer perception about product, customer satisfaction and loyalty intentions, and the regulatory mechanism of consumer perception in the relationship between CrM and brand image, CrM and consumer perception about the product.

Accordingly, the proposed research model is shown in Figure 3 below, including an independent variable that is “perceived CrM”; two dependent variables are (1) “purchase decision” and (2) “customer retention”, and four mediating variables include (1) “brand image”, (2) “consumer perception of the product”, (3) “customer satisfaction”, and (4) “Loyal intention”.

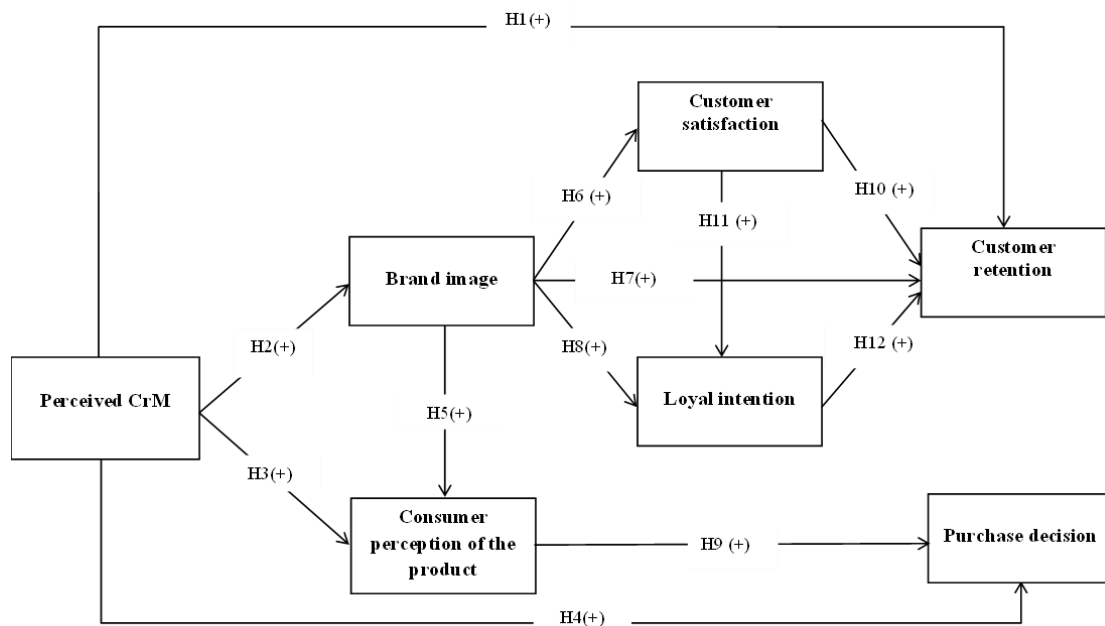

Figure 3: The proposed research model

Source: Authors' compilation

Research hypotheses

H1: A perceived socially significant marketing has a positive impact on a business' customer retention.

H2: A perceived socially significant marketing has a positive impact on a business' brand image.

H3: A perceived socially significant marketing has a positive effect on consumer perception of a product.

H4: A perceived socially significant marketing has a positive impact on consumers' purchasing decisions.

H5: Brand image has a positive impact on consumers' product perception.

H6: Corporate brand image has a positive impact on customer satisfaction.

H7: Brand image has a positive impact on customer retention.

H8: Brand image has a positive effect on customer loyalty intention.

H9: Consumer perception of the product has a positive impact on the purchase decision.

H10: Customer satisfaction has a positive impact on customer retention.

H11: Customer satisfaction has a positive effect on loyalty intention.

H12: Loyalty intention has a positive effect on customer retention.

FMCG is an acronym for Fast Moving Consumer Goods. This category includes all essential products and goods for the human life. FMCG products include household products, functional foods, food and personal care products, cleaning and laundry products, etc. Currently, stationery and pharmaceutical products, and consumer electronics are also as FMCG.

The peculiarity of the FMCG industry can be shown as the products usually have a short life cycle, a small value per unit but a large consumption rate. This industry requires manufacturers to always innovate themselves to meet the tastes of consumers. This is also a highly competitive industry, not only between domestic enterprises but also its importers and foreign markets.

Vietnam's FMCG industry is currently one of the fastest growing markets in the ASEAN region. According to the General Statistics Office, the total retail sales of Vietnam's goods reached about 180 billion USD in 2021, most of which were fast-moving consumer goods. The growth rate over the past decade has been 10-12%, while it was about 6% in the two years of the pandemic. With a growth rate of 19% in the first 8 months of 2022, this industry has recovered strongly. The expected growth rate of 10-12% will continue to maintain for the next 5-10 years. The size of Vietnam's FMCG market could reach \$360 billion by 2030.

With a positive economic growth prospect, consumers' tastes and requirements for goods will significantly change and demand quality and healthy products. Besides, consumers' awareness has also improved and followed the trend of paying attention to corporate social responsibility. Moreover, some factors such as promotion, convenience, delivery method, corporate social responsibility.... are also selected by consumers, especially cheap goods, food, packaged drinks, fashionable products.

The FMCG industry is on track to grow by 4.9% (Data from the General Statistics Office) and is forecast to continue to shine in the coming years. In the coming time, the FMCG industry will have different growth scenarios as follows: (1) Less frequency of shopping but more spending. This presents both challenges and opportunities for brands in attracting and retaining customers. (2) Although people are spending more, they don't buy more categories of goods, but mainly focus on food, milk, tools, cooking, home care, etc. However, this list is likely to change in the near future as consumers should adapt to the new normal after the pandemic era. (3) Brands will have a harder time maintaining buyer loyalty. The proposed solution is to continuously innovate products, improve brand image to keep consumers engaged with the brand (Kantar, 2022).

Successful brands keep their customers' sentiments and their overall satisfaction in mind. This expectation can be met by focusing on the habits and experiences of consumers through the brand image and creating quality products that benefit their health and peace of mind. In addition, catching up with their psychology and changing behaviour is also very important so that businesses in the FMCG industry have strategies to adjust in accordance with consumer behaviour. That is the gap for doing this research.

5. Discussion and Conclusion

CrM has an important influence on consumer behaviour in making purchasing decisions and continuing to use products in the future. In order to increase market share, brand image, consumer awareness of products, customer satisfaction as well as loyalty to a business, businesses must aim to build develop a marketing strategy associated with its social responsibility. In the content of this topic, we clarify the research issues as follows:

The relevant studies show the importance of CrM activities for brand image, customer satisfaction, purchase intention and repeat purchase intention. These studies were carried out in different contexts, or different sectors including Fast-moving consumer goods (FMCG) and services industries. Although customer retention is considered an indicator of business success, especially in the context of an increasingly competitive and rapidly changing environment, however, there has not been a specific study on the influence of CrM on customer retention and purchase decision. Besides, purchasing decision is an important factor affecting the viability and development of enterprises, but this factor has not been covered in previous studies as the expected results of CrM. In addition, a number of studies in Vietnam mainly explore the relationship between brand and consumer behaviour as well as the factors affecting customer loyalty and purchase intention. Therefore, research on CrM

has not been included in these studies. Meanwhile, the arguments show the strategic importance of CrM for the existence and development of enterprises on the basis of balancing benefits between businesses, consumers and society. In the context of a dynamic market and consumers increasingly expect more value from products in the market, this can be considered as a research gap related to CrM activities in the Vietnamese market.

In this study, we conduct the analysis according to three main groups of topics related to the research problem, including (1) Brand image with customer satisfaction, loyalty intention and customer retention; (2) Consumers' perception of products and purchasing decisions; and (3) CrM with customer retention and purchase decisions. In addition, the study points out gaps for current research. First, the relationship between CrM and customer retention exists through a two-layer mediated mechanism of brand image and customer perception of the product, customer satisfaction and loyalty intention, especially the perceptions of consumers have not been covered in previous research. Second, CrM affects brand and customer behaviour (customer retention, purchase decision), however there are a few studies evaluating this comprehensive relationship. Finally, CrM efforts in different contexts may produce different results. Therefore, new studies for different contexts are needed to test the effects of CrM.

Abstract

Competition is inevitable in the market economy, so competitiveness is a vital issue in business and business development. The competitive impact factor is a key concern of academics and professionals. Many researchers investigate aspects of competitiveness and impact factors. This article evaluates the system of factors affecting product competitiveness. Based on a systematic review of studies, the authors review key topics discussed in the literature, identify and resolve research conflicts and gaps, and develop an integrated and integrated conceptual model of factors impacting product competitiveness. In addition, the authors also identified two future research directions that will include: (1) Conducting a multi-factor study to assess the impact of factors on competitiveness; (2) Using quantitative and qualitative criteria to measure the impact of factors on competitiveness.

Keywords: *competition, capacity, factor, impact.*

1. Introduction

Improving the competitiveness of goods is a key requirement for every business. Highly competitive goods will create a solid foundation for business development and help businesses increase their ability to expand production scale (Dang, 2006). In the context of globalization, many countries have the same advantages and opportunities to produce the same type of products with different quality and price, improving the competitiveness of exports becomes even more urgent when it comes to gaining market share in the world market. Competition is a concept used in many areas, which appeared simultaneously with the birth and development of the production of goods. At the initial stage of the development of commodity production, the competition was not fully recognized and

considered in all aspects. It is only when the concepts of value and price are studied scientifically that the issue of competition is more fully understood and its role in the economy is better appreciated.

However, besides capital advantages, exporting enterprises are always subject to fierce competition from competitors in terms of price, quality, distribution channels, technology, and customers,... In particular, exporting enterprises are also under pressure from the exporting country such as laws, culture, and protectionist policies,... (Tri and Na, 2018). Therefore, the study of factors affecting the competitiveness of products is a stepping stone for businesses to self-assess, check, recognize opportunities and challenges, as well as to implement business plans to improve competitiveness and achieve competitive advantages.

In the context of the market growing and expanding, no longer confined to a certain geographical area, it is increasingly necessary to understand the factors affecting product competitiveness. Vietnam is in the process of strong international integration, especially international trade through participation in free trade agreements. Therefore, it is urgent to study issues related to competitiveness to come up with solutions to help businesses participate in the international market. To date, there have been several related studies mentioned at different levels. However, the studies are still relatively independent, with no connection and mutual inheritance, making this issue not attract the attention of researchers. Therefore, the article clarifies gaps in the scope of competitiveness by conducting a systematic review of the literature on the competitiveness of products and impact factors, thereby proposing future research directions.

The research paper consists of 5 parts: (i) Introduction, (ii) Literature review, (iii) Research method, (iv) Research gaps and future research directions, (v) Conclusion.

2. Method

The authors systematically review previous academic studies. The research uses qualitative and quantitative research methods to thoroughly understand the competitiveness of products, methods, and research theories used in previous publications.

2.1. Search procedure

The authors use a variety of approaches to identify and categorize relevant articles, initiating manual searches and sifting through articles related to competitiveness and product competitive advantage. By examining keywords, article titles, and abstracts, the authors built a list of related articles on Scopus, Elsevier Science Direct, and PubMed. The team also expanded the search by looking at a list of references to previously related articles, otherwise known as the Backward and Forward Reference Search method (Johnson and Jaramillo, 2017).

2.2. Inclusion criteria

All articles are further assessed based on the following criteria:

Firstly, international articles must be published in peer-reviewed journals to ensure the quality and reliability of research results. For studies in Vietnam, the scope of the search

is expanded, including some articles from unassessed journals that have a great impact on many fields.

Secondly, this article focuses on evaluating empirical research and theoretical research that is eliminated in order to prioritize the flexibility of the subject in the investigation in different aspects and contexts, as well as ensuring that the subject of research is closely followed.

2.3. Evaluation methods

After the above search and selection process, related articles are synthesized and categorized into four angles: Articles about competition, competitiveness and factors affecting competitiveness. After collecting quantitative data, the team uses a tool that supports accurate assessment and classification of results. From there, identify the issues, extent, and scope raised in related works, point out the research gaps in previous research, and propose some research orientations suitable to the current context of Vietnam.

3. Results

The authors' findings point to the following key issues: (1) How past studies have been conducted and (2) The major themes in previous studies.

3.1. The way competitiveness research has been conducted

Much of the research on competitiveness to date has been published in numerous journals. After evaluating the literature on competition, the authors found many different perspectives on competitiveness and the factors that influence the competitiveness of previous scholars, and how this changes over time.

First, the papers mainly study the competitiveness of products in a particular country/region (84.5%), with little research linking countries, continents, or the world. Oh and Kim (2015) assessed Indonesia's competitiveness of wood products. Muhammad and Yaacob (2008) analyzed Malaysia's export product competitiveness. Vozarova and Fedorko (2013) analyze the competitiveness of agricultural products exported by the Slovak Republic. Thuy (2006) has delved into researching solutions to improve the competitiveness of Vietnamese seafood exports.

Second, the results of a review of relevant studies show that each study uses a combination of different research methods. However, most studies use primary methods such as: (1) Methods of analysis and synthesis of theory (Fagerberg, Mowery and Nelson (2003); (2) Statistical methods used by studies in evaluating criteria of selling price, revenue, export turnover, market share,... (Tambunan, 2006; Sujová, Hlavackova and Marcinekova, 2015; Song and Gazo, 2013); (3) The comparison method is used in two ways: first, comparing values at different timelines such as sales price, revenue, export turnover, market share (Han, Wen and Kant, 2009); Secondly, comparing between competitors, the criteria used for this method are export value, comparative advantage, calibrated comparative advantage, relative goodwill index and trade competitiveness index,... (Paluš et al., 2015); (4) Graphical research methods are used by some researchers in research to describe research

problems using charts and graphs. (Vozarova and Fedorko, 2013); (5) Regression analysis method to evaluate factors affecting the competitiveness of products (Tuan, 2017); (6) The method of analyzing the sequence over time is used to analyze the fluctuations of the criteria for assessing competitiveness over time to find out the laws of development and predict the level of phenomena in the future (Hoa and Xuan, 2012). In addition, in these studies, none have used value chain analysis methods to assess the competition...

Third, the studies mainly applied a quantitative approach by applying questionnaires. Vozarova and Fedorko (2013), Zhao et al. (2012), Tambunan (2006), Sujová, Hlavackova and Marcinekova (2015), Deng (2006) surveyed with academics and administrators to ensure professional relevance before conducting the questionnaire. After receiving expert feedback and making relevant changes, the final draft of the questionnaire was developed. Questionnaires are sent to executives in companies.

Fourth, the research results on the competitiveness of the product have not been completed and there are still conflicting results. Karima et al. (2008) compared and demonstrated measurements for competitiveness in different countries are not the same. Although competitiveness is studied in many works, each theory provides only one perspective on the subject. Therefore, a system theory basis is needed to comprehensively explain all the factors affecting competitiveness (Buu, 2019). Of the influencing factors studied, few were analyzed in depth. Most studies investigate the direct link between influencing factors and competitiveness but ignore the interplay between factors.

3.2. The major themes within the competitiveness literature

3.2.1. Research on competitiveness

Competition in the economy has been studied for a long time. However, competitiveness and systematic competitiveness research have only been around since 1980.

Achieving competitiveness requires a holistic view of business advantages and competitors (Clark and Montgomery, 1999; Day and Nedungadi, 1994) for competitive advantage that comes from a variety of activities, such as product-related areas (Leonidou et al., 2015; Schiefer and Hartmann, 2008), market characteristics (Carbone et al., 2020), quality of service (Johnson and Sirikit, 2002; Pauline and Pauric, 1999; Rapert and Wren, 1998), distribution (Hoffman and Novak, 1996) and the marketing ecosystem (Zhang and Watson IV, 2020).

Aldington (1985) believes that enterprises have good competitiveness when they can produce quality products and services at lower prices than competitors. Prahalad and Hamel (1990) when studying the competitiveness of enterprises emphasize the importance of factors belonging to the endogenous capacity of enterprises. These are: (1) The business strategy of the enterprise; (2) Structures, capacities, and creative abilities; (3) Intangible and tangible resources. The authors point out that the competitiveness of the enterprise is the ability to develop and make better use of resources than competitors, that is, it is necessary to rely on the resources of the enterprise. According to this view, Markusen (1992) asserts:

"a manufacturer is competitive if it has an average unit cost equal to or lower than the unit cost of international competitors". D'Cruz and Rugman (1992) argue that the competitiveness of a business is the ability to design and manufacture products for the market with outstanding prices and quality. From there, it shows that the analysis of business competitiveness can be based on many different angles depending on the perspective and level of interest of the study. While the above studies look at competitiveness in a variety of aspects from measurement methods, to measurement perspectives in each country, Xiao et al. (2009) focused intensively on the causal relationships of competitiveness and suggested that business performance increases if the company has strong competitiveness. more through improving the factors that impact this capacity.

Competitiveness is measured in many ways, such as production capacity, marketing capacity, product quality, differences in price (Katsikeas, 1994), and innovation and cost management (Chandler & Hanks, 1994). According to Song and Parry (1997), competitiveness can be seen from the uniqueness of the product, product quality, and competitive price.

Table 1: Some research on competitiveness

Author/year	Research name	Magazines/publ ishers	Results
Nguyen Dinh Long 2001	Research the main solutions to promote advantages to improve competitiveness and develop agricultural export markets in the coming time: coffee, rice, rubber, tea, cashew	Scientific report of Viet Nam Ministry of Agriculture and Rural Development	Develop a rationale to evaluate the competitiveness of export products from comparative advantages and competitive advantages

3.2.2. *Research on factors affecting competitiveness*

This category involves authors who study and synthesize theories about the factors that affect competitiveness. The process of improving the competitiveness is influenced by external factors as well as internal factors (Buu, 2019).

3.2.2.1. Elements inside the business

According to the competency theory proposed and developed by the studies of Wernerfelt (1984), Barney (1991), Peteraf (1993), Sanchez & Heene (1996, 2008), through research, development and application, Pham Thu Huong (2017) showed that there are 5 main groups of factors inside that affect competitiveness improvement, including: (1) Executive management capacity, (2) Marketing capacity, (3) Financial capacity, (4) Equipment and technology capacity, (5) Service organization capacity. Buu (2019) added (6) The quality of labor resources, (7) The source of raw materials and (8) The ability to create relationships is one of the internal factors (internal resources) affecting the improvement of competitiveness. Those factors are as follows:

a. Equipment and technology capacity

Equipment and production technology are very important factors, greatly affecting competitiveness. Studies by Hudson and Mosley (2001); Qian and Li (2003); Tho and Trang (2008) show that technological characteristics that impact competitiveness are: slow technological innovation; suitable technology; the ability to apply and access new technologies; human resource level of the department of research and application of new technologies in the enterprise.

b. Quality of labor resources

Labor is one of the important inputs of every production process besides capital and technology. To create quality, highly competitive products require quality inputs, including labor (Buu, 2019). In the process of integration, the requirements of high-quality of labor are enough to meet the requirements of the development level of the region, the world, of the times... is necessary. According to Tho (2009) labor and labor quality are one of the resources that make up the capacity of enterprises. Labor quality is evaluated on aspects such as: Experience, knowledge and skills of managers and employees; Adaptability and loyalty of employees. Accordingly, Trang et al. (2004) also assessed the quality of labor resources through the level of education, organizational consciousness as well as the attitude of employees. According to this group of authors, human resources and labor quality affect competitiveness.

c. Sources of raw materials

According to Tho (2009), besides other material resources, raw materials are one of the factors that make up the capacity of enterprises. Raw materials are indispensable inputs of production, directly creating products. Lack of raw materials the production process will be interrupted or unable to proceed. Therefore, raw materials play a very important role in deciding the results and business efficiency of the business. If raw materials are fully

guaranteed in quantity, quality, type ... huge impact on product quality. Raw materials are also directly related to product production and consumption plans. Therefore, timely supply of raw materials at reasonable prices creates favorable conditions for production and consumption of products. Enterprises proactively source input materials, business efficiency will be high. The initiative to source input materials by themselves or find their own supply market, cheap and high quality. This is an important solution that contributes to improving efficiency, increasing business competitiveness, increase product competitiveness.

d. Marketing competencies

Marketing is the function of satisfying the customer's need to achieve the goals of the business (Kotler and Waldermar, 2006). The marketing capabilities of the business are constantly monitored and responsive to customer changes along with competitors (Kotler and Waldermar, 2006; Homburg and Jensen, 2007).

The assessment of the marketing capacity of the enterprise is carried out through four basic components (Tho and Trang, 2008): (1) Customer response, demonstrating the response of the business according to the change in customer needs and desires; (2) Reacting to competitors, demonstrating the company's follow-up to rival business strategies, such as corporate marketing strategies that respond to competitors; (3) Adapting to the macro environment, demonstrating that enterprises monitor environmental changes to seize opportunities and barriers from which to have appropriate policies; (4) The quality of partnerships, referred to as relationship quality, demonstrates the extent to which the enterprise achieves the quality of relationships with customers, suppliers, distributors and relevant levels of government. It is whether the business fulfills the commitments set out with customers or is a participant meeting the established relationship.

e. Executive management capacity

According to Tho (2009) executive management capacity is one of the constituent elements of the enterprise's capacity. In the same vein, Huong (2017) also considers executive management capacity as a factor that has a great impact on the capacity of enterprises. The ability to organize and manage enterprises is considered a decisive factor in the existence and development of enterprises in general as well as the competitiveness of enterprises in particular. Therefore, the enterprise management capacity is shown in the following aspects: The level of the management staff; Qualifications of organization and management of enterprises; Qualifications and capacity of business management (Tho, 2009; Incense, 2017).

f. Financial capacity

Financial capacity is the ability to ensure financial resources for activities to achieve the set goals. According to Tho (2009), financial capacity is reflected in revenue growth, profit growth and market share growth. According to Huong (2017), financial capacity is expressed in the ability to ensure capital sources capable of mobilizing to meet capital needs for activities; is expressed in the size of capital, the ability to mobilize and use capital

effectively, financial management capacity ... First of all, financial capacity associated with capital is a fundamental factor of production. The efficient use of capital, fast capital turnover, good financial growth ... has great significance in reducing capital costs, reducing product costs, rapidly increasing financial scale (Huong, 2017). At the same time, capital is also a premise for other factors of production. The timely mobilization of capital to meet materials, raw materials, hire workers, purchase equipment, technology, organize retail systems ... Financial capacity reflects the economic strength of the enterprise, which is the first and mandatory requirement if the enterprise is to succeed in business and improve competitiveness. Strong financial capacity contributes to increasing competitiveness, thereby contributing to increasing product competitiveness.

g. Ability to create relationships

In production and business activities, in addition to making good use of resource factors to improve competitiveness, enterprises also have to create relationships with different subjects. These relationships include relationships with customers, suppliers, credit institutions, enterprises in the same industry and with the government (Huong, 2017). According to Trang et al. (2004), the ability to create relationships is reflected in the ability of businesses to create relationships with customers; with distributors; with suppliers; relationships with localities, social cohesion; cooperation, affiliation with other enterprises and relationships with credit institutions. The linkage between enterprises creates competitive strength for businesses, thereby affecting product competitiveness.

3.2.2.2 Factors outside the business

According to Porter (1990-1998), external factors affecting the improvement of competitiveness include: Entry conditions; bridge conditions; related and supporting sectors; competitive level strategy and structure; and the impact of the state. These factors are generalized in the Diamond Model (Figure 1) in terms of competitiveness. Porter's diamond model builds on four major attributes of a country and it forms a competitive environment for businesses in that country. These attributes either promote or prevent the creation of that country's competitive advantage. Those attributes are:

(1) Conditions on factors of production: The position of a local country 1 in terms of factors of production, e.g. raw materials, skilled labor, infrastructure necessary to compete in a particular industry.

(2) Demand conditions: Domestic demand for goods or services of an industry.

(3) Supporting and related industries: The presence or unavailability of supporting and related industries with international competitiveness.

(4) Strategy, structure and level of intra-industry competition: What are the conditions of management, organization and administration, the nature of domestic competitors.

(5) The role of government: Government can influence one of the four determinants of competitiveness. The government can influence the conditions of supply of important factors of production, demand conditions in the domestic market and competition among enterprises.

(6) Opportunities: are events that occur outside the control of the subject of study. They are important because they create disruptions, fractures in which some positions increase competition and some are lost.

Figure 1. Mc. Porter's diamond model

Source: Hill và Jones (2009)

MC. Porter argues that there are two more factors that govern the diamond model in other important ways: Opportunity and the role of government. The opportunities that come can help restructure the industry and provide opportunities for a country's businesses to get ahead. The role of government manifests itself by choosing policies, which can reduce or improve national advantages. According to Porter's theory, countries should export products of industries where all four components of the diamond model are favorable and import in those sectors where components do not have favorable conditions.

4. Discussion and Conclusion

4.1. Research gaps

From a theoretical perspective, product competitiveness is always the top concern not only of businesses but also researchers, there have been many studies on competitiveness (Aldington, 1985; Prahalad and Hamel, 1990; Markusen, 1992; Xiao et al., 2009) and each study has a different perspective. There are many different approaches both in terms of methods (Fagerberg, Mowery and Nelson ,2003), content and evaluation criteria (Tambunan, 2006; Sujová, Hlavackova and Marcinekova, 2015; Song and Gazo, 2013). There is not yet a comprehensive and unified theoretical framework, so this is a gap in the study of product competitiveness theory.

The review studies all have in common the use of a comparative advantage platform to evaluate competitiveness through criteria such as: comparative advantage coefficient (Paluš et al., 2015); export value, market share (Tambunan, 2006); trade competitiveness index (Oh and Kim, 2015); localization coefficient (Long, 2001; He, 2010).... The difference

of the studies is that the scope of the research space is taken place in different countries (Paluš et al., 2015; Hoa & Xuan, 2012; Han, Wen and Kant, 2009), there is no study for a specific region or region. In addition, the studies also have some differences in the approach as well as the use of problem-solving research methods and the selection of comparative subjects. The above studies mostly stop at assessing the current state of competitiveness through conventional criteria (Han, Wen and Kant, 2009; Tambunan, 2006; Sujová, Hlavackova and Marcinekova, 2015; Song and Gazo, 2013), not deeply studying internal factors as well as external factors affecting the competitiveness of products.

There have been many domestic studies on product competitiveness. However, so far there has been no comprehensive, complete and up-to-date study on this issue. Moreover, in the process of reviewing the relevant studies gave the author a lot of information in guiding future research.

4.2. Research orientation

One of the main goals of a systematic literature review is to "resolve ambiguities in definition and provide an aggregated view of the current state of knowledge" (Palmatier et al., 2018). As a result, the study found that researchers of competitiveness often neglect to clearly define and evaluate what is involved in competitiveness and focus only on certain aspects of the relationship between influencing factors and competitiveness (Hudson and Mosley, 2001; Qian and Li, 2003; Tho and Trang, 2008; Huong, 2017). This leads to inconsistencies between studies on the main component of competitiveness.

To resolve such inconsistencies in the existing literature and give an overview definition of competitiveness, we do not use the unclear and incomplete descriptive concepts of competitiveness used in previous studies. Instead, we follow the approach used by Xiao et al. (2009) to rely on key influence variables.

Combining these changes with findings from a systematic literature review, we identified two directions for future research that will have a major impact on the team's understanding of the factors impacting competency: (1) Conduct a multi-factor study to assess the impact of factors on competency competitive forces; (2) Use quantitative and qualitative criteria to measure the impact of factors on competitiveness. Below, we briefly discuss each research direction and make initial proposals that can serve as sources of ideas for future studies.

4.2.1. Conduct a multi-factor study to assess the impact of these factors on competitiveness

The study uses factors that are very important and necessary, which are the factors that constitute competitiveness (Katsikeas, 1994; Chandler & Hanks, 1994; Song and Parry, 1997). Depending on the characteristics, business field and size of the enterprise, the analysis of factors determining the product competitiveness of the enterprise from many different angles.

The concept of competitiveness is a dynamic concept, so the factors used to evaluate today's competitiveness can change over time, and differences also appear in different geographical locations, combining many factors to assess the impact of factors on competitiveness is extremely necessary.

4.2.2. Use quantitative and qualitative criteria to measure factor impact on competitiveness

The above studies, each study uses different criteria to assess competitiveness, when considering, researching and analyzing specifically the actual situation of each field of activity, it is possible to use other criteria that the scope of research cannot fully cover. Besides qualitative criteria are product quality, design, design, packaging, brand (He, 2010) then quantitative criteria such as: comparative advantage (RCA), market share (MS), localization coefficient (DRC) (Tambunan, 2006), specialization index, export turnover (Sujová, Hlavackova and Marcinekova, 2015), trade competitiveness index (TC), import and export ratio (Paluš et al., 2015), product selling price (He, 2010), needs to be used in parallel to have the most overview as well as have specific measurement data to help the competitive analysis process more accurately.

4.3. Conclusion

Businesses are now competing fiercely under the pressure of global integration. For sustainable development, enterprises must improve their competitiveness. In that context, identifying, nurturing and developing resources to increase competitiveness is an urgent requirement of enterprises. Over time, research in this area uncovers valuable knowledge about the theoretical basis of competitiveness and factors affecting competitiveness. Studies demonstrate that enterprise-level factors, industry-level characteristics, country-level characteristics, intermediate variables, and regulatory variables are significant impact factors on competitiveness, despite the complexity of measuring competitiveness. Published research on competitiveness is limited to specific industries and regions. In summary, the authors identified, integrated, and synthesized the literature on competitiveness, developed several promising directions for future research.

Abstract

Numerous studies on value co-creation in the context of gaming have been conducted, but they typically focus on the action's process and outcome rather than its fundamental cause. This study emphasizes on the gratification of the participant as the motivating force behind this activity. Using the expectation-confirmation theory (ECT) to explain the relationship between these characteristics and gamers' desire to co-create, we conducted research from the perspective of game service consumers regarding initial expectations and playing experience. Through qualitative surveying, we can determine the factors that influence players' initial expectations, such as enjoyment and attitude toward advertising, as well as the factors that influence their actual gameplay, such as achievements, game visual, and social interaction. In Ho Chi Minh City, 298 video game users provided the sample data for the quantitative analysis. According to the results of the factor analysis, the factors had a positive impact on how participants intended to co-create value. Researchers and developers in the video game industry can benefit from both theoretical and practical contributions.

Key words: *Value co-creation, Expectation-Confirmation Theory (ECT), Video games, Achievement, Game visual.*

1. Introduction

Value Co-creation is considered a novel approach to defining value. They have existed for a long time in business transactions between companies and customers. However, consumer value co-creation was not clarified and received significant scholarly attention until the service-dominant marketing logic debate emerged (Vargo and Lusch, 2004). Blazevic and Lievens (2008) examined its positive impact on firm innovation; the cost,

scope, and competitive advantage that co-creating consumers can bring (Cook, 2008). In addition, co-creation helps organizations increase their innovation by generating concepts that they might not have thought of on their own. Co-creation accelerates the development process by bringing multiple parties together to work toward a common objective, nurturing strong relationships, and cultivating consumer loyalty. In addition, the co-creation process can provide organizations with the agility to respond rapidly to market or consumer requirements shifts. Simultaneously, it increases operational efficacy, thereby generating both business and social value. The most prominent example of this is the partnership between Haier Group, the world's largest manufacturer of home appliances, and Heji Home, a Chinese home furniture company. In response to the Covid - 19, 2020 epidemic in Wuhan, China, these two companies developed a prototype of the device and delivered it to the hospital within two weeks. In the weeks that followed this initial triumph, additional units were manufactured and distributed to local hospitals. One of the most notable instances of co-creation is the 2016 introduction of LEGO Ideas.

Figure 3. LEGO Ideas

Source: Lego

Another example of co-creation is Sodexo's global platform, which aims to empower every Sodexo collaborator to share and realize innovative ideas and launch service delivery initiatives. Sodexo's Autonomous Food Delivery is one of the products created from employee ideas.

Figure 4. Sodexo's Autonomous Food Delivery

Source: Sodexo

Gamification approaches provide a substantial return on investment for the co-creation of new solutions by fostering an environment that is open, engaged, and collaborative (Ind & Coates, 2013). Gamification techniques offer a significant return on investment in the co-creation of new solutions by encouraging this practice in a transparent, interactive, and collaborative environment (Ind & Coates, 2013). Every ardent participant is, at heart, a game designer. He is cognizant of the possible modifications to the game. This topic is frequently discussed on forums and social media by players. Brendan Greene, an avid gamer, created PUBG by recreating Arma II in a manner he believed to be superior. Brandon Beck and Marc Merrill were inspired by DOTA when creating League of Legends. The mobile versions of League of Legends, Arena of Valor, and PUBG were all significant innovations in the gaming industry in 2017, and they were all developed primarily by enthusiasts as opposed to professional game designers.

The Day Z video game's PlayerUnknown's Battle Royale mode proved popular, and Sony Online Entertainment was the first to recognize this trend. Even the game's creator, Brendan Greene, was asked to serve as a consultant for H1Z1: King of the Kill. After several months of negotiations, his contract was not renewed because all relevant skills had been relocated. Soon after relocating to Bluehole in Korea, Brendan Greene rose to the position of chief game designer for the Player Unknown's Battleground (PUBG) project. PUBG and H1Z1: King of the Kill have drastically distinct levels of significance. It appears that you must do more than simply observe the other participants. The majority of research has outlined the characteristics and benefits of consumer co-creation. However, these discussions do not adequately explain why consumers interact with businesses in ways that generate value. Understanding what motivates consumers to engage in value co-creation could enable firms to manage their interactions with consumers in a manner that creates superior value for both the consumer (e.g., more relevant and high-quality products) and the firm itself (e.g. extraordinary margins). In reality, the aforementioned research does not have a comprehensive understanding of motivation and has not exhaustively examined and investigated consumer's motivation to produce user value. Some research articles discuss user motivation, but lack quantitative evaluation; consequently, the theory cannot be generalized, leaving a significant knowledge void in customer-centric innovation.

2. Conceptual Framework and Hypotheses

2.1. Expectation Confirmation Theory

In an effort to fully conceptualize and explain the consumption process, the Expectation-Confirmation Theory (ECT) has been widely applied in marketing to measure consumer satisfaction and post-purchase behavior (Oh, 1999). According to Oliver (1980), Oliver (1999), and Bhattacharjee (2001), the fundamental mechanism supporting ECT is a sequence of procedures. First, prior to actual purchase behavior, consumers create initial anticipation of a particular service/product, which can be characterized as the extent of customers' expectations about the goal and the extent of their opinions about the service provider's capabilities (Coye, 2004). Perceptions of overall performance fluctuate progressively during the consumption phase. Customers then evaluate the extent to which

their expectations were met by comparing perceived performance to their prior expectations of the service. In the subsequent phase, client satisfaction with the service is measured based on pre-purchase expectations, and the disparity between pre-purchase expectations and post-purchase service evaluations is validated. (Kristensen et al., 1999). Figure 3 depicts the fundamental constructs and structural connections of ECT.

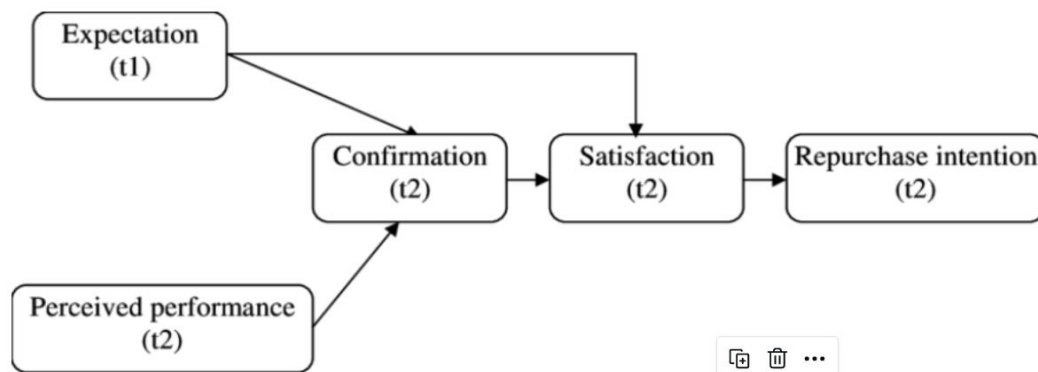

Figure 5. Expectation Confirmation Theory (ECT) sample model

2.2. Hypotheses and Research Model

For the former, Hsu and Lin (2008) defined enjoyment as the degree to which an Internet user participates in social networks because the process “yields fun and enjoyment”. In this research, perceived enjoyment can be considered as enjoying playing games while spending time with them. According to Davis et al. (1992), perceived enjoyment can be described as an intrinsic motivation, whereas expectation in ECT is an example of intrinsic motivation. Based on that, we applied ECT in the field of game. With the trend that more and more video games can be played to meet different needs of users, it is expected that the level of enjoyment after adoption will also become important in developing players' expectations with the games which haven't been experienced. Consequently, this study postulates the hypothesis:

H1: Enjoyment positively influences Expectation

Attitudes towards Ads mentioned in this study mean negative or positive feelings after viewing ads about games they have not played. Most of the ads about games are launched on the Internet. The Internet is a widely used tool for information seeking and decision-making regarding consumer goods (Darley et al., 2010, Johnson et al., 2004, Roscoe et al., 2016). Similarly, Game players can find large amounts of game information on the Internet. It can be observed that a large number of promotional strategies have been carried out by game manufacturers and distributors with the aim of impressing players and motivating them to seek out or play that game. Therefore, the relationships between Advertisement and Expectation were inferred. Based on such facts, this study hypothesizes that:

H2: Positive Attitudes toward Advertisement lead to higher Expectation

Achievement component suggested by Yee (2006) consist of: Advancement (The desire to gain power, progress rapidly, and accumulate in-game symbols of wealth or status); Mechanics (Having an interest in analyzing the underlying rules and system in order to

optimize character performance); Competition (The desire to challenge and compete with others). Achievement focuses on the motivation to behave competently or the desire to perform a task or activity well. We suggest that an individual with a high level of achievement has a higher extent of perceived performance.

H3: Achievement positively impacts on Perceived Performance

Game visuals are visual design elements built into the game to make the game more realistic, close, and attractive to players. Hicks et al (2019) show that engaging design elements improve the visual appeal of the game and contribute to player curiosity (e.g., contributing to the desire to explore the world. player's virtual reality) by adding visual interest, suggesting that the design strategy can be of tangible benefit to the player. Based on the study of Hicks et al (2019), our study hypothesizes.

H4: Game visual positively influences Perceived Performance

Social interaction was defined as App's ability to help customers stay in touch with friends and others. (Eisingerich et al .2019) Customers engage with gamified health apps to share the experience with their peers and join in conversations within their social groups, in a form of social interaction. Many gamified health apps allow customers to share their progress with friends and social groups. In this way, the apps motivate customers to perform better, to avoid any embarrassment due to failing to achieve their health objectives. Similar to our topic, as players experience social interactions, their cognitive performance improves. Hypothesis is:

H5: Social Interaction positively influences Perceived Performance

Expectation-Confirmation Theory (ECT) has been widely applied in the field of marketing to assess customer satisfaction and post-purchase behavior, in an attempt to perfect the concept and explanation of the process of customer satisfaction (Oh, 1999). According to Oliver (1980, 1999) and Bhattacharjee (2001), the basic mechanism of ECT is achieved after a sequenced process. First, before actual purchasing behavior, customers form initial expectations about a particular service/product, which can be understood as the level of customer expectations about the goal as well as their level of confidence in the service provider's capabilities (Coye, 2004). During the consumption phase, the perception of overall performance is gradually developed. The customer then evaluates the perceived performance against their prior expectations for the service to determine the extent to which these expectations are confirmed. In the next step, service satisfaction is determined through the customer's pre-purchase expectations, along with confirmation of the difference between pre-purchase expectations and post-purchase evaluation of the service (Kristensen). Et al., 1999). Applying ECT to the field of game, players firstly form an initial expectation about the game. During the period of playing, their perceptions of overall performance are gradually developed. Then, the players assess the perceived performance compared with their prior expectation about the game to identify the extent to which these expectations are confirmed. In the next step, satisfaction with the game is determined through players' confirmation of discrepancy between pre-play expectation and post-experience evaluations about the game.

H6a: Players's Expectations positively impact on their Confirmation about the gaming process.

H6b: Players's Perceived Performance positively influences their Confirmation about the gaming process.

3. Method

In terms of Quantitative research, this is a method of research that aims to quantify the data and usually makes use of statistical analysis. It is a straightforward tool or method that enables researchers to gather a significant volume of data in a brief length of time. For this method, we focus on having the Online survey which is completed online by the target audience typically by filling out a form. Surveys can be used to gather data on a variety of topics, such as individual characteristics, attitudes, past actions, and opinions. The focus of the survey may be on opinion or fact-based, depending on its goal.

➤ Method

Step 1: Define goals and related issues

We defined the Approach: Quantitative Research - Online Survey to collect a large amount of data on respondents to factors influencing game co-creation. Using the data we collect, we can look at the impact of game elements on the psychological needs of Generation Z users and how that increases player satisfaction. In addition, we wanted to find out the limitations of gamification in increasing customer satisfaction and make some recommendations for the game to improve the user experience.

Step 2: Identify target responders

With locations in Ho Chi Minh City and surrounding provinces, we primarily target Gen Z, ages 15-25. Our sample sizes range from 200 to 300. We use convenience sampling to collect data by sending it to everyone we know.

Step 3: Create a survey:

The survey form must follow standards such as brevity, directness, avoiding asking questions related to personal information first, stating each question clearly, prioritizing multiple-choice questions and a 5-likert scale. In addition, it must include key questions to achieve the research objectives.

Step 4: Analyze

We collect data from the google form and exclude answers that do not come from the target group. We then analyze the information to test the hypothesis and answer the research question. In addition, we have created tables or graphs to better demonstrate the findings and help readers better understand the issues

➤ Data collection and demographic

We survey using Google Forms. Our audience is Gen Z in Ho Chi Minh City, mostly in college, and collected nearly 390 responses. Then, we proceed to filter the answers that

do not have high confidence (such as selecting only all on one level, selecting only on 2 alternating levels, survey participants under the age of 18,...) and finally we get about 299 reliable answers. People between the ages of 18 and 22 are the main participants in this survey. They are university students who have not graduated and have a salary of less than 5,000,000 VND/month. Regarding gender, the respondents were quite similar. More details can be found in table 6.1.

Table 8. Demographic information of the respondents

Items	Detail	Frequency	Ratio (%)
Gender	Male	120	40.3
	Female	178	59.7
	Total	298	100.0
Income	From 5 to 10 million VND/month	83	27.9
	From 10 to 15 million VND/month	15	5.0
	Above 15 million VND/month	8	2.7
	Under 5 million/month	193	74.4
	Total	298	100.0
Age	18-22	281	94.3
	>22	17	5.7
	Total	298	100.0
Education	Vocational degree	5	1.7
	Undergraduate	278	93.3
	Post-graduate	7	2.3
	Working	8	2.7
	Total	298	100.0

➤ **Measurement**

Nominal scale: We collect information on gender, age, place of residence and work, income, education level of survey participants. Interval Scale: We use a 5-point Likert scale, ranging from strongly disagree to completely agree.

4. Results

4.1. Data Analysis and results

- ***Exploratory factor analysis (EFA)***

First, the study will test whether the observed variables are reliable or not, have a close relationship with each other, and can show the characteristics of the scale well. The test is carried out through Cronbach's Alpha reliability coefficient. (Hoang Trong & Chu Nguyen Mong Ngoc, 2008).

Convergent validity was assessed through the factor loadings of the indicators and average variance extracted (AVE). Individual item reliability for all factor loadings was confirmed as they were all above 0.5 and the average variance extracted values were exceeded 0.5 (Table 6.2).

The benchmark value for Cronbach's alpha that analysts typically use is 0.7. The items are sufficiently consistent at this level and above to demonstrate the measure is reliable. The summary table of Cronbach's alpha analysis results (Table 6.2) shows that internal consistency reliability was confirmed as Cronbach's alpha is greater than 0.7. Specifically, Cronbach's alpha of Enjoyment (EY) is 0.806; Attitude toward advertisement (AT) is 0.841; Achievement (AV) is 0.777, Social Interaction (SI) is 0.898; Game Visual (GV) is 0.851; Expectation (ET) is 0.855; Perceived Performance (PP) 0.838; Confirmation (CF) is 0.786; Value Co-creation Intention (VC) is 0.844. Therefore, the observed variables of the scales are kept for confirmatory factor analysis.

Table 9. Hypotheses results

Ho	Relationships	Path Coefficient	Std	t-values	P Values	Results
H1	EY → ET	0.261	0.046	5.715	0.000	Approved
H2	AT → ET	0.431	0.048	8.912	0.000	Approved
H3	AV → PP	0.267	0.064	4.160	0.000	Approved
H4	SI → PP	0.340	0.061	5.565	0.000	Approved
H5	GV → PP	0.160	0.059	2.700	0.007	Approved
H6	ET → CF	0.304	0.055	5.528	0.000	Approved
H7	PP → CF	0.413	0.061	6.828	0.000	Approved

Notes: EY: Enjoyment; AT: Attitude toward advertisement; AV: Achievement; SI: Social Interaction; GV: Game Visual; ET Expectation; PP: Perceived Performance; CF: Confirmation.

4.2. Theoretical contributions

This study contributes to enhancing the understanding of game design, value co-creation, and advances research on these connected issues by making significant theoretical additions to the user engagement literature. This study expanded Expectation-Confirmation Theory (ECT) to investigate the impact of expectations and experience on users' value co-creation intentions while playing games. Unlike most previous studies which lacked a comprehensive grasp of the motivations for user value co-creation and did not investigate any new crucial motivating stimuli through qualitative results (Hussain et al.). This study focuses on bridges this gap. The value of the co-creation endeavor appears to be in the process, rather than the outcome, which is transferred from the elements related to users' expectation and experience to the confirmation of satisfaction, then results in the value co-creation intention. This procedure was used in the gaming area to measure the level of confidence by our study. Therefore, the findings of this study specifically contributes to the theoretical values.

4.3. Practical contributions

This study's findings provide a variety of practical recommendations to assist game developers in structuring certain game qualities to increase players' expectations and experiences, thus encouraging them to value co-creation goals. The results of this study suggested that confirmation had a significant impact on the user's enjoyment of the game. In order to increase the value co-creation intention, businesses must design games that provide players with experiences that fulfill their expectations and leave them satisfied. In addition, one of the other major discoveries is that game trailers and marketing efficiently heighten consumers' anticipation before they start a game. In this sense, developers should exercise caution in this area, as players will feel duped and dissatisfied if their expectations are not met by the game's reality if the advertising is excessively appealing. The studies also revealed that players pay particular attention to social interaction aspects, which have a significant impact on their experiences. Thus, firms should create more opportunities for players to share their gaming experience with their social circle by emphasizing the design of games that stimulate interaction between players within the game or by creating gifts that motivate users to invite more friends to participate. Moreover, let's invest more in the game's graphics and engage the players by providing them with superior gaming functionality, a competitive gaming environment, adding more achievement systems (rankings, rewards, etc.) to the game, allowing users to earn points through their achievements and, based on the points collected, can reach higher levels that include tasks of increasing difficulty, so that they feel as though their capabilities are evolving. Finally, the majority of players are willing to share their thoughts, opinions, and fresh ideas to enhance the game for future players' enjoyment. Thus, businesses should collect feedback frequently and respond actively to customer suggestions.

5. Discussion and Conclusion

The study shows its findings are restricted by a number of restrictions. We currently view this investigation as exploratory because the subjects of the survey are small, mainly students from all over Ho Chi Minh city, so reliability is not really high. Furthermore, the study did not use a variety of consumer samples, such as those who participated in all forms of co-creation as well as those who did not. Future research can further explore these effects by interviewing experts and utilizing larger sample sizes (such as nationwide survey expansion) to be able to report effect size differences between contexts in greater depth. In addition, future research can concentrate on in-depth research on a game genre to better clarify satisfaction motivations and co-creation intentions.

Although this study provided an analytical view of value co-creation, we only considered perspectives from customers (players) as the beneficiary of this process and focused on resource integration along with value perception in this regard. This section should be expanded in future studies, such as by looking more closely at interaction between users and game designers.

The observational scope of the study is still limited to the aspect of consumer expectation and experience. Future research can expand on aspects derived from game manufacturers and brands to clarify co-creation intentions of players. The study also only

identified the motivation that leads to the formation of co-creative intentions. Future research could broaden our understanding of player co-creation behavior (e.g. consider the impact of intention on player co-creation).

FACTORS AFFECTING THE APPLICATION OF MANAGEMENT ACCOUNTING: AN ACTUAL SURVEY OF SMALL AND MEDIUM-SIZED ENTERPRISES IN NGHE AN PROVINCE, VIETNAM

MSc. Le Thi Huong Tram

huongtramle@gmail.com

Dr. Doan Thi Quynh Anh

quynhanhdtulsa@gmail.com

Accounting Department, University of Labour and Social Affairs, Hanoi, Vietnam

Abstract

Using four research methods namely methodology, data collection, qualitative and quantitative research, the authors have generalized the theoretical basis of accounting, management accounting, and the role of accountants. At the same time, it also summarizes the results of several domestic and foreign studies related in the application of management accounting in enterprises. Applying the theoretical basis, the scale is suitable for the economic conditions and the characteristics of Small and medium-sized enterprises (SME) in Vietnam, and the research team has built a research model consisting of four independent factors, namely the interest of Business owners for management accounting, Information technology, accounting personnel qualifications, Costs for organizing management accounting and dependent factors are management accounting applications. Based on the research model, the research team built a questionnaire and conducted a practical survey of SME in Nghe An province. With 154 valid questionnaires, the results of the reliability analysis of the scale, exploratory factor analysis, and multivariable regression using SPSS software have shown that all 4 independent factors have a positive influence on the application management accounting in SME in Nghe An province. At the same time, the results also show the strong and weak influence of each factor. Accordingly, the strongest influence is the qualification factor of accounting staff, and the weakest effect is the factor of Information Technology. Through the influence of each factor, the research team also makes some recommendations to promote the application of management accounting in small and medium-sized enterprises in Nghe An province, such as accountants have time to study and learn about management accounting; business owners need to focus on improving their management skills as well as their knowledge of management accounting; select and apply management accounting models suitable to the enterprise's costs; application of information technology in accounting work, especially management accounting.

Keywords: *Management accounting, Nghe An, Impact factors, SME, Vietnam*

1. Introduction

Management accounting has the function of collecting, processing, analyzing, providing information as required, and helping managers have a basis for planning, operating, organizing the implementation of plans, and making decisions more precise in

production and business activities. Management accounting is especially important in the process of operating a business, and the information provided by management accounting includes financial and non-financial information, meeting the requirements of both managers and departments other in the business. Necessary and brings many benefits, but currently many businesses have not applied management accounting, especially SME. The reason these businesses have not applied management accounting must be mentioned such as the business owner's understanding of management accounting, the cost of applying management accounting, or the level of personnel working as accountants at the enterprise not yet meet the position of management accountant ... Not applying management accounting causes many difficulties and reduces the competitiveness of enterprises. The consequences of this problem lead to many SME making inappropriate business and production decisions, causing losses or even bankruptcy. Therefore, it is necessary to study the factors affecting the application of management accounting in SME in the province of Nghe An and currently, there is no research on this content perform.

2. Literature review

2.1. Some concepts

Accountant

According to the Accounting Law (2015), Accounting is the collection, processing, examination, analysis, and provision of economic and financial information in the form of value, in kind, and labor time [4].

Management Accounting

According to the Law on Accounting (2015), management accounting is the collection, processing, analysis, and provision of economic and financial information according to management requirements and economic and financial decisions within an organization's accountant [4].

The role of management accountants for businesses

In enterprises, management accounting has the role of providing information to support the decision-making of managers. Decision-making is done through four steps as follows:

Planning and Budgeting: Planning is setting goals that must be achieved and outlining the steps to achieve them. Reasonable and well-founded accounting information will be the decisive factor for effective and highly feasible plans and estimates.

Organization for implementation: To achieve the plan effectively, Business owners must know how to link the elements between the organization, people, and resources together, and there is also a great need for information accounting information. Therefore, the information provided by management accounting helps business owners to make the right decisions in the processing of operations, in line with the goal of the business.

Testing and evaluation: The method commonly used in testing and evaluation is to compare the planned or estimated data with the implementation data, thereby identifying the deviations between the achieved results and the set goals.

Decision-making: Decision-making is combination of the three functions of planning, organizing, implementing, controlling, and evaluating. For the most part, in small and medium-sized enterprises, the information provided by management accountants is used to serve short-term decision-making functions such as production coordination, optimal distribution of goods, purchase and sale, pricing, and termination manufacturing goods ... Management accountants will perform professional analysis and select necessary and appropriate information, then synthesize and present them in the most understandable order to help business owners appropriate choices and decision-making.

Small and medium-sized enterprises

The criteria for identifying small and medium-sized enterprises are specified in Article 4 of the Law on Supporting Small and medium-sized enterprises in 2017, as follows:

“1. Small and medium-sized enterprises include micro enterprises, small enterprises, and medium enterprises, having an average number of employees participating in social insurance not exceeding 200 people per year and meeting one of the following two criteria:

- a) Total capital must not exceed 100 billion VND;
- b) Total revenue of the preceding year is not more than 300 billion VND.

c) Micro enterprises, small enterprises, and medium-sized enterprises are defined according to the fields of agriculture, forestry, and fishery; Industry and construction; trade and services” [5].

2.2. Some related studies

Table 1. Literature review of some related studies

The name of the construction	Author	Research results
Some factors affecting the application of management accounting in enterprises	Tuan, T. A	The author identifies eight factors affecting the application of management accounting in enterprises: Competitive pressure; Decentralization; Enterprise size; Proportion of ownership by professional members; Information technology; Production technology; Business owners' interest in management accounting; Management accounting staff qualifications [8].
Factors affecting the application of management accounting in manufacturing enterprises in Ho Chi Minh City	Nga, H.T., & Thao, L.N.N	The research results show managers' awareness of management accounting, information technology, qualifications of accounting staff, costs for organizing the management accounting system, decentralization, level of competition, etc. Market competition has a positive impact on the application of management accounting in manufacturing enterprises in Ho Chi Minh City [7].

The name of the construction	Author	Research results
Factors associated with the adoption and use of management accounting techniques in developing countries: The case of Romania	Albu, N., & Albu, C. N	The authors have pointed out the business environment, business lines, business size, organizational factors, capital sources, stock listing, competition, tax relations, training, and capacity of management accountants. Values are the factors affecting the application of management accounting in enterprises [10].
An empirical investigation of the adoption status of the new management accounting techniques among kenyan manufacturing companies	Patrick Idode	The research results show that the factors affecting the application of modern management accounting are the interest of managers; Accounting personnel qualifications; Enterprise size. The study also shows that these three factors have a positive impact on the application of management accounting in enterprises [6].
The impact of structure, environment, and interdependence on the perceived usefulness of management accounting systems	Chenhall, R. H., & Morris, D	In this study, the factors affecting the application of management accounting in enterprises have been pointed out, including competitive pressure, decentralization, information technology application, management accounting level, and level of management accounting the interest of managers, and the qualifications of the accounting team [2].
Factors influencing the alignment of accounting information systems in small and mediumsized Malaysian manufacturing firms	Ismail, N. A., & King, M	Research has shown that the independent variables in the study are firm size, information technology level, managers' understanding of accounting and information technology, advice of government agencies and audit firms, and the existence of internal IT staff [11].

Source: Results of data analysis of the research team

2.3. Research model

Based on relevant research, based on the actual situation for SME in Vietnam and Nghe An province, the research team identified four independent factors to include in the research model: The interest of business owners in management accounting, Information technology, the qualification of accounting personnel, and the cost of organizing management accounting. The dependent variable on the study is the application of management accounting in SME in Nghe An province. The content of each variable and their research hypotheses have presented below:

Business owners' interest in management accounting

Business owners are people who directly use management accounting information to make decisions, so the need to use the information of business owners has an important influence on the application of management accounting in enterprises. In addition to information needs, the support of business owners in accessing new management accounting techniques and applying them to their businesses is also a positive factor affecting the application of management accounting in enterprises. Research results by Tuan, T.A (2018), Albu, N., & Albu, C. N. (2012), Patrick Idode (2019), Chenhall, R. H., & Morris (1986), DIsmail, N. A., & King, M (2007) shows that the interest of business owners has a significant influence on the level of management accounting application in enterprises.

Hypothesis H1: The interest of business owners in management accounting is assessed to increase or decrease, the application of management accounting in SME in Nghe An province, Vietnam increases or decreases.

Information technology

In the era of Industry 4.0, information technology has a strong influence, and impact on all aspects of social life. The impact's of information technology on Management Accounting is no exception. Russian Studies, H.T - Thao, L.N.N (2022), Albu, N., & Albu, C. N. (2012), Patrick Idode (2019), Chenhall, R. H., & Morris (1986), DIsmail, N. A., & King, M (2007) shows that information technology has a strong influence on the management accounting system and the application of management accounting in enterprises. The application of information technology and computers in management accounting makes the information provided more timely, relevant, and useful (Abdel-Kader, 2006) [1].

Hypothesis H2: Information technology has been assessed to increase or decrease, the application of management accounting in SME in Nghe An province, Vietnam increases or decreases respectively.

Accounting personnel qualification

Accountants at the enterprise must regularly update new knowledge and techniques, apply them to design the system, and build and implement an appropriate cost accounting system to support the business owners in future decision-making (Chenhall, R. H., & Morris, 1986). In addition, the study (Kaplan, 1995) also identified the relationship between the level of accountants and the change in the management accounting system. In this independent variable, the research team wants to investigate the knowledge of management accounting for accountants in SME. Therefore, hypothesis H3 has stated as follows.

Hypothesis H3: If the level of accounting personnel has been assessed to increase or decrease, the application of management accounting in SME in Nghe An province, Vietnam increases or decreases respectively.

Costs for the application of Management Accounting

Management accounting applications require businesses to spend part of the costs on personnel and technology. Therefore, if the enterprise is small in scale, doing business or producing in small quantities, the application of management accounting is not necessary

and may cause a waste of resources and increase the operating costs of the business. In contrast, for enterprises with large production and business scale, the application of management accounting can increase the efficiency of capital and labor ... With the same point of view, author Giang, N.V.T (2017), Russia, H.T - Thao, L.N.N (2022), businesses know that the benefits from the application of management accounting are great, but because the financial potential is always limited, the investment costs for the application of accounting management will also decide whether the entity accepts the application of management accounting or not [3].

Hypothesis H4: The cost for the application of management accounting is estimated to increase or decrease, the application of management accounting in SME in Nghe An province, Vietnam increases or decreases respectively.

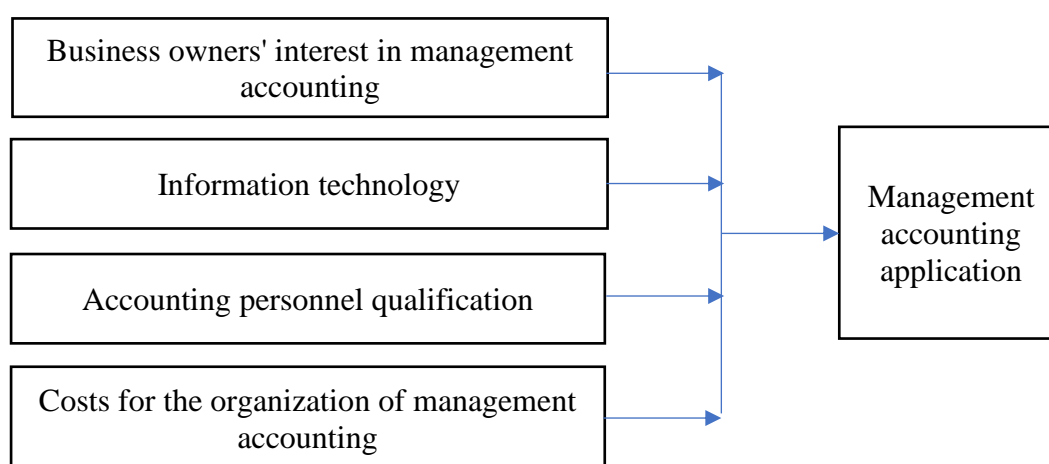

Figure 1. Research model of factors affecting the application of management accounting

Source: Results of data analysis of the research team

3. Method

Methodology: The research team used accounting theory, management accounting, and the role of management accounting as the basis and foundation for the research content Factors affecting the application of management accounting in SME in Nghe An province.

Data collection method: Data collection method is a method of finding and synthesizing information, knowledge, and theories from available sources, thereby building theories and proving and synthesizing to form a data thesis. Through the studies related to this article, the research team has synthesized the research results and the scale used by these authors. At the same time, based on the appropriateness and different economic characteristics, the research team applied a few independent factors and built hypotheses in this study.

Qualitative research methods: From the factors applied by the research team, to consider the suitability, the research team conducted in-depth interviews with experts in the accounting industry, especially those with in-depth knowledge of management accounting. The research team also built and coded the observed variables in the scale. Conduct mock interviews and adjust the questionnaires accordingly.

Quantitative research methods: From the survey table that has been adjusted through qualitative research methods, the research team selects a sample and determines an appropriate sample size. Through face-to-face interviews with respondents, the research team collects and processes data. The data has been processed as a basis for evaluating the quality of the scale, analyzing the factors to discover EFA, and testing the regression model to determine the degree of influence of the factors on the accounting application management are SME in Nghe An province, Vietnam.

Table 2. Scale after adjustment

The scale	Symbols and contents of observed variables
Business owners' interest in management accounting (BIM)	BIM1. Business leaders make necessary and appropriate changes to improve business performance
	BIM2. Business owners appreciate the benefits of Management Accounting
	BIM3. Business owners with knowledge of Management Accounting
	BIM4. Business owners intend to apply Management Accounting
Information technology (IT)	IT1. Enterprises apply advanced production technology
	IT2. Does your business use accounting software?
	IT3. Enterprises apply total quality management in operations
Accounting personnel qualification (APQ)	APQ1. Enterprises recruit accounting personnel in the right profession
	APQ2. Accountants have a good understanding of management accounting
	APQ3. Corporate accountants capable of handling management accounting
Costs for the organization of management accounting (COM)	COM1. Enterprises focus on investing in accounting activities
	COM2. Enterprises always prioritize funding to deploy management accounting
	COM3. Do you think that the budget for accounting activities ensures the application of management accounting in enterprises?
Management accounting application (MAA)	MAA1. Business leaders always consider and apply governance models that are more suitable for businesses
	MAA2. Enterprises using Management Accounting can achieve higher performance for businesses
	MAA3. Planning to develop and supply products of the enterprise by the application of management accounting

Source: Construction of the research team

4. Results

The results of the analysis of the average scores of 16 observed variables were highly appreciate by survey participants from level 3 to level 4. The lowest average score belonging to survey variable IT3 was 3.36, and the highest was rated as the BIM1 variable with an average score of 4.08. In particular, the dependent variable is rated at near level 4,

which shows that the ability to apply management accounting in SME is highly appreciated by the surveyors.

Cronbach's Alpha reliability coefficient according to Trong, H, & Ngoc, C.N.M. (2008), "The requirement for Cronbach's Alpha coefficient must be greater than 0.6 but preferably 0.7 [9]". The research team has performed the analysis of the reliability coefficient for each scale in turn. The analysis results show that the Cronbach's alpha of the whole scale is greater than 0.7, the scales are good and ensure reliability for research and future analysis. In particular, the reliability coefficients of the BIM scale are still above 0.9, and the lowest is 0.858 belonging to the COM independent variable scale. The smallest total correlation of the components of the scales ensures that the level >0.5 is suitable for the research purpose and novelty of the research. Specifically, the smallest total correlation belonging to the observed variable COM3 is 0.621, and the largest is the observed variable APQ2 = 0.824. Data on Cronbach's alpha coefficient if the variable type (the largest) is smaller than the reliability coefficient and satisfies both conditions for keeping the observed variable for the following analyses. Therefore, it can be concluded that: the scale used in the study is appropriate and reliable and can be used to conduct factor analysis and further research steps.

EFA exploratory factor analysis aims to evaluate two important types of values of the scale: convergent value and discriminant value. Theo Trong, H, & Ngoc, C.N.M. (2008), The condition for exploratory factor analysis is to satisfy the following requirements: Factor loading > 0.5 , $0.5 \leq KMO \leq 1$: KMO coefficient (Kaiser-Meyer-Olkin) is the index used to consider the appropriateness of factor analysis. A large KMO value is appropriate for factor analysis. Percentage of variance $> 50\%$: Shows the percentage variation of observed variables [9]. From the results of exploratory factor analysis for all components of the scale of independent and dependent variables, we see that the total variance extracted is $80.314\% > 50\%$, and the KMO index is 0.756, in addition, sig also gives the same results. The result is $0.000 < 0.05$ which warrants our analysis. All scales converge to only one common factor, with all factor weights being 0.5. The results of the factor rotation matrix converging on four factors with the scale and observed variables are kept the same as the original construction of the research team.

To evaluate the relationship and impact direction of the components Business owner's interest in management accounting, Information technology, qualification of accounting personnel, and Cost for organizing management accounting. This study used the regression analysis method with the support of SPSS 22 software. In the regression equation to be performed, it is a multivariate regression equation, to determine the important role of each component in assessing the relationship between the application of management accounting and the group of independent factors mentioned above.

Multivariable regression equation shows the relationship between Management accounting applications and the interest of business owners in management accounting, Information technology, Qualification of accounting personnel, and Cost of organization. Management accounting has the following form:

$$MAA = a_0 + a_1BIM + a_2IT + a_3APQ + a_4COM$$

In there:

MAA: Dependent variable showing the predictive value of management accounting application in SME in Nghe An province, Vietnam

a_0, a_1, a_2, a_3, a_4 : Are regression coefficients

BIM, IT, APQ, COM: Are the independent variables in the order: component Business owner's interest in management accounting, Information technology, Qualification of accounting personnel, Cost of organization management accounting.

The results of the linear regression analysis are as follows:

We see that adjusted R square (Adjusted R square) = 0.557 (>0.5) indicates that the four components BIM, IT, APQ, and COM have an influence on the application of management accounting in SME in the region of Nghe An province, Vietnam. Looking at the results of the regression analysis, we see that the preconditions for the regression analysis are satisfied. The fit of the model is relatively high. Thus, we can consider the results of the regression analysis to be reliable. However, this fit is only true for the sample data. To test whether the model can be inferred for the real population, we must test the model's goodness of fit:

The results of the ANOVA test show that the F-test value is 49.138 at the significance level $\text{sig} = 0.000 < \alpha = 0.1$. Thus, we accept the hypothesis that the four components of the independent variables BIM, IT, APQ, COM, and the dependent variable MAA have a relationship each other. Therefore, the model fits the data set and can generalize to the population. Checking the Tolerance coefficient or VIF (variance inflation factor) showed no sign of multicollinearity.

Table 3. Linear regression results
Model Summary^b

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	0.754 ^a	0.569	0.557	0.60430	0.569	49.138	4	149	0.000

a. Predictors: (Constant), COM, APQ, IT, BIM

b. Dependent Variable: MAA

Source: Compiled and analyzed survey data of the research team

The regression results show that the regression coefficients of the factors BIM, IT, APQ, and COM all have positive signs and $R = 0.754^a > 0$, showing that these components have a proportional effect on the factor MAA dependent factor. Thus, the hypothesis of the research model is accepted. Components Business owners' interest in management accounting, Information technology, qualification of accounting personnel, and Cost for the organization of management accounting has a positive relationship with accounting application management in SME in Nghe An province, Vietnam.

**Table 4. Results of multivariable regression model
Coefficients^a**

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-.585	.361		-1.621	.107
	BIM	.347	.063	.326	5.534	.000
	IT	.151	.045	.188	3.360	.001
	APQ	.390	.051	.451	7.714	.000
	COM	.274	.059	.253	4.642	.000

a. Dependent Variable: MAA

Source: Compiled and analyzed survey data of the research team

The results of the regression table allow us to test the regression coefficients in the model. Components with a statistical significance of less than 5% are kept, and components with a statistical significance greater than 5% are discarded. The larger the beta coefficient of a component, the more important it is, showing the degree of influence on the dependent variable from the table of regression analysis results above, we can see that the constant is not statistically significant because the sig of constant = 0.107 > 0.05, so the constant is eliminated in the regression equation we mentioned above. The remaining four factors BIM, IT, APQ, and COM are all suitable and have the same influence on MAA. So the regression equation for the standardized coefficients Beta is as follows:

$$MAA = 0.451APQ + 0.326BIM + 0.253COM + 0.188IT$$

From the above regression equation, we can make the following table:

Table 5. Influence of factors according to coefficient Beta

Factors	Beta coefficient	Evaluate
APQ	0.451	Other factors remained constant, when the accounting personnel qualification increased (decreased) by 1 point, the application of management accounting in SME in Nghe An province increased (decreased) by 0.451 points.
BIM	0.326	Other factors were unchanged when Business owners' interest in management accounting increased (decreased) by 1 point, and the application of management accounting in SME in Nghe An province increased (decreased) by 0.326 points.
COM	0.253	Other factors unchanged, when Costs for the organization of management accounting increased (decreased) by 1 point, the application of management accounting in SME in Nghe An province increased (decreased) by 0.253 points.
IT	0.188	Other factors remaining constant, when Information technology increased (decreased) by 1 point, the application of management accounting in SME in Nghe An province increased (decreased) by 0.188 points.

Source: Construction Research Team

5. Discussion and Conclusion

Research results have determined the degree of influence of each independent factor BIM, IT, APQ, and COM on the dependent factor MAA. Specifically, all the independent factors have the same influence as the dependent factor. The biggest influence is the APQ component with a Beta coefficient of 0.451 ($t=7.714$ and $\text{Sig} < 0.05$), followed by the BIM component with a Beta coefficient of 0.326 ($t=5,534$ and $\text{Sig} < 0.05$) second major direction. Third is the COM component with a Beta coefficient of 0.253 ($t=4.642$ and $\text{Sig} < 0.05$). Finally, the IT component with a Beta coefficient of 0.188 ($t=3,360$ and $\text{Sig} < 0.05$) is also the component that has the lowest influence on the survey participants' MAA.

From the results of this study, the authors also propose some recommendations to facilitate the application of management accounting in small and medium-sized enterprises as follows:

First, create conditions for accounting personnel to have time to study and learn about management accounting. The research results also show that the level of accounting staff has the greatest influence on the application of management accounting in enterprises. Therefore, business owners need to build a team of financial accounting and management accountants who not only have professional expertise but also understand the production and business activities of the business. business, thereby making accurate analyses and assessments based on collected data.

Second, business owners need to focus on improving their management skills as well as their knowledge of management accounting. Once business owners understand and are aware of the benefits that the application of Management Accounting brings to the business, they will actively invest as well as encourage, motivate, or direct their employees in the implementation process. Apply management accounting in enterprises.

Third, businesses need to base on their financial ability to choose to apply cost-effective management accounting models such as combining management accounting with financial accounting, using compact software but the information provided is suitable for the needs of use, taking advantage of a part of the data source, information from financial accounting that serves the management accountant based on ensuring the relationship of benefits and costs.

Fourth, enterprises need to organize the application of information technology in accounting work, especially management accounting, to improve the quality of information to serve the requirements of business management and administration decision-making.

INTERNATIONAL FINANCIAL REPORTING STANDARDS 17 - INSURANCE CONTRACT AND ISSUES WITH VIETNAM INSURANCE ENTERPRISES

M.Acc. Nguyen Thi Thao Anh
anhntt019@hvn.edu.vn
Banking Academy, Hanoi, Vietnam

Abstract

Accounting for Insurance company has proved a challenging topic for many years for standard setters, preparers and users. Currently, there is only one standard International Financial Reporting Standards (IFRS) 04 make regulations for insurance companies, but it is quite simple and depends heavily on the national accounting standard system. Thus, accounting information comparison between foreign enterprises has lots of differences and difficulties. Therefore, the urgent requirement is to build a comprehensive standard system covering all transactions and applying uniformly to all countries. In that context, International Financial Reporting Standards 17 - insurance contracts have born, which is a globally standardized accounting model for insurance contracts, overcoming all limitations of IFRS 04 and is expected to take effect in Vietnam in 2025. Within the scope of this article, an overview of the new features and requirements of IFRS 04 would be provided before analyzing the differences between IFRS 04 and IFRS 17. Finally, the article presented challenges and difficulties for Vietnamese insurance companies when applying these IFRSs, from that settled out key issues and implications.

Keywords: *insurance contract, insurance enterprises, IFRS 17, insurers*

1. Introduction

IFRS is an international financial reporting standard system, with the goal of building a legal framework that applies to all businesses in the world. Therefore, recognizing the urgent need for improved policy disclosure and some improvements to measurement and recording practices related to insurance policies, and for insurers across Europe to and elsewhere promptly adopted IFRS in 2005, the International Accounting Standards Board (IASB) issued IFRS 04 in March 2004 and entered into force on January 1, 2005. This Standard is considered the first guide of IASB to insurance policy accounting. Because IFRS 4 was compiled in a rather short time frame, just before the adoption of the IFRS Standards by the European Union, IFRS 04 was primarily geared towards minimal rather than maximal harmonization. Under IFRS 4, companies can therefore continue to use national standards when accounting for insurance policies. This makes comparisons extremely difficult, which is not really beneficial for investors as well as business administrators.

It can be seen clearly that IFRS 04 can be considered as an interim standard under the urgent need to have a standard that governing insurance transactions. That is the reason why

right from the setting up of standards, IASB has cherished to build a different accounting system for insurance enterprises, which is more comprehensive, clearer, more detailed and ready to replace and overcome any problems as well as limitations of IFRS 04. Therefore, IFRS 17 - is the comprehensive accounting standard that IASB has cherished, it was born with the aim of creating a unified accounting framework that ensures insurance companies worldwide apply it to all insurance policies, regardless of product.

2. Background: standard history and the need of IFRS 17

Figure 1. Formation process of IFRS 17

According to the IASB, the International Financial Reporting Standards System for the insurance sector was drafted in 1997. However, due to insufficient time to complete this project before the mandatory date of IFRS adoption - 2005, the IASB divided the project into 2 phases:

- Phase 1 - finalization of IFRS 04 in 2004 (the standard is considered to be provisional for insurers, but it is too dependent on national standards of the country);
- Phase 2 - finalizing IFRS 17 in 2017 to replace IFRS 04 (overcoming all limitations of IFRS 04, building a new, more detailed, more comprehensive regulatory system that applies to all countries)

It can be seen that IFRS 04 was issued in 2004 but in the process of application, insurers have difficulty in comparing information and synchronization among insurers from different countries. The reason is because IFRS is dependent on national accounting standards - GAAP, and each country has its own and different characteristics, which has led to great differences in the accounting systems of countries around the world.

Therefore, the completion and issuance of IFRS 17 is urgent to overcome the gaps left by IFR04, to limit errors when assessing the impact of insurance policies on the financial situation and financial performance and the entity's cash flows to users of financial statement information. Based on the efforts of IASB experts in developing standards, IFRS 17 (issued in 2017) was revised on June 25, 2020 and expected to take effect from 2023. This Standard consists of 17 international financial reporting standards, which specifies a number of material points, changes the classification requirements of insurance contract based on expected profit over the entire policy life; additional requirements for some new professional backup components; requires the assessment of the provisioning interest rate based on long-term economic forecasts, and in the application of this standard, premiums collected will not be recognized as revenue under the previous accounting method.

The new standard was pointed out new accounting principles that are more superior than that of IFRS 04. Below is a comparison table of outstanding differences between IFRS 17 and IFRS 04 to see the changes and advantages when applying this new standard.

The notable differences between IFRS 17 and IFRS 04

Criteria	IFRS 17	IFRS 04
Measurement	IFRS 17 provides a uniform accounting framework for all types of insurance policies. This standard provides three evaluation models: the general model, the premium allocation approach and the variable fee approach.	IFRS 04 requires insurance companies to disclose information about insurance contracts, but does not specify the method of evaluating insurance contracts, and allows the application of accounting principles of each country's insurance policies to evaluate insurance contracts issued by insurers. As a result, investors and analysts would face many difficulties in analyzing which groups of insurance products are profitable, which groups are losing, as well as the trend of information about insurance policies.
Comparability of information	IFRS 17 builds a synchronous system to record information about insurance companies, so it is easy to compare and contrast accounting information between firms from different countries.	IFRS 04 mainly allows insurers to apply national accounting principles, so the diversity of accounting systems in countries around the world creates a difficult barrier in accounting information comparison among foreign insurers.
Estimates and assumptions	Insurers are required to use the most up-to-date estimates and assumptions when evaluating insurance policies to represent the time value of cash flows and the uncertainties associated with that policy. It is this requirement of IFRS 17 that will help provide more transparent information about the financial situation as well as the risks of insurers.	Estimates and assumptions when evaluating IFRS 04 insurance policies do not require updating.

Criteria	IFRS 17	IFRS 04
Revenue recognition	IFRS 17 requires insurers to only recognize interest at the time of providing insurance services, not at the time of receiving premiums as it is now. Insurers must also provide information regarding interest from insurance contracts expected to be recognized in the future. This information will be used as a measure to assess the business situation of the insurer over time.	IFRS 04 allows businesses to recognize interest at the time of premium receipt, or contract initiation.
Discount rate	The discount rate of an insurance contract is based on the cash flows of the policies	The discount rate of the insurance contract is based on the amount the investment.

Source: Author's own compilation

With the highlights of the level of detail and coverage in the requirements of insurance policies, IFRS 17 is expected to help the insurance accounting information system become transparent and clear, and at the same time it governs the business activities of insurance enterprises. With the goal of improving transparency and comprehensiveness in reflecting the business performance of each insurance policy to the overall profit of the business, in fact, This standard application is considered to be quite complicated and difficult as well as creates lots of challenges for insurers in the world. Therefore, although the IFRS was issued in 2017, is expected to take effect from January 1, 2021, but up to now, the IASB has delayed and has not officially announced the effective time. Experts had expected it could be 2023.

In addition, the transition from applying national accounting standards to IFRS requires comprehensive preparation because of the complexity of the standard. It requires changes not only in accounting books but also in accounting standards, insurance policy management, business orientation and economic decision-making. Therefore, one of the reasons why IFRS 17 has not taken effect is because insurers in the world are not really ready and have the best preparation for the application.

Table 1. Readiness to adopt IFRS 17 in the Asia-Pacific region in 2021 and 2022

Source: PwC survey

According to the survey results "Assessment of the roadmap to apply IFRS 17 in 2020 and 2021: Asia-Pacific region" by PwC, the percentage of enterprises participating in the survey answered that they were "mostly confident" in the coming time. The likelihood of full adoption of IFRS 17 on the benchmark's effective date has decreased from 41% in 2020 to 35% in 2021, while the "very confident" level has remained at 32%. In addition, 70% of enterprises expressed concern about practical difficulties in implementing IFRS 17, although more than half of them have already entered the detailed design stage. Hence, the implementation of IFRS 17 remains a major challenge for many insurers. Insurance business operators expect it to take an average of 3.8 years to complete the end-to-end implementation of IFRS 17.

In Vietnam, on February 28, 2019, the Prime Minister issued Decision 242/QĐ-TTg approving the Scheme on restructuring the securities market and insurance market until 2020 and orientation to 2025, which sets out the task of developing and implementing the project of applying international accounting standards in Vietnam. On May 23, 2018, the Ministry of Finance issued Decision No. 918/QĐ-BTC on the establishment of a Drafting Committee for the application of IFRS. According to the draft scheme, insurance companies can be subject to the trial application in sync with the time of applying IFRS 17 on a global scale.

Compared to the roadmap that the world insurance groups have to apply, the Vietnamese market has a lag of about 3 years. Thus, according to the MOF roadmap, Vietnam's insurers are expected to apply IFRS 17 to replace the current VAS standards by 2025, which is 2-3 years behind the world.

3. Results

3.1. Opportunity for Vietnamese insurers when applying IFRS 17

Creating global consistency

IFRS 17 stipulates a uniform accounting method for all insurance policies, increasing the comparability of information of insurance policies between insurers in different countries, between insurance contracts. insurance with each other and between businesses in different fields. Therefore, this standard helps to provide more transparent and useful information about insurance obligations and current and future profit and loss situation of insurers.

In addition, this standard will help provide users of accounting information, especially investors, with insight into insurance companies, allowing them to compare one company with another one by one. more consistent way. This improves investors' confidence and understanding of insurance companies in making investment decisions.

Increasing financial statements' comparability and transparency

In Vietnam, some insurance companies have designed their products to maximize initial profits. For products where the premium is paid in one year, the business will make large profits in the first year and then small losses thereafter. However, IFRS 17 does not allow the full recognition of revenue for the first year, but requires measuring profit in accordance with services performed and allocating that profit over the life of the contract into one series of smaller cash flows - providing more insight into how profits are formed. The Standard also excludes deposit insurance from revenue calculations, which would particularly affect the accounting of poorly concealed savings policies - and again, help better reflect reality.

Improving the management accounting in insurance companies

In terms of how insurance policies are managed, IFRS 17 requires the classification of insurance policies into homogeneous portfolio groups based on characteristics, type, risk or level of return. Therefore, with this requirement, enterprises need to take steps to evaluate the characteristics of the list of insurance contracts, select accounting policies to classify contracts and suitable models. Not only that, businesses also need to estimate the profitability of the contract right from the time of signing. It is the detailed requirements of IFRS 17 that will help insurance businesses build and improve their management accounting systems instead of focusing mostly on the financial accounting system like today's businesses.

3.2. Challenges for Vietnamese insurers when applying IFRS 17

The adoption of IFRS 17 worldwide will bring uniformity, standardization and financial reporting to insurance companies. This allows the users of the financial statements to compare the statements of different insurance companies from different countries. However, because of the complexity of the standard, the application of IFRS 17 also has the following challenges as following:

Firstly, the complexity of the standard. IFRS 17 lays out a lot of complicated rules about estimates, judgments and assessments based on information and specific situation of each insurer. Therefore, IFRS 17 requires very detailed information, complicated calculations, and must be regularly updated over time. Therefore, in order to apply this standard, insurers need to have the synchronous coordination of all departments in the enterprise, not only the finance and accounting departments. This requires businesses to have a long-term plan and the right direction from the business leadership.

In addition, the performance indicators will also change significantly depending on the conversion method and accounting policy when applying IFRS 17. Accordingly, this change will not only directly affect the way to manage business activities of the enterprise but also affect the determination of business plans and results.

Secondly, currently, the information technology infrastructure of Vietnamese insurers is not strong enough to collect, store and retrieve data according to the specifications and quantity required by the standards. In addition, IFRS 17 offers 3 evaluation models suitable for insurance, so besides storage requirements, the IT system must also ensure input data processing.

At the same time, to be able to apply IFRS 17, it requires relatively high quality of human resources, especially experienced accounting, actuarial and information technology experts. Therefore, enterprises also have to spend a lot of money to recruit and train employees with appropriate skills for the application of standards. These changes will require a lot of time, effort and financial investment from the insurer.

Thirdly, the negative impact on financial statements due to the adoption of IFRS 17 in the first year. The difference in insurance policy recognition between VAS 19 and IFRS 17 will lead to a situation where the profit of the enterprise is lost. a sharp decline compared to previous years, or create losses incurred by enterprises. This will be detrimental to insurers that are in the process of attracting investment capital.

4. Discussion and Conclusion

4.1. Solutions for Vietnamese insurers to apply IFRS 17

Improving the manager's awareness

Because IFRS 17 requires a large amount of data for evaluation and estimation coming from many different departments and agencies, therefore, insurers must conduct research and reform enterprises to get consensus. between stakeholders in the implementation of this project because this project needs a lot of resources from different departments: finance and accounting department, sales department, planning department, IT department... Therefore, It is necessary to have the right awareness from business administrators to be able to lead the reformed enterprises in the right direction and in accordance with the requirements of IFRS 17.

Changing in insurance management policies according to IFRS 17

Vietnamese insurers need to carefully study IFRS 17 to reclassify the management of insurance policies into homogeneous portfolio groups based on characteristics, types, risks or profitability as required by IFRS 17. At the same time, enterprises need to take steps to evaluate the characteristics of the list of insurance policies, select accounting policies to classify contracts and suitable models, to ensure quick information collection to compute as well as retrospectively the past comparative information.

Improving information technology infrastructure

Vietnam insurance enterprises need to look at the database and information technology system infrastructure that the company has to know where the current position is, and to what extent the system's ability to meet it. From there, proactively plan to upgrade technology infrastructure, insurance management systems and software, and automate document rotation processes. In order to shorten the research time, Vietnamese insurers can choose to attract foreign information technology partners to learn and promote technology transfer.

Investing in company's human resources

In addition to raising awareness about IFRS 17 among internal employees of the enterprise in the form of organizing exchange seminars in the insurance field, participating in domestic and foreign training courses, combining researching with training institutions such as universities, research institutes, etc. VN insurance enterprises need support from experts who act as advisors for the process of applying IFRS 17 to enterprises, especially experts. from countries that have experience in applying IFRS 17.

Limiting negative effects on financial statements

At the time of adoption, Vietnamese insurers need to evaluate and estimate the overall impact of IFRS 17 on their operations, and study and choose appropriate policies to minimize negative impacts. In addition, with the effects of policy changes, enterprises need to clearly explain and notify shareholders and related parties.

4.2. Conclusion

Financial Reporting Standard on Insurance Contracts (IFRS17) is an international financial reporting standard dedicated to insurance companies that guides the recognition of revenue and expenses, and the preparation of reports according to the following principles: new rule. IFRS17 is not only a matter of accounting, recognizing or presenting financial statements, but it deeply and comprehensively affects the insurance business. Faced with the complicated requirements of the standards as well as the urgency to change and use a new set of international accounting standards, especially for the insurance sector, it requires the efforts of insurance enterprises. as well as support from the Government and state agencies.

National Economics University, Hanoi, Vietnam*

Abstract

The study analyzes and evaluates the factors affecting the Vietnamese people's Korean cosmetic consumption behavior by utilizing linear structural equation modeling (SEM), incorporating confirmatory factor analysis (CFA) and exploratory factor analysis (EFA). Data was collected through a survey targeting Vietnamese consumers who have experience using Korean cosmetics. The SEM analysis confirmed the proposed research model's fit, showing significant influences of attitude, subjective norms, perceived behavioral control, product innovation, brand image, and perceived quality on consumers' behavioral intentions. These findings provide valuable insights for marketers and practitioners in developing effective marketing strategies in the Korean cosmetics industry.

Keywords: *consumer behavior, Korean cosmetics, behavioral intentions.*

1. Introduction

Nowadays, as society develops and people's lives are increasingly enhanced, the importance of physical appearance is being given more attention. To meet the growing demands of individuals, the cosmetics industry is thriving more than ever. Schneider et al. (2001) stated that Greece and Egypt were the first countries to use cosmetics. The main consumers of the cosmetics industry are young girls (Anderson, 2014). According to The Statistics Portal (2019), the global cosmetics industry grew at a rate of 5.5% in 2018. In addition to the global development of the cosmetics industry, the cosmetics industry in Vietnam is currently experiencing rapid growth. According to the Insight Handbook 2021 report by Kantar Worldpanel, the largest segment of the cosmetics market in Vietnam is lipstick. The boom of e-commerce platforms has influenced Vietnamese shopping habits. In particular, personal care product statistics increased by 63% in 2019 compared to 2018, skincare products increased by 55%, and makeup products increased by 25%.

According to data collected by Kantar Worldpanel, a multinational company specializing in global consumer shopping behavior research, South Korea is the leading country in cosmetics imports, accounting for nearly 1/3 of the import value and holding the number one position as the country with the highest cosmetics imports into Vietnam in 2018, mainly focusing on makeup and beauty mask products. In 2020, Vietnam imported approximately 60 million USD worth of cosmetics from South Korea. The beauty products from South Korea, also known as K-beauty, are particularly popular among Vietnamese consumers due to the influence of Korean popular culture. In total, the value of cosmetics imported into Vietnam in that year reached approximately 175.6 million USD (Statista).

Currently, Vietnam has over 400 cosmetics companies. However, Vietnamese cosmetics companies only account for 10% of the market, and they are striving to regain this lucrative market share. Vietnamese cosmetics companies are currently only able to compete in the low-priced segment and export to some neighboring markets (90% of Vietnamese cosmetics companies are distributors of foreign cosmetics brands). As a result, popular domestic brands achieve low sales volume and primarily export to neighboring Asian markets. Most foreign cosmetics dominate the shopping centers in Vietnam. Statistics from the General Department of Customs of Vietnam show that South Korea is the largest exporter of cosmetics to Vietnam. In 2021, South Korea accounted for about 44.5% of the total value of cosmetics imports into Vietnam. Therefore, South Korea has been proven to be the leading cosmetics importing partner of Vietnam in recent years.

According to Statista, in 2022, the global cosmetics market witnessed a growth rate of over 16% compared to the previous year. Skincare, haircare, makeup, fragrance, personal hygiene and deodorant, and ingestible beauty products are the main product categories in the cosmetics market. Skincare is the top category in 2021, accounting for about 41% of the global market. Hair Care products account for an additional 22%, while makeup products represent about 16%. Skincare is one of the highest-profit categories as its revenue is predicted to generate around 188 billion USD by 2026.

Currently, there are numerous studies on the role of product innovation, brand image, and quality perception in marketing and business management. The importance of product innovation has been demonstrated in previous studies with positive evaluations and outcomes. Shiau (2014) suggests that product innovation helps consumers better understand product features and enhances their satisfaction with the product. Wahyuni (2019) highlights the positive impact of product innovation on purchase decisions. Dolatabadi, H.R. et al. (2012) argue that brand image represents the personality of the brand or the reflection of the product. According to Jalilvand, M.R. et al. (2011) and Tuškej, U. et al. (2013), the brand is always an important factor for a company. Brand image can foster brand loyalty from consumers. Therefore, brand identity becomes a crucial issue in brand management. Additionally, quality perception is an important factor in consumer decision-making; hence, consumers will compare the quality of alternative choices in a price category (Jin and Yong, 2005). However, specific research on product innovation, brand image, and quality

perception of Korean cosmetic brands in Vietnam is still limited. Therefore, conducting investigations in this field is crucial for empirical research.

This article aims to measure the factors influencing the purchasing behavior of Vietnamese consumers toward Korean cosmetics through a survey on consumer preferences for imported cosmetics in the Vietnamese market. It also clarifies the position of foreign cosmetics in the domestic market, specifically Korean cosmetics. We used the Theory of Planned Behavior (TPB) as the research model and expanded it by adding "product innovation," "brand image," and "quality perception." Through this, the article predicts the near future of the domestic cosmetics industry as well as the cosmetic consumption trends of Vietnamese consumers. The goal is to provide a clearer view of the development and competitiveness of the domestic cosmetics industry in Vietnam. The article was completed based on an online survey targeting consumers of various cosmetics available in the Vietnamese market.

2. Theoretical framework

2.1. The Theory of Planned Behavior (TPB)

The Theory of Planned Behavior (TPB) is derived from the Theory of Reasoned Action (TRA). TRA uses subjective attitudes and norms to predict the behavioral intentions of individuals, and then predicts their specific behavior based on their behavioral intentions (Truong, Y., 2009). The interaction between subjective norms and attitudes is complex, and TRA directly predicts intentions without limitations. Furthermore, some behaviors are beyond the control of individuals. For example, they may not have enough time to complete the behavior or they may lack the opportunity or suitable situation. This makes it difficult for TRA to accurately predict behavior (Solomon, M.R., 2007). When people engage in behavior that may not be successful and they cannot control the situation they encounter, such behavior will not be predicted by TRA. To address this issue, Ajzen (1985) proposed the more advanced Theory of Planned Behavior (TPB).

TPB provides a practical framework that helps us understand complex human behavior (Lu and Chen, 2017). It has a high accuracy in predicting behavior by using attitude, subjective norms, and perceived behavioral control (Ajzen, I., 1991). For this reason, many scholars have used TPB as their research framework (Farah, M.F., 2017). Pikturnienė and Mackelaitė (2013) used TPB to compare the attitudes of consumers towards purchasing skincare products domestically and internationally; Kim and Karpova (2009) explored why consumers want to buy counterfeit goods using TPB as a research model.

Attitude refers to "the degree to which a person evaluates the discussed behavior positively or negatively." Subjective norms refer to "perceived social pressures to perform or not to perform the behavior." Perceived behavioral control refers to "the perceived ease or difficulty of performing the behavior and is thought to reflect past experience as well as anticipated obstacles and impediments" (Ajzen, I., 1991). Since consumers cannot control whether they can purchase cosmetics when they lack time, money, or opportunity, perceived behavioral control seems to influence consumers' purchase intentions. Therefore, TPB is used as our research model.

2.2. Product innovation

For some brands, product innovation has a positive impact on their success (Thoa and Chiu, 2021). According to Hanaysha (2014), product innovation, including new products and technological innovations, helps businesses promote product quality and functionality. Drucker (1985) mentioned that innovation is the introduction of new products, new services, new technological processes, or new business models. According to Rainey (2005), the focus of product innovation is the differentiation from existing products in the market, through new features and functions that have not been provided before. Leow and Ng (2016) point out that product innovation is carried out to improve or apply new production methods for a business. Horn and Salvendy (2006) indicate that if consumers are provided with more detailed information about innovative products, their purchase intentions will be positively stimulated.

According to Thoa and Chiu (2021), product innovation can be analyzed by considering both the internal and external aspects of the product. The internal aspect depends on the company's expertise, capabilities, resources, and technologies used, while the external aspect involves consumer needs and the owner's expectations for the company's products. Therefore, product innovation does not necessarily entail significant differences compared to developing entirely new products or using new technologies to enhance existing products. The research findings of Thoa and Chiu (2021) indicate that Vietnamese consumers seem willing to spend money on a product when there is technological innovation that enhances the functionality of the product rather than choosing a completely new product. Hence, this study focuses on product innovation in the aspect of new technologies.

2.3. Brand image

According to Dobni and Zinkhan (1990), brand image is the subjective perception of consumers, understood through cognition or emotions. Additionally, brand image is often influenced or shaped by marketing activities and advertising content or the individual perceptions of each customer. Park et al. (1986) argue that brand image is not solely based on consumer perception but also on the business activities of the company, both of which bring profit to the business and fulfill consumer needs. Shamma and Hassan (2011) state that the stronger the brand image in the consumer's perception, the more attention it can attract, thereby generating consumer purchase intentions. Saydan (2013) suggests that brand image helps managers and marketing professionals differentiate their products, expand the brand, and benefit the business.

Furthermore, Lee et al. (2014) emphasize that building brand image with the purpose of product development and profitability is crucial for businesses. Enhancing brand image, creating brand advantages, and standing out in consumer perception are always top priorities for any business manager. Keller (1993) defines brand image in three dimensions: essence, concern, and attitude. Within the concern dimension, brand image is defined by functionality, symbolism, and experience. Rahi (2017) argues that to differentiate their products from others, businesses should create distinctive and unique characteristics for their products. Therefore, it can be seen that brand image is constructed based on the objectives of marketers and businesses and subjectively perceived through consumer cognition.

The research conducted by Thoa and Chiu (2021) concludes that based on a positive perception of brand image, Vietnamese consumers tend to purchase more Korean cosmetics. Specifically, the symbolic aspect of brand image is the factor that drives Vietnamese consumers to spend more. This study primarily examines brand image in terms of symbolism through consumer perception and evaluation to understand the role of brand image in purchase intentions.

2.4. Perceived quality

Perception of quality is an important factor in consumer decision-making; therefore, consumers will compare the quality of substitute products in relation to their prices within a product category (Jin and Yong, 2005). The components of the marketing 4Ps, including price, place of sale, and advertising, as well as brand-related variables such as origin, good warranty, and advertising, can provide signals to consumers in evaluating product quality (Rao and Ruekert, 1994; Yoo et al., 2000).

Consumers may be uncertain about product quality because sellers can deceive them with defective products or provide lower-quality products than advertised or stipulated in the purchase contract (Ba and Pavlou, 2002; Pavlou and Fygenon, 2006). Perception of quality is the result of consumers' subjective evaluation of a product (Zeithaml, 1988; Dodds et al., 1991). Garvin (1983) suggests that perception of quality is determined by the user's perception, while objective quality is determined by the product or manufacturing orientation. The difference between objective quality and perception of quality lies in the fact that objective quality has a predetermined design standard for a product, while perception of quality is influenced by the intrinsic and extrinsic attributes of the product, serving as the basis for consumer evaluation (Zeithaml, 1988). Perception of quality is an assessment by consumers of the accumulated benefits of a product and their subjective feeling about the quality of the product (Zeithaml, 1988; Dodds et al., 1991). Perception of quality will be influenced by factors such as prior experience, level of education and perceived risk, as well as situational variables like purchase purpose, purchase situation, time pressure, and consumer social background (Holbrook and Corfman, 1985). In summary, perception of quality is a subjective evaluation by consumers of product quality, and they will evaluate product quality based on their prior experiences and perceptions.

2.5. Hypotheses and Research Model

In this study, attitude refers to the positive emotions towards Korean cosmetics. Consumers' attitude towards products and services can predict individual consumer behavior and purchase intentions, which are derived from positive attitudes (Mooij, M.; Hofstede, G. 2011). Based on this, the first hypothesis is formulated as follows:

Hypothesis H1: Attitude has a positive impact on the behavioral intention of consumers in purchasing Korean cosmetics.

Subjective norm refers to an individual's perception of social influence, such as the belief that important others want them to engage in the target behavior (Hagger, M.S., 2007). The influence of others surrounding individuals impacts their decision-making, including family, friends, colleagues, and others. Therefore, the second hypothesis is formulated as follows:

Hypothesis H2: Subjective norms have a positive impact on the behavioral intention of consumers in purchasing Korean cosmetics.

Perceived behavioral control is an extension of the theory of reasoned action and describes an individual's perception of their personal capabilities or limitations (such as time, money, and opportunities) to perform a specific behavior (Godbersen, H. et al., 2020; Ajzen, 1988). The limited resources of an individual can hinder and influence their ability to make purchasing decisions. Therefore, the third hypothesis is formulated as follows:

Hypothesis H3: Perceived behavioral control has a positive impact on the behavioral intention of consumers in purchasing Korean cosmetics.

Among the factors influencing consumers' purchase intentions, product innovation is a significantly positive factor (Thoa and Chiu, 2021). According to Tidd (1997), to generate innovation for a business and new value for a product, managers often engage in product innovation. Innovation through features, functions, or creating entirely new products creates positive impacts on the company's benefits. Simultaneously, consumers also perceive certain benefits through product innovation, leading to a tendency to prioritize purchasing those products (Holak, 1988). Shiau (2014) indicates that a company with good product improvements enhances consumers' willingness to pay. Through brand image, product innovation also has a positive impact on consumers' perception, resulting in an increased likelihood of purchasing that product. Actualizing customer expectations by introducing new product prototypes will enhance the company's profitability. Leow (2016) suggests that to increase purchase intentions, businesses need to focus on understanding consumer perceptions and implement appropriate improvement and innovation solutions to meet market demands. Based on the above-described relationships, we propose the following hypothesis:

Hypothesis H4: Product innovation has a positive impact on the behavioral intention of consumers in purchasing Korean cosmetics.

Aaker and Keller (1990) suggest that consumer trust increases when they have a clear understanding of the product, thereby enhancing their purchase intentions. It can be said that a good brand image positively influences consumers' purchase intentions. Therefore, when making purchase decisions, brand image is one of the positive factors influencing consumer behavior (Adenan, 2018). Shoaib and Ali (2018) found a positive impact between brand image and purchase intentions and concluded that differences in brand image among companies lead to differences in consumers' purchase intentions. Furthermore, some researchers argue that product innovation is a consideration factor and influences consumer purchase intentions (Boyd and Charlotte, 1999; Shiau, 2014). Waluya et al. (2018) demonstrated that brand image has a certain positive influence on consumers' purchase decisions. Particularly in the cosmetics research field, Kim (2016) investigated the level of preference for domestic and imported cosmetics and argued that the better the brand image and perceived value of their quality, the higher the brand preference. It can be observed that consumers' positive perception of brand image significantly impacts their purchase intentions. Based on the above-mentioned research findings regarding the relationship between brand image and purchase intentions, we propose the following hypothesis:

Hypothesis H5: Brand image has a positive impact on the behavioral intention of consumers in purchasing Korean cosmetics

Perceived product quality is determined by evaluating a specific outcome and comparing it to the consumer's prior expectations; thus, it is fundamentally a cognitive structure (Doyle Kim and Vu Thi Phuong, 2019). Garretson and Clow (1999) argue that perceived product quality influences consumers' purchase intentions, and Monore (1990) suggests that perceived product quality positively influences purchase intentions through perceived value. In the marketing field, the structure of perceived product quality has been widely recognized as a key driver of purchase intentions (Jacoby and Olson, 1985). This also means that perceived product quality varies depending on various factors, such as the timing of consumers' purchase or consumption of the product and the location where they purchase or enjoy the product. Additionally, Chang (2006) and Wu (2006) conclude that perceived product quality and purchase intentions have a positive relationship. Previous studies indicate a positive correlation between perceived quality and perceived product value. Therefore, the perception of high product quality leads to increased and enhanced perceived value, thereby increasing customers' purchase intentions (Cronin et al., 2000; Snoj, 2004; Beneke, 2013). Perceived product quality has been found to significantly and positively influence purchase intentions (Saleem et al., 2015). Additionally, Asshidin, Abidin, and Borhan (2016) also found that perceived product quality significantly affects consumers' purchase intentions for both imported and local products in a positive direction. Based on the aforementioned descriptions of the relationships, we propose the following hypothesis:

Hypothesis H6: Perceived quality has a positive impact on the behavioral intention of consumers in purchasing Korean cosmetics

Based on the above hypotheses, the research team proposes the following research model:

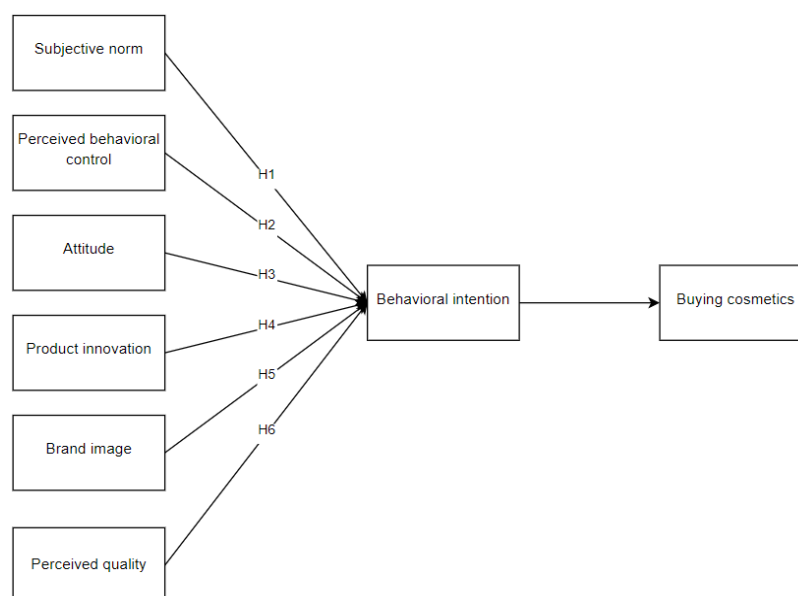

Figure 1. Research Model

Source: Compilation of results by the authors, 2023

3. Method

A quantitative research method was employed to measure the influence of the following factors: Product Innovation (PI), Perceived Quality (PQ), Subjective Norms (SN), Perceived Behavioral Control (PBC), Attitudes (ATT), Brand Image (BI), and Behavioral Intention (BINT) on Vietnamese consumers' purchasing intention of Korean cosmetics.

The survey questionnaire was designed in two parts and distributed to consumers through a direct link. The introduction section provided an overview of the survey's purpose and included demographic questions such as gender, age, purpose of using Korean cosmetics, etc. The second part consisted of questions related to the perception of each factor: Product Innovation (PI), Perceived Quality (PQ), Subjective Norms (SN), Perceived Behavioral Control (PBC), Attitudes (ATT), Brand Image (BI), and Behavioral Intention (BINT) of Vietnamese consumers regarding the purchase of Korean cosmetics. A total of 565 valid responses were used for the study after eliminating incomplete responses.

According to the statistical results from the survey data of 565 samples, the gender distribution was as follows: female (62.7%) and male (37.3%). Participants became aware of Korean cosmetics through various channels, including TV advertisements (18.2%), friends and relatives (35.6%), the internet and social media (45.3%), and other sources (0.9%). The purpose of using Korean cosmetics was categorized as makeup (34.9%), skincare (35.8%), and makeup and skincare (29.3%). The age groups were as follows: below 21 years old (24.8%); 21-30 years old (28.5%); 31-40 years old (24.6%); 41-50 years old (20.9%); 51-60 years old (1.2%); and above 60 years old (0%). Furthermore, 100% of the survey respondents were familiar with at least one of the following Korean cosmetic brands: The Face Shop, Ohui, Innisfree, Laneige, Etude House, Missha, Skinfood, and Sulwhasoo.

To ensure content validity of the survey instrument, an experienced marketing research expert in scale development and quantitative research evaluated the proposed scales. The results of the study were analyzed and tested using SPSS 25.0 software, and Cronbach's alpha values were found to be above 0.8, indicating good measurement reliability. A 5-point Likert scale was used to measure respondents' attitudes towards the factors influencing their intention to purchase Korean cosmetics. To test the measurement model and the proposed hypotheses aiming to determine the degree of influence from each factor: Product Innovation (PI), Perceived Quality (PQ), Subjective Norms (SN), Perceived Behavioral Control (PBC), Attitudes (ATT), Brand Image (BI), and Behavioral Intention (BINT) on Vietnamese consumers' purchasing intention of Korean cosmetics, we utilized an analysis method through the following steps:

1. Evaluation of measurement scales and reliability using Cronbach's Alpha coefficient and exploratory factor analysis (EFA);
2. Validation of scales using confirmatory factor analysis (CFA);
3. Testing the model using structural equation modeling (SEM) in AMOS.

3.1. Cronbach's Alpha measurement of reliability

The reliability of the measurement scale was assessed using Cronbach's Alpha analysis (Table 1) based on the official quantitative survey sample. All measurement scales met the criteria and were used for Exploratory Factor Analysis (EFA). The final results showed that all measurement scales had reliable values for their respective factor groups. This demonstrates that the research concepts built from the observed variables achieved internal consistency and ensured good measurement properties.

Table 1. Results of the reliability testing of the measurement scale

Variances	Cronbach's Alpha	Corrected Item - Total Correlation	The number of scales eliminated
Subjective Norms (SN)	0,849	0,598 - 0,743	0/4
Perceived Behavioral Control (PBC)	0,928	0,805 - 0,861	0/4
Attitudes (ATT)	0,843	0,600 - 0,775	0/3
Product Innovation (PI)	0,922	0,801 - 0,874	0/3
Brand Image (BI)	0,849	0,665 - 0,723	0/4
Perceived Quality (PQ)	0,854	0,721 - 0,731	0/3
Behavioral Intention (BINT)	0,925	0,801 - 0,854	0/4

3.2. Exploratory Factor Analysis (EFA) and Confirmatory Factor Analysis (CFA)

Exploratory Factor Analysis (EFA) was conducted on 19 observed variables belonging to 6 factors. The extraction method used here was Principal Axis Factoring combined with Promax rotation, which reflects the data structure more accurately (Gerbing and Anderson, 1988) and is suitable for analyzing the structural model of linear SEM. The Kaiser-Meyer-Olkin (KMO) measure was 0.899 (> 0.5), and the Bartlett's test of sphericity had a significant value of Sig = 0.000, indicating the meaningfulness of the EFA results. The analysis revealed that at Eigenvalues ≥ 1 , 5 factors were extracted from the 21 observed variables, accounting for an extracted variance of 76.269%. We conducted separate EFA analyses for independent and dependent variables (Table 2 and Table 3). Hair et al. (2010) suggested that combining independent and dependent variables in the same exploratory factor analysis and then examining the dependent relationships is inappropriate. Variables included in the EFA should be of the same type, either all independent or all dependent. Both types of variables should not be combined in a single EFA analysis.

Table 2. Results of Exploratory Factor Analysis (EFA) for Independent Variables

	Factor				
	1	2	3	4	5
PI3	0,892				
PI2	0,890				
PI1	0,836				
PQ1	0,834				
PQ3	0,737				
PQ2	0,725				
PBC2		0,868			
PBC1		0,830			
PBC3		0,780			
PBC4		0,778			
BI2			0,815		
BI1			0,758		
BI4			0,746		
BI3			0,737		
ATT3				0,931	
ATT2				0,857	
ATT1				0,620	
SN2					0,817
SN1					0,779
SN4					0,597
SN3					0,543
Extraction variance	41.349	9.935	7.997	6.408	3.352

Table 3. Results of Exploratory Factor Analysis (EFA) for Dependent Variable

Component	
1	
BINT2	0,922
BINT1	0,916
BINT4	0,894
BINT3	0,888
Extraction variance	3.277

Source: Compilation of results by the authors, 2023

The CFA analysis was further utilized to evaluate the fit of the research model (Model Fit). The results indicated that the measurement scales used to assess the independent variables converged into six factors: Subjective Norms (SN), Perceived Behavioral Control (PBC), Attitudes (ATT), Product Innovation (PI), Brand Image (BI), and Perceived Quality (PQ). Additionally, the measurement scales for Product Innovation (PI) and Perceived Quality (PQ) converged into a new measurement factor related to the perception of product quality and innovation. Consequently, we named this new variable "Perceived Innovation of Product Quality" (PIPQ). Subsequently, we considered standardized residual covariances to improve the Model Fit indices to achieve the best standards. As a result, the observed variables PerceivedQuality1, PerceivedQuality2, BrandImage1, and SubjectiveNorms3 were removed. The final Model Fit results are presented in Table 4 as follows:

Table 4. The indices for evaluating Model Fit are as follows

	Index	Evaluating
CMIN/DF	4,526	Acceptable (<5)
GFI	0,909	Acceptable (>0,8)
CFI	0,946	Acceptable (>0,9)
RMSEA	0,079	Acceptable (<0,08)

Source: Compilation of results by the authors, 2023.

Factor analysis confirms CFA, in addition to assessing Model Fit, also requires examining the convergent validity and discriminant validity between variable groups. We obtained the following results according to Table 4 and various indicators:

1. The composite reliability (CR) ≥ 0.7 and average variance extracted (AVE) ≥ 0.5 for all variables, ensuring convergent validity.

2. The mean shared variance (MSV) $<$ AVE, and the square root of AVE $>$ correlation for all variables, ensuring discriminant validity.

Table 5. Model Validity Measure

	CR	AVE	MSV	MaxR(H)	PIPQ	PBC	BI	SN	ATT
PIPQ	0.925	0.757	0.433	0.939	0.870				
PBC	0.929	0.767	0.561	0.934	0.658***	0.876			
BI	0.819	0.602	0.187	0.822	0.355***	0.432***	0.776		
SN	0.851	0.656	0.561	0.863	0.656***	0.749***	0.418***	0.810	
ATT	0.851	0.660	0.092	0.889	0.275***	0.303***	0.194***	0.269***	0.813

Source: Compilation of results by the authors, 2023

Thus, the results of the Confirmatory Factor Analysis (CFA) have demonstrated that the proposed research model is entirely consistent with the theory. The measurement scales of the variables PIPQ, PBC, BI, SN, ATT, and BINT in the research model exhibit strong relationships with each other and have the ability to provide a good explanation for the corresponding representative variable. We utilized the factor analysis results to confirm the CFA, which serves to test the hypotheses and evaluate the relationships between the factors influencing the independent and dependent variables.

3.3. Structural Equation Modeling (SEM) analysis

We utilized the Structural Equation Modeling (SEM) technique to analyze the multidimensional relationship between the dependent variable "Behavioral Intention" (BINT) and the independent variables in the model. The obtained results are presented in Figure 2.

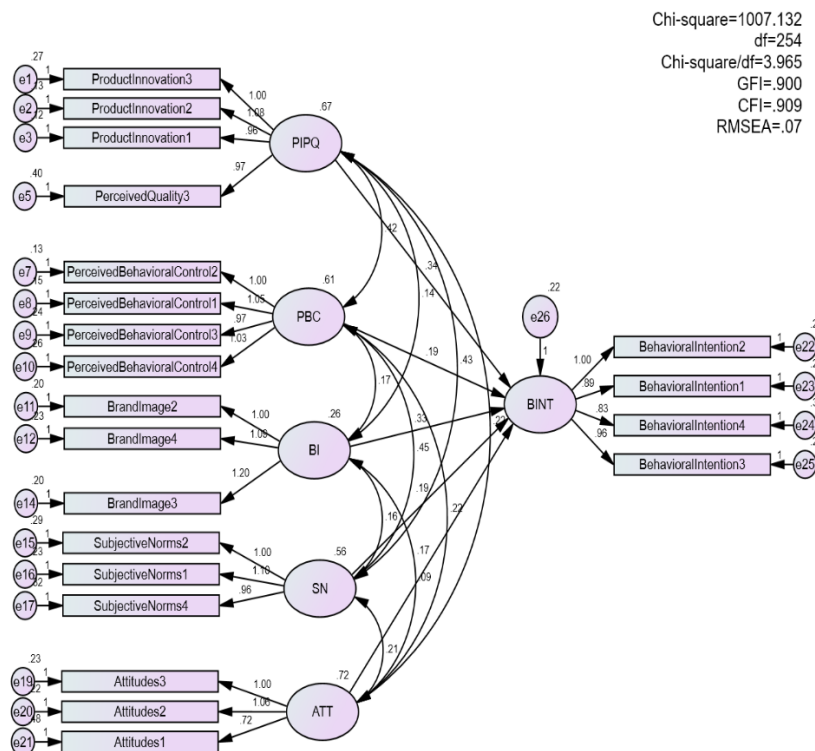

Figure 2. Model SEM

Source: Compilation of results by the authors, 2023

The P-values of all variables are < 0.05 , indicating a 95% level of confidence and significant relationships between the independent variables and the dependent variable. The unstandardized regression coefficients are all positive for hypotheses H1, H2, H3, H4, and H5, indicating a positive impact of the independent variables on the dependent variable. The SEM results confirm the acceptance of all proposed hypotheses H1, H2, H3, H4, and H5.

Table 6. Summary of SEM Results

Hs		Unstandardized ML	SE	CR	P-value	Result
H1	BINT ← SN	0,185	0,068	2,726	0,006	Approved
H2	BINT ← PBC	0,188	0,057	3,300	***	Approved
H3	BINT ← ATT	0,173	0,033	5,272	***	Approved
H4	BINT ← PIPQ	0,341	0,048	7,134	***	Approved
H5	BINT ← BI	0,334	0,061	5,460	***	Approved

Source: The results were synthesized by the research team using AMOS.

The results in Table 6 indicate that all Critical Ratios (C.R) values are smaller than 1.96, indicating no significant difference between the estimated results of the initial model and the estimated mean results. Therefore, the research model remains meaningful with a large sample, and the model estimates are reliable. Perceived product quality innovation (PIPQ) and Brand Image (BI) are the two factors with the strongest impact on Behavioral Intention (BINT). According to the unstandardized regression coefficients, when perceived product quality innovation (PIPQ) and Brand Image (BI) increase by 1 unit, Behavioral Intention (BINT) increases by 0.341 and 0.334 units, respectively. Additionally, for each 1-unit increase in the factors of the Theory of Planned Behavior (TPB), Behavioral Intention (BINT) increases by 0.185, 0.188, and 0.173 units, respectively.

4. Discussion and Conclusion

4.1. Discussion

The latent variable "perceived product quality innovation" was discovered after conducting EFA analysis and was found to have the strongest influence on Behavioral Intention (BINT), with an impact level of 34.1%. The measurement scale for the variable "product innovation" converged with the measurement scale for "perceived quality" to create the independent variable "perceived product quality innovation" (PIPQ). In reality, when purchasing Korean cosmetic products, most consumers are concerned about the quality of the products they buy. Improving product quality plays an important role in consumer repurchase behavior, as consumers perceive upgraded product functionalities to increase their intention to purchase. Therefore, based on the research results, it can be affirmed that if consumers perceive the quality of the product as innovative, they will have a more positive attitude and drive their intention to purchase Korean cosmetics.

Brand image plays a crucial role in consumer buying behavior by building subjective perceptions and providing benefits to consumers when purchasing those products (Thoa & Chiu, 2021). For the Korean cosmetic industry, Brand Image (BI) is the second-highest

influencing factor, accounting for 33.4%. In the beauty industry, consumers pay attention to the brand image they are buying, its popularity, and its reputation on the market. SEM analysis results demonstrate that if consumers perceive Korean cosmetic brands as having excellent quality, being the most preferred brand on the market, having market credibility, and providing reassurance to customers, their intention to purchase tends to increase. To differentiate their products from others, businesses should create unique and distinctive characteristics for their products (Rahi, 2017).

It can be observed that when purchasing Korean cosmetic products, the factors of Subjective Norms (SN), Perceived Behavioral Control (PBC), and Attitudes (ATT) play the least important roles in influencing the Behavioral Intention of consumers regarding purchasing Korean cosmetics. Although the factors of the Theory of Planned Behavior (TPB) have the least impact on consumers' Behavioral Intention to purchase Korean cosmetics, they still explain 18.5%, 18.8%, and 17.3% respectively of the variation in the intention to purchase Korean cosmetics among Vietnamese consumers.

4.2. Conclusion

Based on the research findings, we propose solutions for organizations and cosmetic businesses in Vietnam to improve the quality of product communication to consumers and enhance the effectiveness of their marketing strategies based on the research results on factors influencing the intention to purchase Korean cosmetics among Vietnamese consumers.

To promote consumer intention to purchase cosmetic products through awareness of product quality innovation, businesses should: (1) Stay updated with product functionalities to meet market demands. To achieve this, companies need to build teams for customer needs research as well as research and development.(2) Regularly update production technology to manufacture products, stay informed about the latest market information, improve machinery, and explore high-quality ingredients for product manufacturing. (3) Emphasize product quality as a guiding principle for the business's development in cosmetic production.

To promote consumer intention to purchase cosmetic products through brand image, businesses should (1) Establish a strong brand presence in the market by offering high-quality products to dominate the Vietnamese market.(2) Build credible media platforms to disseminate information about the company's products to enhance the brand image across social media platforms.(3) Build trust with customers regarding the use of the company's cosmetic products. To achieve this, businesses need experienced personnel in the industry, conduct thorough research on product quality and side effects before launching them into the market to avoid unnecessary risks.

To promote consumer intention to purchase cosmetic products based on the factors of the Theory of Planned Behavior (TPB), businesses should: (1) Build product image on social media platforms to reach a wider market.(2) Produce diverse product lines at low, medium, and high price ranges to meet consumers' desire for recognition.(3) Establish online sales channels to expand the sales network and create a convenient purchasing experience for consumers, allowing them to buy anytime, anywhere without visiting physical stores.

Abstract

This study aims to examine the factors affecting the digital financial competency (DFL) of employees in the Vietnamese banking sector. Inheriting previous studies on the digital competency framework; especially the definition of DFC; The data is fed by 431 domestic banks' employee responses. The results of exploratory factor analysis (EFA) show that there are 7 factors affecting DFC. In addition, ANOVA analysis results that: there is a statistically significant difference in DFC between educational groups of employees. Profit-making group of employees has better DFC than the rest. While ANOVA analysis does not find significant differences in DFC of some demographic characteristics and IT training as well as digital financial training. Some policy implications related to the enhancement of DFC for Vietnamese bankers are also discussed.

Keywords: *digital literacy, digital financial competencyframework, financial literacy*

1. Introduction

Today, financial literacy along with digital literacy is crucial for citizens who are actively involved in the monetized and digitized economy (Medlock Paul, Spires, & Kerkhoff, 2017; WEF, 2015). The combination or intersection between digital literacy and personal financial literacy has been referred to as "digital financial literacy" or "digital financial competency" (DFC); while DFC is also recognized as a synergistically essential competency for every citizen today (FinEQUITY, 2021).

Morgan et al (2019) and the OECD (2018a) have recommended that, it is essential to strengthening the DFC of all members of society. Black et al (2018) as well as Buvat (2017) have shown that banks are also facing a shortage of digital human resources.

Specifically, researchs (Murawski, Darvish, Prinz, & Bick, 2020; Shahlaei, Rangraz, & Stenmark, 2017) pointed out that there is still no clarity on the required competency components for each bank- employee. Murawski (2020) emphasized that there is a need for in-depth research on the components of DFC framework for specific groups of bankers. This

issue has also agreed upon by many studies (Henderson & Cockburn, 1994; Strasser, London, & Kortebout, 2005). In addition, Prete (2021) also recommended that digital literacy and personal financial literacy should be considered together when assessing the impact of digitalisation.

Literature review (Azeez & Akhta, 2021) show that research focusing on digital financial literacy and its determinants has been scarce in academic journals.

In Vietnam, the review revealed that there is an absence of study on DFC for bankers while finding a number of studies on digital competency (Hinh & Vân, 2022; Nguyen, Pham, & Le, 2022) and studies on personal financial literacy (Anh, 2020; Vân & Hinh, 2019; Vân, Hinh, & Minh, 2021) separately. Meanwhile, the banking sector is being strongly promoted for digital transformation (Chinh_Phủ, 2020; ĐCSVN, 2019; Hải & Đăng, 2021; Thông_Độc, 2018, 2022a; Thống_Độc, 2019a, 2019b, 2020, 2021; Thủ_tướng, 2018b, 2020a, 2020b, 2020c, 2021, 2022b, 2022c). The authorities (Thông_Độc, 2022a, 2022b, 2022c) has also advocated improving digital human resources for the banking sector by starting to develop the DFC framework for bank employees, while also being aware that this is a challenge even in developed economies as shown by literature (Henderson & Cockburn, 1994; Morgan et al., 2019; Strasser et al., 2005).

In the above context, the purpose of the article is to explore the factors that determine the DFC of bankers and then have some relevant recommendations.

2. Literature reviews & Hypothesis development

2.1. Literature reviews

2.1.1. Competency and competency assessment

Competencies are basic human characteristics that manifest a way of behaving or thinking, are general in many situations, and persist for a long time. The literature reviews (Hinh, Vân, & Nguyệt, 2023; Vazirani, 2010) show that at least five components of competency, which are : (i) Knowledge; (ii) Skills; (iii) Self Concepts & Values; (iv) Traits; (v) Motives.

While the educational and sociological aspects, competency is the knowledge, skills, and attitudes that an individual acquires from education and training (formal or informal). Competency is considered the result of the process of acquiring so that an individual can master knowledge (“K”), the ability to do is called skill (“S”), and have appropriate attitudes or emotions, individually for work in a given field (“A”) (OECD, 2018b; Redding, 2014). Basically competencies are reflected by these factors (“KSA”) (Henderson & Cockburn, 1994b; Hinh et al., 2023) .

On the organizational management point of view, professional competency is an asset or human capital, one of the most important resources and great influence on the success of the organization (Vathanophas & Thai-ngam, 2007) (Boyatzis, 1982, 2008; Hinh et al., 2023)

Competency structure therefore often consists of K", "S", and "A" (Kak, Burkhalter, & Cooper, 2001). They are accumulated by the individual before working in a particular

field; professional competency is accumulated by individuals through study, work, and professional experience (Strasser et al., 2005) (Elliot, Dweck, & Yeager, 2017; Hinh et al., 2023; Machado, 2017).

Studies (Elliot, Dweck, & Yeager, 2017; Hinh et al., 2023; Machado, 2017) indicate that specific competencies are difficult to measure directly and require indirect indicators such as the level of professional maturity in performing a task or job (Henderson & Cockburn, 1994b; Hinh et al., 2023). Davids et al., (2008) also stated that professional maturity is the process of learning and training at each stage of life, accumulating physically and intellectually... Professional maturity is measured at levels from low to high corresponding to the process of personal skill acquisitional process, reach a certain maturity levels, such as: (i) Novice; (ii) New officer or employee; (iii) Skilled officers; (iv) Effective staff; (v) Expert level (Kaba & Ramaiah, 2020). Many studies have used different variables to measure the process of acquiring specific competencies in some career fieldsities (Hinh et al., 2023; Kaba & Ramaiah, 2020)

2.1.2. Digital financial competency

According to Dimova et al (2021) as well as FinEQUITY(2021), digital financial literacy/competency (DFC), is the intersection between “digital literacy” and “financial literacy”, thereby allowing consumers to benefit and take full advantage of the benefits of digital financial services.

(i) Digital literacy

A person who is both knowledgeable about new technologies and at the same time able to use new technologies confidently and securely to interact with the rest of them for their lives and work, In the context of technology and information pervasive, people are seen as digitally competent (Ala-Mutka, 2011b; Hinh et al., 2023; Medlock Paul et al., 2017). The study (Prete, 2021) recommends that both digital literacy and personal financial literacy should be considered when assessing the impact of digitization on employee competencies.,

Studies (Ala-Mutka, 2011a; Dewi, Fahrurrozi, Hasanah, & Dj, 2021; Hatlevik, Guðmundsdóttir, & Lo, 2015; Ryder & Machajewski, 2017; Tang & Chaw, 2016) suggest that digital competency is built or accumulated from an individual's socialization process (study, work experience, social relations, or participation in forums...). Digital competency is determined by the fundamental factors that affect an individual's overall capacity. Digital competency includes (k) Specific knowledge and skills in the use of digital media and tools; (S) Advanced skills and knowledge of communication and collaboration, information management, learning and problem-solving, and meaningful participation; (A) Attitudes toward using strategic skills in an intercultural, criticism, creative, responsible and autonomous manner and also differences in digital competency across demographic groups learn.

Vodă et al. (Vodă, Cautisanu, Grădinaru, Tănăsescu, & Moraes, 2022) have proposed a theoretical framework of 06 factors (domains). However, these 6 domains of digital competency are some what inadequate compared to the 11 domains proposed by Janssen et al., (Janssen et al., 2013a) which could be considered more realistic.

Studies (Deursen & Van Dijk, 2009; EU, 2018, 2022; Janssen et al., 2013a; Jisc, 2014; Martin & Grudziecki, 2006; Pérez & Murray, 2010) show that the digital competency research model is associated with the principle of the individual's process of accumulating new technological capabilities. In the process of learning through many channels, individuals accumulate knowledge, skills and form attitudes and behaviors. Therefore, the research model consists of the basic factors: knowledge (K), skills (S), and attitude (A) of the individual extended to the new technology field and on a multi-dimensional manner, which characterizes by technology and consistent with the cross-cutting-structures character of “digital competency”.

As stated, digital competency includes domains of multi-tasking capabilities; and have gone beyond functional IT skills; Digital competency implies a richer and more diverse range of digital behaviors, practices, and identities than IT competency. The term changes continuously but is still consistent with the skills accumulating process of individual, which is closely related to the individual's learning process (Hinh et al., 2023; Kaba & Ramaiah, 2020; Niyigena, Jiang, Ziou, Shaw, & Hasan, 2020).

That is why, research (Jisc, 2014) has also generalized “digital competency” as essentially a set of professional and academic practices supported by technologies that are both diverse and medium constantly changing. This view is consistent with Janssen et al. (Janssen et al., 2013a) who included 11 components (domains) in the research model on digital competency.

(ii) Financial literacy

The concept of “financial literacy” has undergone a long development process and has been contributed to and improved by many scholars (Lusardi & Mitchell, 2006, 2007, 2014; Lusardi, Mitchell, & Curto, 2009). To now, this term has evolved far from the original meaning of "capability to read and to write" about finance (Hinh et al., 2023).

International Institutions (OECD, 2013; WB, 2013) define and use that personal financial management capacity is quite similar to “financial literacy” and “financial capability”. Financial literacy includes knowledge and understanding of financial concepts and risks, as well as the skills and motivation with confidence to apply that knowledge and understanding to make effective decisions in the financial area and context, to improve the financial well-being of individuals and society, and to enable individuals to participate in socio-economic life (OECD, 2013; OECD/INF, 2013; OECD/INFE, 2011).

Literature review (Hinh et al., 2023) integrates that the concept of financial literacy includes: (1) knowledge of financial concepts, (2) the ability to manage personal finances, (3) financial decision-making skills, and (4) confidence in future financial planning (Remund, 2010).

(iii) Digital financial competency

Studies (Hinh et al., 2023) have distinguished “digital financial competency” (DFC) for citizens in general and for employees of banks. Specifically:

-According to Morgan et al.,(2019), DFC is a multidimensional concept. While earlier OECD (2017) mentioned different aspects of DFC. Even so, there is no standard definition of DFC. In this context, Morgan et al.,(2019) propose four dimensions of DFC, including knowledge of digital financial products and services, awareness of digital financial risks, knowledge of on digital financial risk control, consumer rights knowledge, and procedures or remedies.

Research (Ala-Mutka, 2011b) shows that technology is increasingly popular in modern society and the economy; Every citizen has been able to benefit from digital tools and media in many areas of life. Furthermore, the ways in which individuals use digital technologies and benefit from them vary widely;

Significantly, the use of digital technology is unlikely to lead to the improvement or development of enhanced digital capabilities; This explains why, not all groups of citizens have enough interest, confidence, support or opportunities to develop their digital capabilities. Studies also imply that ensuring digital literacy in the digital age is all about ensuring social equality (Ala-Mutka, 2011b; Hinh et al., 2023). Research (Prete, 2021) indicates that digital literacy and financial literacy need to be linked together in assessing the impact of digitalization on financial instrument users.

-Several researches (Ala-Mutka, 2011b; Murawski et al., 2020) have recommended components for DFC. However, these proposals still exposed lacking completeness compared to the definition of digital competencies that are multi-faced or cross-cutting structures: Studies by Ala-Mutka (Ala-Mutka, 2011b) seems to be about generalizability, which could not follow the convergence and more detailed trend of digital finance, including the economic field (digital economic competency), associated with the social field (digital social competency). Meanwhile Murawski et al. (Murawski et al., 2020) proposes components/aspects of digital financial competency and trends including information technology, computing, and digital data capabilities.

- Gomber et al., (2019) show that DFC is often a matter of concern of banks (Deloitte_Insights, 2017). Black et al., (2018) pointed that recruiting capable staffs for digital banking is not easy for any bank. Research (Buvat et al., 2017) shows that in the digital transformation movement, the banking sector is one of the first sectors facing the challenge of digital human resources compared to other industries.

- There are evidences that what kind of digital competency (which digital competency areas) are needed and required in the “digital financial competency” is still unclear. Shahlaei (2017), and then Murawski et al., (2020), from an information systems perspective propose digital capabilities of the media or data industries. However, the proposed components are considered be inadequate and further studies are needed. Additionally, there is an argument (Murawski et al., 2020) that the digital competency of bankers is very new and specific, so the lack of academic research is a natural matter. Building an appropriate digital financial competency framework for bankers is quite at the very beginning

Berruti (2017) implies that up to now, when entering the banking industry, an individual needs technological skills, data analysis skills, and workforce needs. advanced

technological skills will increase. Murawski et al., (2017) also show that banks are lacking in data processing experts.

Deloitte (2017) states that future financial leaders will have to acquire new capabilities to shape functionality in an environment rife with technology; Moreover, there is a drastic change in the tasks of staff in financial analysis, forecasting, or human resources related to banking and finance.

In the context that the structure of digital financial competency is unclear both to the definition of digital financial competency in general and to bankers, Morgan et al., (Morgan et al., 2019) propose four aspects or aspects of digital financial competency. This proposal has not been tested but can be considered quite advanced compared to previous views. This proposal implies based on the professional characteristics of bank employees such as: directly managing and operating a large number of financial assets, system linkage, and many traditional risks; The digitization process is increasingly challenging, and the requirements are higher and higher in every job position due to the diversity and complexity of financial products and services...

On that basis, the proposal of Morgan et al., (Morgan et al., 2019) digital financial capabilities including knowledge of digital financial products and services, awareness of digital financial risks, knowledge of digital financial risk control, knowledge of consumer rights and troubleshooting procedures: (+) Knowledge aspect of digital financial products and services, ensuring a basic understanding of digital financial products and services. (+) Understanding and perception of digital financial risks. (+) Digital financial risk control aspect: (+) The knowledge aspect of consumer rights and remedial procedures.

This content is an understanding of consumer rights and remedial procedures in the event a DFS user becomes a victim of the risks mentioned above. DFS users should understand their rights and know where they can go and how to get redress if they become victims of fraud or other loss. They should also understand their rights regarding their personal data and how they can remedy unauthorized use... (Morgan et al., 2019). The above views are quite consistent with the definition DFC (FinEQUITY, 2021).

2.1.4. Related studies in Vietnam

Literature review shows that, in Vietnam, there are several studies separately on digital competency (Hinh & Vân, 2022; Nguyen et al., 2022) and personal financial management capacity (Anh, 2020; Vân & Hinh, 2019; Vân et al., 2021). Though, the number and scope of research is still quite modest compared to the orientation of the Government (ĐCSVN, 2019; Thủ_Tướng, 2017, 2020c, 2022a, 2022b) on digital transformation towards a digital society and Strategy for the development of Vietnam banking industry to 2030 (Thông_Độc, 2018; Thông_Độc, 2019a, 2019b, 2021; Thủ_tướng, 2018a).

2.2. Research hypothesis

Based on the literature review, the author proposes the following research hypotheses:

(i) Component competencies or factors A, B, C, D, E, F, G, H, I, K, L (as described in Figure 1) have a statistically significant impact on “digital financial competency” (DFC) (+)

(ii) There is a statistically significant difference in DFS among the groups by demographi (gender, education, position, IT training, digital training) (+/-).

3. Theoretical framework, research model & measurements

3.1. Theoretical framework

The theoretical framework of competency, explains the learning process (formal and informal) in which knowledge, skills, and attitudes are accquised by individuals, and personal competencyis obtained (Deursen & Van Dijk, 2009; Janssen et al., 2013a; Kaba & Ramaiah, 2020; Martin & Grudziecki, 2006; Moir, 2015; Murray & Perez, 2014; Vodă et al., 2022); And it is consistent with definieton of DFC(FinEQUITY, 2021; Morgan et al., 2019). Ít is also inherited from studies (Janssen et al., 2013a; Jisc, 2014; Murray & Perez, 2014; Pérez & Murray, 2010). Some adjustments were also made to suit the conditions of Vietnam. The diagram in Figure 1 (Janssen et al., 2013b) is consisting of 11 components (areas/ domains) of digital competency; These 11 components are consistently the multi-faceted, multi-dimensional and cross-cutting structure of “digital competency”; It would be noted that 11 components, (competent areas) have also integrated two respective competencies (digital literacy and financial literacy) as the definition of DFC (FinEQUITY, 2021; Morgan et al., 2019).

3.2. Research model

Based on the above theoretical framework, the proposed research model is illustrated in Figure 1. It can be understood that the DFC is explained by the respective components in a multidimensional and synergistic manner. As stated, the intersection between digital literacy and financial literacy is DFC (FinEQUITY, 2021; Morgan et al., 2019). Eleven (11) competency dimensions (domains) reflecting DFC are taken into designing the questionnaires for information collection. Therefore, the questionnaire is integrated with measures of digital competency and measures of financial literacy.

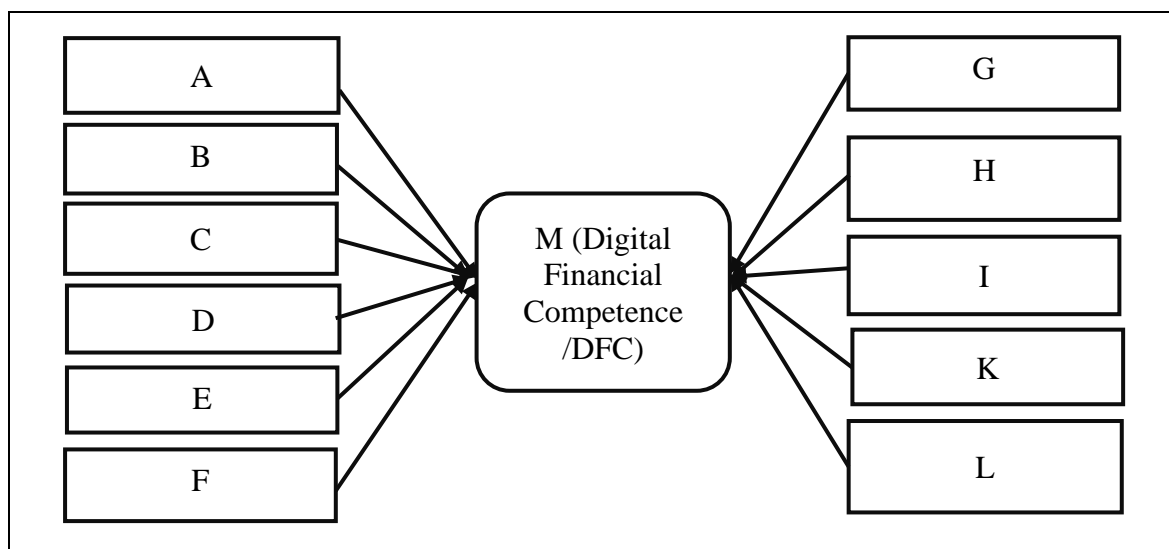

Figure 1. Proposed model for the study of “digital capabilities” [Authors modified from “Digital building blocks of digital competency”) (FinEQUITY, 2021; Janssen et al., 2013b; Morgan et al., 2019; Vodă et al., 2022)

Where (Figure 1), the digital financial competency areas/domains are as follows (FinEQUITY, 2021; Janssen et al., 2013b; Morgan et al., 2019; Vodă et al., 2022):

- (A) General digital knowledge and functional skills associated with daily personal finance;
- (B) Using digital technology associated with personal financial activities in daily life;
- (C) An in-depth and advanced competency to work and demonstrate digital creativity associated with personal finance;
- (D) Communication and cooperation through digital means for personal financial activities;
- (E) Processing and managing information digitally related to personal financial operations;
- (F) Digital privacy and security in personal finance;
- (G) The relevant legal and ethical perspective on digital aspects of personal finance;
- (H) Have a balanced attitude towards financial-related digital technology;
- (I) Understanding and awareness of the role of ICT (digital) in relation to financial performance;
- (K) Learning about and with digital technologies associated with personal finance;
- (L) The capability to make analyzed decisions about digital technologies associated with personal finance;
- (M) Seamless use, demonstrating self-efficacy of digital technology for personal finance.

- Scale (M or DFC): is the dependent variable in the econometric model; This scale is a measure of the degrees of "Simplified and systematic use of demonstrating self-confidence" in operating digital technology for personal financial activities. It is obvious that this measure reflects an individual's proficiency or digital competency.

It should be clarified that the proposed research model is based on the skill acquisition process (in the digital and financial areas) that results in professional maturity (Kaba & Ramaiah, 2020). Taking the definition of DFC (FinEQUITY, 2021; Morgan et al., 2019) the measurement of DFC could be reflected in the outcome of the skill acquisition process by the individual, referred to as "career maturity" or "personer job maturity" (Barendse, 2015; Kaba & Ramaiah, 2020; Qonitatin & Kustanti², 2021; Rahim, Jaafar, & Arsad, 2021).

3.3. Variable description and values

As illustrated in Figure 1; the scales (variables) are measures of digital financial capacity corresponding to aspects (domains). Eleven (11) scales to measure 11 dimensions of digital financial competency; Each of those scales is integrated with digital literacy and financial literacy (FinEQUITY, 2021; Morgan et al., 2019). The scales are used to design the questionnaire to collect information. Therefore, the questions in the questionnaire are integrated with digital literacy and financial literacy; At the same time, those scales are divided into 5 levels, reflecting the 5 levels of professional maturity (from the novice to the expert) as stated (Kaba & Ramaiah, 2020).

Values and scales of component competencies are coded with letters (A,B,C,D,E,F,G,H,I,K,L). As noted above, the measures reflect the intersection of financial literacy and digital literacy (FinEQUITY, 2021; Morgan et al., 2019) simultaneously measure aspects of digital literacy in relation to financial literacy; These scales measure competencies on five levels reflecting professional maturity (Deursen & Van Dijk, 2009; Janssen et al., 2013a; Kaba & Ramaiah, 2020; Martin & Grudziecki, 2006; Murray & Perez, 2014; Vodă et al., 2022); Therefore, the values of the corresponding observed variables in the components (A,B,C,D,E,F,G,H,I,K,L) are the determinants of DFC; and their values would be range from 1 to 5 (where “5” is the best). Similarly, the M scale, is also divided into 5 levels corresponding to 5 levels of professional maturity. And therefore, the observed component values of the M-scale also range from 1 to 5.

3.4. Data collection and processing

Data obtained through the survey questionnaire. In which, the questions are designed with 5 levels (similar to the 5-level Likert scale) reflecting 5 levels of professional maturity respectively. Such professional maturity questions correspond to 11 digital financial competency dimension. This question is designed based on research by Janssen et al., (Janssen et al., 2013a) as well as benefited from studies on digital financial capacity (FinEQUITY, 2021; Morgan et al., 2019). In addition, the questions are designed in the form of a behavioral scale (Behaviorally Anchored Rating Scale -BARS) (Debnath, Lee, & Tandon, 2015; joboko, 2020; Kaba & Ramaiah, 2020; Klieger et al., 2018; McCoy, 2020).

Interviews were conducted face-to-face and emailed (in google form) to about 500 people. The data obtained by responded by 431 employees working in the banking sector in Vietnam;

As mentioned, a total of 431 interviewees came from the Northern provinces and cities (Hanoi, Vinh Phuc, Hai Phong) and the South (Ho Chi Minh City, Binh Duong, Dong Nai, Ninh Thuan). In which: 24.1% from the State Bank of Vietnam - representing policymakers and supervisors of banks in Vietnam, 24.8% from state-owned commercial banks (SOCBs); 26.2% from joint-stock commercial banks (JSCs); 24.8% from other credit institutions.

SPSS25 software is used to process and test the research hypotheses with the data obtained.

3.5. The econometric model and its variables

3.5.1. The econometric model

(.) Exploratory factor analysis (EFA). The procedures include: descriptive statistics; Evaluate the reliability of the scale according to Cronbach's Alpha index; exploratory factor analysis (EFA); Multivariate regression analysis...(.) In addition, testing the mean difference according to individual characteristics is done by one-way analysis of variance (One-way ANOVA), in-depth test ANOVA (Post Hoc)...In which, the variables measuring the component competencies (competency area) and the variable "digital competency" are measured by the behavioral scale (BARS, as mentioned) on the basis of a 5-level scale.

corresponding to 5 levels of professional maturity; Demographic variables are also included in the test model appropriately according to the requirements of the study and inherited from previous studies.

The variables in the econometric model: the study is expected to estimate the impact of the factors (specific competency areas) as independent variables (A,B,C,D,E,F,G,H,I,K,L) affects DFC which is the dependent variable (**M**). It is also hypothesized that demographic factors have statistically significant relationship with DFC.

Then the econometric model could be as follows:

$$f(M_i) = \beta_0 + \sum_{i=1}^{11} \beta_i X_i + \epsilon \quad (1)$$

Where: β_i là are the coefficients; X_i corresponds to variable A, B, C, D, E, F, G, H, I, K, L (independent variable)

Where: β_i are the coefficients; X_i corresponds to variables A, B, C, D, E, F, G, H, I, K, L (independent variables) respectively,

3.2.2. Econometric model variables

- Dependent variable (**M**): as mentioned above, it represents the ability "Seamless use demonstrating self-efficacy" about digital technology for personal financial activities. This measure reflects an individual's level of proficiency in DFC, which is the intersection between digital literacy and personal financial literacy (FinEQUITY, 2021; Morgan et al., 2019). Values range of **M** from 1 to 5 reflecting 5 levels of professional maturity.

- Independent variables. As mentioned above (A,B,C,D,E,F,G,H,I,K,L), they reflect the component or domains competency (Janssen et al., 2013a). In addition, it is noted that, they also reflects the multifaceted characteristic of DFC (which integrated digital literacy and personal financial literacy) (FinEQUITY, 2021; Morgan et al., 2019). Similar to dependent variable, values of independent variable also range from 1 to 5, reflecting 5 levels of professional maturity of each domains of DFC;

- Demographic factors (gender, age, income, education, occupation ...) are considered as control variables that affect the population's intellectual level due to different characteristics of each individual. ANOVA analysis is used to assess the difference in DFC between groups or within these groups.

4. Results

4.1. Research results

4.1.1. Exploratory factor analysis (EFA)

The econometric model includes 12 variables (scales): 11 independent variables (corresponding to 32 observed variables measuring different aspects of DFC; and 1 dependent variable (corresponding to 4 observed variables measuring digital DFC in term of levels of maturity). The results of the scale reliability testing (Cronbach's Alpha in Table 1) show that the condition for EFA is satisfied (Trọng & Ngọc, 2008).

Table 1. Scales reliability (Cronbach Alpha test results)

No	Scale (variables) of digital financial competencies as domains/ dimensions	Number of characterized variables	Cronbach Alpha
1	(A) General digital knowledge and functional skills associated with daily personal finance;	A (1-4)	0.723
2	(B) Using digital technology associated with personal financial activities in daily life;	B(1-4)	0.818
3	(C) An in-depth and advanced competency to work and demonstrate digital creativity associated with personal finance;	C(1-4)	0.776
4	(D) Communication and cooperation through digital means for personal financial activities;	D(1-4)	0.848
5	(E) Processing and managing information digitally related to personal financial operations;	E(1-4)	0.665
6	(F) Digital privacy and security in personal finance	F (1-4)	0.732
7	(G) The relevant legal and ethical perspective on digital aspects of personal finance	G(1-4)	0.636
8	(H) Have a balanced attitude towards financial-related digital technology	H(1-4)	0.854
9	(I) Understanding and awareness of the role of ICT (digital) in relation to financial performance;	I (1-4)	0.940
10	(K) Learning about and with digital technologies associated with personal finance	K (1-4)	0.809
11	(L) The capability to make analyzed decisions about digital technologies associated with personal finance	L (1-4)	0.751
12	(M) Seamless use, demonstrating self-efficacy of digital technology for personal finance	M (1-5)	0.871
<i>Source: A, B, C, D, E, F, G, H, I, K, respectively, are characterized variables; M is the dependent variable (Janssen et al., 2013a); and Cronbach Alpha test results by author</i>			

MO & Bartlett's test results show that the observed variables in the population are correlated with each other and factor analysis (EFA) is appropriate: KMO and Bartlett's test for Sig.= 0.000 (sig.<0.05); The KMO value is 0.938 with the method of factor extraction (principal component), the method of factor rotation (Varimax) allows to extract 8 factors from 32 observed variables that meet the requirements of loading factor > 0.55 and extracted variance cumulative is 66.933 (>50%), that is, these 8 factors explain 66.933% of the variation of the data and correspond to Initial Eigenvalues from 1,033 to 17.022. The EFA results are described in Table 2.

Table 2. EFA analysis results: Factors affecting digital financial capacity

4.1.2. Multivariate regression

EFA analysis converges to 08 factors containing observed variables. The variables for multivariate regression would be as follows: $x_1, x_2, x_3, x_4, x_5, x_6, x_7, x_8$,

It is hypothesized that the independent variables: $x_1, x_2, x_3, x_4, x_5, x_6, x_7, x_8$ are correlated with the dependent variable (M or DFC). Given the results of the Spearman test are satisfied (sig. < 0.05, respectively), it could be concluded that these independent variables: $x_1, x_2, x_3, x_4, x_5, x_6, x_7, x_8$ are linearly correlated with the dependent variable DFC. Therefore, these variables: $x_1, x_2, x_3, x_4, x_5, x_6, x_7, x_8$ could be possible inputs of the multivariable regression model to explain the variable "digital financial capacity" (DFC).

To explore factors affecting DFC or level maturity of digital finance; and to test the suitability of independent variables (factors that reflect the areas of DFC) and dependent variables (DFC), the author uses multi-variable regression to test the impact of many independent variables to dependent variable in quantitative research model as follows:

$$DFC = \beta_0 + \sum_{i=1}^n \beta_i x_i + \varepsilon \quad (1)$$

$$DFC = \beta_0 + \sum_{i=1}^8 \beta_i x_i + \varepsilon \quad (2)$$

In which DFC is dependent; And independent variables include variables: $x_1, x_2, x_3, x_4, x_5, x_6, x_7, x_8$ and β_i ($i=1..,7$) are coefficients. Considering in factors $x_1, x_2, x_3, x_4, x_5, x_6, x_7, x_8$ which factors really affect the level of maturity in personal digital finance or the degree in "Seamless use, demonstrating self-efficacy of DFC directly will be done by linear regression equation; illustrated as above (2).

Table 4. Variable as domains of DFC and Multi -variable regression results

Domains of digital financial competency explain for variables	Independent variables	Coefficient

4.3.4. Hypotheses testing

The research hypothesized that 11 factors statistically significant impact on DFC. However, the EFA analysis has converged on 8 factors that are somewhat different from the expectations.

Referring to the results of EFA and the regression coefficients (Table 4), except x_5 , there are 07 independent variables ($x_1, x_2, x_3, x_4, x_6, x_7, x_8$) with the positive coefficients, togetwitd sig, <0.05. These standardization coefficient of these variables is positive and has statistical significant at sig. <0.05. It means that the hypotheses of $x_1, x_2, x_3, x_4, x_6, x_7, x_8$ are accepted at 95% statistical significant (except x_5).

The description of the variables in the model in Table 4 reflects the multifaceted nature of the DFC as its definition.

As the regression result, $x_1, x_2, x_3, x_4, x_6, x_7, x_8$ impact on DFC would be explained by the following model:

$$DFC = -1.463e^{(-16)} \left[+ 0.095x_1 \right] + 0.437x_2 + 0.216x_3 + 0.224x_4 + \left[0.104x_6 \right] + 0.318x_7 \left[+ 0.207x_8 \right]$$

4.2. Discuss the results of multivariate regression

(i) Unnormalized regression coefficient:

According to the variables $x_1, x_2, x_3, x_4, x_6, x_7, x_8$ we can discuss as follows:

Variable x_1 has a regression coefficient of + 0.095, positively related to personal DFC. It could be explained that when x_1 increases by 1 point, the personal DFC increases by 0.095 points (corresponding to the unnormalized correlation coefficient of 0.095);

Variable x_2 : has a regression coefficient + 0.437, positively related to personal DFC. It could be explained that when the factor x_2 increases by 1 point, the personal DFC increases by 0.437 (corresponding to the unnormalized correlation coefficient of 0.437);

Variable x_3 : has a regression coefficient + 0.216, and has a positive relationship with DFC. It could be explained that when the factor x_3 increases by 1 point, the personal DFC increases by 0.216 points (corresponding to the unnormalized correlation coefficient of 0.216);

Variable x_4 : has a regression coefficient + 0.224, having a positive relationship with personal DFC. It means that when the factor x_4 increases by 1 point, the personal DFC increases by 0.224 points (corresponding to the unnormalized correlation coefficient of 0.224);

Variable x_6 : has regression coefficient + 0.104, has a positive relationship with personal DFC. It means that when the factor x_6 increases by 1 point, the personal DFC increases by 0.104 points (corresponding to the unnormalized correlation coefficient of 0.104);

Variable x_7 : has a regression coefficient of +0.318 that is positively related to personal DFC. It means that when the factor x_7 increases by 1 point, the personal DF increases by 0.318 points (corresponding to the unnormalized correlation coefficient of 0.318).

Variable x_8 : has regression coefficient + 0.207, has a positive relationship with personal DFC. It means that when the factor x_8 increases by 1 point, the personal DFC increases by 0.207 points (corresponding to the unnormalized correlation coefficient of 0.207)

(ii) Standardized regression coefficient:

The normalized regression coefficients could be expressed as a percentage reflecting the contribution of or factors (independent variables) to DFC (Table 5):

Table 5. Contribution of variables affecting digital financial competency

Name of variables as dimension of digital financial competency	Variables	Contributions	
		Valoue	%
(G) The relevant legal and ethical perspective on digital aspects of personal financel and (K) Learning about and with digital technologies associated with personal finance	x2	0.437	27.2%
(E) Processing and managing information digitally related to personal financial operations;	X7	0.318	19.8%
(C) An in-depth and advanced competencyto work and demonstrate digital creativity associated with personal finance;	X4	0.224	14.0%
(D) Communication and cooperation through digital means fore personal financial activities;	X3	0.216	13.5%
(A) General digital knowledge and functional skills associated with daily personal finance;	X8	0.207	12.9%
(F) Digital privacy and security in personal finance	X6	0.104	6.5%
(H) Have a balanced attitude towards financial-related digital technogyl and (I) Understanding and awareness of the role of ICT (digital) in relation to financial performance	X1	0.098	6.1%
Total		1.604	100%

The variable x_2 contributes 27.2 %, followed by the variable x_7 (19.8%) followed by the variable x_4 (14.0%); followed by x_3 (13.5%); followed by x_8 (12.9%); followed by x_6 (6.5%) and finally the variable x_1 (6.1%), by that order of impact from stronger to weaker on DFC.

Conclusion, it could be concluded that: the factors affecting the personal DFCs are in the order of importance respectively $x_2, x_7, x_4, x_3, x_8, x_6$ and x_1 . The description of variables are illustrated in Table 6.

4.5. Test the mean difference in digital financial competency

Inheriting hypothesis from previous studies (Vodă et al., 2022), given Histogram plot showing the normally distributed pattern of DFC, One way ANOVA analysis are carried out with control variables. Using Levene's Test (Levene's Test sig. >5%; ANOVA sig.<5%); and Duunet T3 (Levene's Test sig. =<5%), results as follows:

-There is a statistically significant difference in DFC: (+) between staff groups of different educations. Specifically, the staff groups of higher-level education have higher DFC; and (+) between staff groups of different positions. In which, the staff group of positions/ duties associated with the business activities of the credit institution have better DFC than the other groups.

-While the test does not find a statistically significant difference in DFC of staff grouped by gender, institutions, majors, head office-branch; IT, digital economy as well as digital finance training.

5. Conclusions & Implications

5.1. Conclusions

Inheriting previous studies on the digital competency framework; the structural definition of the digital financial competency (DFC); Data collected through interviews with 431 domestic bank employees. Exploratory factor analysis resulting 7 factors determine the DFC of bank employees. Additionally, the ANOVA analysis shows that there are statistically significant differences in DFC between groups of education among employees (the higher level of education will be the higher level of DFC); and the group positions associated with profit-making has better DFC than the other groups. While analysis could not find statistically significant difference in DFC grouped by some demographic characteristics, and IT, digital economy or finance training.

5.2. Implications

Benefiting from the estimated results, authors have the following relevant policy implications:

- Relevant agencies should accelerate the implementation of the National Strategy on Digital Human Resource Development (Thủ tướng, 2022b, 2022c); building a digital competency framework for all citizens in general and then for workers in important fields (such as the banking sectors, including policymakers). There is a need for a basic digital competency training program as a foundation to develop advanced capabilities for employees in specific industries such as the banking industry, where a strong digital transformation is taking place. It is suggested that training courses should focus on legal and ethical issues related to the digital aspects of personal finance and promote personal

motivation in learning digital technologies related to personal finance. These are fundamental elements and therefore they will contribute strongly to the improvement of DFC as the regressed results.

- It is necessary to define a specific digital finance competency framework (DFC) for employees in the financial industry before conducting relevant training. As mentioned, DFC has a broad and multifaceted structure of digital literacy and financial literacy. Currently, however, state agencies seem to be focusing on training IT and digital skills simply and separately. As mentioned, currently, there is no (widely recognized) digital financial competency framework as a guideline for training implementation. Several studies have linked digital competency with personal financial literacy (Prete, 2021); and DFC has a multidisciplinary, interdisciplinary structure; This is also a controversial issue (FinEQUITY, 2021; Morgan et al., 2019; WEF, 2015).. Regression results have shown that a number of important knowledge and skill areas have a multi-faceted, multidisciplinary/field structure that affects DFC. Therefore, in developing a DFC framework for bank employees, the characteristic of the cross-cutting structures of DFC should be taken into consideration, before implementing the training programs oriented by the Government (Thủ_tướng, 2022a, 2022b).

- Strengthen innovation capacity training for bank CEOs to improve organizational capacity of new technologies absorption; create a foundation to strengthen DFC and promote digital transformation in the banking sector. ANOVA analysis shows that profit-making employees have better DFCs than CEOs and other departments. This suggests that the DFC training for the bank's directors, deputy directors, and related officers is required. To this end, training is needed to improve the capacity for new technology absorption that underpins the DFC promotion. This orientation certainly not only supports the digital transformation process but also ensures safe and effective banking operations in the current context of digital transformation domestically and internationally.

- There should be policies for internal exploitation and external absorption of qualified human resources for digital transformation in the banking sector. The results of the ANOVA analysis show that the higher the education level of the group, the higher the corresponding DFC. This suggests taking advantage of existing high-quality digital human resources as well as attracting investment. This makes sense because DFC is a multi-faceted and cross-cutting structure, and therefore highly educated staff often go hand in hand with better DFC as their better at accessing and absorbing technology. In addition, this team will certainly be the starting point for employees' digital transformation; and in that, specifically when they are used as lecturers on digital transformation in government programs (Thông_Đức, 2022a; Thủ_tướng, 2022b, 2022c).

- More large-scale studies on DFC are needed to develop a specific DFC framework for bankers in Vietnam. Despite many efforts, it can be admitted that the research still has certain limitations. Studies (Murawski et al., 2020) also show a lack of consistency in DFC; and there are controversies about the DFC framework for banks' employees./.

THE INFLUENCE OF AUTHENTIC LEADERSHIP ON INNOVATIVE WORK BEHAVIOR OF EMPLOYEES IN THE BANKING SECTOR IN VIETNAM: A LITERATURE REVIEW AND A PROPOSED MODEL

Thanh Kim Hue

huetk@hvnh.edu.vn

Banking Academy of Vietnam, Bac Ninh Campus, Bac Ninh, Vietnam

Abstract

The purpose of this paper is to review previous research and to propose a conceptual framework for the influence of leadership styles on innovative work behavior (IWB) of employees. This provides the foundation for the authors to conduct further empirical research in the banking sector in Vietnam. A model and hypothesis are developed based on a review of previous research. It is proposed that authentic leadership has a positive direct influence on IWB. Not only that, but those said leadership style is also expected to have an indirect relationship with the IWB through the mediating roles of knowledge sharing. The study contributes theoretically as it extends current knowledge of the impact of leadership styles on IWB, which contributes to further developing an integrated framework of leadership-related factors for enhancing IWB in organizations, especially in the banking sector.

Keywords: *Leadership style, Innovative work behavior, Authentic leadership, Knowledge Sharing*

1. Introduction

The cultivation of Innovative Work Behavior (IWB) and the concomitant motivation of employees to exhibit greater creativity and innovation in the workplace is widely regarded as a strategic objective for businesses across various sectors, both financial and non-financial. In addition, the IWB of employees is a crucial factor in determining the success of enterprises, as it enables them to establish a competitive edge in the market (Wang et al., 2015; Jiang & Gu, 2016; Shin et al., 2017). Enhancing the innovative capacity of employees is considered a sustainable approach for organizations to enhance operational efficiency, as per the findings of Janssen et al. (2014). Therefore, understanding the characteristics that influence employees' IWB is crucial for firms across numerous industries (Savelsbergh et al., 2012; Somech & Khalaili, 2014).

In contemporary times, scholarly research has predominantly examined the significance of innovation as a crucial asset for ensuring the sustained expansion of business organizations (De Jong & Den Hartog, 2010). Numerous studies have been conducted to investigate the various internal and external factors that influence the IWB of employees. Among these factors, the most significant seems to be the influence of leadership styles. Therefore, many research has focused on assessing the direct and indirect impacts of leadership style on employees' IWB. However, research on the Innovative behavior of

employees is still limited because most comments are one-way subjective about the impact of leadership styles on IWB's employees. There is still a lack of consistency in the factors affecting the IWB of employees (Walumbwa & Schaubroeck, 2009). Consequently, there is a call for a study that conducts more precise and detailed investigations regarding the influence of leadership on employees' IWB. Which includes an extensive analysis of the factors that affect such behavior. Additionally, there is a necessity for a broader range of research areas concerning this subject, as suggested by Brown et al. (2005); Brown & Treviño (2006).

Amidst the current trend of global integration and the impact of the Covid-19 pandemic, fostering innovative behavior among employees is widely regarded as a key principle in the operational strategy of commercial banks. Hence, commercial banks are inclined towards promoting novel concepts aimed at enhancing operational procedures and augmenting the performance of their workforce. Innovation initiatives undertaken by enterprises are likely to yield a plethora of innovative products and services, enable prompt responsiveness to consumer demands, and enhance the competitive standing of said enterprises. The advancement of leadership styles and the encouragement of IWB among employees in commercial banks have contributed significantly to the innovation of enterprises. Numerous prior researchs has demonstrated that Authentic possesses a direct influence and an indirect influence on the IWB of employees. However, yet there is limited research looking at how authentic leadership style affects employees' IWB in the banking industry, particularly in the Vietnam context. Consequently, it is imperative to assess the effects of leadership on the innovation behaviors exhibited by employees in the banking sector in Vietnam.

Therefore, we must continue to study the influence of leadership styles on the IWB of employees in the banking sector. More precisely, this study will focus on reviewing the literature review and propose a model and measure instruments that would be the base for further empirical research.

The present paper is structured as follows: Section 2 provides a comprehensive review of prior research on the direct and indirect impact of leadership styles on innovative work behavior. In Section 3, a model, hypotheses, and recommended scales for future research are presented. Finally, Section 4 outlines the conclusions and implications of the study.

2. Literature review and Hypotheses

2.1. Literature review

Authentic Leadership

According to Luthans et al. (2003), authentic leaders are confident, optimistic, ethical, and focused on developing successors. The fundamental components of authentic leadership are self-awareness, self-regulation, trust in personal characteristics, emotional stance, and intelligence, as indicated by Luthans et al. in 2003. Authentic leaders tend to promote diversity of thought among their employees (Avolio, 2007). Authentic behavior and authentic relationship orientation are believed to aid leaders in objectively accepting

situations, prioritizing the well-being of their employees, and striving toward favorable outcomes for the organization. Authentic leadership has been defined by Walumbwa et al (2008) in various dimensions, one of which is self-awareness. Self-awareness is defined as an individual's introspective assessment of their own personality traits, behaviors, and attitudes, which allows them to gain insight into their own identity and perception of the world around them. It is important for individuals to have an awareness of their personal strengths and weaknesses in order to comprehend their influence on others. (2) Transparency in the relationship. The act of being transparent in interpersonal relationships is considered a manifestation of one's innate self-expression. The concept of transparency in leadership pertains to the practice of openly communicating and disclosing a range of information, as well as expressing genuine emotions, which in turn fosters trust among followers. (3) Balanced Processing, which refers to the conduct of leaders who demonstrate the ability to evaluate all available information in a fair and impartial manner prior to arriving at a decision. (4) Internalized Moral Perspective. The process of internalizing a moral perspective pertains to an individual's capacity to exercise self-control or self-regulation. Therefore, the practice of authentic leadership results in decision-making that aligns with established ethical norms.

Knowledge Sharing

Knowledge is an important organizational resource that provides a sustainable competitive advantage in a competitive and dynamic economy (Davenport & Prusak, 1998; Foss & Pedersen, 2002; Grant, 1996; Spender & Grant, 1996). Knowledge sharing refers to providing mission information and experiences to help and collaborate with other members to solve problems, develop new ideas, or implement policies (Cummings, 2004; Pulakos et al., 2003). Sharing knowledge within the company has a positive effect on cost reduction, speeding up the completion of new product projects, team performance, and company performance, and especially has a positive effect on a firm's innovation capacity (Arthur & Huntley, 2005; Cummings, 2004; Hansen, 2002; Mesmer-Magnus & DeChurch, 2009; Collins & Smith, 2006). According to Cummings, (2004), knowledge sharing including knowledge sharing inside the organization or sharing knowledge outside the organization has an important role in improving work efficiency. This means that employees have a better chance of achieving job performance when knowledge is shared between members of the organization and with people outside the organization in their social relationships. Knowledge sharing within the organization may include providing information to customers or providing project information feedback to management (Cummings, 2004).

Innovative Work Behavior

According to Janssen (2000), IWB is the creative, purposeful application of new ideas in order to benefit the performance of that role. IWB was also defined by Dorenbosch et al. (2005) as the willingness of employees to produce innovation, such as improving the way they work, utilizing computers, or creating new services or products. On the other hand, IWB is also defined as a multi-stage process in which an individual realizes a problem, generates

new ideas and solutions, then works to promote and build support for it, and at the same time creates a model that can be applied to its use and enhance the benefits of the organization (Carmeli et al., 2006).

Shalley et al. (2004) asserted that in order to foster employee performance, companies must engage in innovation due to the ever-evolving nature of the contemporary work environment. According to Chen & Huang (2009), innovation activity is regarded as a significant input factor in the crystallization process of enterprise values. The innovative work behavior (IWB) exhibited by employees is a crucial determinant of competitive advantage and success for enterprises, as highlighted by several studies (Wang et al., 2015; Jiang & Gu, 2016; Shin et al., 2017;). According to Rank et al. (2004), the identification of employee innovation behavior is contingent upon their involvement in activities that promote their professional growth and development as well as their efforts to innovate and enhance their work performance within the organizations they are affiliated with. In the workplace, obstacles and hindrances necessitate that employees generate more innovative concepts to enhance operational efficacy and align with contemporary trends. According to Janssen et al. (2004), innovation plays a crucial role in enhancing organizational efficiency. Enterprises that are able to capitalize on opportunities resulting from positive changes brought about by innovation are likely to achieve remarkable success.

The impact of IWB on businesses is contingent upon the innovative capacity of employees, thereby resulting in enhanced operational efficiency (Janssen, 2000). Previous studies mostly identified employees as the source of innovation, through which scholars mainly focus on assessing the importance of IWB for organizational success. According to Janssen (2000), businesses can effectively integrate, keep up with trends, and adapt to the rapid changes of today's world when their employees possess the willingness and the ability to innovate. Janssen (2000) also indicated that the innovation of a firm is significantly impacted by the actions of its individual employees. Not only that, the idea of research on the importance of employee IWB is emphasized in many managerial theories around the world such as total quality management or enterprise entrepreneurship (Sharma & Chrisman, 1999). Consequently, researchers globally have exhibited a growing interest in identifying the determinants that impact the IWB of employees (Woodman et al., 1993; Scott & Bruce, 1994).

Research has indicated that the internal and external variables have a significant impact on the employee's IWB within the organizational setting. A number of studies have also shown that one of the effective ways to increase employees' IWB is by encouraging their creativity in the working process (De Jong & Den Hartog, 2010). It is imperative for the organization to incentivize its workforce to leverage their innovative potential and endow them with the autonomy to suggest novel ideas. This helps to increase employees' confidence in their personal abilities, and at the same time, promotes the desire to contribute many innovative ideas to improve working processes that have many gaps, and improve products and services that are not suitable (Janssen, 2000).

In addition, many scholars who have studied IWB in enterprises have shown that there exist many different factors affecting employees' IWB. Many studies have shown the internal and external factors affecting employees' IWB, in which the most prominent is the impact of leadership styles. The impact of leadership style on employee's innovative work behavior has been extensively studied, with Authentic leadership emerging as two prominent factors frequently examined in the literature.

2.2. Hypotheses

Authentic leadership

Authentic relationship orientation necessitates honesty, directness, and trustworthiness in interpersonal connections. The theory of authentic leadership is based on the leader's ethical behavior in making decisions based on a high degree of self-awareness and establishing transparent relationships with subordinates for optimal performance (Avolio & Gardner, 2005). Research has demonstrated that authentic leadership has a beneficial impact on various aspects of work life. This is due to the fact that target leadership traits foster a positive work attitude and enhance employee motivation toward their work. Authentic leaders possess the capacity to inspire their subordinates to attain objectives, enhance their performance, and foster innovative conduct. According to Kim (2014), it is imperative for leaders to enhance trust and mutual trust among their subordinates, foster collaboration, and attain optimal levels of work innovation. Effective leaders demonstrate a willingness to foster trust within the organization and promote positive attitudes among employees (Edú-Valsania et al., 2016). This is achieved through the transmission of motivation and encouragement of innovative behavior, ultimately leading to positive outcomes in the workplace. According to George (2003), authentic leaders play a significant role in enhancing the psychological capital, hope, and positive emotions of their subordinates, thereby motivating them to exert greater effort in their work. When employees have confidence in their leader, they are more likely to engage in proactive behaviors such as seeking out novel approaches to tasks and striving for improved work outcomes, resulting in enhanced performance (Kim, 2014).

The model incorporates the authentic leadership style, which has been derived from prior research conducted by Scott & Bruce (1994), Oldham & Cummings (1996), Walumbwa et al (2008), Oke et al., (2009), Purwanto et al (2020), and Sengupta et al (2020). Empirical research has substantiated a direct correlation between authentic leadership and the IWB of employees. According to Oke et al. (2009), leaders have the ability to improve employee innovation behavior and foster attitudes that are favorable to engaging in innovative activities. According to authentic leadership theory, authentic leaders can stimulate innovation by encouraging their followers to become bolder and more imaginative (Walumbwa et al., 2008). Authentic leadership style has a positive relationship with employee creativity and innovative behavior, and employee creativity also has a positive effect on organizational innovation (Müceldili et al., 2013).

Thus, the first hypothesis of this research is

H1: Authentic Leadership has a positive impact on employee IWB

Authentic leadership and knowledge sharing

Avolio & Gardner (2005) indicated that authentic leaders encourage the open sharing of information with their employees, which will increase the effective interaction among employees, thereby promoting knowledge sharing (Cabrera & Cabrera, 2005). Peterson & Peterson, (2012) stated that fairness, motivating employees to share knowledge of authentic leadership styles contributes to encouraging knowledge sharing in the organization. In addition, research by Rego et al (2013) and research by Walumbwa et al. (2011) also suggest that sharing knowledge will help employees accumulate knowledge and learn new skills. Thus, employees will be more confident in their abilities and capabilities (Rego et al., 2013; Kirkman & Rosen, 1999).

Thus, the following hypothesis is proposed:

H2: Authentic leadership has a positive impact on knowledge sharing.

Knowledge sharing and innovative work behavior

Knowledge has a positive effect on innovation (Hulsheger et al., 2009). Sharing knowledge within the company has a positive effect on cost reduction, speeding up the completion of new product projects, team performance, and company performance, and especially has a positive effect on a firm's innovation capacity (Cummings, 2004; Hansen, 2005). Sharing knowledge within the organization will also help protect valuable heritage, new techniques, technologies, enhancing the capacity to solve problems and propose new ideas (Hsu, 2008; Hu et al., 2009; Huang et al., 2010). According to Cummings (2004), increasing knowledge sharing in organizations leads to creativity and innovation that helps to develop new working methods, and new processes, and change traditional methods and practices. While sharing their knowledge with colleagues, individuals not only provide them with information but also synthesize and develop that knowledge into useful knowledge for work (Hansen et al., 2005). Likewise, when an individual acquires knowledge from others, he/she improves his/her ability to innovate (Hsu, 2008). Woocheol & Jiwon, (2017) also showed that knowledge sharing enhances innovative behavior.

Thus, the following hypothesis is proposed:

H3: Knowledge sharing has a positive impact on IWB.

A proposed research model and Hypotheses

Figure 1: Proposed research model

Source: Proposed by Author

Measurement

Authentic leadership

To measure authentic leadership, the author uses a scale developed by Neider & Schriesheim (2011), which consists of 16 questions assessing 4 components: Self-awareness, Relational Transparency, Internalized Moral Perspective, and Balanced Processing.

Self-Awareness: (1) My leader solicits feedback for improving his/her dealings with others. (2) My leader describes accurately the way that others view his/her abilities. (3) My leader shows that he/she understands his/her strengths and weaknesses. (4) My leader is clearly aware of the impact he/she has on others.

Relational Transparency: (1) My leader clearly states what he/she means. (2) My leader admits mistakes when they occur. (3) My leader openly shares information with others. (4) My leader expresses his/her ideas and thoughts clearly to others.

Internalized Moral Perspective: (1) My leader shows consistency between his/her beliefs and actions. (2) My leader uses his/her core beliefs to make decisions. (3) My leader resists pressures on him/her to do things contrary to his/her beliefs. (4) My leader is guided in his/her actions by internal moral standards.

Balanced Processing: (1) My leader asks for ideas that challenge his/her core beliefs. (2) My leader carefully listens to alternative perspectives before reaching a conclusion. (3) My leader objectively analyzes relevant data before deciding. (4) My leader encourages others to voice opposing points of view.

Knowledge sharing

The author references the scale of Carmeli et al. (2013), adapted from Lee (2001) and Lu (2006). The scale evaluates two factors, including knowledge-sharing behavior within the organization and knowledge-sharing behavior outside the organization (Carmeli et al., 2013). 8 observation items include: (1) Meet with my colleagues in this organization and exchange ideas with them regularly (2) Access my colleagues in this organization and exchange new ideas and developments with them. (3) Interact with my colleagues in this organization to discuss suggestions and ideas. (4) Make sure to be available for sharing experiences with my colleagues in this organization and meet and exchange ideas regularly with people outside this organization. (5) Access people outside this organization and exchange new ideas and developments with them. (6) Interact with people outside this organization to discuss suggestions and ideas. (7) Available for sharing experiences with people outside this organization.

Innovative work behavior

To evaluate innovative work behavior, the author inherits the scale of Scott & Bruce (1994), which includes 6 observation items: (1) I search for new technologies, processes, techniques, and/or product ideas. (2) I generate creative ideas. (3) I promote and champion ideas to others. (4) I investigate secure funds needed to implement new ideas. (5) I develop adequate plans and schedules for the implementation of new ideas. (6) I am innovative.

3. Conclusion and implications

Authentic leadership is the factor that are frequently examined in IWB studies. The results of previous studies are also quite consistent, saying that the factor has a positive effect on IWB. This paper examined the characteristics of authentic leadership style in relation to the IWB of employees through a literature review of previous research. The suggestion is that leaders should adopt authentic leadership in their leadership style since it is significant in predicting the innovation capabilities of employees and organizations.

In addition, the paper also indicated the mediating role of knowledge-sharing in fostering the impact of authentic leadership style on IWB. Authentic leadership is a leadership style that emphasizes transparency, authenticity, and honesty. Authentic leaders focus on building strong relationships and instilling trust and motivation in their employees. It also helps employees to be more open in sharing knowledge. Sharing knowledge between employees inside and outside the organization would help employees improve their professional capacity, experience, and skills, thereby having a positive impact on work performance and innovative behavior. As a result, in enhancing the innovation capacity of the organization, leaders should be aware of the roles of employees' knowledge sharing.

Despite the limitation that there may be other leadership styles that also have significant relationships to employees' innovative behavior beyond authentic leadership styles, as well as there may be other potential mediating factors that govern the influence of leadership style on IWB, research has provided an adequate research model on the influence of leadership style to IWB. The model takes into account the direct and indirect impacts of authentic leadership styles on employees' IWB through the mediating factor, knowledge sharing. Besides, based on the study of previous studies, the author has also proposed a scale for the research model. We hope that the research model proposed in this paper will contribute to the further development of an integrated framework of leadership-related factors for enhancing IWB in organizations, especially in the banking sector.

We suggested that further empirical research should be conducted to apply the above conceptual framework to study banking employees in Vietnam to reconfirm or reject the relationship between those said factors with IWB in this specific context. Therefore, it will point out the good points as well as the drawbacks of the research model.

A STAKEHOLDER PERSPECTIVE ON THE ADOPTION OF INTERNATIONALLY RECOGNIZED QUALITY CERTIFICATES OF SMES IN VIETNAM

Dr. Tran Ngoc Mai

maitn@hvnh.edu.vn

Faculty of International Business, Banking Academy, Hanoi, Vietnam

Abstract

Obtaining internationally recognized quality certifications has become a valuable means for manufacturing companies to exhibit their dedication to excellence, ultimately reducing market uncertainties stemming from incomplete information and deficiencies. Acquiring such certifications demonstrates the organization's commitment to quality, diminishes trade barriers, and endows a competitive edge in global markets, positively impacting business performance. Nevertheless, existing literature remains silent on the rationale behind why SMEs in emerging contexts seek internationally recognized quality certifications. This study employs stakeholder theory and data obtained from the SME Survey conducted in Vietnam during 2015, analyzing approximately 2,500 enterprises in ten provinces, to investigate the motivations behind Vietnamese SMEs' adoption of internationally recognized quality certifications with regard to the viewpoints and expectations of multiple stakeholders including customers, business associations, regulators and competitors. By shedding light on the intricate interplay of factors that affect SMEs' decisions in this particular domain, the study offers a unique perspective and approach to contribute to the ongoing discourse on the adoption of quality certifications in emerging markets.

Keywords: *internationally recognized quality certificates, stakeholder, SMEs, Vietnam*

1. Introduction

Quality management is a critical aspect of maintaining competitiveness and ensuring customer satisfaction in businesses. Internationally recognized quality certificates such as ISO 9001 and ISO 14001 can provide numerous benefits for SMEs as they demonstrate the organization's commitment to meeting globally recognized standards (Psomas & Antony, 2017). Studies have shown that adopting such certificates can lead to increased operational efficiency, customer loyalty, and market share (Doerga, 2021; Kakouris & Sfakianaki, 2018; Lazibat et al., 2022). However, studies also indicate that the adoption rate of international quality certificates among SMEs in developing countries like Vietnam remains relatively low.

Small and Medium Enterprises play a crucial role in the economy of Vietnam, constituting more than 97% of the total enterprises (Nguyen & Ngo, 2022). These SMEs contribute significantly to job creation, economic growth, and reducing poverty. Despite their importance, Vietnamese SMEs face several challenges, including limited

access to finance, inadequate managerial skills, and a lack of awareness about international quality certificates.

Understanding stakeholder perspectives on the adoption of internationally recognized quality certificates is essential, as stakeholders such as customers, employees, suppliers, and regulatory bodies can significantly influence the decision-making process. Research has shown that businesses that consider the expectations and needs of stakeholders are more likely to implement effective quality management practices (Montiel et al., 2019). Some studies have explored stakeholder perspectives on quality management among SMEs in Vietnam (Nguyen & Ngo, 2022); however, the focus on the adoption of international quality certificates remains limited.

Given SMEs' vital role in the global economic landscape and their unique challenges in accessing resources and complying with international standards, understanding the drivers of certification adoption among these enterprises is of paramount importance for both industry stakeholders and policymakers. The present study aims to bridge this gap in the literature by employing stakeholder theory to investigate the adoption of internationally recognized quality certificates among SMEs in Vietnam.

2. Literature review and hypotheses development

A growing body of literature highlights the importance of adopting internationally recognized quality standards for businesses, particularly for SMEs, to remain competitive and successful in global markets (Barbosa et al., 2021). Previous studies have emphasized the crucial role of stakeholders in influencing organizational decision-making, particularly in the area of quality management (Kim & Lee, 2012; Qi et al., 2012) and identified several types of stakeholder pressures. The following sections will discuss these stakeholder pressures in detail and their potential impact on the adoption of quality certificates among Vietnamese SMEs.

Customer Pressure

Customers, as primary stakeholders, can significantly influence the adoption of quality standards. Studies by Anderson et al. (1999), Jahn et al. (2005), and Tarí et al. (2014) demonstrated that customer demand for higher-quality products and services could act as a driver for organizations to acquire internationally recognized quality certifications. In Vietnam, consumer awareness of product quality and safety is growing, which may lead to increased pressure on SMEs to adopt such standards (Van et al., 2020).

Business Association Pressure

Industry groups and trade associations can play a significant role in promoting the adoption of international quality standards among their members. Font (2002) found that peer pressure from other firms or industry groups adopting quality certifications leads to increased adoption among the members of the same network. In Vietnam, the Vietnam Association of Small and Medium Enterprises (VINASME) has been actively promoting the importance of quality certification to its members.

Politicians and Civil Servants Pressure

Regulators and government agencies can also influence the adoption of quality certification. Ltd, (2010) and Santos et al. (2016) highlighted the role of regulatory pressures in motivating firms to adopt the ISO 9001 standard. In the context of Vietnam, it is important to consider the role of government initiatives, such as the National Quality Award, in promoting the adoption of international quality standards among Vietnamese SMEs.

Politicians and Civil Servants Pressure

Market competition is another factor that may influence the adoption of international quality certificates. Otrachshenko et al. (2023) and Santos et al. (2016) suggested that industries with higher levels of imported or foreign competition face greater pressure to adopt quality management systems to maintain competitiveness. Vietnamese SMEs facing competition from state-owned enterprises, non-state informal enterprises, and legal imports/foreign competition may be more inclined to adopt internationally recognized quality certificates.

Therefore, the following hypotheses are developed:

H1: Customer pressures positively correlate with the adoption of internationally recognized quality certificates of SMEs in Vietnam.

H2: Business association pressures are positively correlated with the adoption of internationally recognized quality certificates of SMEs in Vietnam.

H3: Regulator pressures positively correlate with adopting internationally recognized quality certificate SMEs in Vietnam.

H4: Level of competition from state enterprises, non-state informal enterprises and legal imports/foreign competition positively correlates with adopting internationally recognized quality certificate SMEs in Vietnam.

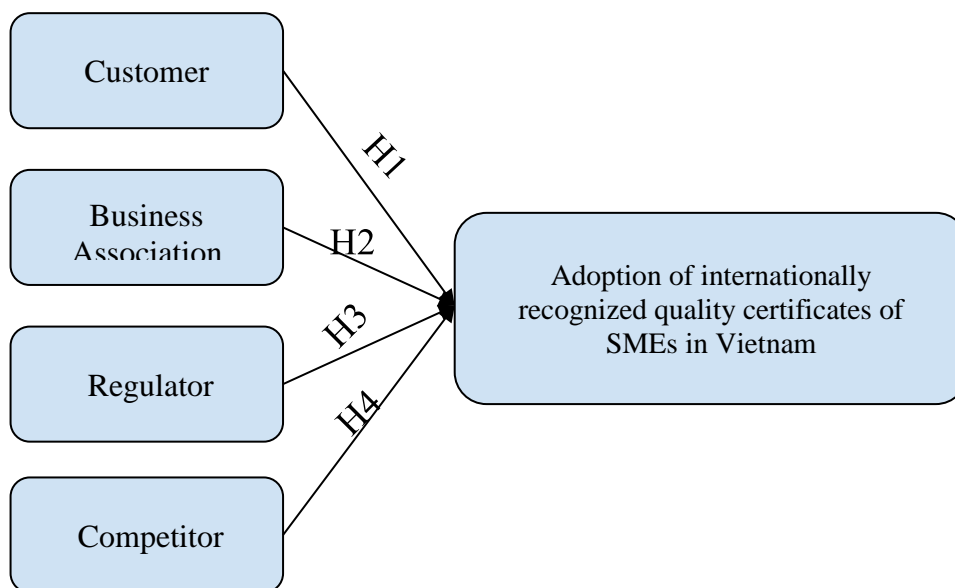

Figure 1. Proposed model

3. Method

To complete this research, data from the SME Survey in Vietnam from 2005 to 2015 was collected, covering approximately 2,500 enterprises in ten provinces such as Ha Noi, Quang Nam, Hai Phong, Phu Tho, and Khanh Hoa, Long An, Lam Dong and Ho Chi Minh City. It is the result of a collaboration between three entities: the Vietnamese Institute for Labor Sciences and Social Affairs (ILSSA), the Ministry of Labor Invalids and Social Affairs (MOLISA) and the Development Economics Research Group (DERG) at the University of Copenhagen in Denmark along with the World Institute for Development Economics Research at United Nations University (UNU-WIDER).

This study's unit of analysis is the owner/manager reporting on their SME after excluding "do not know" and missing values from the regression analysis; this results in a final sample of 417 valid observations. The logit model has been adopted in order to predict an organization's likelihood of obtaining an internationally recognized quality certificate. The binary variable is represented by the value of 1, which indicates that the surveyed organization has obtained an international certificate. The logarithm: $\text{Logit}(P) = \alpha + \beta_1 X_1 + \beta_2 X_2 + \dots + \beta_m X_m$, where m is the number of independent variables. These independent variables are survey questions evaluated on a 7-point scale (from very little to very much).

Table 1. Description of research variables

Variable label	Variable name	Variable description
IQC	International Quality	Firm has an internationally recognized quality certificate
DQC	Domestic Quality	Firm has a domestically recognized quality certificate
CUSTOMER	Pressure from customer	How important were buyers/customers for standards
ASSOCIATION	Pressure from association	How important were business associations for standards
INSTITUTION	Pressure form institution	How important were politicians and civil servants for standards
STATE	Pressure from state competition	Level of competition from state enterprises
NONSTATE	Pressure from non-state competition	Level of competition from non-state informal enterprises
FOREIGN	Pressure from foreign competition	Level of competition from legal imports/foreign competition

Table 2 demonstrates that around 3.82% of surveyed businesses have acquired the internationally recognized quality certification, while 12.73% have obtained the domestically recognized quality certification. A majority of these are small and medium-sized enterprises that are limited liability companies (23.99%). 89.25% of businesses possess

only one owner, who generally have the highest completed professional technical level without a certificate. 87.65% express that they face competition in their field of activity, with 61.12% indicating that competition levels have increased compared to 2 years ago.

Table 2. Descriptive statistic

Factors	Description	Freq.	Percent
Legal status	Household	1,663	62.83
	Private/sole proprietorship	167	6.31
	Partnership	4	0.15
	Collective/Cooperative	50	1.89
	Limited liability company	635	23.99
	Joint-stock company with state	10	0.38
	Joint stock company without state	118	4.46
One or multiple/owners	One owner	2,283	86.25
	Multiple owners	364	13.75
Ethnicity	Kinh	2,487	93.96
	Hoa	143	5.4
	Other	17	0.64
Professional education	Unskilled	86	3.25
	Technical level without certificate	893	33.74
	Vocational elementary	528	19.95
	Vocational secondary	234	8.84
	Professional secondary	192	7.25
	Vocational college	51	1.93
	College	139	5.25
	University and higher	524	19.8
Internationally recognized quality certification	No	2,546	96.18
	Yes	101	3.82
Certification recognized domestically (only in Vietnam)	No	2,310	87.27
	Yes	337	12.73

Factors	Description	Freq.	Percent
Competition in the field of activity	No	327	12.35
	Yes	2,320	87.65
Level of competition compared to 2 years ago	Increased	1,418	61.12
	Same	839	36.16
	Decreased	63	2.72

4. Results

4.1. Empirical analysis

To assess our hypothesis, a binomial logistic regression model was employed with the adoption of internationally recognized quality certificates as the dependent variable to analyze the effect of independent variables on the possibility of choosing to adopt or not adopt them.

Table 3. Regression results

	Internationally recognized quality certification
CUSTOMER	0.868595*
ASSOCIATION	1.566138***
REGULATOR	0.8334028***
STATE	0.6273231***
NONSTATE	1.378628*
FOREIGN	0.60381***
_cons	2.871999
Number of obs	417
Pseudo R2	0.2486
McKelvey and Zavoina's R2	0.426
-Log-likelihood	167.21607
Prediction	80.34%

*** $p \leq .01$; ** $p \leq .05$; * $p \leq .1$

*Indicates significance at 10%; ** indicates significance at 5%; ***indicates significance at 1%

Table 3 showcases the outcomes of the binomial logistic regression analysis. These coefficients reveal each variable's impact on the likelihood (expressed as a ratio of two probabilities) of acquiring or not acquiring the globally accredited quality certification. To interpret the odds ratios accurately, consider the following: A coefficient greater than one (or above zero) suggests that the respective variable heightens the likelihood of being in the specified category as opposed to the "adopt" group. Conversely, a coefficient of less than one indicates that the variable lessens the likelihood of being in the specified category compared to the "not adopt" group.

According to the model fit test outcomes, a significance level of less than 0.01 reveals a strong correlation between the dependent and independent variables. With a McFadden's R² of 0.426, the model accounts for 42.6% of the variation in the dependent variable, while the remaining percentage can be attributed to unaccounted factors. The Prob>LR value of 0.000 signifies that the relationship between variables is statistically significant, exceeding the 99% confidence interval. Boasting an average correct prediction of 80.34%, this model is deemed suitable for professional academic use.

4.2. Discussion

Pressure from *buyers/customers* significantly influences the enterprises' adoption of internationally recognized quality certification. Customers are like the compass that guides a business toward success. Unsurprisingly, companies strive to maintain a good rapport with their customers, as they can make or break a business's profitability and revenue. In order to keep up with customers' evolving demands, companies need to provide them with high-quality products and services. One of the ways companies achieve this is by implementing a quality certification program. For Vietnamese customers, international certificates are particularly appealing as they are often perceived as being superior to domestic ones. To win over customers, businesses must ensure they adhere to internationally recognized standards. In Vietnam, there's a struggle with consumer awareness of quality standards. This lack of awareness can impact businesses' decisions to adopt these standards. To bridge the gap, policymakers should explore various communication channels, from national TV to social media, to educate and inform consumers. When shoppers have an understanding of quality standards, they can make better purchasing decisions. In turn, businesses are motivated to apply such standards to meet customer needs.

The decision to adopt quality certifications can be heavily influenced by formal and informal regulatory pressures. Politicians, civil servants, and business associations can play a significant role in driving continued participation by individual firms. These associations can include groups like professional bodies and activist organizations, and they can be powerful motivators for enterprises seeking to meet internationally and domestically recognized standards. Certification standards serve as a worldwide guideline that puts specific requirements on firms that aim to earn recognition. Implementing these regulations go beyond traditional regulatory guidelines in the industries they serve. Companies investing in these standards are able to showcase their accomplishments to key external groups such as regulators, clients, and financial institutions (Berliner & Prakash, 2014). As a result, it's

essential for policymakers to promote the creation of industrial unions in businesses and support the development of trade associations.

The impact of competition on a company's decision to gain internationally recognized quality certification is paramount. It's no secret that being certified can significantly improve a company's marketability and competitive edge. When a company achieves such certification, it shows customers its products or services meet high standards, increasing confidence and support. However, when it comes to domestic quality certification, the pressure from competitors is less significant, as these certifications are less prestigious and provide lower credentials. Essentially, the push to obtain the best certification possible is driven by the desire to stand out in an increasingly crowded market. By adopting international quality certificates, companies meet domestic standards and a competitive advantage that can be crucial in today's market. As a result, more and more businesses are adopting these practices, creating a domino effect that puts pressure on non-adopters to follow suit (Guler et al., 2002). This type of competition is not limited to businesses but can also be seen in social systems where members may imitate each other for competitive reasons. To encourage an environment of healthy competition, policymakers can establish legal frameworks and non-enduring mechanisms. By doing so, the benefits of competition can be promoted, and businesses can thrive in an environment that fosters innovation and growth.

5. Conclusion

By employing stakeholder theory as a theoretical lens and utilizing a mixed-methods research design, this study seeks to contribute to the extant literature on quality certification adoption in the context of emerging markets. The study highlights the significance of customers, business associations, politicians and civil servants and competitors as key drivers in the decision-making process for SMEs. Findings from this research have the potential to enrich not only an academic understanding of the factors influencing SME decision-making in relation to quality certifications but also provide valuable insights for industry professionals, certification bodies, and policymakers as they seek to encourage and support the pursuit of internationally recognized quality standards among SMEs in Vietnam and similar emerging market settings.

This research study has achieved some results, yet several limitations must be considered in order to direct future research. Firstly, the study focuses on small and medium-sized enterprises within the Vietnamese market, suggesting that results may not necessarily be applicable to other settings. Secondly, data is only evaluated from 2015, thus limiting the assessment of changes in the dependent variable over time; a more comprehensive approach would involve a time series analysis across several eras. Thirdly, this study solely concentrates on the stakeholder perspective, omitting various firm-driven determinants that could impact implementation. In light of these points, future investigations should adopt diverse theoretical models to include external factors in addition to using panel data from multiple countries and time periods.

DISCLOSURE OF CUSTOMER PROTECTION IN COMMERCIAL BANKS IN VIETNAM

Hoang Thi Thu Hien

hienhtt@hvnh.edu.vn

Nguyen Minh Phuong

phuongmn@hvnh.edu.vn

Banking Academy of Vietnam, Hanoi, Vietnam

Abstract

Customer satisfaction and customer protection is the central of serving customer in any industry. Yet the financial industry seems to lag behind other peer by not being recognised as transparent as the others. This calls for the awareness of both the users and the service providers. Good customer protection not only helps the banking industry to develop sustainably, but also constructs a basis for investors, regulators, depositors to build their trust in banks. This comparative research marks the first attempt in measuring and contrasting customer protection operation within Vietnamese commercial banks. On doing so, the research builds an customer protection index which is based on the Good Practice developed by the World Bank, which then is calculated based on data of 8 commercial banks of different sizes and ownership structures in Vietnam. Our findings indicate that there is a disparity between the level of Vietnamese commercial banks' customer protection. Results of this study call for improvement in customer protection in Vietnamese commercial banks, their peers and challengers.

Key words: *consumer empowerment, market conduct, customer protection, customer satisfaction*

1. Introduction

According to the World Bank (Ardic et al. 2011), consumer protection framework generally includes the introduction of greater transparency and awareness about the goods and services, promotion of competition in the marketplace, fraud prevention, customer education, and elimination of unfair practices.

Therefore, customer protection is a subjective and qualitative term and expressed in terms of general principle or in code of conduct. “*Customer protection in financial service can be derived from various sources; direct from generic legal terms, indirect from laws or voluntary standards aimed at protecting the consumer in general and customers of financial service in particular*” (Customer International, 2013). Protecting consumers from abusive practices and enabling them to make well-informed decisions regarding the use of financial products and services is an important goal. Besides, better customer protection also has implications for the healthy development of the financial sector on general, and banks in particular.

There is relationship between customer satisfaction and customer protection. Reaching these two goals should come hand in hand for any companies. The customer who is satisfied with a product or service is more likely to repeat the purchase and to recommend the consumption experience to other persons. Similarly, financial consumer protection frameworks, properly designed, implemented and supervised will instill trust in consumer products and services of the banks. products and services. However, customer satisfaction has received much attention, especially from companies, because it seems to directly affect a firm's revenue. Research on customer protection has lagged behind that on customer satisfaction, eventhough customer protection contributes to customer satisfaction and also to the loyalty of the customer on the firm. In developing country like Vietnam, customer protection term is quite new, especially on the field of the financial market (*Hoang & Nguyen, 2019, Hoang et al., 2020*).

This paper, thus, to fill the gap on the literature on customer protection on the financial market in a developing country, which experiences increasing competitiveness. Specifically, this paper builds an index which is based on the World Bank Good Practices on Customer Protection on financial services, examines how banks in Vietnam conduct customer protection. This paper achieve this aim by doing several steps. First, we develop a set of criteria that reflect customer protection which are based on the Good Practices developed by the World Bank. Then we collect information on customer protection practices by commercial banks in Vietnam and map these practices of Vietnam to the World Bank criteria. Finally we calculate the total points to a score and compare the level of customer protection performance between groups of commercial banks based on this final score.

Vietnam is an interesting case for the analysis of financial customer protection as the country is now experiencing un upsurge of the market in terms of users, the volume of transactions, and also the number of fraud cases, and disputes and complaints.

In term of legislation structure, the legal framework for financial customer protection is still limited. The Law on Customer Protection were in 2010 which did not involve specific sections for financial service consumption. In the Law on Credit Institutions 2010 there is one point (Number 10th principle) that refers to customer protection yet it is very general. There are other principles introduced by Ministry of Finance, Ministry of Industry and Trade, and State Security Commission of Vietnam, but still lack of specific regulations of financial customer protection.

In 2020, complaint and dispute cases sent to Competition and Customer Protection Authority mainly in the field of finance, insurance, banking, and consumption credit (which account for 12.5% of all cases). The leading cause of this situation is that the service providers either do not disclose sufficient information, or violate the right of the customer, or even hazard the customers, i.e. consumer loan services (*Duong et al., 2021*).

2. Literature review

2.1. Rationale for financial customer protection

Market discipline reduces information asymmetries, and facilitates financial market expansion

One of the essential characteristics of the financial market, especially the market for retail customers, is asymmetry of information between professional market actors and retail clients (Akerlof, 1970, Stiglitz and Weiss, 1980). This happens when the suppliers of financial products understand better all characteristics of what they about to provide, while the opposite is for the buyers who may be biased and/or have cognitive limitation to optimize their financial situation even if presented with all the information that in principle is required to do so (Velliscig, 2018, Campbell et al., 2011). That may be worse for the retail buyers if the sellers of the products do not have the intention to put the buyers on the priority when designing and selling the products. Therefore, consumer protection is becoming more and more important regarding an efficient financial market. Actually, due to the now greater complexity of financial instruments, the chance that customers, especially retail customers, do not adequately grasp structure, characteristics and risks of products is real.

Consumers who demand information play an important role in ensuring transparency among financial institutions. Transparency in the market encourages institutions to compete on the basis of better products and services and lower costs. Ultimately the availability of quality information of retail financial services will draw in new customers and expand the market (World Bank, 2008), and to gain trust from the customers (Safari, 2012).

Consumers need information to make good decisions

Customer protection is also important for the financial customers because some of their decisions are only made infrequently, for example, the decision to ask for a bank loan to buy a house or a student loan. That makes it hard for them to learn from the past experiences. Besides, financial decision is very individual, so one can not learn from other success and failures.

In order to correct this information asymmetry and to allow the customer to make an informed decision, the traditional approach has been based on disclosure obligations requiring the professional party to provide the client with all relevant information to make proper choices. More recently, in the financial market regulation, due to a more interventionist strategy, conduct of business rules at the point of sale have been associated with the duty of disclosure to enhance the protection of retail customers. An appropriate system of transparency and conduct regulation would assure an efficient allocation of available resources in the financial market and thus prevent failures in customer decisions (Campbell et al., 2011, Velliscig, 2018).

Customer protection requires the sellers to disclosure, which enables consumers to make decisions that are more informed. Thus, customer protection aims to anticipate the protection of retail customers from the point of sale to the product design and development phase. In this perspective, the suppliers has to evaluate the conformity of the financial

products with the needs of an identified target market before products are sold to customers and should act in the clients' best interests during all the stages of the life cycle of products or services. Structured financial products are one of the current issues discussed by legislators and regulators, because their complexity and the related lack of transparency can lead to the risk that retail customers could not correctly identify the characteristics of products (Velliscig, 2018). This is especially true when the customer financial literacy is limited, which is true when taking into account the basis knowledge, even in developed countries (Campbell et al., 2011).

Consumer protection becomes indispensable element of contemporary financial markets because of existing imbalances in access to knowledge, power, information and resources between consumers and their financial service providers, placing consumers at a disadvantage (Rutledge, 2010). This situation creates asymmetric information problem causing consumers to make financial decisions in the conditions of insufficient knowledge and information, while a bank knows its product and has comprehensive information about real profits and costs of using it. This means that in the relation: a bank and its customer, a bank can take an advantage of its under-informed client, what constitutes a serious problem, especially in the context of some financial institutions' practice of intentional providing their customers with insufficient information. It leads to making the customers vulnerable to unfair and abusive practices by financial institutions.

Without adequate consumer protection, the benefits of financial inclusion can be lost

Customer protection also can reduce financial fraud, which severely reduces the trust of customers in financial institutions. Even in a very developed market, US, about 16% of consumers are victimized yearly (Anderson, 2019, Raval, 2021), with similar rates of victimization internationally (Dijk *et al.*, 2007). That may be far more severe in a developing market, like Vietnam. In a paper discussing population victimised by fraud in the US, Raval (2021) finds out that financial services are among fields that have higher proportions of fraud cases. This research also gives evidence that people who are better in terms of financial literacy, being younger, and having higher credit rating scores have fewer chances of being victimized. That being said, not all customers hold all these characteristics. That means customer protection needs to be more effective in order to reduce financial victimisation (Schicks, 2013). A strong consumer protection regime is very important to ensure that expanded access to financial services benefits consumers, enabling them to make well-informed decisions on how best to use financial services, building trust in the formal financial sector, and contributing to healthy and competitive financial markets (Ostalecka, 2013).

2.2. Good practices for financial customer protection

The World Bank's Good Practices for Financial Consumer Protection (the Good Practices) was first developed in 2012 as an attempt to build a global set of tools on financial consumer protection. Since then, international guidance and country practices regarding financial consumer protection have substantially evolved. The 2017 Good Practices is

designed to serve as a comprehensive reference and assessment tool for policymakers that consolidate the latest research, international guidance, and country examples.

The Good Practices is designed as both a comprehensive reference and an assessment tool for country-level policymakers and regulators. It is intended to serve as a practical, helpful collection of good practices in financial consumer protection, drawing from successful practices seen around the world and consolidating, complementing, and expanding upon high-level international principles and guidelines.

The 2017¹ Good Practices follows a functional structure, which includes four chapters, namely (1) Deposit and Credit Products and Services; (2) Insurance; (3) Private Pensions; and (4) Securities. Each chapter lays out good practices in the following areas:

- Disclosure and transparency: format and manner of disclosure, disclosure of terms and conditions, key facts statements, etc.
- Fair treatment and business conduct: unfair terms and conditions, unfair practices, product suitability, sales practices, agents, compensation, etc. Principle 3 of the G20 High Level Principles on Financial Consumer Protection states that “all financial consumers should be treated equitably, honestly and fairly at all stages of their relationship with financial service providers.”
- Data protection and privacy: lawful collection and usage of customer data, confidentiality and security of customer information, sharing customer information, etc.
- Dispute resolution mechanisms: internal complaints handling, out-of-court formal dispute resolution mechanisms, etc.

Each good practice is accompanied by detailed explanatory notes that expand on its intent, purpose and provide practical guidance as well as country examples of implementation, including considerations for trade-offs, proportionality, and compliance costs. The Good Practices also propose tools and methods to achieve their objectives and recognize that implementation needs to take into account of national specificities.

3. Method

3.1. Methodology

Good practices for financial customer protection include (4) items, which are covering different aspects: Disclosure and Transparency, Fair Treatment and Business Conduct, Data Protection and Privacy, Dispute Resolution Mechanisms. It is expected that commercial banks and other financial institutions incorporate these practices in their operations, from strategies to actions, and disclosed accordingly. However, in fact, due to

¹ Actually, there are 6 categories, which we have dropped two out of the range to make 4 for this research. These two are Legal and Supervisory Framework (Regulation on Customer Protection), and Guarantees Scheme. These are left out of the scope of this paper because they are general requirements from the Authority as such, therefore the information on these should be similar for all banks, which do not bring much meaning for comparison.

different reasons, the institutions may undertake this endeavor in different levels, which raises the question which institution does it better.

In order to find the answer for the above question, this research attempt to built an index and measure the customer protection score of each bank. Specifically, we first generate a Financial Customer Protection Index (FCPI), which is a combination of 4 categories of the Good Practices, which then break into a set of 77 attributes:

- 1 - B: Disclosure and Transparency (37 attributes)
- 2- C: Fair Treatment and Business Conduct (29 attributes)
- 3 - D: Data Protection and Privacy (2 attributes)
- 4 - E: Dispute Resolution Mechanisms (9 attributes)

For each attribute:

- “1” is assigned if the commercial bank discloses the according information;
- “0” is assigned if the commercial bank doesn’t disclose the according information.

We have used the unweighted method in constructing the financial customer protection index where the items score “1” if it is disclosed and score “0” if it is not disclosed. The FCPI is then calculated by summing up unweightedly all the scores as follows:

$$FCPI_n = \sum X_{in} / \sum Y_{in}$$

Where,

FCPI_n = Financial Customer Protection Index for bank n

$$\sum X_{in} = \text{disclosed items by bank n}$$

$$\sum Y_{in} = \text{full items expected to be disclosed by bank n}$$

Consequently, we calculate the FCPI of each bank by searching the bank’s annual reports and the bank’ website for the inclusion of 77 possible information items. For example: With Category 1- Disclosure and Transparency, attribute No3 “Format and manner”, the annual reports and other sources of the selected banks should be examined. All of the materials we find that the banks actually provide easy to follow documents, materials, and use appropriate, simple language that the customer can be easy to find the information. For this criteria, all banks we mark full 7. Annual reports of banking institution provide stakeholders with relevant information, operational and strategic information. Hence disclosure of information relating to the banks’ relationship with customers and the way the banks treat its customers is expected to be included. The annual reports have been obtained from the banks websites. We also collect information through other disclosed information on the banks’ websites, such as forms of contracts. Nowadays, as customers are more and more engaged with the banks electronically, banks have had the intention to voluntary disclose information on their websites.

This content analysis method is a valid way to describe and make the inferences about the characteristics of banks annual reports content and comparing it to the above mentioned

practices. The unit of analysis used are words and sentences for examining the qualitative disclosure while the index is reflecting a checklist of disclosed items in our sample banks in which we can measure the level of customer protection. We expect to observe some differences in terms of customer protection between the chosen banks. This method has been followed by some empirical research in the field, such as Mulugeta (2015), Nguyen et al. (2022).

3.2. Data and the banking context of Vietnam

The research used secondary data from the full annual reports of Vietnamese banks. The list of the banks are selected based on banks' owners capital levels. We selected a group of four large banks, two medium banks, and two small banks in terms of owner capital. Of which half of the banks are State-owned partially or wholly owned. The annual reports have been obtained from the banks websites.

We compare the FPCI index within the three groups of banks, large, medium, and small banks to see which group is better in terms of customer protection. We also do the same for each category to analyse in detail. Similarly, we compare the difference of customer protection between State-Owned banks and non State-Owned banks. The banks are listed in the Table 1.

Table 1. List of the banks

No.	Code of the banks	Size	State-owned (partially or wholly) or Non-State owned
1	LB1	Large	State-owned (partially or wholly)
2	LB2	Large	State-owned (partially or wholly)
3	LB3	Large	State-owned (partially or wholly)
4	LB4	Large	State-owned (partially or wholly)
5	MB1	Medium	Non-State owned
6	MB2	Medium	Non-State owned
7	SB1	Small	Non-State owned
8	SB2	Small	Non-State owned

From 2017 up to now Vietnamese banking system has been comprised of different ownership types. There are four government-owned banks with their owner's equity comes 100% from the state budget. These are Agribank, GP Bank, Ocean Bank, and Construction Bank. There are 31 joint-stock banks,² 9 commercial banks which has 100% foreign capital, 2 joint-venture banks, and 51 branches of foreign banks in Vietnam. Most Vietnamese commercial banks focus on retail business, so retail loans account for 90% of loan volumes of the whole system. Banks with owners' capital above 30 thousand billion Vietnamese dong are considered big banks, medium banks own from 10 thousand Vietnamese dong up to 30 thousand Vietnamese dong, and the quality of owners' capital for small banks is under 10 thousand Vietnamese dong.

² Including 3 joint stock banks which 51 percent is owned by the State budget

The strength of Vietnamese commercial banks are traditional services such as providing deposit services, lending, and payment services. Nevertheless, some large commercial banks have expanded their activities to investment banking, mortgage banking, insurance services.

4. Results

Table 2 below shows the financial customer protection score (the FPCI Index) of 8 selected banks in Vietnam. As can be seen in the Table, there are four categories, B. “Disclosure and Transparency”, C. “Fair treatment and Business Conduct”, D. “Data Protection and Privacy” and E. “Dispute resolution mechanisms”. In which, there are 5 subcategories in B, nine subcategories in C, two categories in D, and there is not any subcategories in E.

Overall, we can see that the non-State-owned banks have the higher average score than the State - owned banks. To be more specific, the FCPI Index for the State-owned banks and the non-State-owned banks is 47.5 and 50.75, respectively. This can be explained due to the fact that State-owned banks take the direct intervention from government, their policies may affect the concentration of banks in customer protection. In contrast, non-State-owned banks can focus more on financial customer protection.

Table 2. Customer protection scores - Results

Category	Benchmark point	Large				Medium		Small	
		LB1	LB2	LB3	LB4	MB11	MB12	SB1	SB2
B. Disclosure and Transparency	37	32	32	32	29	32	33	32	32
<i>B1. Format and Manner</i>	8	7	7	7	7	7	8	7	7
B1.1 Form of communication	2	2	2	2	2	2	2	2	2
B1.2. Highlighting disclosure of key features	3	3	3	3	3	3	3	3	3
B1.3. Form and format	3	2	2	2	2	2	3	2	2
<i>B2. Disclosure of terms and conditions</i>	18	14	14	14	11	14	14	14	14
B2.1. Account agreement	8	8	8	8	8	8	8	8	8
B2.2 Loan agreement	10	6	6	6	3	6	6	6	6
<i>B3. Key fact statement</i>	3	3	3	3	3	3	3	3	3

Category	Benchmark point	Large				Medium		Small	
		LB1	LB2	LB3	LB4	MB11	MB12	SB1	SB2
		<i>B4. Statements</i>	5	5	5	5	5	5	5
<i>B5. Notification of changes in rates, terms, and conditions</i>	3	3	3	3	3	3	3	3	
C. Fair treatment and Business conduct	29	9	9	10	10	11	11	10	13
<i>C1: Unfair terms and conditions</i>	6	1	1	1	1	2	1	1	2
<i>C2: Unfair Practices</i>	7	0	0	1	1	0	0	1	0
<i>C3: Sales practices</i>	4	2	2	2	2	2	2	2	3
<i>C4: Product Suitability</i>	1	1	1	1	1	1	1	1	1
<i>C5: Customer Mobility</i>	2	0	0	0	0	0	0	0	0
<i>C6: Professional Competence</i>	2	2	2	2	2	2	2	2	2
<i>C7: Compensation of Staff and agents</i>	2						1		1
<i>C8: Fraud and Misuse of customer assets</i>	3	2	2	2	2	3	3	2	3
<i>C9: Debt collection</i>	2	1	1	1	1	1	1	1	1
D. Data Protection and Privacy	2	2	2	2	2	2	2	2	2
<i>D1: Lawful collection and usage of customer data</i>	1	1	1	1	1	1	1	1	1
<i>D2: Confidentiality and security of customers' information</i>	1	1	1	1	1	1	1	1	1

Category	Benchmark point	Large				Medium		Small	
		LB1	LB2	LB3	LB4	MB11	MB12	SB1	SB2
E. Dispute resolution mechanisms	9	5	5	4	5	5	5	5	6
E1: Internal complaints handling	9	5	5	4	5	5	5	5	6
Total	77	48	49	48	46	50	51	49	53
Percentage	%	62.34%	63.64%	62.34%	59.74%	64.94%	66.23%	63.64%	68.83%
Average %		61.69%				65.91%			
Average		47.5				50.75			

Results in table confirm that non-state-owned banks tend to be more customer-centered than the non-state-owned banks. The average score of state-owned banks is 47.5(61.69%), 3.25 points less than the average score of non-state-owned banks, which stood at 50.75(65.91%). However, this difference between the scores of the 2 groups of bank is not high compare to the total score. The score range of non-state-owned banks is from 46 to 49 and the score range of the non-state-owned banks is from 49 to 53.

The figure above shows a clear difference in the total number of financial customer protection score in 8 banks in Vietnam. The lowest point - 46 (59.74%) belong to the bank,

which is, strangely, a large bank - LB4. In contrast, the smallest bank (SB2), owns the highest score 53 (68.83%). The highest score of the state-owned bank belongs to LB2 at 49, but this only equals to the score of SB1 - which is the lowest score in the non-state-owned group. In the non-state-owned group, the two banks that have not been mentioned, MB1 and MB12, reach score of 50 and 51 respectively. LB1 and LB3 in the state-owned group both equally have 48 score.

The results show that even for the highest score bank, there is a huge distance to the benchmark, which the Good Practices have suggested the bank to follow in order to generate a long-term financial stability and ensure the sustainable market. The highest score is 53, which is 24 points lower than the benchmark. That shows that the Vietnamese banks still have large room to improve in terms of customer protection.

5. Conclusion

Effective customer protection has many positive impacts on the development of the financial market. It provides the customers with more equal opportunities in the relation with the financial service provider in terms of access to relevant information, and decreasing information asymmetries. Well-informed customers constitute an important source of market discipline, because they force banks and other financial institutions to offer better, safer products and services which better fitted to their needs and opportunities. Financial consumer protection plays a significant role in creating and maintaining public confidence, which is in turn a condition for financial markets safety and stability. Last, but not least, it constitutes an essential instrument of reducing financial exclusion.

However, customer protection has just received the attention of the service provider only recently. This is very true for the developing context like Vietnam. There is not yet a comprehensive regulation on customer protection for the financial market. That is the reason for the fact that banks have taken this endeavour differently. This research, in line with not many others, attempts to assess the customer protection performance in different commercial banks in Vietnam. Based on the Good Practices introduced by the WB, this research builds and measures the FCPI Index from the disclosed information on the banks' annual reports and their websites. The results show that customer protection has been incorporated into the action of the bank, but there is still much room for improvement for the banks in Vietnam./.

DETERMINANTS OF HIGH-PERFORMANCE WORK SYSTEM AND ITS IMPACTS ON ORGANIZATIONAL PERFORMANCE: EMPIRICAL STUDY OF LISTED COMPANIES IN VIETNAM

PhD student, MA. Vy Vu Hong Thao
hongthaovyvu@gmail.com
Lac Hong University, HCMC, Vietnam

Abstract

The current study investigates the influence of organizational characteristics on the adoption of a high-performance work system (HPWS) and the impacts of such practices on the organizational performance of listed companies in the Ho Chi Minh Stock Exchange (HOSE), Vietnam. Using a sample of listed companies provides an objective measure of organizational performance and reduces common method bias caused by a single source of data. Survey questionnaires were filled in by managers in charge of HR to ensure the accuracy of information. The final sample included 145 firms of the total 318 listed firms. Results suggested that firm characteristics were positively associated with the adoption of Ability-Motivation-Opportunity bundles of HPWS. The influence of HPWS on organizational performance was confirmed by the data. Moreover, the mediating impacts of employee creative behaviors and customer-oriented behaviors were also established.

Keywords: *high performance work system, organizational performance, listed companies, objective measures, mediation, Vietnam.*

1. Introduction

Human resource has long been widely recognized as the most important asset of the firms in surviving and thriving in the ever-increasing competitive environment (Pfeffer, 2007; Hitt, Bierman, Shimizu, & Kochhar, 2001). Human resource can be the source of sustainable competitive advantages (Kundu & Gahlawat, 2016), however, it requires the effective implementation of HRM practices (Collins, 2007; Chew and Basu, 2005). Previous research suggested that a set of HRM practices may play a critical role in promoting organizations' competitive advantage and enhance their performance (Becker and Huselid, 1998; Bello-Pintado, 2015; Delery & Shaw, 2001). These HRM practices are often referred to as "HRM best practices" (Pfeffer, 1998), "strategic HR practices" (Delery and Doty, 1996), "high performance work practices" (Huselid, 1995), "high performance work system" (Boxall and Macky, 2007) or "progressive HRM practices" (Delaney and Huselid, 1996). The current study adopts the term high performance work system (HPWS) to refer to "a set of HR practices that enhance the ability, motivation, and opportunity of employees to make contributions to the success of the organization" (Rabl, Jayasinghe, Gerhart, & Kuhlmann, 2014).

While most of the literature on HPWS was still in developed countries, there are evidences that organizations in emerging economies have started to adopt high

performance work systems to enhance effectiveness (Kundu and Gahlawat, 2016). However, the adoption and implementation of HPWS in the developing countries remains largely underresearched (Osman, Ho and Galang, 2011). Previous research suggested that the implementation and effectiveness of HPWS is dependent on a number of factors from national level factors such as culture (Kundu and Gahlawat, 2016), and level of economic growth (Lawler, Chen, Wu, Bae, and Bai, 2011) to industrial factor such as industry (Combs, Liu, Hall, & Ketchen, 2006).

The current study investigates the implementation of HPWS among Vietnamese companies and the impacts of HPWS on organizational performance. Vietnam provides an interesting context for HPWS study for a few reasons. First, Vietnam has been culturally and economically influenced by both Eastern and Western styles. During its history, Vietnam was under long colonization periods under China and French. The culture of Vietnam consists of both Chinese characteristics such as “respect for seniority” and “middle of the road” and French notions of “elite system” and “individualism” (Quang and Thang, 2004). Moreover, the economic revolution of Vietnam since 1986 has turned the country into a market-oriented economy, but characteristics of the old “egalitarianism” system are still ubiquitous (Thang and Quang, 2007). As a result, it could be an interesting question of whether or not HPWS could improve the performance of Vietnamese companies. Second, Vietnam is an economy in transition, with only 30 years of experience since the structural reform from a strictly centralized system to a market-oriented economy. High economic growth has attracted waves of foreign direct investment as well as the growing number of private companies (Bartram, Stanton and Thomas, 2009). These businesses have implemented a number of HRM practices primarily used by companies in Western cultures (King-Kauanui, Su and Ashley-Cotleur, 2006). On the other hand, Thang and Quang (2005) found that HRM practices in Vietnamese firms are diverse with a number of patterns of HRM practices across ownership forms. Specifically, companies in the private sector shows a lower level of adoption of HRM practices than State owned enterprises. Similarly, Bartram et al., (2009) studied HRM practices in Vietnam and concluded that there were significant differences between firms of different ownership forms regarding the application of HRM practices. Specifically, state-owned enterprises still employed personnel management practices rather than HRM. Joint ventures placed strong emphasis on cost-based HRM practices. On the other hand, private enterprises were experiencing a wide range of HRM practices including strategic HRM practices. The situation signifies the need for an empirical research on the application of HPWS among Vietnamese firms and its impacts on firms’ performance.

The current study examines the influence of organizational characteristics on the uses of HPWS and impacts of HPWS on the performance of the firms listed on the Ho Chi Minh City Stock Exchange (HOSE). The study’s contributions can be two fold. First, the selection of

listed firms on the stock exchange provides objective measures of company performance. Because most studies on the impact of HPWS used self-assessment of business performance, these studies might be subject to common method bias. The current study

collects data on company performance based on listed figures which may improve objectivity and validity of the results. Second, although studies on HPWS have been widespread over the last two decades, most of these studies used these practices as a priori and assessed the impacts of these practices on the performance of the business. Researchers have pointed to different views on HPWS (Delery and Doty, 1996), in which the universal view is that there are a number of HRM practices, if applied, will bring high achievements to all organizations. Meanwhile, contingent and configurational views assert that effectiveness of the HPWS should be dependent on organizational characteristics. Quang and Thang (2005) studied the antecedents and consequences of HRM practices in Vietnam and concluded that although the data seems to support the universal school of thought about the direct impacts of HRM practices on firm performance, it would be necessary to examine the relationship between the characteristics of the firms and the adoption of HRM practices. The current study responds to the need by investigating the influence of organizational characteristics on the adoption of HPWS among listed firms in Vietnam.

2. Literature review and Theoretical framework

Human resource is the most important resource of the firms and can be the main catalyst for the success of the firms (Pfeffer, 1998). Resource-based view asserts that in order for human resource to create competitive advantage for the firms, it should be valuable, rare, and inimitable (Wernerfert, 1984). As a result, the main challenge facing a manager is to use HRM policies and practices to turn human resource in to an engine for organizational success. Previous research supports the consensus that a high-performance work system (HPWS) can contribute to the success of the firm. It is, however, more interesting to investigate the mechanism through which HPWS influences organizational performance. One of the ways to look into this “black box” is through the lens of the Ability-Motivation-Opportunity framework (Appelbaum, Bailey, Berg, and Kalleberg, 2000; Delery and Shaw, 2001; Lepak, Liao, Chung and Harden, 2006). This theory suggests that HRM system can influence employees’ performance and discretionary efforts towards organizational goals by enhancing their skills and knowledge, motivating and inspiring them to put in additional effort to the work and offering opportunities for them to make best use of their competency to perform and contribute (Hyde, Harris, Boaden, & Cortvriend, 2009). In the current study, HPWS is operationalized in to three categories: ability enhancing practices, motivation enhancing practices and opportunity enhancing practices. Because there is no consensus list of HRM practices which comprise a high performance work system, the current study includes effective HRM practices used in previous literature adopting the AMO framework (Appelbaum et al., 2000; Jiang et al., 2012a, Bello-Pintado, 2015; Delery and Gupta, 2016; Kundu and Gahlawat, 2016). Ability enhancing practices including selective hiring, and extensive training; motivation-enhancing practices include participative performance appraisal, performance-based compensation and promotion, and opportunity enhancing practices include career support, participative decision making, and delegation.

2.1. Influence of firm characteristics on the use of HPWS

Firm's capital

Although the positive impacts of HPWS on organizational performance has received supports from a wide range of research (Comb et al., 2006), there are evidences that the effectiveness of such practices are dependent on the fit between HPWS and organizational characteristics (Datta, Guthrie and Wright, 2005). Firm size is one of the organizational characteristics that may influence the adoption of HPWS by businesses. Previous research reported the differences in the adoption of human resource management practices between small and large firms (Wiesner and McDonald, 2001). However, the impacts of firm size, measured by the number of employees, on the implementation of HPWS were usually explained by the availability of resource associated with firm size (de Kok, Uhlaner, L. and Thurik, 2006; Patel and Conklin, 2012). The current research investigates the impact of firm's resource, measured by charter capital of the listed firms, on the adoption of HPWS practices. Resource-poverty perspective (Welsh and White 1981), proposes that the availability of resource influences the implementation of HR practices. While HPWS may improve the overall performance of the firms, the design and application of HPWS requires investment of resources. Resource is of great importance for firms to recruit HR experts who could ensure successful implementation of HPWS (Patel and Conklin, 2012). Availability of resource enables firms to implement all bundles of HPWS practices. Therefore, it can be hypothesized that:

H1: Firms' charter capital is positively associated with the implementation of ability-enhancing practice, motivation enhancing practices and opportunity-enhancing practices.

Firm age

Literature suggests that firms go through several stages during their development. HRM practices, as a component of the organizations, must also change to meet the needs of the organizations (Baird and Meshoulam, 1988). The authors suggest five stages of HRM practices development: initiation, functional growth, controlled growth, functional integration and strategic integration. At the initial stages, HRM practices focused mainly on basic salary and benefit administration and housekeeping. At the growth stages, new HR programs and practices are added into the portfolio such as training, budgeting and management control. Finally, at the integration stages, HRM requires the integration of activities, with the introduction of productivity improvement, change management and succession planning. Moreover, the focus is now on the long-term needs of the organizations. The author also reported that HRM practices in later stages should incorporate previous stages and, thus, more complex in earlier stages. Smith, Mitchell & Summer (1985) also reported that as firms move through various stages of development, different management skills are needed to address different problems. Ibrahim and Shah (2013), on the other hand, argued that at the early stage of organizational development, commitment HR system could be important. But as the firm grows, the increasing size of the organization may require the application of traditional HR system to control the more complex organizational structure.

It can be argued that at the start-up phase, the firms are small in size and usually limited in resource, so, in order for the firm to survive and growth, the commitment of the founders and first-generation employees is of great importance. Therefore, at this stage, firms would focus more on motivation-enhancing practices. At the later stages, on the other hand, the firms grow in both size and complexity, it could be necessary to ensure that all the employees have the required abilities to perform. Moreover, available resource would enable the firms to focus on training and selective hiring. Therefore, we hypothesized that:

H2: Firm age will be positively related to the adoption of ability-enhancing practices.

CEO's education

Research indicated that the owners or CEOs of the firms may have decisive influences on the adoption of HPWS. Kim and Mauborgne (1997), for example, found that entrepreneurial oriented managers tend to implement growth-fostering HR activities. Kroon, Van De Voorde, and Timmers (2013) found positive relationship between entrepreneurial orientation and the adoption of ability-enhancing practices. Another characteristic of the top manager that influence the use of HPWS was awareness of HPWS (Colbert, Rynes and Brown, 2005). They proposed that lack of awareness about HPWS was one of the explanations for the ignorance of many firms in implementing HR best practices. Kroon et al., (2013) argued that if managers know about HR best practices, they are more likely to adopt HPWS practices. They also suggested that delegation and empowerment would likely be applied by managers who are well aware of the potential of HPWS practices. Manager who understand about HR best practices know how to make their employees exert maximum efforts by influencing their motivation. Barringer, Jones and Neubaum (2005) reported that educational level of the managers can be used as a proxy of their understanding of HR practices. The third hypothesis is therefore:

H3: CEO' educational level will be positively related to the implementation of motivation and opportunity bundles of HPWS practices.

The impacts of HPWS practices on firm performance

A large body of literature provided supports for the role of high-performance management practices in improving firms' performance (Huselid, 1995; Delaney and Huselid, 1996; Delery and Doty 1996; Bartram, 2005; Combs et al., 2006). We also hypothesized that:

H4: Ability, Motivation and Opportunity bundles of HPWS positively influence organizational performance.

2.2. The mediating impact of employee creativity and satisfaction on the relationship between HPWS and organizational performance

While it was widely accepted that HPWS can have significant impacts on firm performance, it is more important to understand the mechanism or "black box" through which such influences realize. The "black box" has attracted numerous research efforts for the last two decades (Mao, Song and Han, 2013). Bowen and Ostroff (2004) proposed two

approaches to understand the link between HR practices and organizational performance, the content approach and process approach. Content approach argues that HRM practices improve employees' goal-

directed behaviors, which in turn leads to increased organizational performance. The process approach suggests that human resource management practices influence employee perspectives, changes in perspective then influence their behavior and performance. A number of attitudinal and behavioral factors has been found to serve as the mechanism of the relationship between HPWS and organizational performance such as job satisfaction, and affective commitment (Gong, Law, Chang, and Xin, 2009), service-oriented citizenship behaviors (Sun, Aryee, and Law, 2007), and social exchange (Takeuchi, Chen, and Lepak, 2009). In support of the content approach, we propose that HPWS would influence employees' creative behaviors and customer service-oriented behaviors, which in turn improve organizational performance. In particular, we propose that ability-enhancing practices influence employee's creative behaviors and motivation-enhancing practices impact customer-oriented behaviors. Therefore:

H5a: Employee's creative behaviors will mediate the influence of ability enhancing practices on organizational performance.

H5b: Employee's customer-oriented behaviors will mediate the influence of motivation-enhancing practices on organizational performance

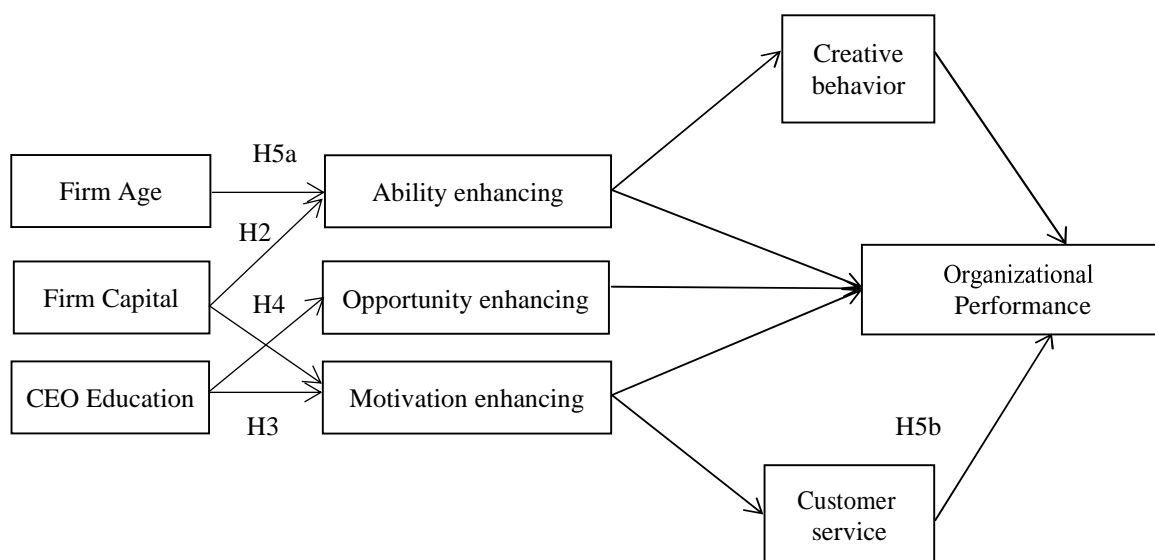

Figure 1. The operational model

3. Method

The survey was conducted from July to September 2016. Self-administered questionnaires were e-mailed to the entire of 318 companies listed on the Ho Chi Minh City Stock Exchange (HOSE) based on information listed on the official website of the stock exchange. Contacts via telephone were initially made with a person in charge of HRM of the companies such as HR director, HR manager or general manager to request them to

participate in the survey. Because the study examines HRM aspects, the most suitable person to respond to the questionnaire should be the top HRM executive of the companies. In order to ensure that the questionnaires have been received, emails confirming receipt status were followed in 1 week. For unsolicited or unanswered responses, the questionnaires were sent a second time to the email address of the respondents. The authors then telephoned the companies who did not respond to the confirmation email to make sure the questionnaires were sent to the correct address. After the above steps, the author confirmed that 283 enterprises have received the questionnaires. The author required that the respondents fill out questionnaires and send them back within 15 days. After that deadline, subsequent emails and phone reminders were made to ensure the response rate of the questionnaire. After one month, there were 164 questionnaires returned by the surveyed firms, with a response rate of about 58%, an acceptable rate for sociological surveys.

After checking the information, the author identified 12 questionnaires with missing information. In order to ensure that the questionnaire could be used, the author contacted the participants to request for supplement information. Next, to ensure that the information in the questionnaire accurately reflects the reality of the business, this study required that questionnaires to be filled by senior executives of the company or the HR manager. Therefore, questionnaires which were filled in by other personnel were discarded. After eliminating the questionnaires which were not completed by senior executives or the director/ head of human resources function (19 observations), the dataset used for the analysis included 145 responses from the listed companies.

Of the 145 companies, the shortest firm age was 7 years and the longest was 27 years. Average age of the companies in the sample was 12.8 years. The average charter capital of the firms in the sample at the time of the survey is VND 1616 billion. Of which, the lowest chartered capital is VND 80 billion and the highest of over VND 37000 billion. The average number of employees in the survey sample is 1530, with the lowest is 29 and the highest is 21403 at the time of the survey.

Measures

High performance work system (HPWS): the instrument asked the manager to respond to the degree to which the practices of HPWS were implemented at their respective companies. Response to these items ranged from 1: “to a very little extent” to 5: “to a very large extent”. In the current study, HPWS was categorized in to 3 components: ability-enhancing practices, motivation enhancing practices and opportunity enhancing practice. A list of HRM practices was developed to cover the three components based on previous research (Appelbaum et al., 2000; Jiang et al., 2012a, Kroon, Van De Voorde, and Timmers, 2013). Ability enhancing practices consisted of 5 items focusing mainly on selective hiring and extensive training. The first two items measured the number of rounds in the hiring process and application-per-placement ratio. The remaining three items concerned the extent of training including budget for training, training for current needs and training for future needs. The reliability for this scale was 0.864.

Motivation enhancing practices referred to the application of participative performance appraisal, fair performance rating, the degree of pay-for-performance, the extent of performance based promotion and competitive compensation. This 5-item scale had good reliability (Cronbach's alpha 0.733).

Opportunity enhancing practices referred to the degree of delegation at work and the extent of participation in the decision-making process. The scale consisted of 5 items. The first two items measured the degree to which the employees have autonomy at work through the mechanism of delegation. The next two items concerned the employees' awareness and participation in the decision-making process at work. The final items mentioned the supports offered to employees by the organization. The reliability for this scale was 0.772.

Firm capital: In the current study, we used the firm's charter capital at the time of survey (Cap) as an indicator of firm capital.

Firm age (Age): In this study, the total time in year from the establishment of the companies was used to measure firm age.

CEO's education (Education): We measure CEO's education by the highest degree that the manager achieved with 5= Ph.D degree, 4= Master Degree, 3= University/college degree, 2= High school/vocational school diploma, 1 = less than high school and 0 = did not go to school.

Organizational performance (Profit): An objective measure of organizational performance was used in the current study. Pre-tax profit figures of the companies were obtained for the 3- year period from 2013 to 2015. Pre-tax profit figures were publicly announced on the companies' website as well as on the annual reports. The 3-year averaged pre-tax profit was used to represent company performance.

Employee's creative behavior (*Creativity*): This variable was measured by the HR manager's subjective evaluation of employee's creative behaviors. Response to these items ranged from 1: "strongly disagree" to 5: "strongly agree". The scale consisted of 4 items an example which is "Many of our new products and service are from our employees" and "We are receiving many creative ideas from our employees". The reliability coefficient for the scale was .765

Employee's customer-oriented behavior (*Customer service*): This variable was also measured by the HR manager's opinions on a series of statement regarding customer-oriented behavior. Response to these items ranged from 1: "strongly disagree" to 5: "strongly agree". The scale consisted of 4 items including "The employees at my company always put customer first" and "Customers' evaluation of our employees are positive". The reliability coefficient for the scale was .806

4. Results

Descriptive statistics including mean, standard deviation and correlations between pairs of variables was showed in table 1. There were significant relationships between 3 bundles of HPWS practices. Furthermore, significant correlations were observed between profit and the 3 bundles of HPWS practices. Moreover, creativity was significantly correlated with ability- enhancing practices and customer service was correlated with motivation enhancing practices, which enabled mediation analysis for testing H5a and H5b.

Table 1. Means, standard deviations and correlations between variables

Variable	Mean	SD	1	2	3	4	5	6	7	8
1. Firm age	12.81	4.921								
2. Capital	2.6471	.55954	.125							
3. Education	3.42	.603	-.084	.174*						
4. Ability	3.8092	.86674	.299**	.481**	.121					
5. Opportunity	4.2458	.50393	-.030	.255**	.214**	.277**				
6. Motivation	3.9660	.60602	.019	.220**	.313**	.177*	.368**			
7. Profit	4.8968	.76077	.138	.677**	.223**	.288**	.321**	.312**		
8. Creativity	3.9782	.52798	.097	.224**	-.054	.319**	.066	.059	.230**	
9. Customer service	3.9804	.49888	.051	.127	-.038	.030	-.145	.266**	.208*	.417**

Notes: N=145. *, ** Correlation significant at the 0.05 and 0.01 levels respectively (two-tailed)

Discriminant validity of the research constructs

We conduct a factor analysis of all research variables to examine discriminant validity of the construct. A five-factor solution has been found from factor analysis with principle component extraction and Varimax rotation method. Five factors accounted for nearly 70% of the variance. There have been no items that cross load on multiple factors. The results indicated discrimination validity of the A-M-O constructs and employee behaviors.

Table 2. Factor analysis of research variables Items

	Ability	Motivation	Opportunity	Creativity	Customer oriented
Ability enhancing practices					
Regular budget for training is maintained in every department.	.912				
Training for current demand is being conducted regularly.	.895				
Training for future demand is being implemented regularly.	.888				
Hiring process contains multiple rounds.	.694				
The company require high application-to- placement ratio.	.631				
Motivation enhancing practices					
Employees are given autonomy at work.		.825			
The company has policy to delegate authority to the employees.		.728			

	Ability	Motivation	Opportunity	Creativity	Customer oriented
Employees are involved in the decision-making process.		.685			
Employees are informed about the changes in the company.		.684			
The company offers career support for the employees.		.593			
Opportunity enhancing practices					
Participative performance appraisal is conducted in my company.			.721		
Performance ratings are subject to force distribution rating system.			.698		
Pay and bonus are based on work performance.			.668		
Work performance serves as the basis for promotion decision.			.636		
My company maintains competitive compensation schemes.			.535		
Customers oriented behavior					
The employees at my company always put customer first.				.764	
Customers' evaluations of our employees are positive.				.746	
Employees at my company exert a great deal of efforts to serve our customers well.				.692	
My staff focuses on satisfying both internal and external customers.				.679	
Creativity behavior					
Employees of my company are showing creativity at work.					.857
Many of our new products and service are from our employees.					.795
We are receiving many creative ideas from our employees.					.728
My staff is trying to find new and creative ways to do the job					.725

Note: N=145. Principal component analysis with factor extracted based on Eigen value >1, rotated solution based on Varimax method.

Hypothesis testing

The first three hypotheses predicted the influence of organizational characteristics such as firm capital, firm age and CEO educational level on the adoption of HPWS by business. The results of the multiple regressions were showed in table 2.

Table 3. Influence of organizational characteristics on the adoption of HPWS

Independent	Model 1		Model 2		Model 3	
	Ability enhancing practice		Motivation enhancing practice		Opportunity enhancing practice	
	Coefficient	VIF	Coefficient	VIF	Coefficient	VIF
Constant	1.020*		3.277***		7.03***	
CEO Education	.094	1.05	.142*	1.05	.287***	1.05
Firm age	.074***	1.04	.007	1.04	.004	1.04
Firm capital	.679***	1.03	.208**	1.03	.181*	1.03
F (3, 141)	20.63***		5.32**		7.20***	
R ²	.293		.100		.127	

Note: N=145, *: $p < .05$, **: $p < .01$, *** $p < .001$.

Hypothesis 1 proposed that firm' capital would have positive influence on the implementation of all three bundles of HR. Results of multiple regression indicated that firm's capital had significant impacts on the implementation of all three bundles of HPWS: ability ($\beta = .679$, $P < .001$), motivation ($\beta = .208$, $p < .01$) and opportunity practices ($\beta = .181$, $P < .05$). Therefore, the data provided full support for hypothesis 1.

Hypothesis 2 suggested that firm age will have positive impacts on the firm's investment on ability-enhancing practices. The figures in Table 3 indicated that with firm capital and CEO educational level controlled, firm age had positive influence on ability enhancing HRM practices ($\beta = .074$, $p < .001$). H2 was supported by the data.

Hypothesis 3 which predicted that CEO's educational level would positively influence the implementation of motivation and opportunity bundles of HPWS practices also received support from the data ($\beta = .142$, $p < .05$ for motivation) and ($\beta = .287$, $p < .001$ for opportunity).

Table 4. Influence of HPWS on organizational performance and mediating impacts of creativity and customer services

Variable	Model 1	Step 1		Model 2	Step 1	
		Coefficient (Step 1)	Coefficient (Step 2)		Coefficient (Step 1)	Coefficient (Step 2)
Ability enhancing	.174*		.130	.174*		.155*

Variable	Model 1	Coefficient (Step 1)	Coefficient (Step 2)	Model 2	Coefficient (Step 1)	Coefficient (Step 2)
Motivation enhancing	.253*		.246*	.253*		.175
Opportunity enhancing	.298*		.308*	.298*		.377*
Step R-square		.181				
F (3, 141)		10.379***				
Step 2						
Creativity			.230*			
Customer service						.288*
R-square change		.023*			.031*	
Sobel coefficient		.078*			.082*	

*Note: N=145, *: p<.05, **p<.01, ***p<.001. Dependent variable: Profit*

Analysis results for hypothesis 4 and 5 were detailed in table 4. Model 1 was used to test the mediating effect of creative behaviors on the relationship between ability enhancing practices and organizational performance. Model 2 was used to test the mediating impacts of customer service on the motivation bundle-performance relationship. The results showed that ability- enhancing practices ($\beta=.174$, $p<.05$), motivation-enhancing practices ($\beta=.253$, $p<.05$) and opportunity-enhancing practices ($\beta=.298$, $P<.05$) positively predicted organizational performance. Therefore, hypothesis 4 was supported.

For model 1, when creativity was added into the model, the influence of ability-enhancing practices on organizational performance became insignificant ($\beta=.130$, n.s.) while the impact of creativity on organizational performance was significant ($\beta=.230$, $p<.05$). Moreover, the Sobel statistics confirmed the mediating impact of creativity (Sobel coefficient= $.078$, $p<.05$). Therefore, H5a was fully supported.

For model 2, when customer service was added into the model, the influence of motivation-enhancing practices on organizational performance became insignificant ($\beta=.175$, n.s.) while the impact of creativity on organizational performance was significant ($\beta=.288$, $p<.05$). Moreover, the Sobel statistics confirmed the mediating impact of customer service (Sobel coefficient= $.082$, $p<.05$). Therefore, H5b was fully supported.

5. Discussion and Conclusion

The results of analysis suggested that organizational capital had profound impacts of HPWS application. Implementation of such practice as comprehensive training, pay-for-performance and providing support and opportunity are often accompanied by high costs. Enterprises that have the financial ability to afford are more likely to invest on HPWS than those with lesser financial capability.

The CEO's level of education is an important feature of the business. Education is often regarded as a variable representing knowledge, human capital, or intellectual ability.

High-level CEOs are often said to be more intelligent and able to handle information (Hambrick & Mason, 1984). High-performing CEOs are also well aware and receptive to new ideas (Hitt & Taylor, 1991). Highly qualified CEOs are ready for change and actively engage in innovative ideas and apply modern management methods (Bantel and Jackson, 1989). Highly educated CEO may apply performance-based compensation and promotion rather than the outdated tenure-based system. Highly qualified CEO would be more aware of the role of empowerment, delegation, and team building. Proper delegation may also help the CEO to focus resources on the strategic and important issues of the enterprises rather than day-today matters.

Older enterprises are often large in scale and more complex so human resource management need to be done to improve efficiency and reduce costs. Therefore, enterprises with longer operating times are more likely apply higher development training and selective hiring measures.

The impacts of HPWS on organizational performance were also verified and confirmed in this study. In particular, ability-motivation-opportunity bundles of HPWS had positive impacts on organizational performance. Moreover, creative behavior was the mechanism through which ability-enhancing practices influences organizational performance. Similarly, customer-oriented behavior mediate the impact of motivation enhancing practices.

Although the research confirmed the positive impacts of HPWS on firm's performance, it also provided some evidence against the universalistic view of HPWS practices. Instead, the study supports the contingent view of HRM best practices in which organizational characteristics play a very important role in the adoption of HPWS. CEO's awareness of HRM best practices would be of utmost important for the implementation of HRM best practices. Because there were evidences that managers who read scientific papers are more likely to accept findings and understand the impacts of HPWS on organizational performance. Cooperation between businesses and University in general and between academia and manager would be of mutual benefit for both parties.

Because ability-enhancing practices are strongly associated with creative behaviors, it could be suggested that firms that operate in innovative markets should apply more of such practices to foster employees' creative behaviors.

On the other hand, firms operating in service industry must be able to serve their customers extremely well. Because motivated employees may exert more efforts to satisfy customers, it is suggested that such company should invest on motivation enhancing practices.

The first limitation of the current study was its sample; the use of listed companies in the survey limited the representativeness of the sample. While it is estimated that there are over 600,000 enterprises in Vietnam, only more than 300 of those are listed on the stock exchange. Furthermore, we were able to collect data from only 145 of the 318 listed firms; the sample could not be considered a perfect representative of the listed companies. These weaknesses reduced the generalizability of research findings.

The second limitation was that the data were collected from human resource manager or top management in charge of human resource. The opinion of these people may or may not be the same as the employees' views on the use of HPWS. Moreover, using manager's evaluation of employees' creative behaviors and customer-oriented behaviors may be biased. Multiple data sources, from both employees and manager, if applied would be much better.

The final limitation lies in the cross-sectional research design. Because it may take time for the application of HPWS to influence performance, cross-sectional design was unable to test this influence. It is difficult to identify the date at which HPWS practices were initially applied. Therefore, longitudinal research may yield more interesting results.

This study supplements significant empirical support for the link between high-performance work systems and firm's performance. This study also suggests specific organizational characteristics which influence the application of HPWS. Finally, some insight into the "black box" about the mechanism through which HPWS influences organizational performance was provided.

National Economics University, Hanoi, Vietnam

Abstract

Digital transformation is a concern and one of the main directions of the business community in the digital age. This article uses econometrics models to evaluate the impact of digitization on the competitive capacity of enterprises. The research results show that if an enterprise fully digitizes at least 50%, it will have a positive impact on its competitive capacity. In addition, other factors such as digital orientation, digital capability, exporting/importing, or experience working with FDI enterprises also contribute to higher competitive capacity compared to other business groups.

Key words: *Digital transformation, digital orientation, digital capability, competitive capacity.*

1. Introduction

The enterprises are important part of the economy, especially in contributing to economic growth and creating employment opportunities for workers. The Covid-19 pandemic has caused serious consequences for people, the economy, and society in most countries around the world, including Vietnam. To survive and overcome the pandemic, the competitive capacity of the enterprises is extremely necessary. One of the solutions that enterprises have been applying to maintain their operations is to integrate digital technologies into their activities. The application of digital technologies has become one of the major directions for economic and social activities in general and for the business community in particular.

On the other hand, in an era where digital technology is developing strongly, the application of information technology and digital transformation in enterprises is a common and necessary trend. To take advantage of digital opportunities, businesses need to quickly develop capabilities that can help them adapt and survive changes in their circumstances and environment. These capabilities are related to specific organizational processes and strategies, such as redeveloping products, identifying new working methods, and making strategic decisions to create value in a dynamic environment. From there, enterprises can leverage existing resources into new value-creating strategies. Therefore, the ability to transform digitally is one of the key factors for innovation and competitive operations of

enterprises in the business environment. Enterprises are increasingly relying on information technology, including process technology, knowledge, and communication, to improve their agility (Sambamurthy et al., 2003).

Rupeika-Apoga et al. (2021) investigated the direct impact of digital orientation and digital capability on digital transformation, as well as exploring the intermediary impact of digital transformation on the performance of SMEs in Latvia. The results of the study showed that both digital orientation and digital capability have a positive direct impact on digital transformation. At the same time, digital transformation has an intermediary impact from digital orientation on revenue and business models, as well as from digital capability on revenue.

There have also been some studies on the digital transformation capabilities of businesses in Vietnam in general, as well as SMEs in particular, but these studies have mostly stopped at synthesis, comparison, descriptive statistical analysis of survey data, and expert interviews (Luong et al., 2020; Bui & Nguyen, 2021). The study by Luong et al (2020) showed that in the context of the Covid_19 pandemic, awareness of digital transformation in Vietnamese businesses has shown positive signs through a high proportion of businesses applying digital technology before the Covid_19 pandemic occurred. At the same time, this study also showed that the majority of businesses have only applied digital transformation to management, logistics, marketing, etc., and have not focused on applying digital transformation in production. Meanwhile, the study by Bui & Nguyen (2021) indicated that the obstacle to SMEs' digital transformation is due to the lack of bold changes and limitations in digital transformation awareness of business leaders.

This study is different from the above studies in that the authors simultaneously used parametric and non-parametric regression methods, so the research results will be more reliable. At the same time, this study will use a quantification method to analyze the impact of digital transformation on the competitiveness of businesses. The authors hope that this study will contribute to enriching the research on digital transformation of business groups, and at the same time, the study is useful for business managers and state management agencies in planning policies to develop and improve digital transformation capabilities in business groups.

2. Method

2.1. Data

In this article, the author used survey data on "The status of digital transformation in enterprises in the context of Covid-19 pandemic" conducted by the Vietnam Chamber of Commerce and Industry. The questionnaire consisted of 28 questions divided into three sections including: general questions about businesses, questions about the impact of Covid-19 on business operations, and questions about digital transformation of businesses. The data was collected online from July to August 2020. The results included 403 completed questionnaires from businesses nationwide, with the largest concentration in the Red River Delta accounting for 38% and the Southeast region accounting for 31.8%. This can be

explained by the fact that these are the areas with the highest concentration of businesses in the country. In terms of business scale, the proportion of micro, small, and medium-sized enterprises (SMEs) accounted for the majority at 64%, including 36.1% of businesses with less than 50 employees, 13.4% with 51-100 employees, and 14.4% with 101-200 employees. Among the 36% of large enterprises (over 200 employees), 24.6% had more than 500 employees, which is also in line with the fact that SMEs make up the majority of businesses.

2.2. Research method

Interval regression model

Interval regression model can be represented as follows:

$$y_i = x_i' \beta + u_i$$

in which:

- 1) y_i is the dependent variable, taking values in the interval [a,b]
- 2) x_i is $J \times 1$ matrix of factors that affect y_i of observation i
- 3) u_i is random error that follows Standard Normal Distribution law, $u \sim N(0, \sigma^2)$
- 4) β is coefficient that need to be estimated

Stewart (1983) pointed out that the combination of the first step, which is an approximate estimation of the maximum likelihood function, with the second step, which is the method of moments or least squares, is as follows:"

Step 1:

In the first step, the logarithm of the likelihood function is defined by:

$$\text{Log}L = \sum_{k=1}^K \sum_{i \in (k)} \log(F[(A_k - x_i' \beta) / \sigma] - F[(A_{k-1} - x_i' \beta) / \sigma]) = \sum_{i \in (k)} \log(F_k - F_{k-1})$$

With F is the cumulative function of standard normal distribution, σ is the constant variance of residual u_i , also is a parameter that needs to be estimated, and the k -th observation of y falls within the interval (A_{k-1}, A_k) . The notation $i \in (k)$ implies that all observations make the variable y take values in the interval (A_{k-1}, A_k)

Step 2:

The method proposed by Stewart (1983) is based on the iterative estimation formula, and the regression coefficients will be estimated using the OLS method. Stewart (1983) has shown that the estimates obtained by this method are robust and efficient (Stewart, 1983)."

Kernel non-parametric regression method

Two methods commonly used in non-parametric kernel regression are the local constant method and the local linear method. The local constant method was introduced simultaneously by Nadaraya (1964) and Watson (1964), so it is also called the N-W (Nadaraya-Watson) estimator. The non-parametric method does not require assuming a

specific form of the regression function $m(\cdot)$, but a set of x neighboring data points containing some information about the value of $m(x)$. Therefore, a visual estimation tool for the conditional mean function $m(x)$ is the local average, which is implemented. The new improved method is the weighted local average. Suppose K is a weight-assigned real-valued function. K is usually a symmetric density function and is called the Kernel function. Let h be a partitioning parameter (also known as a smoothing parameter), which is a non-negative number controlling the size of the neighborhood.

At each neighborhood of a given observation point x , instead of assuming that y takes on a constant value as in the N-W method, it is assumed y to be linear within that neighborhood. Specifically, at each x_i in the neighborhood of x , determine the coefficient vector α, β such that:

$$\text{Min}_{\alpha, \beta} \sum_{i=1 \rightarrow n} (y_i - \alpha - \beta'(x_i - x))^2 K(x_i, x, h) \quad (*)$$

where n is the total number of observations x_i in the neighborhood of x , and the summation is taken over the observations x_i such that $|x_i - x| \leq h$ with h being the chosen bandwidth in the estimation process.

Where $K(x_i, x, h)$ is defined as follows:

$$K(x_i, x, h) = \prod_{j=1 \rightarrow k} K_j(x_{ij}, x_j, h_j)$$

with k being the dimension of vector x_i . The Kernel function for continuous variable x_i takes the form:

$$K_j(x_{ij}, x_j, h_j) = k_j\left(\frac{x_{ij} - x_j}{h_j}\right)$$

The research team used the Epanechnikov Kernel function, which is commonly used in many documents. Specifically:

$$k_j(z) = \begin{cases} \frac{3}{4\sqrt{5}} \left(1 - \frac{1}{5}z^2\right) & \text{for } |z| \leq \sqrt{5} \\ 0 & \text{eslewhere} \end{cases}$$

The Kernel function for discrete variable x_i takes the form:

$$K_j(x_{ij}, x_j, h_j) = \begin{cases} 1 & \text{for } x_{ij} = x_j \\ h_j & \text{eslewhere} \end{cases}$$

If the bandwidth is too large, there will be many observations in the estimation of (*), resulting in small variance but large bias in the estimation. If the bandwidth is too small, there will be only a few observations for the estimation, resulting in large variance but small bias in the estimation. To balance the trade-off between bias and variance, the research team used the cross-validation method proposed by Li and Racine (2004) to choose the bandwidth for each variable

3. Results

The quantitative economic model in this section aims to evaluate the impact of digital transformation and other factors on the competitiveness of businesses. Some studies suggest that digital transformation is very important for modern economies because it has many business implications (Rupeika-Apoga et al., 2022). Other studies have shown that applying digital capabilities and knowledge to improve service delivery and customer integration increases the value of products and services provided, while also increasing long-term profitability (Daub & Wiesinger, 2021; Kuzmina-Merlino & Saksonova, 2018). In addition, scientists have also agreed that the positive impact of digitization on revenue growth, cost reduction, and financial efficiency (Osmundsen et al., 2018).

Digital transformation is a process of changing almost the entire business model and must be supported by an ecosystem, a specialized digital strategy, and digital skills. When evaluating the business model, the popular business model framework proposed by Osterwalder & Pigneur (2010) suggests that it can be divided into four main business areas, including infrastructure, value proposition, customers, and financial capacity. This study explores financial capacity. Some of the most commonly used indicators that can help measure a company's financial capacity are revenue, net income, gross profit margin, current assets, etc. (Ziółkowska, 2021). This article chooses revenue because in the survey table, revenue represents financial capacity. In addition, revenue is a suitable measure for measuring the financial capacity of enterprises for the following reasons: First, it is one of the three measures, along with the number of employees and assets, used to determine types of businesses. Second, revenue is a subjective measure of how much a business can use its core business assets to generate profits. Third, revenue is the total income received from selling goods or services related to a enterprises' core activities. Selling goods or services is the backbone of any enterprises activity, while digital transformation has almost completely changed the way businesses operate. In this section, the study will further confirm the impact of digital transformation and factors on the competitiveness of enterprises.

3.1. Regression models and variables

Interval regression model

The interval regression model for evaluating the impact of digital transformation and other factors on competitive capacity is as follows:

$$Revenue_i = \alpha + X_i' \beta + u_i \quad (1)$$

Non-parametric regression model

The non-parametric regression model evaluates the impact of digital transformation and factors on competitiveness in the following form:

$$E(Revenue_i | X_i) = m(X_i) \quad (2)$$

Which,

$$X_i = \left(\begin{array}{c} Export_i, FDI_exp_i, Digital_trans_i, Over_impact_i \\ Product_impact_i, Digital_orient, Sales_market_i, Enter_type_i \end{array} \right)$$

is vector of factors affecting the competitiveness of Vietnamese enterprises in the context of the Covid-19 pandemic. Competitive capacity of enterprise i is notated by $Revenue_i$

In model (1), u_i is random error, α is the intercept, and β is the vector of coefficients that need to be estimated.

In model (2), the function $m(.)$ is unspecified functional form.

Revenue: This is dependent variable and a categorical variable, measured in %. The revenue of enterprises is measured by the increase or decrease in revenue in the first six months of 2020 compared to the same period in 2019. Businesses are required to report their actual revenue (net revenue) in 2020 with suggested answers: *Revenue decreased by more than 50%*; *Revenue decreased from 25% to 50%*; *Revenue decreased from 1% to 25%*; *Revenue did not change*; *Revenue increased from 1% to 25%*; *Revenue increased from 25% to 50%*; *Revenue increased by more than 50%*

Digital_trans: It reflects the digital transformation capability of enterprises, measured by the percentage increase in digital technology applications on a scale of 1-5: 1 = below 10%; 2 = from 10-25%; 3 = from 25-50%; 4 = from 50-75%; 5 = above 75%. In this model, *Digital_trans* is the main independent variable to determine the role of digital transformation in the competitiveness and sustainable development strategy of enterprises. The coefficient of this variable is expected to be positive (Daub & Wiesinger, 2021; Kuzmina-Merlino & Saksonova, 2018; Osmundsen et al., 2018).

Export: The variable representing import-export enterprise that has a value of =1 if the enterprise is engaged in import-export activities, and =0 if the enterprise is not engaged in import-export activities

FDI_exper: The variable assigns a value of 1 to groups of businesses with experience working with FDI businesses, and 0 to businesses without experience working with FDI businesses.

Over_impact: The variable representing the 'impact of Covid_19 on overall operations' is a categorical variable with a value of =1 if the enterprise is facing difficulties due to Covid_19, and =0 if the enterprise is not facing any difficulties.

Product_impact: is a variable that receives a value of 0 if the business is not affected by the Covid-19 pandemic on production activities, and 1 if the business is affected by Covid-19 on production activities.

Digital_orient: The variable representing 'digital orientation' is a categorical variable with a value of =1 if the enterprise had already applied digital technologies before Covid-19; =2 if the enterprise started applying digital technologies since the outbreak of Covid-19; =3 if the enterprise has not yet applied digital technologies

Sale_impact: The variable representing 'impact of Covid_19 on sales activities' is a categorical variable with a value of =1 if the domestic market is contracted due to Covid_19, and =0 if the domestic market is not contracted due to Covid_19.

Enter_type: is a variable that receives a value of 1 for non-FDI businesses, and a value of 2 for FDI businesses."

Table 1. Descriptive statistic of dependent variable in the model

Revenue	1	2	3	4	5	6	7	Total
Frequency	69	138	121	35	12	2	2	379
Percentage	18.21	36.41	31.93	9.23	3.17	0.53	0.53	100

Source: The author's calculations on VCCI survey data.

According to the statistical data in Table 1, the proportion of businesses with a decrease in revenue during the pandemic of 25 to 50 (%) is the highest at approximately 36.41%, followed by the percentage of businesses with a revenue decrease of 25-50 (%) compared to before the pandemic at about 31.93%. Meanwhile, the proportion of businesses with unchanged or increased revenue during the pandemic compared to before the Covid-19 pandemic is relatively small. This is also evidence of the negative impact of the Covid-19 pandemic on the competitiveness of businesses.

Table 2. Descriptive statistic of independent variables in the model

Variable	Value	Percentage	Total (%)
Export	1	58.58	100
	0	41.28	
FDI_exper	1	31.4	100
	0	68.6	
Digital_trans	1	14.51	100

3.2. Result of interval regression

The summary of the regression results for Model (1) is presented in Table 3. Based on the estimation results shown in Table 3, the variable *Chuyendoiso* is significant at the 5% level for levels 4 and 5; the variable *Nhanthuc_KTS* is significant at the 5% level for perception levels 3. The variables *Xuatnhapkhau*, *Tacsdong_SX*, and *Banhang* are all statistically significant at the 1% level, while the remaining variables are significant at the 10% level. Overall, all variables in the model are statistically significant.

Overall, the regression coefficients of the independent variables are consistent with expectations and reality. The coefficient of the variable *Export* is -14.8 indicates that, in the context of the Covid-19 pandemic, firms without import-export activities have a competitiveness capability lower than the average of about 14.8% compared to firms with import-export activities. This is consistent with the fact that firms with import-export activities have a larger and more potential market, and although their competitiveness may decrease during social distancing, it remains strong. The coefficient of the variable *FDI_exper* is -5.7 shows that firms without experience working with foreign direct investment (FDI) have a competitiveness capability lower than the average of about 5.7% compared to firms with experience working with FDI. This is entirely consistent with the fact that firms with experience working with FDI have a wider market and access to enterprises from developed countries with modern technology, giving them more experience and advantages in competition.

Table 3. Results of the regression model assessing the impact of factors on competitiveness

Biếndộc lập	Coefficient	Robust Std. Err.	95% conf. Interval	
<i>Export 0</i>	-14.7***	4.3	-23	-6.3
<i>FDI_exper 0</i>	-5.7*	3.3	-12.2	0.8
<i>Digital_trans</i>				
2	2.1	3.8	-5.4	9.7
3	3.0	3.6	-4.0	10.0
4	8.2**	4.2	0.05	16.4
5	14.9**	6.9	1.4	28.5
<i>over_impact 1</i>	5.7**	2.5	-0.49	10.1
<i>Product_impact 1</i>	-7.2***	2.6	-12.6	-2.5
<i>Digital_orient</i>				
2	-3.0	2.8	-8.3	2.5
3	-7.0**	3.3	-13.4	-0.59
<i>Sale_maket 1</i>	-11.9***	4.0	-19.7	-4.1
<i>Enter_type 2</i>	-6.1*	3.5	-12.9	0.6
<i>Cons.</i>	-11.7**	5.9	-23	-0.11

***, **, and * correspond to the significance level of 1%, 5%, and 10%, respectively.

Source: The author's calculations on VCCI survey.

The coefficient of the variable *Digital_trans* shows that at three levels of digital transformation (level 1, level 2, and level 3), i.e., the ability to convert digital below 10%, from 10-25%, and 25-50%, the coefficients are not statistically significant, meaning that the competitiveness of firms at these levels of transformation is the same. However, compared to firms with a level of digital conversion below 10%, firms with a level of digital conversion from 50-75% have a competitiveness capability higher than the average of about 8%, and firms with a level of digital conversion above 75% have a revenue higher than the average of about 15%. This result is consistent with many previous studies and with the fact that firms with a high level of digital transformation have a large competitiveness capability, as expected by resource-based theory.
