Quang Ninh	6.31	2.83	3.13	88%	50%	1	27%
Thai Binh	6.31	2.57	2.87	79%	79%	6	43%
Vinh Phuc	5.63	2.56	2.79	94%	91%	3	43%

Source: VCCI (2021)

On average, the Red river delta region has a policy-making transparency index of 5.58, higher than the national average of 5.34. Quang Ninh is the city with the highest policy-making transparency index in the region with data of 6.31. Ninh Binh is the city with the lowest policy-making transparency index in the region with data of 4.60.

3.4. Policy Bias index

The policy bias index show how the regional policies have create the bussiness environment among the business entities within region. Moreover, the index also indicate which business industry or company has a prioror than the other.

Table 6. Policy bias index among business sectors at Red river delta region

Province	Sub-Index 6: Policy Bias	Local Gov's attitude does not depend on firm's contribution (%)	Provincial authorities prioritize handling large firms' difficulties over SMEs' (%)	Provincial authorities prioritize attracting investment from large firms over SMEs (%)	Land access as a privilege to large firms (%)	Faster and simpler administrative procedures as a privilege to large firms (%)	Ease in getting state contracts as privilege to large firms (%)	Mineral exploitation license as a privilege to large firms (%)	Ease in information access as privilege to large firms (%)
Bac Ninh	6.29	74%	57%	45%	25%	19%	16%	5%	16%
Ha Nam	6.07	70%	53%	39%	26%	19%	14%	8%	17%
Ha Noi	5.38	77%	53%	48%	31%	27%	22%	12%	27%
Hai Duong	8.38	86%	32%	25%	16%	15%	5%	4%	11%
Hai Phong	6.02	70%	44%	44%	28%	25%	16%	7%	26%
Hung Yen	7.17	83%	44%	32%	22%	22%	10%	8%	19%
Nam Dinh	5.91	79%	61%	24%	23%	17%	15%	7%	18%
Ninh Binh	7.57	76%	39%	32%	22%	8%	16%	2%	14%
Quang Ninh	6.96	83%	46%	36%	22%	20%	9%	6%	14%
Thai Binh	5.32	65%	55%	37%	28%	22%	17%	13%	22%
Vinh Phuc	7.07	75%	49%	27%	19%	10%	8%	6%	13%

Source: VCCI (2021)

The index shown that Hai Duong was a province having the highest score. It means that 86% companies in the province said that the provincial government policies were not favored by the contribution of the companies. Meanwhile the index was lowest in Thai Binh province, just 65% companies believing in non-bias policies among the business sectors.

3.5. Entry Costs

Entry cost sub-index is used to measure how long a firm has to wait to register a business and to apply for a land use right certificate, and how long it takes to receive all required permits to conduct a business, including the number of licenses, registrations and required official approvals. The lower entry cost is, the better business environment. Table 3.5 shows that the entry cost in the Red river delta has erratically varied from province to province. Quang Ninh province has a highest score with 7.98 while Thai Binh has a lowest score with 6.08.

Table 7. Entry Costs Index at Red river delta region

Province	Sub-Index 1: Entry Costs	Length of business registration in days (Median)	Firms have to make +2 revision to their biz registration dossier (%)	Length of biz re-registration in days (Median)	Firms registered online, PAC & Posts (%)	Biz Registration: Publically listed procedures	Biz Registration: Clear and adequate guidance	Biz Registration: Knowledgeable officials
Bac Ninh	6.53	10	21%	7	53%	39%	83%	22%
Ha Nam	6.73	7	14%	7	45%	50%	67%	42%
Ha Noi	6.57	9	14%	7	78%	55%	61%	35%
Hai Duong	7.24	7	17%	4	57%	91%	64%	45%
Hai Phong	6.52	7	16%	5	69%	63%	81%	30%
Hung Yen	6.78	10	15%	5	55%	67%	74%	43%
Nam Dinh	7.07	14	14%	5	48%	70%	60%	20%
Ninh Binh	6.20	7	13%	7	26%	89%	37%	19%
Quang Ninh	7.98	7	10%	4.5	61%	77%	77%	62%
Thai Binh	6.08	14.5	23%	10	54%	60%	60%	40%
Vinh Phuc	7.02	10	16%	5	66%	63%	58%	38%

Source: VCCI (2021)

This finding is completely consistent with the sub-index of time cost. The score for time cost sub-index for the Red river delta region (6.79) is lower than the national average score (6.84). While some indicators of time cost sub-index have been significantly improved (more efficient state officials, reduced number of hours worked with tax inspectors, civil servants friendlier so forth), the important indicators that reflect time costs have not changed much, especially the proportion of businesses who though they still have to go back and forth many times to complete administrative procedures are still high in recent years (from 30% to 40%). The “time cost” sub-index of the provinces indicate local limitations in administrative procedure reform. Although some provinces have made progress, they still

need to further reform and maintain achievements to facilitate business environment. Along with the review of all procedures, provinces need to pay more attention to the coordination among line departments in order to create favorable conditions for businesses.

4. Discussion and Conclusion

Through calculating the competitiveness indexes of the Red river delta region and the whole country, it can be seen that most of the indexes of the Red river delta region are higher than the whole country. This is understandable because the RRD is one of the two regions with high population and economic density compared to other regions of the country. However, some of the pillar indexes are difficult to find information, and many Vietnamese indexes currently do not have any reputable units to perform statistics. Therefore, the indicators that can be applied in the RRD research are not yet complete and comprehensive.

Some Institutional Indicators could use the Vietnam Provincial Governance and Public Administration Performance Index (PAPI) to complement the PCI index since PCI is based on a business perspective and PAPI considers three interrelated processes, that is: policy formulation, policy implementation and monitoring of the delivery of public services, from the point of view of the people.

However, the study is a good suggestion for further studies on regional competitiveness in Vietnam, thereby proposing recommendations to authorities add indexes to the annual published data system to help domestic and foreign investors, local government agencies and citizens have more basis for their decisions.

DEVELOPING COMMUNITY-BASED TOURISM FOR ADAPTING TO CLIMATE CHANGE IN THIENG LIENG ISLAND, CAN GIO MANGROVE BIOSPHERE RESERVE, HO CHI MINH CITY, VIETNAM

Ta Duy Linh

duylinh12679@gmail.com

Duong Duc Minh

duongducminh.vn@gmail.com

Institute for Tourism Economic Development Research, Ho Chi Minh City, Vietnam

Abstract

Thieng Lieng is “island in island” and “the salt kingdom” of Can Gio mangrove biosphere reserve, Ho Chi Minh city, Vietnam. In Thieng Lieng, salt is not only a spice but also a “brainchild” of people. However, livelihood of salt farmers is strongly affected by climate change. Therefore, local community has just created a new livelihood - community-based tourism to help them “find opportunities from challenges”. Community based tourism contributes to giving socio-economic efficiency for localities and improving the lives of farmers. Community based tourism makes a major contribution to local sustainable development. This article emphasizes analyzing the support of tourism economy to help people adapt well to climate change associated with salt production. This study also expresses the approach that livelihood diversity as an appropriate strategy for farmers to “overcome to the threshold of survival in a fluctuating environment” in the context of current climate change.

Keywords: *community based tourism, Thieng Lieng island, climate change, overcome to the threshold of survival, sustainable development*

1. Introduction

Vietnam is identified by the International Panel on Climate Change as one of the countries likely to be most affected by climate change (Schmidt-Thomé et al, 2015, p.61). In rural areas in Vietnam, especially in coastal areas, people are heavily affected by climate change. And Can Gio is the only coastal district in Ho Chi Minh city. People's livelihoods in Can Gio depend largely on natural resources. Thus, any negative changes due to climate change will directly affect their livelihoods. These changes are potential risks affecting the livelihoods of local residents (L T Hoa et al, 2022, p.1). Ho Chi Minh city finding solutions to respond to climate change in Ho Chi Minh city is very urgent in the current conditions (Ngo, L. & Hoang, H., 2021). But solutions to adapt to climate change in Can Gio district by tourism livelihood is the research gap.

Eva Kaján and Jarkko Saarinen (2013) stated that “climate change impacts on tourism or the role of tourism as a new livelihood option cannot be evaluated as a single force but as

a dynamic phenomenon and a process that affects not only tourists and their decision-making and behaviour, businesses and their activities, and also local people and communities” (p.23). In particular, local people in Thieng Lieng island, Can Gio district, Ho Chi Minh city has flexibly integrated tourism livelihood into salt production. In this study, the research team mention that tourism as new livelihood to help local people adapt to climate change. Consequently, this article focus on discussing and illustrating the effectiveness of implementing community based tourism in the climate change context.

2. Method

Through the process of collecting secondary materials and field surveys in Thieng Lieng island, Can Gio district, Ho Chi Minh city from December 2021 to April 2023, we use research methods: in-depth interviews (tourist, local community, representatives of the government authorities on tourism management, representatives of travel company and consultant expert). Besides, we also carry out the community group interview method to identify and analyze the impacts of the natural environment on local livelihoods and tourism.

3. Results

3.1. Study Area: Thieng Lieng island context

Thieng Lieng is an island hamlet with an area of 12.999 hectares. The general topography of Thieng Lieng is a low coastal plain. The terrain elevation does not change much, from 0.2 - 0.5m. About Thieng Lieng climate is characterized by a sub-equatorial monsoon tropical climate, with two distinct rainy and sunny season. Thieng Lieng mangrove forest is a typical ecosystem in the southern region of Vietnam. Currently, in Thieng Lieng, there are 396 hectares of salt field. In addition to the livelihood of salt production, the people of Thieng Lieng also have a livelihood of keeping forests and fishing for aquaculture. All forms of livelihood are created by people and increase their production life to both rely on the natural environment but also live in harmony with the natural environment. The origin of the population from the Mekong delta has been immigrated since the early 1970s.

Associated with a special geographical position is the “island in island”, Thieng Lieng is located separately from the destinations of Ho Chi Minh city and other areas of the Southeast region of Vietnam. Thieng Lieng is only 70 km from the center of Ho Chi Minh city, the connection from the center of Ho Chi Minh city to Thieng Lieng must be done through the use of water transport. The problem of connecting and developing Thieng Lieng tourism is still facing many difficulties in terms of means of transport and berths. However, Thieng Lieng is a unique destination capable of contributing to the creation of the route “connecting from the river to the sea” in order to both characterize and diversify tourism products in Ho Chi Minh city in particular and in the Southeast region of Vietnam in general. The process of building a community-based tourism destination in Thieng Lieng aims to raise awareness of the community of Ho Chi Minh city residents in preserving and promoting the unique values of natural and humanistic ecosystem. Department of Tourism in Ho Chi Minh city has launched the community - based tourism product on Thieng Lieng island on the 28th of December, 2022. The tourist market to Thieng Lieng is identified as the segment of

international tourists and domestic tourists with high affordability. The main source of supply of Thieng Lieng tourists is customers using water transport from the center of Ho Chi Minh city. Currently, some travel agencies in Ho Chi Minh city are interested in connecting tourists to Thieng Lieng island. By the end of April 2023, Thieng Lieng has welcomed 1000 tourists.

3.2. Community based tourism as a strategy for sustainable development in Thieng Lieng island

According to Clause 15, Article 3 of the Law on Tourism 2017 of Vietnam: “Community based tourism is a type of tourism developed on the basis of the cultural values of community, managed, organized and exploited by the resident community. Benefit”. At the same time, according to Clause 3, Article 19 of the Law on Tourism 2017 of Vietnam, it is defined “Development of community-based tourism in order to preserve cultural identity and protect the environment”. Since then, the development of community-based tourism in Thieng Lieng island is towards sustainable development of livelihoods, natural environment and humanity. Development of community based tourism in Thieng Lieng island is consistent with the viewpoint of building the Ho Chi Minh city tourism development strategy to 2030 with the undertaking of “conservation and development of tourism resources, preservation and promotion of national cultural identity, regions” (The Ho Chi Minh City People's Committee, 2018, p.2).

“Tourism livelihood is considered an additional livelihood that contributes to raising incomes, improving lives and increasing the contribution of the tourism economy to the overall economy of Can Gio district in particular and Ho Chi Minh city in general. But the exploitation and development of community-based tourism in Thieng Lieng should be implemented in the direction of sustainable development.” (Result of in-depth interviews, The Leader of Department of Tourism in Ho Chi Minh city, 28/12/2022)

Jaeyeon Choe & Giang Phi (2022) supposed that: “the tourism research in Vietnam has explored alternative tourism forms and practices such as pro poor tourism and community-based tourism as a means for reducing inequity and poverty” (p.31). Therefore, community-based tourism contribute to sustainable development (Walkowski, M. d. C., Pires, P. d. S., Tricárico, L. T, 2019) or community based tourism as a sustainable direction in destination development (Heesup Han et al, 2019). In Thieng Lieng island, community-based tourism as a strategy for sustainable development.

3.3. Livelihood diversity to adapt to climate change in Thieng Lieng island

In Thieng Lieng hamlet, the population is scatteredly divided into many clusters according to production land, including: the central area of Thieng Lieng hamlet, 50 Canal, Can Gao, Ba Giong, Long Tau and Nong Truong Quan 1, with 226 households, 761 people. In terms of economic structure, the main occupation is salt production (80% of local people). From 2022, Thieng Lieng has a new livelihood - tourism.

Actual survey in Thieng Lieng from 2022 - April 2023, we found that the climate has changed. Specifically, the rainy season comes earlier and lasts longer than usual. This situation makes salt production increasingly difficult.

“This year (2023), the local people harvest less salt than in previous years. The production of salt is highly dependent on the weather. Salt making is very sensitive to weather. Due to the prolonged rainy season, the amount of salt decreased by nearly 50% compared previous year.” (Result of in-depth interviews, salt farmer, man, 45 years old, 6/4/2022).

The livelihood of making salt can hardly help farmers to ensure their daily life. Since then, local people have engaged in community-based tourism practices to adapt to climate change. Adapting to climate change have become main discourse and excited story to create unique tourism product in Thieng Lieng island.

About Thieng Lieng accommodation establishment, there are 3 homestay service providers: Ba Huyen (5 rooms, capacity: 16-20 tourists), Muoi Gia (5 rooms, capacity: 16-20 tourists) and Chin Tho (5 rooms, capacity 10 - 12 tourists). In terms of culinary facilities, there are households in Thieng Lieng that can participate in the supply chain such as Nam Doi restaurant (capacity: 150 tourist), Muoi Bung restaurant (capacity: 150 tourists), Ba Loan - site of making folk cakes (capacity: 60 tourist), Sau Trung - site of making herbal refreshments (capacity: 60 tourist). Regarding sites of supplying drinking water and soft drinks in Thieng Lieng, there are households that can provide such as: Ut Hai (capacity: 40 tourists), Tu Tuan (capacity: 80 tourists), Ut Kieu (capacity: 60 tourists) Muoi Gia (capacity: 50 tourists). About other services, there are site of relaxing footbath - Nam Tuyet (capacity: 40 tourists), Hai Nhoc - site of folk game (capacity: 40 tourists), Tu Huynh - site of traditional art performance (capacity: 60 tourists). All tourism services in Thieng Lieng are implemented based on the philosophy of “convergence tourism”. Especially, “convergence tourism” focuses on adapting to climate change.

“Developing community-based tourism in Thieng Lieng will contribute to unpacking local convergence values. Convergence in community-based tourism development is the convergence of human values associated with the natural condition of Can Gio in order to build a community-based tourism product with identity and uniqueness in the locality. Convergence tourism to adapt to climate change is the way to help local people overcome the challenge.” (Result of in-depth interviews, Director of Thieng Lieng Agricultural and Trading Tourism Service Cooperative, woman, 46 years old, 6/4/2022)

Developing community-based tourism in Thieng Lieng with the philosophy of “convergence tourism” towards strength of system and solidarity of the local people. From there, a network of tourism service providers was formed. Basically, this network is a value chain. When developing community-based tourism associated with salt production in the direction of the value chain, it will destroy the fragmentary nature, lack of systematicity and lack of cohesion of stakeholders. Invisibly, the value chain makes the structure of tourism products more stable, limits the risks brought by tourism livelihood practices. Therefore, people are increasingly connected to adapt to climate change.

4. Discussion and conclusion

Ho Chi Minh city is the convergence center of Vietnam's unique tourism development resources. In recent years, many resources have been exploited and made an important

contribution to raising the position of the tourism industry to become one of the key economic sectors of the city. Currently, the structure of tourism types and products of Ho Chi Minh city is quite diverse and highly universal, but still lacks the form of community-based tourism.

In fact, the resources for developing community-based tourism in the city have a lot of potential but have not yet been properly exploited. One of the unique areas containing many values of natural and human tourism resources cultivated along with the process of formation and development of the city is Thieng Lieng hamlet - Thanh An commune - Can Gio district. The return of residents to make salt, keep forests, and catch fish has created an integrated ecosystem with an identity that helps Thieng Lieng be compared to a beautiful, peaceful and attractive land. Developing community-based tourism in Thieng Lieng will contribute to connecting resources and networks to build a highly attractive model of community-based tourism for Ho Chi Minh city to adapt to climate change. To make the story of exploiting and developing community based tourism in Thieng Lieng more sustainable and create meaningful contributions to the goal of improving the lives of the local people, we suggest appropriate functions for the following tasks:

- The exploitation and development of tourism in Thieng Lieng should be implemented in the direction of sustainable development. Calculate the optimal capacity for Thieng Lieng. Propagating and mobilizing people to protect the natural landscape and environment, building Thieng Lieng as an environmentally friendly destination.

- Organize tours to learn experience in exploiting and developing community-based tourism in Vietnam for representatives of local households. The objective of the training courses is to raise awareness with practical skills associated with tourism in the local community to adapt to climate change.

- Building a solid tourism product structure and ensuring the quality of tourism services associated with the enjoyment process of visitors. Step by step specializing in local tourism products and at the same time contributing to diversify tourism products for Ho Chi Minh city. Create and supplement tourism services in Thieng Lieng in order to complete services and increase revenue for households engaged in local tourism activities.

MOTIVATIONS OF HOUSING TENURE CHOICE AMONG RURAL-URBAN MIGRANTS: A CASE STUDY IN HANOI, VIETNAM

MSc. Nguyen Le Dieu Linh

nldlinh@hunre.edu.vn

*Faculty of Land Management, Hanoi University of
Natural Resources and Environment, Hanoi, Vietnam*

Abstract

This study aims to assess the impact of motivations affecting the housing choice of migrants from rural to urban areas. These motivations were identified as sociology and physical well-being, household events and housing adequacy. A questionnaire survey was conducted to investigate migrant workers' housing tenure choice as well as the influence of motivations on housing tenure choice. The research results showed important implications. Firstly, the influence of migration purposes has a positive impact on housing choice. Secondly, when a life event occurs, it also changes the intention to change residence as buying or renting house. Thirdly, the important finding of the study showed that the majority of people who were not satisfied with the housing conditions in the city tend to change their house. This study recognized a number of important and significant results for investors and policymakers. However, it also has some limitations. It is necessary to clarify the binding factors, as well as the effects of opportunities and accessibility to housing of migrants from rural to urban areas

Keywords: *Housing tenure choice; migrants; motivations; sociology; physical well-being; household events; housing adequacy.*

1. Introduction

In Vietnam, since 1986, there has been remarkable economic development thanks to public policy reforms. Industrialization led to urbanization in big cities and led to a massive migration of people from rural to urban areas to live and work. The results of the 2019 population and housing census show that more than half - about 53.1% of people migrate from rural to urban areas in search of work and by family/relocating 20.7%. Housing becomes a major issue for migrants and migrants' intention to stay in the city. Firstly, the housing area of migrants in recent years has always been lower than that of non-migrants. The reason is that owning a house with a large area in the city is not easy for migrants. Second, migrants always face difficulties with housing ownership. For migrants from rural to urban areas, more than 62% have to stay in rented or borrowed private houses, while the household's own house accounts for only 33.6%, the lowest among migration flows.

Theoretically, there have been many domestic and international studies interested in the housing choice of migrants. In the world, the housing choice of migrants has been mentioned by many researchers from different aspects such as factors affecting the ownership of migrant housing, migrant housing in poor areas, housing purchase intention

(Costello, 1987; Owusu, 1987; Tian et al., 2017). Specifically, for the research on factors affecting the choice of migrant housing, the theoretical frameworks that are often applied in the research are the life cycle theory (Rossi, 1995), the theory of planned behavior (Ajzen, 1991), decision theory (Jansen et al., 2011). In general, the proposed theories are consistent and explain the research results. However, when studying on the same aspect, the studies give different research results. Because Vietnam has economic and political characteristics based on the socialist regime similar to China, especially both countries have high densities of migrants in urban areas. Therefore, the question is whether the factors affecting housing choice in Vietnam are similar to previous research results, and what policy changes need to be made by the government to help and housing support for migrants. In particular, the factors driving migration, constraints and opportunities for migrant housing, or financial capability, income, social capital are all very important in making policy decisions, housing investment for migrants. In this research, the author used the combination of two theories, namely risk approach and the theory of consumer behaviors as it is indicated that these approaches are appropriate to look at motivations or triggers of residential mobility and migration.

In terms of socio-economic regions in Vietnam, the Red River Delta is one of the largest regions with the highest proportion of rural-to-urban migrants, accounting for 22.4%. Besides the reason for finding a job, the reason for migrating with family or moving house of migrants in these two regions is also the largest in the country, showing that the housing needs of migrants is also very important. The author chooses Hanoi, because it is not only in terms of population size but also in terms of the number of people migrating from rural to urban areas. The study of migrants' housing choices in Hanoi will be representative of the provinces with rural-urban migration flows in Vietnam.

The main research purpose is to evaluate the impact of motivation factors affecting the housing choice of migrants from rural to urban areas. Specifically, the study will clarify theories to determine the factors affecting the housing choice of migrants, as well as the demographic characteristics. The study proposes a number of recommendations to help policymakers, businesses, and investors come up with appropriate policies and housing products to better meet the needs of rural-urban migrants when buying houses.

2. Literature review

2.1. Housing choice and risk approach

In housing research, the concept of housing choice (housing choice) is widely used as distinct from housing preferences (housing preference). However, in many cases, choice requires a motivation to find a housing option that is appropriate. According to Coolen and Hoekstra (2001), housing choice is oriented towards the values and goals achieved of that choice. This means that while tastes reflect housing preferences, choices refer to actual behavior after taking into account many factors. Even when preferences strongly influence housing choices, buyers still consider options more than they are influenced by preferences.

However, in terms of the migration issues, housing choice is associated with socio-economic goals such as employment opportunities, income, with institutional and policy constraints (Mulder, 1996). These components cannot be separated but related to each other.

In this study, the author uses the "risk approach". The term "risk" originated in demographic studies of mortality, but it is now more commonly used to express the likelihood of an event occurring. The risk approach is the dominant research method on the determinants of migration and population mobility as it is often practiced by geographers and demographers (Sandefur and Scott, 1981; Courgeau, 1985; Davies and Pickles, 1991). The occurrence of events leading to spatial displacement of people, either in a fixed time period or in continuous time is analyzed by regression models. The data used here is usually census or sample survey data that measures behavior: it is not known whether people participated in the choice process. This method is used to test whether a change or no change in residential mobility occurs over a short period of time.

2.2. Motivations

In order to make a decision to change or not to change a place of residence, there must be causes or factors that trigger the mobility, also known as the motivation to change the place of residence. In Western countries, these motivations are divided into two categories: material motivations (to satisfy financial, entertainment, and personal preferences); immaterial motivation (wanting to be recognized by society, confirming one's status). These factors are concretized in daily life by the following groups of factors: wealth (high or stable income); status (having prestigious work, power and influence); comfortable (living in a pleasant community; comfortable housing); spiritual (happy, excited, meeting many people); self-control (being able to say and do what one wants); affiliation (wanting to be near family, friends; staying with spouse, children); ethical culture (wanting family and children to interact with a cultural and ethical community). In addition, changes in family and life also directly create a change of residence from the countryside to the city, and also change the place of residence in the city itself. Housing adequacy also affect housing options, which determine whether to stay or leave the current place. The author selects three factors that are suitable for the research context in Vietnam, specifically in Hanoi, including the following factors:

2.2.1. Physical well-being and sociology

Material goals are one of the important reasons affecting migrants' housing choice. Hooimeijer et al (1996) clarified how these factors influence housing choice. For example, work is also a factor because it not only determines how much a household can afford to pay for housing, but also creates an incentive to get a better job. Owusu (1998) pointed out the primary reasons for migration that affect the choice of housing of migrants. In it, the author points out that migration can provide opportunities for migrants to achieve their material desires to improve their material well-being and their families.

In terms of sociology, Owusu (1998) also suggested that the desire to own a house in the place of migration is also affected by the need for accommodation as well as creating opportunities for relatives and relatives to live together. together. Besides, finding new accommodation in the place of migration also fulfills the desire to improve the quality of life and raise children better. In addition, the author also points out that when considering housing choices affected by the purpose of migration, the focus should be on who the migrants are. The migration status of each individual can have a significant impact on housing choice. For

example, long-term migrant workers have a desire to create self-worth in society through home ownership. In contrast, short-term migrants tend to own less housing due to their intention to return to their homeland after finishing work or achieving personal goals.

However, not all studies confirm that the above reasons have a significant influence on the housing choice of migrants. Research by Coolen et al. (2002) found that the values and goals of migrants as reasons for migration account for only 9% to explain the variance of the housing choice variable, but it is also a significant factor. the most representative among the micro-factors that affect the intention to choose migrant housing. These values include material goals, wealth, and a happy family life, and are part of a scale of power and achievement that reflects family values.

2.2.2. Household events

The above goals are only considered as general goals, but when analyzing an individual's intention to move, it is necessary to clarify the stages, or events that change the life. In fact, it is easy to connect with De Jong and Fawcett's migration goals such as education, work, changing family size, entertainment, and housing. Also, according to Mulder, 1993, there are two main reasons for changing residence. Firstly, it is the desire to change the current situation, towards improving the quality of life. Second, it is due to the occurrence of an event in the trajectory of life, or the desire for that event to happen, such as moving out, getting married, divorced, going to school away from home, or due to a change in job.

Events at different times of life produce different shifts in location, direction, and destination. For example, changes in the number of household members and jobs create changes in the demand for space as well as housing facilities. Mudler (1993) showed that a change in the number of household members caused a 10-fold increase in changes in housing in the proximal area instead of having to migrate to another area. Meanwhile, the reason for getting married only makes it 6 times more likely to have to migrate in the nearby area instead of migrating to the neighboring area. As can be seen, different life events will create different geographical travel distances.

2.2.2. Housing adequacy

Housing adequacy is a measure of how well housing conditions meets a household's needs, expectations and desires in terms of both quantity and quality of housing. One of the best descriptions of the housing adequacy was given at the second United Nations conference (Habitat II) held in Istanbul, 1996 concerning the issue of housing: “adequate privacy; adequate space; physical access; appropriate security; guarantee ownership; structural stability and durability; suitable lighting; heating and ventilation where appropriate; adequate infrastructure, such as water, sanitation and waste; relevant health and environmental factors; location with access to both the workplace and basic facilities at a reasonable price” (UN-HABITAT, 1996).

Research by Mohit et al (2010) has shown that physical factors such as housing services, followed by facilities, apartment characteristics, and neighborhood facilities, and social environment, respectively, are the factors affecting the satisfaction of affordable housing in Kuala Lumpur, Malaysia. Research has discovered that apartment dimensions,

such as the space of the loggia, bedroom, dining room should be improved to satisfy the needs of buyers. In another study by Dinc et al (2013), it was clearly shown that factors such as distance to the workplace, school, city, public transport, or the suitability of parks and trees, the landscape, the lighting system of the building, the size of the rooms of the apartment, and the outside light did not have a great influence on the satisfaction of the occupants of the individual house. Meanwhile, the above factors have a great influence on people living in complex housing such as apartment buildings and low-rise houses.

2.3. Research framework

According to the risk approach, it is not possible to shed light on what causes people to change their place of residence. One cannot distinguish between those who do not want to move and those who do not have the resources or opportunity to do so. But it is possible to get closer to such an elucidation by testing the correct hypotheses. Hypotheses about the effects of independent variables should best represent factors about goals, life-changing events, or housing suitability. These hypotheses should address the factors that lead to migration.

Besides, the theory of consumer behaviors also has its starting point as motivations to own a house. They often compare a range of alternatives under certain constraints in making a home tenure choice. Migrant workers will make reasonable economic considerations to maximize benefits and minimize risks. As a result, tenants' perception of the suitability of their home plays an important role in their home ownership decision-making process. When considering the degree of ownership restriction, only housing that matches or exceeds their needs, aspirations and expectations can stimulate their willingness to buy housing. The hypothesis about housing choice is formed as follows:

Hypothesis 1 (H1): There is a positive relationship between sociology and physical well-being of migrant people and their housing tenure choice.

Hypothesis 2 (H2): There is a positive relationship between household events of migrant people and their housing tenure choice.

Hypothesis 3 (H3): There is a positive relationship between housing adequacy satisfaction of migrant people and their housing tenure choice.

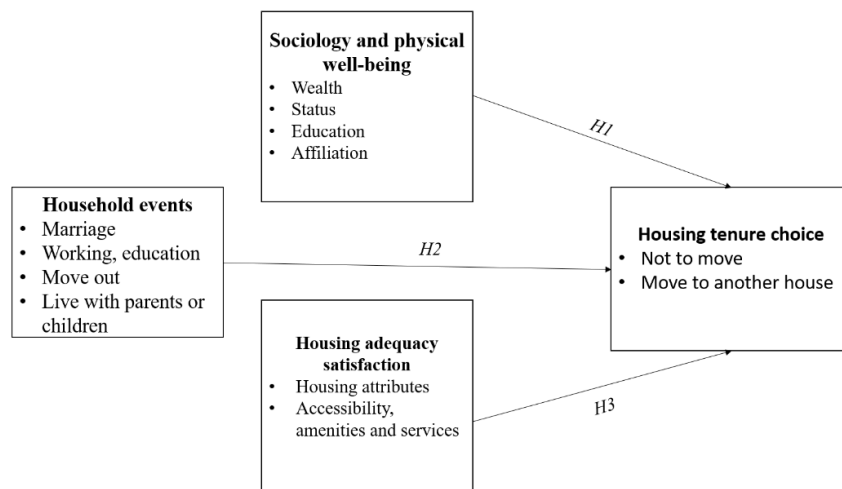

Figure 1. Research model

3. Method

This research employed a hybrid research methodology. An extensive literature review was conducted to identify the motivations of migrants moving from rural to urban city, including sociology and physical well-being, household events and housing adequacy. Secondly, the survey was conducted among 300 rural-urban migrant people with via five-point Likert scale. Finally, the influence of these factors on housing tenure choice are identified by regression model.

In terms of socio-economic regions in Vietnam, the Red River Delta and the Southeast are the two regions with the highest proportion of rural-to-urban migrants. It is estimated that every year the population in Hanoi increases by more than 200,000 people, of which more than a third are rural people who migrate to the urban area. According to the Institute of Population and Social Affairs, by 2050, the population in Hanoi may double to 14 million people. This research was conducted in Hanoi as it is one of the most typical cities in Vietnam which has enormous number of rural-urban migrant people. The study of migrants' housing choice in Hanoi will be representative for rural-urban migration flows in Vietnam.

The questionnaire survey was conducted to investigate migrant workers' housing tenure choice as well as the influence of motivations on housing tenure choice. The first section was designed to collect their socio-economic characteristics, consisting age, gender, income, family size, education, income, career, and residence length to housing type. The second section serves to measure the purposes of moving to the city such as wealth, status, education and affiliation; household events such as marriage, working or higher education, moving out and live with parents or children; housing adequacy including housing attributes, accessibility, amenities, and services satisfaction. All of questions are undertaken via five-point Likert scale (1=very unimportant, 2=unimportant, 3=slightly unimportant, 4=important, 5=very important). In the last section, the respondents were asked to express their housing tenure choice (1=not to move, 2=move to another house). A pilot test was conducted with 50 randomly selected migrant people. Preliminary research was conducted in order to check the appropriateness of the questionnaire in Vietnam.

Data collected from primary sources is analyzed by using quantitative tools, including descriptive statistics, factor analysis, testing and regression analysis. These methods are used to analyze the impact of motivation factors on housing choice of rural-urban migrants in Vietnam.

4. Results

4.1. Descriptive statistics

Table 1 showed the characteristics of respondents. About half of the respondents were women. Education is mainly university with 41%, followed by high school with 22% and college with 12.7%. Only 2% of respondents said that they have not finished primary school or have completed primary school. Most of the respondents were married, accounting for a total of 88%. The majority of migrants from rural to urban areas get married and have children, with the number of family members of 4 or more accounts for the majority, 68%.

The questionnaire survey were also conducted with both low- to medium- and high-income migrant people. Descriptive statistics showed that the majority of migrants have low and middle income, in which income from 5-10 million VND/month, accounting for about 30.7%. Average income from 10-15 million VND/month, makes up for about 23% and high income from 20 million VND/month or more accounts for 15.7%. Of these people, nearly half (41.7%) are self-employed, about 18.7% are civil servants and only about 15.7% are doing business..

Table 1. Characteristics of rural-urban migrant people

Socio demographic	Count	Percentage	Household structure	Count	Percentage
Gender			Married status	26	8.7
Male	124	41.3	Married	264	88.0
Female	176	58.7	Unmarried	10	3.3
			Divorced, widow	26	8.7
Education			Number of family members		
Primary school and less	6	2.0	1	12	6.0
Secondary school	35	11.7	2	17	8.5
High school	66	22.0	3	35	17.5
College	38	12.7			
University	123	41.0	4	88	44.0
Postgraduate	32	10.7	> 4	48	24.0
Employment type			Monthly income		
Civil servant	55	18.3	<5 million VND	46	15.3
Military	10	3.3	5-10 million VND	92	30.7
Officer	41	13.7	10-15 million VND	70	23.3
Self-employed	125	41.7	15-20 million VND	41	13.7
Business	47	15.7	>20 million VND	47	15.7
Online business	6	2.0			
Others	14	4.7			

4.2. Factor analysis

The Kaiser-Mayer-Olkin coefficient (KMO) of the observed sample after measuring is 0.944, showing that it is higher than the limit value of 0.5. Bartlett's test results also show a value less than $p < 0.0001$. Therefore, the indicators are suitable for factor analysis. Table 2 shows that there are 10 items and these items account for 82.5% of the total variance. These eight factors are wealth; status; education; affiliation; marriage; working; education; move out; live with parents or children; housing attributes; housing accessibility, amenities and services.

Factor analysis result in Table 2 showed that three components of motivations for housing tenure choice were identified. The factor loading of all items were appropriate as they reached more than 0.5. These factors represent a combination of reasons leading to the choice or not to choose to continue in the old place of residence. This is an important finding for previous studies, while being mentioned only as an implication for future studies in different geographical contexts.

Table 2. Factor analysis of measurement items

Motivations	1	2	3
Sociology and physical well-being			
SP1: To earn better income	0.878		
SP2: To earn better job with higher salary	0.873		
SP3: To have better education with moral standards	0.711		
SP4: To live with family and relatives	0.56		
Household events			
EV1: To get married and have children		0.633	
EV2: To work and study in the city		0.742	
EV3: To move out, no longer live with parents		0.712	
EV4: To live with parents or children		0.676	
Housing adequacy satisfaction			
HS1: Housing attributes' satisfaction			0.907
HS2: Accessibility, amenities and services's satisfaction			0.817

4.3. Regression analysis

The adjusted R Square in this model was 0.559 showed that four independent variables have influenced 55.9% of the change of the maximum HC variable, the remaining 44.1% is the effect of numbers and wrong variables outside model.

We need to evaluate the model fit accurately through hypothesis testing. To test the regression model, we hypothesize $H_0: R^2 = 0$. The F test is used to test this hypothesis. The test results showed that sig in F test was $0.000 < 0.05$. We can conclude that the R squared of the sample is not 0. Therefore, the linear regression model can be generalized and applied to the sample.

According to Table 3, the Sig. of t-Test are less than 0.05, showed that all dependent variables have impacts on dependent variable. Especially, the sociology and physical well-being components are the most significant factors as its significane are 0.002. The coefficient B of this factor is 0.122, indicating that as the motivations relating to sociology and physical well-being increase, the housing tenure choice will also increases. The same result is also shown for the variables of household events. When migrants have a change in the number of family members such as getting married, going to work or getting higher education in the city, they tend to rent or move to a new place. However, the coefficient of satisfaction with

housing adequacy is negative, indicating that the lower the satisfaction of housing adequacy is, the more migrants moving to other place will continue to increase.

Table 3. Regression analysis

		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
	Components	.960	.177		5.425	.000
	SP	.122	.039	.183	3.107	.002
	HE	.005	.047	.008	.103	.018
	HS	-.008	.037	-.016	-.216	.029

5. Discussion and Conclusion

The study results on the influence of three motivational factors on the housing choice of migrants from rural to urban areas have shown important implications. Firstly, the influence of migration purposes will have a positive impact on housing choice. Specifically, when migrants from rural to urban areas decide to change jobs with better income, they will choose a housing location close to the workplace, with affordable prices. For households with children living in the same city, families will consider choosing a good school and ensuring it is close to work, or they can choose only one location that is near school or work place. This finding fully supports previous studies (Hooimeijer et al, 1996; Owusu, 1998; Coolen and Hoekstra, 2001, Coolen et al, 2002).

Second, the occurrence of a life event also changes the intention to change residence or own a house. A person who is getting married, or has children will tend to look for more spacious housing in the city. These households will also tend to find houses to buy instead of rent if not financially bound. In addition, people who go to the city to work or study will also look for housing or tend to change their place of residence. They will choose to live close to school, work or both. And there are a few, who tend to leave the family to live on their own, or the elderly tend to move to the city to live with their children when they get old. This trend is in contrast to countries in the West, where retirees often go to the suburb rather than choosing the city.

Third, the important finding of the study showed that the majority of people who were not satisfied with the housing conditions in the city tend to change their house. The first group is people with middle and high income, most of which are not satisfied because they want to increase the housing area or change the already familiar living environment. This is completely consistent with previous studies of Gan et al, 2006; Dinc et al, 2013; Mohit et al., 2010. According to statistics, up to two-thirds of low-income workers, most of them living in temporary housing, with unfavorable housing conditions, are not satisfied. The rest low-income people are satisfied with housing conditions are simply because their financial ability allows only temporary conditions. This showed that if there are better job

opportunities, higher income, low-income migrants are more willing to move to a new better place. This is different from previous studies, especially in the context of the shifting economy in urban areas.

This study recognized a number of important and significant results for investors and policymakers. According to research data, more than half of the migrants surveyed are women. From a gender perspective, migrant women face many difficulties not only in terms of employment but also in housing and sanitation. The survey results described that more than half of migrants are low-income migrant workers with cramped living conditions, inadequate sanitation and clean water systems. Besides, renting houses for migrants is the majority compared to owning houses. In fact, the management from State with this housing type is still not strict and careful. The payment for water, electricity and living expenses in the slums is too high and uncontrolled, leading to an unsatisfactory quality of life for migrants. Therefore, the State needs to promote and implement meaningful policies for rural-to-urban migrants, such as employment policies, housing policies, or inventive policies for local level or housing investors towards a safe and affordable housing model.

The study also suggests that in further studies, it is necessary to clarify the binding factors, as well as the effects of opportunities and accessibility to housing of migrants from rural to urban areas. Clearly, when migrants are motivated to move to the city, they need to find a place to live, therefore, it is necessary to consider opportunities that give them the right to own or rent housing, as well as the factors that promote financial capability, improve their income and living standards in urban areas.

Abstract

Located on the Central Highlands heritage road, on the gateway connecting Laos and Cambodia to the East Sea, Phu Yen province has many potentials and advantages to develop tourism. The location, the unique natural and cultural resources are the basis to develop its own tourism products and routes, with high competitiveness. The article analyzes the potential and advantages of tourism routes in Phu Yen province by applying the AHP method. The results of this paper demonstrate that Phu Yen can develop and exploit many competitive tourism routes within the province and link with the neighbors as well. This surely can make a great economic transition of such a rural province like Phu Yen.

Keywords: *tourism route, tourism potential, Phu Yen*

1. Introduction

Phu Yen defines tourism as a key economic sector in its socio-economic development strategy. By 2025, the goal of "Phu Yen tourism development project for the period 2015 - 2020 and orientation to 2025" is: "To strongly develop tourism to become a spearhead economic sector with many products: unique tourism products, strive to become a major tourist and service center in the region and the whole country; becomes an important bright spot in regional development linkages between the Central Highlands and South Central Coast provinces" (Provincial Steering Committee for Tourism Development 2012; Foreign Affairs Committee of Vietnam 2005).

Currently, the exploitation of natural and cultural resources of Phu Yen for tourism activities is still limited compared to the nearby province. In some coastal localities, tourism potential has not been converted into tourism resources (Pham, 2016). Over the years, there have been several investigations and projects to assess natural and cultural resources for tourism of Phu Yen. However, most of these focused on the level of general assessment, preliminary assessment on a large scale. The lack of focusing on tourism resource routes,

clearly evaluating the potential and exploitation status need to be bridge. And the paper "To assess the potential and orientation development of tourism routes in Phu Yen province, Vietnam" contributes to this job. Results of this paper supplements a necessary document, serving as basis information to plan and design specific and effective tourist routes, aiming at sustainable tourism development.

2. Theoretical Framework and Method

In fact, assessments tourism routes can be divided into different categories: elemental resource assessment and territorial resource assessment; qualitative assessment and quantitative assessment to determine the degree of convenience (very good, good, average, not good. In this paper, we apply *Analytic Hierarchy Process* to evaluate the potential and advantages of tourism routes in Phu Yen.

The process of evaluation of tourism routes

Tourism route is a route linking tourist attractions and tourist service providers in association with traffic routes. Tourism routes are an important basis for service providers to build up tours. In each locality, there are tourism routes connecting tourist destinations in the province called intra-provincial tourist routes; and tourist routes connecting tourist destinations of the province with others called inter-provincial (at macro-level it is called international tourism routes). There are different criteria to evaluate tourism routes for specific purposes. In this study, we define a system of criteria including 1-Criterion 1 (Cri.1) Average number of tourism resources in the route; 2-Criterion 2 (Cri.2) The attractiveness of tourism resources; 3-Criterion 3 (Cri.3)- The convenience of transportation; 4-Criterion 4 (Cri.4)- Synchronization of facilities; 5-Criterion 5 (Cri.5)- The duration of operation tourism activity. The evaluation score of these criteria is also determined by four levels 4,3,2,1 like the assessment of points and clusters of tourist resources (Mai, 2019). We will present the five criteria in the following part.

a. Average number of tourism resources

According to Ngo (2016), the average number of tourism resources in the route is calculated as the ratio between the number of tourism resources and the length of the route. A short route with several tourism attractions will be more convenient and attractive to tourists. Whereas a long route with few tourism sites will be less attractive to tourists. Therefore, this criterion is very important and is evaluated with 4 levels:

- + Very high: 0.4 tourism resources per kilometer.
- + High: from 0.2 to less than 0.4 resources per kilometer
- + Average: from 0.1 to less than 0.2 resources per kilometer
- + Low: less than 0.1 resources per kilometer

b. The attractiveness of tourism resources

In reality, the route with attractive tourism resources will attract tourists and generate high revenue. The more special the tourism resource is, the more attractive it is. This criterion

is also considered important to identify favorable routes (with high tourist attraction) and unfavorable routes (with low tourist attraction). This criterion is evaluated by 4 levels:

- + Very attractive: the route has at least 5 tourist attractions of national significance.
- + Attractive: the route has at least 3 tourist attractions of national significance.
- + Moderate attraction: the route has at least 1 tourist attraction of national significance.
- + Unattractive: the route has no tourist attractions of national significance.

c. The convenience of transportation

In tourism, traffic plays a very important role to move the tourists to the tourism site. In terms of traffic, the convenient tourism route has high tourism business efficiency and vice versa. Therefore, evaluating the capability of tourism routes, and proposing solutions to invest and exploit tourism routes effectively need to consider traffic criterion. This criterion is evaluated by 4 levels:

- + Very convenient: routes located along national highways, roads to tourism sites have been upgraded, and operated on both rainy and sunny days.
- + Convenient: routes located on national highways, have 1 or 2 tourism spots located no more than 10 kilometers from the national highway, and operate on both rainy and sunny days.
- + Moderate convenient: routes located near national highways or provincial roads, have 1 to 2 tourism sites located 10 to 20 kilometers from national highways.
- + Less convenient: routes located far from the national highway and operate only on sunny days.

d. Quality of facilities and techniques for tourism

The purpose of tourism activities is to enjoy both material and spiritual values. Visitors will be pleased if their physical conditions are satisfied. Tourism conditions, comfortable housing attract and retain tourists to stay longer. And tourism revenue will be greater. In fact, some destinations have attractive tourism resources, but the physical and technical conditions do not meet the needs of tourists. Thus, the length of stay is shortened, and of course low tourism revenue. This criterion is divided into 4 levels:

- + Very good: the route with many convenient places to stay, with 3 (or more) one-star hotels.
- + Good: the route with 2 to 3 (or more) one-star hotels.
- + Average: the route with 1 one-star hotel and has a motel system meeting the needs of average travelers.
- + Poor: the route without star hotels except a system of motels at average level.

e. The duration of operation tourism activity

In general, the good weather, not raining and warm will be very favorable for tourism activities. However, with the tropical and monsoonal climate, Phu Yen has lots of rain. The

rainfall is relatively large and varies seasonally. The rainy season in autumn - winter is not favorable for tourism activities. The dry season in June, July and August with southwester winds is also not suitable for tourism. The longer the travel period, the higher the tourism revenue is. Therefore, this criterion is also considered important to evaluate the convenience of tourism routes.

Operation time for tourism activity is defined by calculating the number of days operated tourism activity. This criterion is classified into 4 levels: very long, long, medium, and short.

- + Very long: over 200 days in a year can hold tourism activities.
- + Long: from 150 to 200 days in a year can perform tourism activities.
- + Average: from 100 to less than 150 days in a year can implement tourism activities.
- + Short: less than 100 days in a year can deploy tourism activities.

The results of the assessment method are presented in Table 1.

Table 1. Criteria for assessing tourism route (5 criteria), rating scale (4 levels)

Criterion (Cri.)	4 points	3 points	2 points	1 point
Cri. 1	very high	high	average	low
Cri. 2	very attractive	attractive	average attractive	less attractive
Cri. 3	very convenient	convenient	average	inconvenient
Cri. 4	very good	good	average	bad
Cri. 5	very long	long	average	short

In fact, the selected criteria have different important degrees of for the assessment score. Therefore, to ensure that the assessment results are accurate and objective, it is necessary to determine coefficients for the more important factors. We define that the criteria having great influence on tourism activities would be the highest coefficients, including the average number of tourism resources, the attractiveness of tourism resources, the duration of operation, respectively; then comes the two remain criteria. Based on practice in Phu Yen, and previous research results, we determine the coefficients as follows:

The average number of tourism resources has great influence on the choice of travelling. Generally, tourists do not want to sit in the car/bus for a long time. So, a route with lots of tourism resources within a short distance will be more favorable for its convenience and comfort. This criterion is determined the highest coefficient, number 3.

Tourist routes with the following things will attract a great number of tourists, i.e., attractive, and unique tourism resources, having national and international significance sites, having typical tourism products. Sometimes, this criterion is the vital reason for tourists to choose the tour. Thus, we also determine this criterion the highest coefficient, number 3.

The duration of tourism activities in the route determines the seasonality and rhythm of the tourist flow. It is also determined the highest coefficient, number 3.

The coefficient of synchronization of facilities and duration of operation tourism activity criteria are quite important. Because the convenient transportation and the better facilities and quality technical is, the stay of tourists is longer, the revenue is higher. Thus, we determine the coefficient of these two criteria as number 2. We summarize the coefficient and degree in Table 2 below.

Table 2. Coefficient and degree of tourism route assessment

Criterion (Cri.)	Coefficient	Degree			
		4	3	2	1
(Cri. 1) Average number of tourism resources	3	12	9	6	3
(Cri. 2) Attractiveness of natural resources	3	12	9	6	3
(Cri. 3) Operation time for tourism activity.	3	12	9	6	3
(Cri. 4) Synchronization of facilities	2	8	6	4	2
(Cri. 5) The duration of operation tourism activity	2	8	6	4	2
Total		52	39	26	13

With the above summarized table, the score is divided into 3 following levels. Each tier has a different level of convenience and meaning. Level 1 is from 39-52 points; level 2 from 26-38 points; and level 3 from 13-25 points. Thus, tourism route will be rated from 13 to 52 points. The least convenient route is rated 13 points, the most convenient ones is rated 52 points. Summary scores are presented in Table 3.

Table 3. Table of evaluation of the convenience of the tourist route

Number	Convenience	Points
1	Very convenient	39 - 52
2	Convenient	26 - 38
3	Inconvenient	13 - 25

3. Results

3.1. Evaluating 6 intra-provincial routes

In this study, we evaluate 6 intra-provincial routes as mentioned by (Tran & Dang, 2015).

* *The route within Tuy Hoa City*

The main tourism sites are Nhan Tower - Da Rang River - Tuy Hoa Beach - Long Thuy Beach - Chop Chai Mountain - Binh Ngoc Flower Village - Binh Kien Flower Village - Bao Lam Pagoda - Bao Tinh Pagoda - Ho Son Pagoda - Wind Afternoon tourist area - Da Ban tourist area - Thuan Thao eco-tourism area - Sao Viet eco-tourism area. The tourism products includes relics and landscapes in Tuy Hoa area; handicraft villages; cultural and art programs such as Bai Choi, Ho Drill, Ho Ba Chao, Rock trumpet, and harp performance, etc.

** Tuy Hoa city - Tuy An - Song Cau town*

The main tourism attractions on this route includes Long Thuy Beach - Hon Chua - Bai Xep - Temple of Le Thanh Phuong - O Loan lagoon - Thanh Loi poplar forest - Ganh Da Dia - Mang Lang Church - An Tho citadel - Da Trang pagoda - Ganh Do fish sauce village - Vung Lam - Wing Xuan Dai - Cu Mong Lagoon - Bai Rang - Bai Tram - Bai Tu Nham, etc. This route is along the 1A National Highway and reaches most of the valuable tourism destinations in the northeastern coastal area of Phu Yen.

** Tuy Hoa city - Tuy An - Dong Xuan*

The main tourism attractions on this route includes Long Thuy beach - Chua island - Bai Xep - Le Thanh Phuong temple - O Loan lagoon - Ganh Da Dia - Mang Lang church - An Tho citadel - Gò Thi Thung Tunnel (where the first branch of the Communist Party of Phu Yen was established) - Triem Duc mineral water - Tra O mineral water - Xi Thoai - Ha Rai mountain villages- Phu Xuan lake. This route is along 1A National Highway, Road 641, Road 647, and is a history, cultural, ecological, convalescence tourism route.

** Tuy Hoa City - Ca Mountain Pass - Vung Ro - Da Bia Mountain*

The main tourism attractions on this route includes Da Bia Mountain and Resort-Ca Mountain pass, Forbidden Forest - Bai Mon - Mui Dien - Bai Goc - Bai Bang - Vung Ro - Hon Nua - The historical site of the Ho Chi Minh Trail on the sea. This route is along 1A National Highway from Tuy Hoa City to Ca Mountain Pass, Highway 29, is a general sightseeing tour for eco-tourism in the North of Ca mountain pass, forbidden forest, climbing Da Bia Mountain, enjoying the sunrise in Bai Mon - Mui Dien, etc.

** Tuy Hoa city - Tuy An - Son Hoa - Phu Hoa*

The main tourism sites on this route includes Van Hoa Plateau - Revolutionary base of Phu Yen province - Hoa Nguyen Waterfall - Dong Cam Dam - Phu Sen mineral water - Hoa Thang Da Ganh - Luong Van Chanh's tomb and temple - Thanh Ho - Traditional craft villages. This tour is along the road 643, Highway 25. The main tourism products are historical cultural tourism and craft villages.

** Tuy Hoa City - Song Hinh - Son Hoa*

The main tourism attractions on this route includes Phu Sen mineral water - Song Hinh hydroelectric lake - Song Ba Ha hydroelectric lake - Hai Rieng town - La Diem ethnic minority cultural village - Son Nguyen Tourism area - Krong Trai Nature Reserve. This route is along highway 29, highway 25 connecting the South-Central Coast region and the Central Highlands. This route is associated with the cultural and ecological values in the western mountainous area of Phu Yen. In addition, there are other sea tourism routes such as Xuan Dai Bay - Cu Mong lagoon; O Loan lagoon - Hon Lao Mai Nha; Vung Ro Bay - Hon Nua; Chua river route; Ky Lo river route; downstream of Ba River route.

After assessing and calculating the scores of 5 criteria, the assessment results of some cultural tourism sites in Phu Yen province are presented in Table 4.

Table 4. Overall evaluation score of Phu Yen intra-provincial tourist routes

Tourism routes	Cri. 1	Cri. 2	Cri. 3	Cri. 4	Cri. 5	Total points
1-The route within Tuy Hoa city	9	6	12	8	8	43
2-Tuy Hoa City - Tuy An - Song Cau Town	12	12	12	4	8	48
3-Tuy Hoa City - Tuy An - Dong Xuan	6	12	3	2	6	29
4-Tuy Hoa City - Ca mountain Pass - Vung Ro - Da Bia Mountain	9	9	12	2	8	40
5-Tuy Hoa City -Tuy An-Son Hoa-Phu Hoa	3	9	9	2	6	29
6-Tuy Hoa City - Song Hinh - Son Hoa	3	3	3	2	6	17

Source: Author survey and calculation, 2022

Table 5. Evaluation results of tourism routes in Phu Yen province

Tourist routes	Total	Result
1.The route within Tuy Hoa City	43	Very convenient
2.Tuy Hoa City - Tuy An - Song Cau Town	48	Very convenient
3.Tuy Hoa City - Tuy An - Dong Xuan	29	Convenient
4.Tuy Hoa City - Ca Pass - Vung Ro - Da Bia Mountain	40	Very convenient
5.Tuy Hoa City - Tuy An - Son Hoa - Phu Hoa	29	Convenient
6.Tuy Hoa City - Song Hinh - Son Hoa	17	Inconvenient

Source: Author survey and calculation, 2022

Among the 6 evaluated routes, Phu Yen has 3 tourism routes rated very convenient, accounting for 50%. The route with the highest score is route number 1, with 48 points, accounting for 92.3% of the maximum score (52 points). The two routes considered convenient are number 3 and 5. Route number 3 is 29 points, accounting for 55% the maximum score. The route number 5 is considered only 17 points, accounting for 32% the maximum score. The route with the lowest score is route number 6, with only 17 points, accounting for 32.7% of the maximum score.

Inter-tourism routes with neighboring provinces.

** Tuy Hoa - Central Highlands provinces*

This route is along the highways 25 and 29. This route includes special tourism sites such as Phu Cuong waterfall, low Ayun lake, Ayun Pa tourism cluster (Da stream, Mong wharf, Hong valley), Tan Truc lake, and ethnic minority villages.

This is a meaningful tourism route strategy for the development of tourism in Phu Yen. The reason is that, within about 200 km, this is the shortest route to bring tourists from Phu Yen to the Central Highland provinces and vice versa, connecting the mountainous area with the East Sea. Besides, Phu Yen also plays an important role in promoting socio-economic cooperation between Vietnam, Laos, and Cambodia as a gateway to the East Sea. This role will become more obvious since the operation of Vung Ro port becomes more effective.

** Tuy Hoa - Quy Nhon - Da Nang - Hue - Quang Binh*

The inter-tourism routes connect Phu Yen with the northern provinces on the "Central Heritage Road" having many unique tourism resources such as relics of the Tay Son uprising, Cham towers (Binh Dinh), Truong Luy (Binh Dinh, Quang Ngai), My Son Sanctuary, Hoi An Ancient Town (Quang Nam), Ngu Hanh Son (Da Nang City), Hue ancient Citadel (Thua Thien Hue), Phong Nha - Ke Bang (Quang Binh), etc. In the future, when the trans-Asia tourism route through Lao Bao border gate (Quảng Trị Province) starts, this route can connect with Phu Yen to make an international route.

** Tuy Hoa - Nha Trang - Ninh Chu*

This is an important tourism route in the region, both national and international. Nha Trang (Khanh Hoa), Ninh Chu (Ninh Thuan) are two sea tourism destinations in the South-Central Coast. This route also can connect with Da Lat, and Tuyen Lam lake (Lam Dong province). Moreover, this route can be expanded to connect with the tourism areas of Southeast and Southwest along the 1A National Highway.

3.2. Orientation to develop and exploit tourism routes in Phu Yen province

In order to develop and effectively exploit the tourism routes, both intra and inter, in Phu Yen, we propose some orientations for the specific route in Table 6 and 7.

Table 6. Intra-provincial tourism routes

Route	The max length of the route	Main tourism activities	Duration
Number 1	36 kilometers	shopping, entertainment at the end of the day, sightseeing, visiting monuments, landscapes, handicraft villages; enjoying cultural and art programs.	1-2 days
Number 2	75 kilometers	resort tourism - sea sports, sightseeing, festivals, enjoying local cuisine.	1-2 days
Number 3	81 kilometers	historical - cultural - ecological - convalescent tourism.	1-2 days
Number 4	40 kilometers	eco-tourism, visiting forbidden forest, climbing Da Bia Mountain, watching the sunrise.	1-2 days
Number 5	95 kilometers	visiting historical sites, convalescence tourism, community tourism.	1-2 days
Number 6	150 kilometers	cultural, ecological, sea tourism.	1-2 days

Table 7. Inter-provincial tourism routes

Route	Significant tourism activities	Future prospect
1-Tuy Hoa - Central Highlands provinces	waterfall, low Ayun lake, Ayun Pa tourism cluster (Da stream, Mong wharf, Hong valley), Tan Truc lake, and ethnic minority villages.	Inter-tourism routes national routes (to the Highland, Laos, Cambodia)
2-Tuy Hoa - Quy Nhon - Da Nang - Hue - Quang Binh	relics of Tay Son uprising, Cham cultural and towers, My Son Sanctuary, Cham Museum, Hoi An, Hue ancient Citadel, Son My	international tourism routes
3-Tuy Hoa - Nha Trang - Ninh Chu	sea tourism (Ninh Chu, Nha Trang)	Inter-tourism routes, national routes (to the Southeast and Southwest).

4. Discussion and conclusion

Phu Yen has many valuable tourism resources, widely distributed throughout the territorial space of the province. This is an important basis to develop specific tourism products on each tourism routes. However, to develop and exploit the routes effectively, it is necessary to develop tourism services on balanced and appropriate routes.

Results of the paper show that some intra-tourism routes in Phu Yen are very convenient to exploit (route number 1,2, and 4), some are not (route number 6). In contrast, the inter-tourism routes are very prospect and may become important national and international tourism routes.

If the province has reasonable solutions to organize tourism territory; especially the industry has a breakthrough investment in infrastructure - facilities - techniques, Phu Yen tourist routes will have more prosperity, increasing attraction to tourists.

Therefore, Phu Yen should focus on assessing tourism resources according to specific routes. Combining tourism promotion with the enhancement of local culture, creating a healthy competition for products on the province's traditional tourist routes, combining tradition with modernity in serving tourists, increasingly bring high efficiency in terms of socio-economy and environment, contributing to improving people's living standards in the whole province could make sense.

The results of the article have shown the strengths and limitations of tourism resources for sustainable development. On that basis, the locality will develop suitable specific tourism products, increasing competitiveness with other provinces and cities in the country.

The results of the article also show that it is necessary to evaluate the synthesis of resources in tourist routes to develop sustainable tourism for the locality. In terms of methods, the author chooses a research method that combines both qualitative and quantitative assessment as appropriate, helping the evaluation research to achieve the most accurate and objective results. In particular, these results will contribute to the stable and sustainable development of Phu Yen tourism in the future, contributing to the province's tourism industry to integrate with the whole country and international friends.

Abstract

The study employs statistical analysis method to assess the ongoing economic restructuring and some analytical indicators of digital transformation in Nghe An province on the following pillars: digital economy, digital government, digital society, thereby making comments on the province's structural transformation in terms of digital transformation.

Keywords: *digital transformation, digital economy, digital society, digital government.*

1. Introduction

Digital transformation is one of the issues discussed in recent times, especially when the global outbreak of coronavirus led to more interest in online-related activities. Vietnam is one of the pioneering countries in promulgating National Digital Transformation Programs and Strategies. Indeed, Resolution No. 52-NQ/TW dated September 27, 2019 of the Politburo on a number of guidelines and policies to actively participate in the Fourth Industrial Revolution. The National Digital Transformation Program has set a goal of increasing its position to the top 70 by 2025 and the top 50 by 2030 on the United Nations e-government rankings. Along with that, the digital economy will contribute 30% of GDP and annual labor productivity growth will reach over 8%.

On August 5, 2022, Nghe An Provincial Party Committee issued Resolution No. 09-NQ/TW on provincial digital transformation to 2025, with orientation to 2030. Its focus is on developing a digital database; creating a foundation for the development of digital government and digital economy, towards a digital society; linking the digital transformation process with administrative reform in order to enhance the quality, effectiveness and efficiency of state management as well as the quality of public service served by authorities at all levels; striving to always keep the position in the group of 25-30 provinces and cities with high indexes of digital transformation.

To realize the goal of Resolution No. 09-NQ/TW, it is extremely necessary to evaluate the potential for digital transformation growth in Nghe An province, in line with

the general goals of the province as well as the goals of the country, effectively make use of resources from related parties; industrial groups of the province; facilitate other stakeholders to engage in digital transformation.

In this study, the authors employ statistical analysis method to assess the ongoing economic restructuring and some analytical indicators of digital transformation in Nghe An province on the following pillars: digital economy, digital government, digital society, thereby making comments on the province's structural transformation in terms of digital transformation.

2. Literature review

According to Demirkan et al (2016), digital transformation is the profound and rapid transformation of business activities, processes, capabilities and business models to take advantage of changes and opportunities brought by technological advancements to society. Hess et al. (2016) argue that digital transformation refers to changes in digital technology that can create new products and services, and new business models for companies, or the organizational structure converts to the automation of processes. This shift can be observed in the increasing demand for Internet-based media, which leads to changes in the entire business model.

The Digital Transformation Manual of the Ministry of Information and Communications introduces the following concept: “Digital transformation is a process of total and comprehensive change of individuals and organizations in the way of living, working, and production methods based on digital technologies”. Digital transformation is an objective process. Each individual or organization can participate in or stay out of that process. If you stay out of it, there will be a big gap between organizations that have done and have not yet implemented digital transformation. That gap will gradually widen at an exponential rate.

The assessment of the impact of Digital Transformation (including the Digital Economy, Digital Government and Digital Society) on economic growth in Vietnam has not been paid much attention. Some digital transformation-related research is as follows: the study on “Improving labor productivity in the context of the digital economy” (2019) by Tran Tho Dat and To Trung Thanh mentions the impact of the digital economy on labor productivity in enterprises nationwide. Research by Dang Thi Viet Duc titled "Digital economy: Current situation and growth direction in Vietnam" (2020) uses the production function to assess the contribution of the ICT industry to Vietnam's economic growth in the 2000 - 2018 period.

Huynh Thi Tuyet Ngan et al (June 2021) conducted research on "Impacts of Digital Transformation on Economic Growth in the provinces in the Southern Key Economic Region". In september 2021, these authors continue to publish the study: “The impact of digital transformation on economic growth in Asian countries”. The study using the SGMM

estimation method with data from 30 Asian countries in the 2004 - 2019 period indicates that digital transformation has a positive impact on economic growth in Asian countries. The study “The Impact of Digital Transformation on Macroeconomic Stability: Evidence from EU countries” by Inna Tiutiunsky et al (2021) examines the role of digital transformation in achieving competitive advantage of the economy. Research carried out by Inna Tiutiunsky et al (2021) identifies the benefits and risks of digital transformation for the macroeconomic stability of EU countries. According to Inna Tiutiunsky et al (2021), digital transformation and macroeconomic stability manifest in two aspects. The first aspect is digital transformation affecting the country's economic - technical development. The second one is that digital transformation is a tool to predict the level of macroeconomic stability

3. Results

3.1. Economic restructuring

In the period 2014 to 2021, the province's economic structure has shifted in a positive way, gradually reducing the proportion of agriculture, increasing the proportion of industry (including construction) and stabilizing services. Of these sectors, the service sector accounts for the largest proportion in the structure of the economy. The proportion of agriculture, forestry and fishery sector decreased from 26,48% in 2013 to 24,57% in 2021. During the same period, the industry and construction sector increased from 24,15% to 29,48%, the service sector receded from 45,55% to 40,87%. In 2021, the agriculture, forestry and fishery sector of Nghe An accounts for the highest proportion compared to the region and the whole country while industry and construction are lower than the regional and national average; services are higher than the regional average and approximately reaches the national average.

The growth trend of industries will determine the change in the proportion of added value of economic sectors in the GRDP or in economic restructuring. Figure 1 shows the economic structure by three main sectors: agriculture, forestry and fishery; industry (including construction) and services. Based on Figure 1, it is easy to see that the service sector accounts for the highest proportion of GDP in Nghe An province in the period 2017 - 2021 while the proportion of services is likely to decline slightly and the proportion of the agriculture, forestry and fishery sector is likely to increase slightly instead. Farming is still the main industry in agricultural production, with a clear shift towards commodity production and gradually improving product quality. Services develop rapidly, diversifying types across fields and regions. In the 2020 - 2021 period, the service sector is the most affected by the covid-19 pandemic, therefore its growth is only 2.8% and 1.3% respectively. Those are the lowest levels in recent years.

Figure 1. Distribution of GRDP across economic sectors in Nghe An province

Source: Nghe An Statistical Yearbook

The first-tier economic structure of Nghe An province in recent years are likely to shift positively. This trend is driven by the rapid growth of the industry - construction sector which is in line with the province's economic growth target to 2030 with expectations that the industry - construction sector will reach 38-39% in 2025 and 42,4% in 2030.

Table 1 describes the economic structure by sector in Nghe An province. Accordingly, in 2021 the agriculture, forestry and fishery sector accounted for a high proportion and increased 39,5% compared to 2018. Besides, Nghe An province also focused on developing the processing and manufacturing industry when it experienced a marked increase of 6.704.562 million VND from 2018 to 2021. During this period, there was also a notable growth in the construction industry, by 40,81%. Other economic sectors were also likely to increase slightly for 2018 - 2021.

Table 1. Economic structure by sector in Nghe An province

Unit: million VND

Number	Economic sector	2018	2019	2020	2021
1	Agriculture, forestry and fishery	27.370.778	30.034.685	35.563.247	38.192.329

3.2. Digital transformation in Nghe An

Table 2 represents the ranking of the Digital Transformation indexes in the North Central provinces/cities. Da Nang has the highest DTI index nationwide for 2020-2021, followed by Thua Thien Hue which ranks 2nd on the ranking. Excluding Da Nang and Thua Thien Hue, Thanh Hoa is the only one in the North Central provinces/cities in the top 20 DTI indexes nationwide in 2021. The remaining provinces' DTI rankings are likely to decrease compared to 2020. Indeed, the North Central provinces have a rather low DTI rating compared to the country average.

Table 2. Digital Transformation Index Rankings in North Central Provinces/Cities

Provinces/ Cities	DTI ranking		Digital government		Digital economy		Digital society	
	2020	2021	2020	2021	2020	2021	2020	2021

Source: <https://dti.gov.vn/>

In 2021, DTI index of Nghe An province decreased significantly compared to 2020. Indeed, in 2020, Nghe An's DTI index ranked 36th out of 63 provinces throughout the country. Digital government ranked 40th out of 63. Digital economy ranked 34th out of 63 and Digital society ranked 32th out of 63. Meanwhile, in 2021, DTI index decreased 19 places, ranked 55th out of 63 provinces. In particular, the ranking on digital government, digital economy, digital society are 56th, 52th and 55th out of 63 respectively.

Figure 2. Nghe An Provincial DTI Ranking Indexes in 2021

Source <https://dti.gov.vn/>

3.2.1. Digital government

Figure 3 shows that Nghe An province belong to the group of provinces and cities with high PAPI indexes in 2021 (The Viet Nam Provincial Governance and Public Administration Performance Index - PAPI). Thua Thien Hue has the highest PAPI index with 48,059 points. Binh Duong ranks second with 47,178 points, followed by Thanh Hoa with 47,102 points. Nghe An achieved a total score of 43,821 points, which puts Nghe An in the list of provinces and cities with the highest PAPI index nationwide. Previously, Nghe An's PAPI composite score reached 43,86 points, ranking 15th out of 63 provinces and cities in 2020.

Figure 3. Nghe An Provincial PAPI Indexes in 2021

Source: <https://papi.org.vn/>

In 2021, management and public administration efficiency in Nghe An focuses on public service provision; corruption control in the public sector and public administrative procedures.

Table 3. Indexes of Public Administration Procedures in Nghe An Province in the period of 2018 - 2021

	2018	2019	2020	2021
Public administrative procedures	7,53	7,39	7,32	7,25
Certification/ Attestation	1,96	1,89	1,89	2,49
Construction permit	1,72	1,77	1,66	2,23
Certificates of land use rights	1,92	1,88	1,89	
Administrative procedures at commune/local level	1,93	1,85	1,88	2,49

Source: <https://papi.org.vn/>

Public administrative procedures are calculated based on 4 factors: Attestation/certification; Construction permit; Certificates of land use rights; Administrative procedures at commune/ward level. In 2021, although Nghe An's total index decreased compared to previous years, its total index consists of 3 components instead of 4, including: Attestation/certification; construction permits and administrative procedures at commune/ward level. All these 3 indexes in 2021 are higher than in the 2018 - 2020 period.

E-governance contains 3 elements: use of the local government's web portal; access to the Internet locally; response via the web portal. Nghe An's e-governance is at a high level in 2021 compared to the North Central provinces (behind Da Nang and Thua Thien Hue) with the usage of the local government's portal at 0.47 points. Access to the local Internet is 2.21 points and the response via the web portal is rated at 0.51 points.

Table 4. E-Governance Index of North Central Provinces in 2021

Province	E-Governance Index
Thanh Hóa	3,17
Nghệ An	3,18
Hà Tĩnh	2,85

Table 5. Nghe An's online public service in 2020

Province	Level 1	Level 2	Level 3	Level 4	Total	online public service index	Rank		
							2020	2019	2018
Nghe An	91,1%	76,7%	60,3%	26,5%	94,5%	0,4186	6	11	5

Source: Vietnam ICT Index Report in 2020

Nghe An's online public service index in 2020 reached 0.4186 points, ranking sixth nationwide, up 5 places compared to 2019. In 2021, Nghe An's online public service portal and inter-provincial electronic one-stop are integrated on the same system, with the participation of 20 departments and 21 cities, districts and towns. The system has been connected to the national public service portal. Up to 2021, 1.833 public services were provided on the system, including 673 level 2 public services, 407 at level 3 and 753 at level 4. In 2021, the system received 355.164 applications. The portal includes the main portal and 51 sub portals integrated. The number of articles and documents throughout the system in 2021 was 27.968, of which there were 7.185 on the main portal and 20.783 on the sub portals.

3.2.2. Digital society

Digital transformation in society is to form a digital society. Digital society, in a broad sense, covers all human activities. The main driving force of the digital society is digital technology based on the rapid growth of information and data, which changes every aspect of social organizations. Digital society in a narrow sense includes digital citizens and digital culture.

Digital transformation is people-centric. Mobile smartphones are prominent devices used in the digital world, so people-centered digital transformation must first equip people with necessary devices through the universalization of mobile smart phones. Each citizen has at least a mobile phone and have an Internet connection.

Table 6. Percentage of mobile phone users, Internet users and Internet-connected households in Nghe An

	2017	2018	2019	2020	2021
Percentage of mobile phone users (%)	80,3	74,29	84,56	88,83	81,68
Percentage of Internet users (%)	27,11	35,03	38,08	56,29	59,94
Percentage of households with Internet connection (%)	36,53	44,39	42,12	45	48

Source: Nghe An Statistical Yearbook

The percentage of mobile phone users in Nghe An increased slightly for 2017-2020; and decreased in 2021. However, the proportion of Internet users and the proportion of households with Internet connection experienced a steady increase during this period of time. Especially, the percentage of Internet users went up by 1,21 times.

Figure 4. Number of Internet subscribers in Nghe An in the period of 2017 - 2021

Source: Nghe An Statistical Yearbook

Internet connection is the foundation for digital society. Figure 11 indicates that the number of Internet subscribers of mobile networks are likely to increase sharply in the period of 2017 to 2021. Indeed, the figure rose 1.72 times compared to 2017 and experienced a marked growth in 2020. Besides, Internet is also the basis of over-the-top media service (OTT).

3.2.3. Digital economy

Vietnam's digital economy includes 3 main components: ICT digital economy is the information technology industry and telecommunications services; Platform economy represents the economic activity of digital platforms, online systems connecting supply and demand, and online services on the network; Sectoral digital economy is digital economic activity in industries and fields. The following content concentrates on digital economy when it comes to ICT.

Table 7 shows that Nghe An province experienced a steady increase in investment capital in the Information and Communication industry from 2018 to 2021. Besides, the development index of the Information and Communication industry went up gradually in the period.

Table 7. ICT investment capital and investment development index in Nghe An province

	2018	2019	2020	2021
ICT investment capital (billion VND)	244	338	346	428
ICT investment development index (%)	107.97	109.03	105.34	105.11

Source: Nghe An Provincial Yearbook 2021

Nghe An has constantly increasing information technology revenue with an increase of 38.4% from 2017 to 2021, along with the continuous development of the telecommunications industry. Figure 6 shows that telecommunications revenue grew very well and accounted for a high proportion of revenue from postal, telecommunications and information technology activities.

Figure 5. Revenue from postal, telecommunications and information technology activities in Nghe An province in the period of 2017 - 2021 (million VND)

Source: Nghe An Provincial Yearbook 2021

The ICT index is used for measuring the readiness to develop and apply information and communications technology to fields field of each locality or of each country. In 2018 and 2019, Nghe An's ICT index ranked 18th, however this figure dropped 8 places and ranked 26th by 2020. In contrast, Nghe An's IT services index increased 18 places with revenue of 120.007 million VND. In Nghe An, there is no export value related to IT production and IT services.

Regarding other components of the digital economy, containing the platform economy, the digital economy of all sectors, their current data has not been fully updated. In 2022, Nghe An's e-commerce ranking index ranked 15th out of 56 provinces, equivalent to 21.3 points. In the North Central Coast, Nghe An was the third place after Da Nang and Binh Duong. Although being ranked 15th position, the e-commerce index of Nghe An was quite far from the figure of two leading provinces, consisting of Ho Chi Minh City and Hanoi. Meanwhile, in the North Central Coast, the provinces such as Ninh Thuan, Phu Yen, Quang Ngai, Binh Dinh, and Thanh Hoa did not have a local e-commerce exchange (according to the report of Vietnam e-commerce index 2022).

4. Conclusion

From the above analysis, it can be concluded that the economic structure of Nghe An province tends to grow positively. The trend is driven by the strong growth of the industry and construction sector; consistent with the goals set forth by Nghe An. In 2021, Nghe An's growth rate ranked 22nd out of 63 provinces. Besides, digital transformation indexes in Nghe An decreased in terms of three pillars: Digital Government; Digital Economy and Digital Society even though there have been positive changes in digital government activities such as the integration of the online public service portal and the electronic one-stop system. For digital society assessed based on people-centeredness and mobile smartphones, Nghe An has not focused on developing digital infrastructure and digital human resources. For digital economy, revenue from information technology and telecommunications services increased slightly in the 2017 - 2021 period. The majority of revenue comes from telecommunications services. In addition, the number of ICT enterprises in Nghe An is 113 out of 11,225 in 2021, accounting for only 1% of total revenue of enterprises in the province. This result is due to Nghe An's goal which is to grow the industry and construction sector. Therefore, resources concentrated for ICT businesses are still limited. In conclusion, it is necessary to invest in digital infrastructure and digital human resources as well as issue preferential policies for ICT enterprises in order to accelerate digital transformation process in Nghe An.

THE WORLD'S POLICIES ON DEVELOPING REAL ESTATE ENTERPRISES AND GOVERNANCE IMPLICATIONS FOR VIETNAM

PhD student. MBA. Le Nguyen Hong Phuong

hphuonguk19@gmail.com

National Economics University, Hanoi, Vietnam

Abstract

State policies play a leading role in influencing the development of real estate enterprises, thereby directly affecting the movement and development of the real estate market. This study analyzes and summarizes policies on developing real estate enterprises of some countries around the world. Thereby recommending a number of solutions for the State to develop a system of real estate enterprises that are large in number, balanced in structure, and sustainable, effective in operation.

Keywords: *real estate, real estate market, real estate enterprises.*

1. Introduction

The system of real estate enterprises plays an important role as a key part constituting the enterprise system in general in the socialist - oriented market economy of Vietnam. This system is formed, mobilized and developed under the influence of many factors, of which state policies play a leading role.

Over the years, the development of the real estate market in Vietnam and the system of real estate enterprises have contributed many achievements to the economic growth and development of the country. However, the shortcomings of the market and the system of real estate enterprises are also gradually revealed such as: the situation of real estate prices is too high, the market information lacks of transparency, the market is sometimes unstable and has experienced many fluctuations, the number of real estate enterprises fluctuates, is unbalanced in structure, unsustainable and inefficient. Therefore, it is very necessary to find out about the experiences of other countries and draw lessons for Vietnam regarding the policy of developing real estate enterprises.

2. Method

This study utilized a desk research approach to examine the real estate policies of various countries around the world. The study was conducted primarily through the use of secondary sources, including academic literature, government reports, and policy papers.

The search strategy for identifying relevant literature involved a systematic search of multiple online databases, including Google Scholar, JSTOR, and ProQuest. The search terms used included "real estate market development policies", "price policy," and "tax policy," as well as the names of specific countries and regions.

The data collected through the literature review was analyzed thematically, with key themes and trends identified and compared across different countries.

The study also utilized a case study approach, focusing in-depth on the real estate policies of several countries. These case studies were conducted through a combination of literature review and expert interviews with policymakers and practitioners in each country.

The limitations of the study include the potential for bias in the selection of literature and the focus on a limited number of case studies. However, the study provides valuable insights into the similarities and differences in real estate policies across different countries and highlights key policy challenges and opportunities.

Overall, the desk research approach was effective in providing a comprehensive understanding of real estate policies in different countries, and the findings of this study can inform future research and policy development in this area.

3. Results

3.1. Experience in real estate market development policies of several countries

Real estate includes many types, there are different classifications depending on the criteria, but the basic point is that the real estate is attached to the land or the real estate commodity itself is land. Correspondingly, we will have types of real estate market. Real estate market development includes many contents and involves many policies. However, when it comes to the policy on developing real estate enterprises, we often review the following specific policies:

3.2. Policy on creating and owning real estate

The policy on creating and owning real estate plays an important role in the real estate market, because the value of real estate can only arise when the ownership of such real estate is established (Dinh Van An, 2011) [1], Basically, this policy regulates the registration and establishment of ownership of real estate properties. In the world, there are two main types of regulations in creating and owning real estate in general: (i) Regulations that private owned land is a commodity, therefore, it can be traded and exchanged. according to market principles; (ii) Regulations that land is owned by the State, belonged to the nationalization, so it cannot be traded and exchanged.

In each country, depending on the common ownership regime, the policies on creating and owning real estate stipulate that land is privately owned, state owned or multi - owned (including both types). In the G7 countries (UK, Germany, Canada, Italy, USA, Japan and the French Republic) a form of multi - ownership of land is practiced - recognizing both private ownership and state ownership of land. In countries with transition economies - countries belonging to the former Soviet Union and Eastern Europe such as Albania, Bulgaria, Czech Republic, Hungary, Poland, Romania, all recognize that land of private ownership and land owners is entitled to buy - sell - rent - lease; however, land owned by the State still accounts for a large proportion. A number of countries in the ASEAN region: Timor-Leste, Indonesia, Malaysia, Singapore, and Thailand all implement state and private

ownership of land. In China, the land ownership regime is public ownership - including: State ownership and collective ownership regimes [2].

Therefore, the policy on creating and owning real estate in countries is determined by the political regimes of such countries. Basically, the countries follow the multi - ownership regime on land, in fact, there is no country implementing the absolute private ownership of land. In addition to regulation on private ownership of land, there are regulations on State ownership of land. Normally, the content of ownership of land and real estate in countries is stipulated in their Constitution and the Land Law.

3.3. Policy on transactions, real estate supply - demand

Countries have strict and specific regulations on conducting transactions related to real estate, including regulations on registration of land use rights and real estate fluctuations after the transfer. The implementation process complies with provisions of the Law on registration of land - real estate (except for adjustments according to provisions of the Civil Code), market participants must comply with conditions on goods and transfer procedures. The implementation of transaction policies contributes to the transparency and revitalization of the real estate market. Most countries in the world have a real estate registration system that was established early and has undergone a long development process.

Documents regulating the real estate registration in some countries: Japan (Law on Real Estate Registration of 1899 dated February 24, 1899); Korea (Law on Real Estate Registration of 1960 (Law No.536 dated January 01, 1960); Federal Republic of Germany (Law on Real Estate Registration of 1897 dated March 24, 1897 and amendments and supplements of 2004 dated December 09, 2004); Philippines (Law on Land Registration, also known as the Law on Torrens Registration of 1903, Law No.496 dated February 01, 1903 and reinstated in 1974); Malaysia (National Land Code of 1966); Singapore (Ordinance on registration of land ownership rights of 1956); Cambodia (Land Law of 2001 dated August 13, 2001); Indonesia (Government's Regulation on land registration of 1997); China (Law on property ownership of the People's Republic of China dated March 16, 2007), (Ministry of Justice, 2008).

3.4. Policy on real estate enterprises and real estate business

The policy on real estate enterprises and real estate business contains contents related to the formation of enterprises and the process of conducting real estate business. Most countries regulate that the establishment of real estate enterprises and real estate business is a conditional business process. Real estate business is considered including business investment and real estate service business. In Germany, domestic and foreign subjects trading in real estate must comply with and obtain full permits to carry out the construction or purchase or sale of a building, project or piece of land. In Japan, in addition to regulations on the establishment and investment of real estate enterprises, the government uses a number of policies to encourage the development of real estate which is industrial parks [3]: tax incentives, subsidies or preferential loans.

The implementation of real estate service business in countries is subject to very strict regulations. In the US, the real estate market currently consists of 1 548 058 real estate brokers (NAR, 2023). There are many regulations that must be satisfied in order to be able to practice as a real estate broker. First, they must pass an exam with fee collection to obtain a certificate of real estate brokerage practice and registration for brokerage practice issued by the state government. Appraisers must pass an exam and obtain a license for practice issued by the Federal government. In Singapore, the Singapore government through the Taxation Authority allows ERA Singapore (a company which develops a training system for real estate brokers learned from the US) to train real estate brokers and agents. In Poland, since 1992, individuals who wish to engage in brokerage activities must undergo specialized training courses in real estate brokerage for 6 months and undergo a half - year internship in real estate companies, directly conduct brokerage operations (at least 15 real estates). In addition, after satisfying all the conditions, candidates must pass a national exam organized by the National Assessment Council in the field of professional practice [4]. In Sweden, real estate brokerage services are not only regulated by commercial law, but also complied with provisions of the Law on Real Estate Brokerage (established in 1984 and revised).

3.5. Financial policies in the real estate market

When it comes to financial policies in the real estate market, we consider three specific contents as follows:

3.5.1. Pricing policy

In other countries, the Government sets out pricing policies and price frames for the market to operate. In principle, prices are formed by the market and the State only intervenes in case of appearing real estate "bubble" situation or being used for social purposes. Real estate prices are made up of land prices and property - on - land prices. Therefore, normally when studying price policies in the real estate market, the policy on land valuation is often focused on. Through the study, it is found that, most countries in the world have regulations in the laws related to land price, which specifically regulates: purposes, principles and methods of valuation, forms of land price, involvement in valuation services, valuation and control bodies.

3.5.2. Tax policy

Tax policy for real estate is a form of property tax, which plays an important role in maintaining and ensuring State budget revenues. At the same time, real estate tax is an effective tool helping the State manage the use and transaction of real estate, perform the function of checking the operation of the real estate market, contribute to limiting speculation and encouraging the effective use of real estate. Taxes for real estate include tax levied on real estate and tax levied on real estate transactions. Most countries around the world use real estate taxes with different taxes, methods and bases for tax calculation and tax rates. Through studying, real estate tax includes the following main types: tax on land, tax on housing, tax on real estate transactions, tax on registration of real estate ownership.

Experience in land tax policies in France, China, Taiwan, Korea

In China, the tax on land use is calculated on the basis of area, the applicable tax rate takes into account different types of land. Therefore, the unit for calculating land tax in big cities, medium - sized cities and mining districts is 0.5 - 10 yuan/m², 0.3 - 6 yuan/m² và 0.2 - 4 yuan/m², respectively.

In France, the government conducts land classification for taxation, accordingly, land without structures or vacant land will be taxed at a higher rate than land with construction works and land in use. The average tax rates in 2009 for vacant land and land with works in France were 45.5% and 19.32%, respectively. Tax rates levied in the second house in is very high, from 2015, the tax rate in Paris is up to 60%.

In Taiwan, the tax liability is borne by the owner, based on a taxable beginning rate based on the value of the land parcel declared annually by the owner. The amount in excess of the taxable beginning rate will be subject to a progressive taxation.

In Korea, land tax is based on the value of the land parcel brought by the land use purpose. There is a difference between national and local tax rates. The tax rates for land used for business and non - business purposes according to the local tariff are 0.2 - 0.4% and 0.2 - 0.5%, according to the national tariff are 0.5 - 0.7% and 0.75 - 2% [5].

➤ Experience in housing tax policies in Russia, France, Korea, China

Table 1. Housing tax policy in several countries

Countries	Tax base	Tax rate
Russia	Value of a house is valued by the tax authority	0.1% < (house value under 300 thousand rubles) 0.1 - 0.3% (house value from 300 - 500 thousand rubles)
France	Apartment rental price	Average tax rate 14.97% (in 2009)
Korea	Standard value of a house, (tax threshold of 900 million Won)	Local Tariff: 0.15 - 0.5%/unit National Tariff: 0.5 - 1%/unit
China	Rental value or house value	12% (rental price) or 1.2% (house price)

Source: Compiled according to (Thuan, 2011) [6].

➤ Experience in tax policy for real estate transactions of Singapore, Korea, Japan.

In essence, this tax is a kind levied on the difference between the selling price and the purchase price of real estate. Taxpayer is a person who earns income from real estate transactions. The taxable price is the market price of real estate. In Singapore, purchased land which is resold in the first year will be levied at 100% of the difference, and after 2 years and 3 years, the land tax rate is reduced by 50% and 25%, respectively. In Korea, the tax rate is 50% (if resold before 1 year), 40% (if resold from 1 - 2 years) according to the profit and 70% (for unregistered real estate) [7]. Korea applies a tax rate of 50% and 60% of profits to individuals owning 2 and 3 houses or more [5]. In Japan, income from real estate transactions by individuals and enterprises is adjusted according to personal income tax and corporate tax.

Experience in policy on real estate registration tax in Japan and Korea: Normally, real estate registration tax is collected once when the owner of real estate registers real estate transactions or real estate ownership.

In Japan, the tax base is the actual value of real estate. The tax rates will be: 0.4%, 0.4% and 2% for registration of ownership, transfer of ownership through inheritance, capital contribution, merger and transfer of rights through purchase and sale [8].

In Korea, real estate registration tax is calculated based on the value of real estate at the time of registration, with the tax rate based on the nature of ownership registration. The tax tariff for: registration of ownership due to inheritance, non - inheritance and outside these two cases are: 0.8%, 1.5% and 3% respectively; registration of protection of property rights is 0.8%, transfer of real estate lease rights is 0.2%.

➤ **Policy on capital channels for the real estate market**

In different countries, capital channels for the real estate market are very diverse. In practice, capital for the real estate market is provided through the following main channels: Credit channels from commercial banks; Channel through the mortgage and re - mortgage system in the banking system. Real estate savings channel; Channel through bonds, real estate stocks; Channel through investment funds (notably Real Estate Investment Trust - REIT).

In developed countries, the channel of mobilizing and lending real estate through commercial banks and credit institutions plays an important role, accounting for 50 - 80% of the total market share of real estate mortgage loans [9]. For example, in Australia and New Zealand, there are many credit products for real estate investors such as: home equity loan, split purpose loan.

The mortgage banking model in Denmark provides borrowers with long - term loans at fixed interest rates, mortgage banks accounts for more than 90% of total credit in the country.

In developed countries of Europe, the form of savings under house purchase contracts has been developed, notably the Bauspaken system in Germany. The model of financing channels through real estate investment trusts (REITs) is very developed in some countries due to the strength of REITs with their high diversity, liquidity, dividends as well as stable average annual income. In the US, the first REIT was applied in 1960, after 40 years of development, REITs have been very successful in the US with a total market capitalization up to 450 billion USD. The regulations applicable to REITs fall within the U. S. Domestic Income Law system. Each REIT may be structured as a joint stock company, association, or trust and is managed by one or more trustees or managers, and the shares of REITs are transferable.

4. Discussion and Conclusion

4.1. Governance implications of real estate development policy of Vietnam

After researching, analyzing and comparing market development policies and real estate enterprises in some countries, the author believes that:

In each country, the role, content and impact level of policies on real estate market are different, depending on the level of economic development and the level of real estate

market. However, in order to create market and real estate enterprise, the first thing to do is to create a legal framework system;

The State not only creates the economic, legal and social environment, but also plays the role of a “midwife” for the real estate market through guidelines, policies and solutions to support in all aspects [10];

The land market is the first market formed in the development process of real estate market. Therefore, there is a legal element on land that is particularly important. In order for the land market to develop sustainably, it is necessary to well carry out the establishment of land ownership and use rights, and land use planning. This is a factor contributing to healthy and transparent real estate market;

The State should strictly implement the housing policy. In some cases, the State should intervene more deeply in regulating the housing market, especially the housing issues for social subjects, ensuring the supply of housing types for people and the limit of buying and selling;

In market activities, the activities of enterprises providing services to support the market are necessary, particularly brokerage and real estate valuation services;

Financial policies contribute to promoting the formation and development of real estate market.

Some lessons learned for Vietnam about real estate market development policy:

Firstly, the State plays a very important role in the development of real estate market, from regulating the market, balancing supply and demand, anti - speculation, macro - economy stabilization to ensuring basic housing needs for people. To do so, the State must implement the policy on ownership and creation of real estate well;

Secondly, when conducting land reform, it is necessary to have land planning and implement land policies well; compensation in land acquisition must be carried out carefully and openly;

Thirdly, in terms of housing development policy, it is required to pay attention to the diversification of housing types, along with the process of housing construction with a mechanism for allocating house area to the subjects which is extremely important. Pay special attention to social objects in housing issues;

Fourthly, promulgate and implement policies on real estate transactions, supply and demand well. First, promulgate the Law on Real Estate Registration. This is a prerequisite to solve the problem of transparency in Vietnamese real estate market and ensure that other policies are implemented, being especially meaningful in creating capital for the real estate market;

Fifthly, professionalize enterprises, organizations and individuals providing services to support the development of real estate market step by step, clearly define and realize the goals of quantity, structure and operation efficiency of real estate enterprises;

Sixthly, improve efficiency in the implementation of financial policies in the real estate market. Continuing to research and perfect on pricing policy and real estate valuation; research and promulgating the Law on Real Estate Tax; research and issue legal documents in relation to policies on funding channels for the real estate market.

4.2. Conclusion

Policy on real estate market development is a broad issue with many contents, in which, developing the real estate enterprise system is the top goal. It is the real estate enterprises that will contribute to creating a healthy and fair real estate market and operating in accordance with the market mechanism under the management and regulation by the State. Therefore, there will be many methods and approaches in studying the experiences of countries on real estate enterprise development policies. Within the scope of this study, it will not be possible to cover all the contents in relation to the development of real estate enterprise system. Therefore, this issue should be studied more deeply, forming a scientific basis for perfecting the policy of developing the real estate enterprise system in Vietnam.

PROMOTING THE ROLE OF CULTURE IN ECONOMIC - SOCIAL DEVELOPMENT IN THE NORTHWEST OF VIETNAM TODAY

Tran Thi Phuong Nga

phuongngaajc@gmail.com

Faculty of Political Theory, Vietnam Forestry University, Hanoi, Vietnam

Abstract

The Northwest is one of the rich cultural regions of Vietnam. If culture is exploited well, it is really a "golden resource" for the sustainable development of the region. Therefore, it is really necessary to study the Northwest culture as well as the directions to exploit the cultural potential to promote the growth of the Northwest. In this article, the author focuses on analyzing the instrumental role of regional cultural values that can promote the effect of creating strength for the sustainable development of the Northwest region.

Keywords: *promote, culture, sustainable development*

1. Introduction

During the 9th Plenum of the Central Committee of the 11th term, the Communist Party of Vietnam emphasized the implementation of the view that "Culture must be put on an equal footing with economy and politics". From this point of view, culture is not only a goal but also a driving force, a condition, a potential, and a soft power for the country's development in the context of international integration. With such awareness, our Party has issued many directives on preserving, preserving and promoting traditional cultural values, arousing the endogenous strength of culture to achieve the goal of "rich people", strong country, fair and democratic"

In preserving and promoting culture as the "spiritual foundation" of society, our Party and State pay special attention to promoting good cultural traditions in regions. Because Vietnam is a country with a unified, rich and diverse culture. Each region, with its unique geographical and natural conditions, has its own unique cultural influences and characteristics, which can be utilized for sustainable socio-economic development. The Northwest is a unique cultural region of Vietnam with many values Cultural "DNA" cannot be mixed with other regions of our country as well as the world. This is one of the precious capitals of this land that should be properly recognized and actively promoted for development.

On the basis of the awareness that the "golden resource" of the locality is a region-specific culture, the Northwest provinces of Vietnam have tried to implement the policy of promoting the role of culture in performing economic tasks. economic, political, national security... in the area. With the efforts of the government and people of the Northwest region, the endogenous strength of the culture of the region has been aroused, have important achievements, and contributed to "changing the skin" of some villages. countryside.

However, the promotion of the role of culture is still not commensurate with the inherent potential in localities in the region. The exploited cultural value has brought economic benefits but compared to the proportion in the economic structure of the region is not as high as expected, this land is still considered as the "poor core" of the country. In the process of promoting culture for economic development, there is also a situation of "exploitation" of culture, commercialization of traditional cultural products, the phenomenon of overloading tourist areas in heritage sites. Culture has affected the environment and the lives of indigenous people.

Therefore, researches to promote traditional cultural values, find solutions towards sustainable development and draw lessons for other localities in exploiting the strengths of the specific cultural region towards to sustainable development is very meaningful in both theory and practice. Therefore, this article focuses on analyzing and clarifying the role of culture in the sustainable development of the Northwest region of Vietnam today.

2. Method

Methods of data collection, documentation, use of secondary data collected through reports on relevant contents of specialized agencies, statistical yearbooks.

Method of analyzing documents and data: using descriptive statistics method.

3. Results

3.1. The role of culture in the sustainable development of the Northwest region of Vietnam today

Economic activity is one of the material activities of human beings, which is the basic aspect of social life. To be able to exist and develop, people need to be met with essential needs, so people conduct production, exchange products, and carry out economic activities. Economic development thus becomes a common goal of human communities. However, economic development cannot be separated from other social issues.

Socio-economic development of a region or a country is an increasing process towards the improvement of all aspects of the economy. It is not only an increase in quantity but also must be consistent with the qualitative changes of the economy such as the progress of economic structure, economic institutions, quality of human life, prosperity. and social progress. The depth of this issue is towards people, towards perfecting the living environment of people both in terms of material - economic, spiritual - cultural, natural environment - environment. To achieve that goal, the system of ethical principles, lifestyle, aesthetics.... plays an important role in directing people to practical action in the present without encroaching on the interests of the future. It means that process culture plays an important role in permeating all areas of life, orienting and leading people to work to achieve sustainable development. The role of culture in sustainable development in the Northwest is reflected in the following main points:

Firstly, culture is the goal of the sustainable socio-economic development of the Northwest today. Even in economic and social development itself, there are cultural

requirements. When cultural goals are achieved, sooner or later socio-economic goals will be realized. Because culture also contains a series of elements of spiritual life - social consciousness has a strong impact on social existence - material life, economic life of society. Culture stipulates a series of values that sustainable development needs to achieve, such as prosperity, happiness, solidarity, love between people, the national spirit, the will to rise...

Secondly, culture is the driving force of socio-economic development. The Northwest is a land rich in heroic traditions, with a long history of formation and development, with natural geographical conditions associated with rugged mountains. Therefore, the tradition of loving labor, hard work, industriousness, spirit of overcoming difficulties, spirit of solidarity, and love for the homeland has been molded. the driving force of development besides scientific and technical factors. When the motivational factors are activated, it will create economic development, changing the quality of development. In fact, a land rich in tradition and culture is an important basis for development. No matter how developed science and technology, no matter how favorable the objective conditions of natural geographical position, each ethnic group and land do not have the consciousness and aspirations to rise up of the ethnic group. impossible to develop: "It is impossible to move the peoples of countries forward without making them understand their identity, their roots and their past"¹. Therefore, awakening and arousing the cultural potential and aspirations of good ethnic groups will create strong motivations for healthy development.

Third, culture acts as a regulatory system for the region's socio-economic development. Today, in the context of integration, the exchange between countries in all fields of economy, politics, culture - society has been creating favorable conditions for the transfer of positive cultural elements. polar regions, paving the way for rapid development for the Northwest because the Northwest borders on the border of China and Laos. However, in that exchange process, the Northwest of Vietnam is facing challenges of sustainable socio-economic development. The general trend of the current market economy development is integration, so economic activities not only take place in localities but also take place on an international scale. to cultural values in production, business, and economic development in general. The cultural identity and good cultural values of the nation will play a role in regulating economic activities in the direction of humanity, directing people to good values: truth, goodness, beauty, eliminating those Evil and negative factors are entering the social environment

Fourth, the culture of the Northwest contains great potentials for socio-economic development. Facing the majestic and dangerous natural environment, the Northwestern people have adapted and improved these environmental conditions to be able to survive. It was during that process that all the typical cultural values of the Northwest were formed. At present, it is possible to exploit the cultural "golden resources" of the region for socio-economic development: Each province of the Northwest has ethnic minorities, corresponding to unique cultural heritages: cuisine, folk art, traditional craft villages, festivals, customs.... These are specific cultural features that can be exploited in the long

¹ Thomas L. Friedman (2000), *The Lexus and the Olive Tree*, World Publishing House, Hanoi, tr.373

term for socio-economic development: developing community-based tourism, cultural tourism, and eco-tourism while ensuring towards an appropriate economic structure. while preserving the environment and preserving the ethnic cultural identity.

3.2. Promoting the traditional cultural values of the Northwest region for sustainable development today

Promoting the role of culture in the sustainable development of the Northwest is essentially exploiting the inherent cultural strength of this land to serve economic development, realize social goals, and protect the environment. With the inherent advantages of a land which is considered as the "pearl of tomorrow" of the country, the Northwest besides the majestic poetic landscape also has a rich history of culture that can arouse and awaken the development of the country. develop. The unique cultural values of the Northwest region can be exploited for sustainable development:

The first, the people of the Northwest have a very rich indigenous knowledge capital that can be promoted in agricultural production and development of specific traditional handicraft villages. The basis for forming these indigenous knowledge is due to the process of adapting to the specific natural conditions here. The region has rugged mountainous terrain and is inhabited by two large rivers, the Ma River and the Da River. To be able to survive in such a special environment, the people here had to learn, penetrate, stick to, and immerse themselves in the environment to cultivate a unique treasure of indigenous knowledge. Only the people here understand the homeland, the village, the strengths and limitations of their land. Therefore, self-use and exploit that cognitive cultural capital combined with modern technology to develop agricultural production with products with the unique flavor and quality of the land such as tea, fruit trees. : pear, peach, plum, mango, passion fruit... is what the Northwestern government and people are trying to do. An experience of the people here is to closely combine the indigenous cultural knowledge capital with modern technology, combine clean agricultural production with tourism development to improve economic efficiency, ensure "green development". About 60% of households have combined traditional knowledge and modern new techniques in farming, 33.8% have applied new techniques in crop production¹. Agricultural production in some localities is gradually moving towards branded export products to major markets such as Japan, Korea, and Europe.

The second, the Northwest is also a land with a culture that behaves with the natural environment in harmony: love the forest, love the land, stick with the village, the homeland.... In terms of nature, origin, traditional roots, the Northwest ethnic groups love nature and get along with nature. In the culture of the Dao and Thai people, the forest is the environment, the ancestor, the source, so it must be protected. Previously, most villages had the custom of banning exploitation, cutting down the watershed forests was a crime, being punished, ostracized and cursed by the Muong. The consciousness of protecting the forest

¹ Tran Hong Hanh (2018), Climate change and livelihoods of some ethnic minorities in the mountainous Northwestern region of Vietnam, Social Sciences Publishing House, Hanoi, tr.159

and living environment has become the way of life, law and spirituality of the Thai and Dao ethnic groups. Sticking with the native nature, but because they do not know how to exploit the strengths of forest resources, there are some communes and districts in the region with the phenomenon of ethnic minorities mainly living on nature and depriving it of nature. In recent years, the harmony in cultural behavior of the Northwest ethnic groups towards the natural environment is threatened by outside interference with important resources as well as changes in the environment. in their own behavior. That change causes many consequences, among which are more and more natural disasters, floods, and forest fires. These are proofs of the people's excessive impact on the environment and the consequences are not only economic losses, the environment is destroyed but human lives are also threatened. Therefore, continuing to research and promote knowledge, experience, and lessons in dealing with forests and nature of people in the Northwest to find solutions and mechanisms towards environmental protection is very valuable. for the sustainable development of this land. Because the environment is not only the living place of the ethnic minorities here, but also an important natural basis for the formation of their culture and spiritual foundations.

Currently, in many lands of the Northwest, people have used the culture of dealing with the natural environment to develop their economy as well as preserve their own culture and environment. For example, they sell typical products that are renewable, harvested from the native forest such as bath medicine of the Dao people, pickled wine, buffalo meat, rice lam, etc. They create tourism products. From the Northwest nature itself: eco-tourism to discover villages such as Lac Mai Chau village of Hoa Binh, Moc Chau Plateau of Son La, discover nature in Sa Pa of Lao Cai, explore the field heritage trail terraces in Lao Cai, Yen Bai and Ha Giang provinces; tourism "Northwest flower colors": Ban flowers, azaleas, buckwheat flowers

The third, promote the role of behavioral culture in ethnic communities in the Northwest in order to achieve socio-political stability and create conditions for strong economic development. The Northwest is a region with a history of heroic revolutionary struggle. It meets the border of Laos and China. This is one of the favorable conditions for economic development in the border region, with opportunities for economic, political and cultural exchange and integration with other countries in the region. In contrast, border exchanges in general also have potential challenges in protecting the border and political security of the country. People living in the Northwest provinces are mainly ethnic minorities, with a complex spiritual life. Therefore, it is very important to maintain solidarity and build a politically stable area, contributing to creating favorable conditions for economic development.

The building of a stable political environment in the locality begins with arousing the spirit of solidarity, attachment and mutual assistance in the community of the Northwest ethnic groups. This traditional culture was formed during the struggle to survive the harsh natural conditions as well as the invasion of hostile forces. Currently, in localities in the region, people continue to support each other in socio-economic development. 72.2% of Thai

households, 42.9% of Dao households and 44% of Mong households receive support from brothers, relatives and neighbors in growing maize and rice². In addition to supporting each other in production in that traditional way, a part of the people have jointly implemented the cooperative economic model to jointly increase the benefits of the participating members, typically in Son La province. As of October 2022, the province has 877 registered cooperatives with 38,328 members. The development of cooperatives has helped to improve and solve problems that the individual household economy could not do or do inefficiently, facilitating the transformation of economic structure towards modernity.

Fourth, promote the potential of folklore sources in the Northwest for sustainable economic transformation. Products of traditional crafts, traditional cultural and culinary products, folk music and traditional festivals of the ethnic minorities have the conditions to become economic products, creating more jobs and income for people, changing the perception of preserving traditional cultural values. With that cultural potential, the provinces in the Northwest can fully develop community-based tourism in combination with promoting traditional craft villages in villages inhabited by ethnic groups with the state model. and the people do the same. Accordingly, each village can send people along with cultural officials to participate in tasks such as introducing cultural products, providing products, guiding tours.

However, in the process of exploiting community-based tourism, it is necessary to avoid hasty development, unsustainable development model because this can lead to many negative impacts on people's lives. The development of models of community-based tourism combined with the promotion of specific handicraft villages is clearly essential to achieve the dual goals of economic development without infringing on the preservation of cultural characteristics. But in which the responsibility of the government and the people must be put first, the coordination of stakeholders, the distribution of profits, the rights and responsibilities of the community requires each locality to develop a specific project, clearly suited to the local situation. To do this, it is necessary to have a mechanism to promote the support of state management agencies in tourism, tourism research institutes and development organizations in collecting and analyzing information, orientation of market research, product development... to, together with the community, step by step identify opportunities suitable to the locality, ensure sustainable development, preserve and promote good cultural identity Of the area.

The above are specific cultural aspects of the Northwest that can be promoted in sustainable development. However, in order to really exploit and promote the "golden resources" of the Northwest culture in order to develop a healthy society, it is necessary to implement synchronous solutions. First of all, the provinces in the region need to pay special attention to strengthening education on cultural values of the Northwest region, especially education for young people, young people, and cultural cadres as an important foundation.

² Tran Hong Hanh (2018), Climate change and livelihoods of some ethnic minorities in the mountainous Northwestern region of Vietnam, Social Sciences Publishing House, Hanoi, tr.176

important in continuing to preserve and promote unique cultural values. Because obviously, if the people themselves do not understand the values of their national identity, they will easily lose the direction, goals, and meaning of socio-economic activities, ultimately unable to achieve their goals sustainable development.

At the same time, it is necessary to have a localization policy in the process of integration and economic, political and cultural exchanges with other countries to ensure the preservation of traditional cultural values. Localization is the process of ensuring the integration of new cultural values in the direction of growth but not crushing the inherent endogenous values of the nation. In order to do well this process, it is necessary to improve the state management of culture, solve the limitations and weaknesses in the ineffective exploitation of the role of culture in economic development and environmental protection.

In the region, it is also necessary to focus on building typical models of promoting the role of culture in socio-economic development and environmental protection in the provinces. From these examples, there is an assessment of effectiveness, quality and when satisfactory, it can be replicated. A system of laws and market policies is needed to ensure that these models are developed in a healthy way, with the right goals for sustainable development. In particular, the legal system will allow unique cultural areas to avoid the negative attack of the "claw" of the market, avoid the exploitation of culture, cultural heritages for commercial purposes only. not interested in solving social and environmental problems.

4. Discussion and Conclusion

Socio-economic development associated with environmental protection, better implementation of social security and preservation of national cultural identity is always a difficult problem for each country, ethnic group and region. In realizing the dual goals of the sustainable development of the Northwest, the cultural identity of the people of the land plays an important role in realizing and ensuring those goals are maintained in the long term. First of all, culture is the goal, the driving force, and the endogenous strength for the development of the region. It is the cultural identity of the land that will arouse the spirit, the will to rise, the national pride to overcome difficulties and challenges and "solve difficult problems" for economic development associated with the implementation of national security. social welfare, environmental protection and preservation of ethnic identity. In the context of integration, the Northwest region has favorable conditions for cultural enrichment as well as cultural potential exploitation for economic development, but it also faces the challenge of being culturally infiltrated by other countries. China, Laos - two countries bordering the border. The cultural identity of the region will play a regulatory role to direct the Northwest communities to humane and good values.

The Northwest has been gradually promoting its cultural potentials for sustainable development. The cultural capitals that have been and need to continue to be promoted in this land, the culture of perception - indigenous knowledge, the culture of dealing with the natural environment, the culture of behavior in the community, the culture of art. folk. All these cultural aspects have very unique values that can be exploited to develop the economy

of community tourism, cultural tourism, eco-tourism, cultural tourism.... When the economy develops, it will create conditions for poverty reduction, increase income, and direct people to healthy livelihood activities, useful for environmental protection. And in order to turn the cultural potentials of the Northwest into an endogenous force towards sustainable development, it is necessary to encourage the positivity and initiative of the indigenous people through education, policy systems, Statutory...

ANALYZING THE IMPACT OF PUBLIC INVESTMENT ON PRIVATE INVESTMENT IN THE CENTRAL KEY ECONOMIC REGION

Ho Thi Hoai Thuong

thuonght@ftu.edu.vn

Faculty of International Economics, Foreign Trade University, Hanoi, Vietnam

Abstract

In the post-Covid-19 context and the complicated developments of the Russian-Ukrainian war and the fiercer global competition for FDI flows, domestic public and private investment have become the driving force to help economic recovery and accelerated growth in the global countries. In Vietnam, the Central Key Economic Region with its existing potentials in the marine economy is oriented to "become an economic driving force for the development of the North Central Coast and Central Coast". However, in the Central Key Economic Region, there are some limitations related to public investment and private investment. Specifically, localities in the region have not used public investment effectively, thereby limiting the ability to attract private investment, and reducing the growth rate of the whole region. Using the PMG method to analyze the impact of public investment on private investment in the Central Key Economic Region in the period 2010-2021, the study shows that public investment has a complementary effect on private investment in the long-term, but the short-term impact is not clear. Based on the research results, the author has proposed some solutions to effectively use public investment to promote private investment in the Central Key Economic Region.

Keywords: *Central Key Economic Region, PMG method, public investment, private investment*

1. Introduction

Public investment is a controversial concept not only in Vietnam but also in the world. The United Nations (UN, 2009) states that public investment can be understood as investments made by the State to increase the productive capacity of the economy in the future. According to the World Bank (WB, 2010), public investment is public expenditure that helps to increase the accumulation of physical capital. Meanwhile, the Organization for Co-operation and Development (OECD, 2016) believes that public investment means government investment in physical infrastructure (roads, government buildings, etc.) soft infrastructure (innovation support, research and development...).

In Vietnam, recognizing the importance of public investment, in 2014, Vietnam developed and promulgated a law on public investment (Public Investment Law 2014). This is the first time that public investment policy has been recognized in a law, clearly

demonstrating the importance of this field. In addition, a series of other relevant laws have also been updated, amended and supplemented to ensure compatibility. However, after a period of implementation of the Law on Public Investment in 2014, there were limitations and inadequacies that hindered public investment activities (Le Nhat Bao et al., 2020). To remove limitations and shortcomings, on June 13, 2019, the National Assembly passed the Law on Public Investment 2019. According to Clause 15, Article 4 of the Law on Public Investment 2019, public investment is "investment by the State in other public investment programs, projects and objects in accordance with the Law on Public Investment".

Thus, the concept of public investment introduced in the Law on Public Investment 2019 consists of two parts: first, the owner of the investment capital is the State and second, the purpose of investment activities is to invest in socio-economic infrastructure programs and projects and invest in programs and projects in service of socio-economic development. The second part includes programs and projects in service of socio-economic development, which are considered to include all projects invested by the State because the projects are neither directly nor indirectly serving economic development - society. So, the term Public Investment under the Law on Public Investment 2019 can be understood as an investment of the State.

Private investment

According to the Cambridge dictionary (2008), private investment is defined as an investment made by companies, financial institutions or other investors other than the State. Meanwhile, according to the World Bank (2019), private investment is the expenditure of the private sector, including private nonprofit organizations, to supplement domestic fixed assets. In more detail, it can be understood that private investment is the purchase of capital assets by the private sector with the expectation of generating a larger amount of income and value in the future.

Meanwhile, in Vietnam, based on the concept of investment according to Article 3 of the Law on Investment 2020, it can be understood that private investment is the investment by private investors to form assets to conduct other activities in accordance with the provisions of the Investment Law and other relevant laws.

Thus, from the above points of view on private investment, it can be seen that private investment differs from public investment in the ownership nature of the investment capital and the investment purpose. Private investment is the investment of private economic sectors while public investment is the investment of the State. The purpose of private investment is to make a profit while the purpose of public investment is to serve socio-economic development, not for profit.

The impact of public investment on private investment

Theoretically, the impact of public investment on private investment is explained through the following points of view.

The first view favors the crowding-out effect. Accordingly, the increased demand for government investment causes private investment to decrease (Blejer and Khan, 1984; Beck,

1993; Voss, 2002; Ganelli, 2003). Accordingly, the crowding out effect can take place through two main channels: (i) debt financing and (ii) competitive production of goods and services with the private sector. First, if government investment is financed through borrowing from the financial system or issuing bonds in the capital markets, the market must reserve a certain amount of capital for the government. On the one hand, this leads to a decrease in the amount of credit provided to the private sector. On the other hand, the scarcity of capital in the market pushes up interest rates in the market. Both of these factors lead to a contraction in private investment. Second, public investment can also reduce private investment as it produces goods and services that compete with the private sector (Khan and Kumar, 1997).

In contrast to this substitution effect, the crowding-in effect is seen when there is an increase in private investment due to an increase in public investment. First, through the construction or improvement of physical infrastructure such as roads, highways, water and sanitation, ports, airports and railways (Aschauer 1989a and Hatano 2010) public investment creates an environment a more favorable business environment, often increasing the productivity of private investment. Second, the demand for goods and services from the government causes the demand for products of the private sector to increase, encouraging this sector to invest more due to the expectation of better revenue and profit (Ramirez, 1994; Greene and Villanueva, 1990). Third, the increase in national income arising from public investment can also attract private investment. This is because an increase in national income stimulates economic growth, which in turn can prompt the private sector to increase investment to exploit any profitable opportunities (Reungsri, 2010).

2. Literature review

2.1. Public investment

The Central Key Economic Region (Central Key Economic Region) was established under Decision No. 1018/1997/QĐ-TTg, dated November 29, 1997 of the Prime Minister, including Da Nang, Thua Thien-Hue, Quang Nam, Quang Ngai and Binh Dinh. With a natural area of 27,881 km² - accounting for 8.45% of the country's area, the Central Key Economic Region has a population of 6.55 million people. Regarding the scale of public investment in the region, it did not change much in the period 2010-2021. The scale of public investment increased from VND 20,829 billion in 2010 to VND 31,216 billion in 2021. The Central Key Economic Region was established in July 1997, experiencing the first phase with a rapid increase in public investment to support. In the field of construction and infrastructure improvement, from 2001 to now, public investment capital has not increased much in scale. Specifically, the average size of public investment capital in this period fluctuated at VND 28,208 billion. However, in the period 2018-2020, the scale of public investment increased rapidly because the Central Key Economic Region prioritized investment and completed the inter-provincial and inter-regional axes, the system of highways, roads, seaports, and airports. Besides, public investment in the Central Key Economic Region develops unevenly among cities and provinces in the region. While the scale of public investment in Binh Dinh increased sharply in the period 2010 - 2021

(increasing by 4.1 times), the scale of public investment of the remaining provinces/cities did not increase or show signs of decreasing.

Regarding the growth rate of public investment in the region, in the period 2010-2021, public investment will grow at a rate of 4.17%. In general, the region's public investment in the 2010-2015 period grew stronger than in the 2016-2021 period. Specifically, in the period 2010-2015, the average growth rate of public investment in the region was 8.25%, but in the period 2016-2021 it was 0.78%. The reason is that in the period 2010-2015, the Vietnamese and local economies were negatively affected by the world economic crisis and the European public debt crisis; and Dung Quat oil refinery suspending production for maintenance in 2014 also slowed down the growth rate of the whole region. Therefore, the Government has implemented public investment packages to support the regional economy because in this period, private investment is still growing moderately, so public investment still plays the role of the growth engine of the whole region. However, in the period 2016-2021, domestic private investment as well as foreign direct investment (FDI) both increased sharply, becoming the fulcrum for the growth of the region. Therefore, the growth rate of public investment also decreased compared to the previous period. Among the provinces/cities in the region, Thua Thien Hue and Da Nang are the two provinces/cities with the strongest growth in public investment. For the remaining provinces and cities, the growth rate of public investment tends to increase and decrease unstable in the period 2010-2021.

Unit: Billion VND

Figure 1. Scale of public investment in localities in the key economic region Central region in the period 2010-2021

Source: Statistical yearbook of localities in the Central Key Economic Region

Regarding the structure of public investment by capital source, it can be seen that public investment mainly depends on the state budget. This capital source reached VND 232,936 billion, accounting for 69.39% of public investment capital in the 2010-2021 period. Thus, public investment capital from the State budget is mainly focused on building socio-economic infrastructure, especially traffic and irrigation, and at the same time focusing on investment in education and training, hunger eradication and poverty alleviation. Loans from Government bonds, local government bonds, official development assistance (ODA), concessional loans from foreign donors, and development investment credit capital of the State accounted for 30, 61%, ranking second after the State budget capital. This capital mainly focuses on areas such as: Construction and development of infrastructure such as renovation of water supply, drainage and traffic systems; Building and upgrading

information and communication technology infrastructure; Providing high-tech medical equipment ... with loans and ODA, actively contributing to supporting the socio-economic development of the Central Key Economic Region. In terms of capital structure, loans accounted for 86% and grants accounted for about 14%.

2.2. Private investment

Regarding the scale of private investment, the scale of private investment has increased significantly in the period 2010-2021. If in 2010, the scale of private investment capital reached VND 17,406 billion, in 2021 the scale of private investment capital reached VND 60,853 billion, in 2018 alone, private investment capital reached VND 77,648 billion. Thus, within 12 years, the scale of private investment has increased 3.46 times. In addition, while public investment in the Central Key Economic Region increased or decreased insignificantly, the scale of private investment in the provinces/cities in the Central Key Economic Region changed markedly during the period 2010-2021. Specifically, the scale of private investment increased sharply in the period 2010-2018 and decreased in the period 2019-2021. The scale of private investment of provinces/cities in the period of 2019-2021 decreased due to the negative impact of the Covid-19 epidemic.

Unit: Billion VND

Figure 2. Scale of private investment in localities in the key economic region Central region in the period 2010-2021

Source: Statistical yearbook of localities in the Central Key Economic Region

Regarding the growth rate of private investment in the region, in the period 2010-2021, on average, private investment grew at a rate of 12.37%. Compared with the growth rate of public investment during the same period, private investment increased at a faster rate. This is completely consistent with the economic restructuring of localities with the increase of investment capital of the non-state sector and the gradual reduction of dependence on investment capital of the state sector. Among the provinces/cities in the region, Quang Ngai has the highest growth rate of private investment with 16.33%, while despite being the province with the largest scale of private investment in the region, the growth rate is high. Investment growth in Danang is decreasing, only 8.09% on average. Quang Ngai has attracted a large amount of private investment, with 1 economic Region, 4 industrial parks and 15 industrial clusters. Especially, Dung Quat Economic Region is a multi-functional area, attracting important and large-scale private investment projects in industries such as shipbuilding, mechanics, cement production, automobiles, etc.

Regarding the structure of private investment by capital source, the proportion of private investment capital from the enterprise sector is 64.69% while the proportion of investment capital from the household sector is 35.31% for the period 2010-2021. Thus, the Central Key Economic Region has a clear difference in the structure of private investment. Specifically, the contribution of the business sector to private investment is almost twice that of the household sector. This shows the important role of the business sector in promoting private investment and economic growth. Regarding the types of enterprises operating in the local localities in the Central Key Economic Region, mainly enterprises belong to the group of micro, small and medium-sized enterprises. The number of large-scale enterprises is very small in the local areas within the region. Large-scale enterprises are mainly concentrated in Da Nang, Quang Nam and Quang Ngai, although the proportion of this type of enterprise in the provinces is quite low (6.18 percent on average).

3. Impact of public investment on private investment in the Central Key Economic Region

3.1. Research Methods

The study uses the PMG method to analyze the impact of public investment on private investment in the Central Key Economic Region. The PMG method allows for short-term parameters to differ between groups while constraining long-term parameters to be uniform across subgroups. Therefore, the advantage of PMG is that it allows to distinguish short-term (difference between groups) and long-term (homogeneous between groups).

The PMG is used to estimate the elasticity coefficients and adjustment speed as follows.

$$\Delta Y_{it} = \theta_i (Y_{it-1} - \gamma_i X_{it}) + \sum_{j=0}^n \rho_{ij} \Delta Y_{it-j} + \sum_{j=0}^m \beta_{ij} \Delta X_{it-j} + \tau_i + \varepsilon_{it}$$

Trong đó

$(Y_{it-1} - \gamma_i X_{it}) = EC$ The error correction factor reflects the adjustment speed

γ_i và ρ_{ij} , β_{ij} are the long-run and short-run regression coefficients, respectively

τ_i, ε_{it} are the unobserved and observable error respectively

Model estimation by the PMG method requires that the variables included in the model have cointegration, so it is necessary to test the cointegration of the dependent variable and the independent variables included in the model. The model uses unit root test by Breitung test (2000) based on Augmented Dickey Fuller and Philips Perron with a lag of 2 for two cases with and without trend. To test the panel cointegration for the variables included in the model, the author uses the Pedroni test (2004).

3.2. Research model

Accordingly, based on the research of Malik (2013) and Omotogun, O. (2018), the research model has the following form:

$$PI_{it} = \alpha + \delta PU_{it} + \sum \varphi_j X_{itj} + \mu_{it}$$

In which: $i=5$ provinces in the Central Key Economic Region, t is the period from 2010 to 2021, PI is the total private investment (at 2010 constant prices), PU is the total public investment (at 2010 constant prices), X is the control variables μ_{it} is the error.

Based on the studies of Peltonen et al. (2012), Demilie Basha Hailu et al. (2015), Carrasco, M. (1998), Cavallo, E., and C. Daude (2010), Sofia Vilela São Marcos (2019), X can be measured through real interest rates (IR), inflation (INF) and gross local product (GRDP). Besides, based on the research of Tran Ngoc Anh Thu and Le Hoang Phong (2014), Nguyen Thi Canh (2018), and Nguyen The Khang (2022), foreign direct investment (FDI) is one of the factors that affects private investment in Vietnam. Therefore, the research model is rewritten as follows

$$PI_{it} = \alpha + \delta PU_{it} + \varphi_1 IR_{it} + \varphi_2 GRDP_{it} + \varphi_3 INF_{it} + \varphi_4 FDI_{it} + \mu_{it}$$

3.3. Research data

The data of the variables in the model are collected year by year mainly from the Statistical Yearbooks of the provinces of the Central Key Economic Region, including total public investment capital PU, total domestic private investment capital (PI), total foreign direct investment (FDI), Gross Local Product (GRDP), Inflation (INF). The real interest rate (IR) is collected from the World Bank.

Variables are expressed in logarithmic base natural form. In addition, the variables are calculated in per capita form. Specifically, the variables will be calculated by the logarithm of the value of the variable divided by the local population (POP- Entire labor force in the provinces aged 15 years and over (thousand people), for example $PU = \ln(PU/POP)$. With this calculation, the values will be adjusted to suit the characteristics (population size) of the locality.

3.4. Research results and discussion

Table 1. Unit root test results

Variable	Level		First deference		Integrated level
	Constant	Constant & Trend	Constant	Constant & Trend	
PU	-0.075 (0.469)	0.490 (0.688)	-3.020*** (0.001)	-2.180* (0.097)	I(1)
PI	-0.688 (0.245)	-0.405 (0.342)	-1.855** (0.031)	-1.085* (0.053)	I(1)
PIE	-1.842 (0.032)**	-1.365 (0.047)**			I(0)
PIH	0.109 (0.543)	0.457 (0.756)	-2.279** (0.011)	-2.056* (0.063)	I(1)
FDI	0.159 (0.563)	-0.583 (0.279)	-2.556*** (0.005)	-0.181 (0.428)	I(1)
GRDP	0.516 (0.697)	0.328 (0.628)	0.119** (0.032)	0.954 (0.830)	I(1)
IR	-3.222*** (0.001)	-2.437*** (0.007)			I(0)

Source: Stata-15

The research results in the table above show that the initial values of the variables (except IR) are not stationary when testing the trend factor and no trend factor. However, when using the first difference, the unit root hypothesis is rejected at 1% and 5% significance levels when there is no trend factor. Therefore, the study is based on stationarity at first difference to assess the relationship between public investment and private investment in localities in the Central Key Economic Region. The above results show that the variables in the model have a co-integration relationship or a long-term relationship. To test this hypothesis, the author uses the Pedroni test (2004) to assess the short-term and long-term impacts of public investment on private investment in localities in the Central Key Economic Region.

Table 2. Cointegration test results

Test	Coef.	p-value
Modified Phillips-Perron t	2.426***	0.0076
Phillips-Perron t	-5.521***	0.0000
Augmented Dickey-Fuller	-3.530***	0.0002

Source: Stata-15

The results presented in the table above suggest that the null hypothesis H0 without cointegration is rejected at the 1% significance level or that there is a long-term equilibrium between the variables in the model.

Table 3. Testing the long-term and long-term effects of public investment on private investment in the Central Key Economic Region

		Coef.	Std. Err.	z	P> z	[95% Conf.Interval]	
Long run	PU	0.417***	0.048355	8.64	0.000	0.322776	0.5123233
	FDI	0.082***	0.018388	4.47	0.000	0.04622	0.1182976
	GRDP	0.525***	0.022776	23.06	0.000	0.480589	0.5698681
	IR	-0.041***	0.010067	-4.13	0.000	-0.06126	-0.0218037
Short run	EC	-0.660***	0.220469	-3.00	0.003	-1.09243	-0.228212
	Δ PU	0.013	0.278405	0.05	0.961	-0.53208	0.5592477
	Δ FDI	-0.012	0.014702	-0.86	0.391	-0.04143	0.0162024
	Δ GRDP	-0.221	0.49371	-0.45	0.654	-1.18897	0.7463429
	Δ IR	-0.004***	0.001317	-3.6	0.000	-0.00732	-0.0021556

Source: Stata-15

The error correction vector (EC) is negative and statistically significant (at the 1% level) indicating the existence of a co-integration relationship between the variables in the model in at least one of the four provinces in the Central Economic Region.

In the long term, public investment, foreign investment, interest rates, and GRDP all affect private investment. In which, PU, FDI and GRDP have the same effect and IR has opposite effect. More specifically, when public investment increases by 1%, private investment increases by 0.417%. This result coincides with the research results of Oshikoya (1994), Kamps (2004b), Afonso and Aubyn (2008), Su (2011), Nguyen (2018) and Nguyen (2022). This result also shows that it is consistent with the general situation in the Central Key Economic Region when the proportion of public investment in total social investment and the growth rate of public investment tends to decrease in the period 2010- 2021. Meanwhile, the proportion of private investment in total social investment and the growth rate of private investment tends to increase gradually in the period 2010-2021. On the other hand, in the structure of public investment capital in the Central Key Economic Region, investment capital from the State budget for infrastructure accounts for the highest proportion. Therefore, as the analysis results show, in the long term, public investment has a complementary effect on private investment in the Central Key Economic Region. Besides, the research results also show that a 1% increase in FDI increases private investment by 0.082%. Similarly, a 1% increase in GRDP boosts private investment by 0.525%. Meanwhile, the IR real interest rate increased by 1%, while private investment decreased by 0.041%. The impact of the variables in the model on private investment shows that it is consistent with the theoretical model and the studies of Jorgenson (1963), Bui et al. (2017), Nguyen (2018).

In the short term, however, the impact of PU public investment on private investment in the Central Key Economic Region is unclear. This result is not as expected of the author but can be found in the study of Kollamparahr and Nicolaou (2011). According to the author, the cause comes from the short-term factor that public investment in infrastructure cannot immediately create a complementary effect for private investment, while public investment in the Central Key Economic Region is due to account for a smaller proportion than private investment, so it does not create a crowding effect. Similarly, GRDP is also unknown for private investment. In contrast to the long run, in the short run FDI has a crowding out effect on private investment. Specifically, a 1% increase in FDI will cause private investment to decrease by 0.012%. The research results were in line with the author's expectation and coincided with the study of Fry (1993), Agosin and Mayer (2000), Nguyen (2018), Nguyen (2021). In the short term, the construction of infrastructure to encourage foreign investment has not yet brought into play the complementary effect of private investment. In addition, foreign-invested enterprises always have advantages in technology and management over domestic private enterprises, so the increase in FDI capital will create an overwhelming effect on private investment. However, the degree of crowding is not significant because the proportion of FDI capital compared to the proportion of private investment in the Central Key Economic Region is relatively small compared to public and private investment. In addition, short-term real interest rates have the same overwhelming effect on private investment as in the long-run.

4. Discussion and conclusion

Firstly, affirming the "leading" role of public investment in private investment, especially in the long term in the Central Key Economic Region. Through the above research results, public investment in the Central Key Economic Region has an impact on private investment in the long run. Currently, public investment in infrastructure in the Central Key Economic Region has not kept pace with demand, so additional public investment is necessary and must be accompanied by efficiency in planning, avoiding duplication and delay. ... inhibiting infrastructure development in the region (UNDP, 2022). However, the current road transport infrastructure still exposes many weaknesses, partly due to the region's topography (saltwater, landslides, poor geology...) difficultly to implement road projects. In the context that the budget is shrinking due to the Covid-19 pandemic, the Government budget cannot invest in all items related to road projects in localities, so the Government needs to support for public investment capital focusing on intra-regional linkages.

Secondly, strengthen the coordination between public investment and private investment in the localities of the Central Key Economic Region. The study shows that in the short run FDI has a negative effect on private investment. Moreover, in the context that FDI inflows are highly volatile due to the impact of the Covid-19 pandemic and public investment resources from the state budget are shrinking, public investment combined with private investment is the solution. PPPs help the State transfer project-related risks to a private counterparty that is perceived to be better able to manage risks. Especially in the field of infrastructure, public investment from the State budget or even loans cannot be fully financed. Therefore, combining with private investment resources and policies on ways to mobilize the necessary capital to support the localities in the region to continue to grow. Currently, localities in the Central Key Economic Region have implemented this form of investment and Da Nang is leading in the number of projects. Specifically, Da Nang currently has 32 projects in the form of public-private partnership (PPP). In which, there are 4 volume payment projects, 7 transition projects and 21 new investment projects invested by the Departments and PMUs as investors and invested in the form of BT, BOT, and BLT.

Thirdly, it is necessary to promote the leading role of Da Nang city as an economic, cultural and social center, a driving force for the development of the Central Key Economic Region. With its position as the center of the Central Key Economic Region, Da Nang needs to accelerate the disbursement of public investment capital, focus on investing in key projects, and in the immediate future attract a lot of investment resources from the private sector. Specifically, the city needs to focus investment capital on developing the logistics system, setting aside land fund to develop infrastructure and logistics centers. In addition, focusing on speeding up the implementation of key infrastructure projects. In addition, there should be preferential policies and support for logistics service enterprises to apply high technology in their operations.

ASSESSMENT OF POTENTIAL AND SOLUTIONS FOR SUSTAINABLE TOURISM DEVELOPMENT OF THE CENTRAL COASTAL PROVINCE - WEST HIGHLANDS

PhD. Student. Tran Quoc Nhuan

nhuanlvcpy@gmail.com

University of Education Ho Chi Minh City, Ho Chi Minh City, Vietnam

Abstract

The Central Coast region and the Central Highlands of Vietnam have many advantages in marine - forest tourism and concentrate many famous heritages imbued with the region's national cultural identity. However, the potential factors affecting the sustainable tourism development are increasingly evident. Therefore, the article focuses on surveying, evaluating, analyzing potentials and providing solutions to link sustainable tourism development in the Central Coast - Central Highlands provinces. The research results serve as the basis for the effective planning of the province's tourism development in the coming time.

Keywords: *Links, tourism, The Central Coast region*

1. Introduction

The provinces of the Central Coast - Central Highlands are facing problems of sustainable development, especially the rapid urbanization rate but the lack of synchronous investment in technical infrastructure. The construction of too many hydropower projects on rivers has caused a lot of loss of natural forest area, a huge amount of soil and rock has been excavated and moved, but no measures have been taken to restore and replace forests in time. . In coastal coves and bays, spontaneous and unplanned development of aquaculture also causes many environmental consequences. Along with that is the massive development of industrial parks, which creates considerable pressure on the environment. The problems of natural resource depletion and the impact of climate change lead to environmental pollution, especially the water environment, and the decline in the value of ecosystems and biodiversity leading to the decrease in attractiveness for tourism activities... The master plan on tourism development of the Central Coast and Central Highlands to 2020, vision to 2030 approved by the Prime Minister shows the importance The close guidance of the leaders of the Party and Government for the development of the tourism industry in general and the region's tourism in particular, creating a premise for investment and management of regional tourism development in the right direction and lasting.

The development objective is to maximize the potential and advantages of each region to develop tourism to become the leading strength of tourism in the Central Coast - Central Highlands provinces. In the past few years, provinces. The Central Coast - Central Highlands has been interested in tourism development, but in fact. That planning work only stops at some basic

orientations, the main development targets as well as spatial zoning only stop at a few tourist areas and attractions without highlighting the planning scope. development of the industry (Tourism Research and Development Institute - Ministry of Culture, Sports and Tourism, 2010).

2. Method

Methods of data collection and processing: on the basis of collected data on tourism development in the Central - Central Highlands; The author conducts analysis, assessment and synthesis to clarify opportunities and challenges in order to provide solutions for sustainable tourism development for the region.

Field method: conduct discussions with managers, owners of tourism businesses and some leaders of provincial departments to find out the current status of regional tourism development linkages about advantages and disadvantages. need to be removed in tourism development cooperation.

Qualitative method: conducting interviews with experts to find out the advantages and disadvantages of linking and cooperating in regional development; and breakthrough solutions, in order to help regional tourism promote its inherent strengths in the short term as well as in the long term.

3. Results

3.1. Opportunities in linkage and cooperation in tourism development in the Central Coast - Central Highlands provinces

The Central Coast region - Central Highlands of Vietnam includes 19 provinces and cities with a natural area of about 152,000 km², a population of more than 25 million people. With 1,870 km of coastline, more than 1,500 km of land border with Laos and Cambodia. The Central Coast - Central Highlands region has diverse and rich resources with many outstanding potentials. The whole region currently has 12 airports in operation with 5 international airports; The seaport system has been upgraded with 10 class 1 seaports, including Chan May deep-water port (Thua Thien - Hue), Cam Ranh port (Khanh Hoa) to receive the world's largest seagoing vessel. The Central Coast - Central Highlands region converges many resources and tourism potentials, in which: potential for sea and island tourism is a strength with a chain of world-class beaches and many beautiful bays in the world. such as: Lang Co Bay (Thua Thien - Hue), Xuan Dai Bay, Vung Ro Bay (Phu Yen), Nha Trang Bay (Khanh Hoa) (Prime Minister, 2013 - 2014). Many attractive islands and peninsulas stretching from Thanh Hoa to Binh Thuan; Mountainous tourism resources with many famous hilly eco-tourism sites, lakes and waterfalls are concentrated in the Central Highlands provinces. Notably, there are 9 national parks here, notably Phong Nha - Ke Bang (Quang Binh) with a system of caves that are magnificent and fanciful wonders. The Central Coast region - Central Highlands is the residence of 47 ethnic groups, creating a treasure of tangible and intangible cultural heritages imbued with ethnic identity with 9 world cultural heritages. Among them are the Ho Dynasty Citadel (Thanh Hoa), the complex of Hue monuments, Hue royal court music (Thua Thien - Hue), My Son Cham relic complex, Hoi An ancient town (Quang Nam).), the system of Cham temples and pagodas along the Central

Coast... The Fisherman Festival in the sea area, epic treasures, the space of gong culture in the Central Highlands... these are great and valuable potentials and advantages that allow development. Integrated economic development with many key industries, especially linking tourism development, when combining two different cultures and geographies, complementing and creating diversity and uniqueness with tourism products “Sea - Forest” (Prime Minister 2011 - 2013).

Based on the 2019 ranking of the World Tourism Organization (UNWTO), Vietnam ranks 5th in ASEAN in terms of international arrivals, specifically Vietnam is behind the following countries: Thailand, Malaysia, Singapore and Indonesia. Although the growth rate of our country's tourism industry has improved year by year, it is not difficult to see the regional disparity in reality. In 2019, Vietnam welcomed more than 18 million international visitors, especially international visitors to the Central Coast and Central Highlands are still modest; while Thailand welcomed more than 38 million arrivals, of which 1 million international visitors were Vietnamese.

Table 1. World tourist destination ranking in 2019

Numbers	Destination	International arrivals (millions of arrivals)
1	France	90.0 million of arrivals
2	Spain	83,7 million of arrivals
3	United States	79,3 million of arrivals
4	China	65,7 million of arrivals
5	Italy	64,5 million of arrivals
6	Mê - hi - cô	45,0 t million of arrivals
7	UK	39,4 million of arrivals
8	Türkiye	51,2 million of arrivals
9	Germany	39,6 million of arrivals
10	Thailand	38,9 million of arrivals
(Ranked 5/10 ASEAN countries)	Vietnam	>18 million of arrivals

Source: World Tourism Organization - UNWTO

The Central Coast with the "heritage road" gives visitors a wonderful feeling about the scenic spots associated with the sea, islands, historical and cultural relics, and unique traditional folk festivals. Along with culinary dishes rich in coastal emotional flavors, the Central Highlands will be the unique experiences and discoveries of the great culture where many plateaus, natural reserves and national parks are gathered. many rare and precious plants, ornamental plants and medicinal plants; rich and diverse multi-layered vegetation and rare wild animals. In particular, Chu Mon Ray and Kon Ka Kinh National Parks are recognized as ASEAN Heritage Parks. This is a favorable natural condition for building unique eco-tourism products bearing the characteristics of the Central Highlands (Vietnam National Administration of Tourism (2015).

Stemming from the potentials and advantages mentioned above, in recent years, the Central Coast - Central Highlands provinces have expanded links and cooperation in tourism development with other provinces in the region and other provinces and cities. regions, regions nationwide. From the joint efforts of each province combined with the programs of signing, cooperation and tourism promotion, tourism in the Central Coast - Central Highlands provinces has made new strides, the number of domestic and international tourists to localities has increased compared to previous years. The question arises how the Phu Yen tourism industry can take advantage of geographical factors in regional cooperation to promote strong growth in tourism while still meeting competitive needs. ?

According to Philip Kotler, in a competitive market there are always four components: the leader, the challenger, the follower, and the corner-filler. From that perspective and based on the actual situation, it is not difficult to realize the current state of tourism in each locality:

Table 2. Recent statistics on tourism development in localities

Gr.	Provinces/ Cities	Visitors	International visitors	Domestic visitors	Revenue (Unit: billion VND)	Accomm- odations	Travel businesses	Forecast 2023
1	Đà Nẵng	>7,6 million	>2,8 million	>4,7 million	24.060	785	331	>9 million
1	Quang Nam	6,5 million	3,78 million	2,79 million	4.700	624	>50	>8 million
1	Khanh Hoa	>6,3 million	2,8 million	4,5 million	20.524	750	128	>7,5 million
1	Lam Đông	>6,5 million	485.000	>6 million	11.700	426	>60	>6,6 million
2	Binh Thuan	5,8 million	670.000	5,1 million	12.864	488	49	7 million
3	Binh Định	>4 million	286.463	3,8 million	3.301	217	36	5,8 million
4	Ninh Thuan	2,19 million	80.000	2.110	1.050	132	6	2,35 million
4	Phu Yen	1,6 million	41.005	1,6 million	1.556	126	12	>2,2 million
4	Đac Lac	812.00 0	76.000	736.000	761	199	25	>1,6 million

Source: compilation

However, the effectiveness of tourism development activities, especially in terms of income and job creation for the society, is still limited. In 2022 alone, the total number of tourists to Vietnam will reach 104.96 million, of which international tourists will reach 3.66 million, domestic tourists will reach 101.3 million, total revenue from visitors tourism reached

VND 495,000 billion, reaching 66% compared to 2019 (<https://vnexpress.net/nam-bung-no-du-lich-noi-dia>, December 24, 2022); but the Central - Central Highlands only received about 38 million visitors, of which international visitors reached 6.3 million, the total tourism revenue was about 80 billion VND (2018: 58 million visitors; international visitors more than 9.5 million visitors. total revenue of 120 billion VND, accounting for 18.75% of the total tourism revenue of the country). In addition, although the number of tourists is relatively large, the distribution is uneven, the total revenue from tourism is still low, not attracting the high-end tourist market, the tourism infrastructure system is still limited, the tourism infrastructure is still limited. Technical material is still weak and lacking. The linkage in tourism development is not tight, especially the linkage to build specific tourism products. (<http://www.vtr.org.vn/phat-trien-du-lich-mien-trung-va-tay-nguyen-no-luc-cung-nau-phat-trien>).

Through contact, it can be seen that Phu Yen tourism today has been lacking in mutation in tourism business management activities. Provincial Competitiveness Report 2022 Phu Yen ranks 47 out of 63 provinces and cities, rated medium, which also partly demonstrates the province's competitiveness and investment attraction. An interesting coincidence is that the ranking of localities in the South-Central Coast - Central Highlands also partly corresponds to the level of tourism development, specifically:

Table 3. Assessment of Provincial Competitiveness in 2022

Places	Provincial/City	Ranking PCI Index (total score:100)	PCI Rank	Tourism Development Level
2	Đà Nẵng	70,11/100	Very good	Leading group (1)
7	Quang Nam	65,41/100	Good	
18	Binh Định	64,08/100	Fair	The following group (3)
22	Lam Đông	63,50/100	Fair	Leading group (1)
23	Khanh Hoa	63,36/100	Fair	
24	Binh Thuan	63,34/100	Fair	Challenge group (2)
31	Đạc Lac	62,19/100	Average	Corner group (4)
38	Ninh Thuan	61,60/100	Average	
47	Phu Yen	60,59/100	Average

3.2. Challenges in linkage and cooperation in tourism development in the Central Coast - Central Highlands provinces

The association and cooperation in tourism development in the Central Coast - Central Highlands provinces revealed limitations such as: the linkage and cooperation programs in tourism development between the Central Coast and Central Highlands provinces have not yet been established. concretized, has not yet given a way to do it for businesses but let businesses "swim by themselves". Among the provinces in the region, there is not a "conductor" in this field; Most of the attractions and tourist products of the Central - Central Highlands provinces are quite similar. This "copying" has both lost the unique characteristics of each province and created a feeling of monotony and boredom for tourists, and at the same time affected the healthy competitive environment.

The Central Coast - Central Highlands provinces have signed quite a number of cooperation and tourism development cooperation programs with other provinces and cities in the region and the whole country, but this connection mostly just stops at Italy. The will of local leaders/or of the Culture, Sports and Tourism industry, in fact developing tourism in a strong way, still lacks an overall vision. The association and cooperation in tourism development between the Central Coast provinces - the Central Highlands is not stable and sustainable, there are still many shortcomings. Specifically: not yet coordinated and implemented the plan for cooperation in developing tourism products. Tourism products are still quite monotonous, duplicated, not specific and unique. Has not yet created tourism products with specific characteristics and high quality. The common tourism brand of each region has not been built yet. There has not been a general tour of the provinces with unique characteristics of each locality. There has not been any association or cooperation in training and development of tourism human resources. The organization of cultural and tourism events has not yet been linked to form a series of events to attract tourists... Tourism promotion and promotion is still limited, not yet highly competitive in the region and internationally to promote tourism. attract customers from key markets with high affordability. The ability to exploit and link tourism products between provinces has not met the actual requirements of many tourists, especially foreign tourists (VNAT, 2010 - 2015).

Another limitation is that human resources in the tourism industry in the Central Coast - Central Highlands provinces have increased in number each year, but there are still many aspects that have not met the task of tourism development when integrating into the world. deepening, comprehensive and demanding development of a knowledge-based economy. The number of trained human resources is small, the structure is not synchronized, and the practical capacity is not commensurate with the qualifications. There are not many qualified and skilled human resources and there is a shortage of leading cadres to act as the core of young human resource training. The knowledge of integration, foreign languages, informatics, creative capacity, leadership, management, administration and practical experience still have many limitations (Vietnam National Administration of Tourism, 2005).

3.3. Proposing a group of solutions to link sustainable tourism development in the Central Coast - Central Highlands provinces

3.3.1. Pay proper attention to tourism planning and management and investment according to planning

It is necessary to pay attention to tourism planning and management and investment according to planning. Continue to focus on synchronously implementing many positive measures, developing in depth and stability, constantly improving competitiveness, affirming and maintaining the brand on the basis of maximum exploitation and potential efficiency. capabilities and advantages of each province. Identify the main types of tourism as a driving force to promote tourism development in the province, thereby creating a driving force for the development of the whole region. With the potential of existing tourism advantages such as: Long coastline, many historical and cultural relics, beautiful landscapes, the central provinces can strongly develop the type of tourism in the sea and islands, tourist

relics. history - culture, festivals associated with the river region. The Central Highlands provinces focus on strongly developing forms of eco-tourism, agriculture, culture and festivals imbued with indigenous national identity. These types of tourism are being loved by young people, especially international tourists.

Focus on improving the investment environment. Strongly reform administrative procedures and perfect mechanisms and policies to create favorable conditions for investors. Actively support to remove difficulties and obstacles of investors regarding land, clearance, compensation..., to quickly deploy the project after the investment project is approved by the province.

To increase investment and call for investment according to planning in infrastructure for tourism development, on the basis of ensuring the natural landscape, protecting the natural environment and preserving and conserving tourism resources. calendar. The distance between the provinces of the Central Coast - Central Highlands is not too far, the road, railway, waterway and air transportation system is quite convenient, so the link and cooperation in sustainable tourism development between the two countries are very convenient. This province to support and complement each other, can meet many different segments and markets of tourists, creating a strong development in tourism for each province and the whole region.

3.3.2. Focus on training human resources in the tourism industry

The tourism industry includes many professions, many different business fields, human resources also have respective departments and groups, but it can be seen that there are two main groups, indirect groups and direct groups. The indirect group is a force of leaders, managers, experts and researchers with the requirement to have talent in leadership and management, to have a vision, to be sensitive to trends and prospects of the tourism industry. domestic and international. Must know how to use, retain and attract talented people who have the ability to dedicate and create for the sustainable development of the industry. Direct human resources group includes tour guide, receptionist, room service, table, chef..., with high requirements on professional ethics, job skills, creativity, life skills, coordination work, know how to apply appropriate advanced technology, especially knowledge about history, culture, good at foreign languages. In order to overcome the above mentioned shortcomings and limitations, tourism human resources in the Central Coast - Central Highlands provinces need to be trained in awareness, professional knowledge, and sense of responsibility to be able to spread success. responsible tourism practices, towards sustainable tourism development. Localities in remote and isolated areas, ethnic minority areas and flat sea areas due to difficult economic conditions and inadequate educational attainment. Therefore, it is necessary to provide practical assistance to employees in tourism business activities, such as organizing free vocational training programs, training in tourism skills, and supporting vocational training for people. labor force, gradually specializing and formalizing the labor force. Continue to improve the mechanism in attracting the community to participate in tourism activities, on the other hand, it is necessary to raise awareness and improve the capacity of the community so that they are the ones who have a sense of protection and promotion of the values. natural tourism resources and humanistic tourism resources in the area to live in a sustainable way.

3.3.3. Raise awareness of stakeholders in activities on sustainable tourism development

Sustainable tourism development requires a synchronous and comprehensive implementation of a system of economic, social and environmental solutions. With this importance, local authorities; State management agencies in charge of tourism in the Central Coast - Central Highlands provinces need to strengthen propaganda and education to raise the awareness of stakeholders about sustainable tourism development. Each entity has an important role, which is expressed in both responsibilities and obligations to ensure tourism activities are developed in a sustainable way. For local communities, especially ethnic minorities, it is necessary to pay attention to people's livelihoods, create jobs, and provide vocational training for workers. Promote propaganda and explanation so that people can clearly see the immediate and long-term benefits from tourism activities, and be responsible for sustainable tourism development; actively participate in protecting the environment, protecting historical and cultural relics, festivals, traditional industries and fine customs and traditions of the nation, preserving civilized lifestyle, maintaining security and safety. social, friendly attitude towards tourists... All of these actions have great significance for the sustainable tourism development of each locality and the whole region.

3.3.4. Coordinate and support businesses, organizations and individuals in tourism-related activities

Close linkages between local authorities in the Central Coast - Central Highlands provinces, businesses in the tourism industry, and between the tourism industry and other industries such as transportation, diplomacy, security, and finance , industry and agriculture in the province as well as connecting with the Central Coast - Central Highlands provinces and the whole country to expand the market. Tourism is an interdisciplinary, inter-regional and highly socialized economic sector, tourism development cannot be isolated and confined within each locality, province and city but must be a common issue. of the region and the country as a whole. Therefore, it is necessary to focus on linking in promotion and promotion of destinations, linking in product design, in customer service organizations, and building value chains. It is necessary to develop a common operating mechanism of the association and cooperation programs in a practical and effective manner. Do well the promotion of tourism types of the Central Coast - Central Highlands provinces with regional, domestic and international markets.

Support investors, businesses, organizations and individuals operating in the field of tourism, carry out administrative procedures; visa procedures; link building complete tourism products. Enterprises are considered as the root for tourism in the provinces to develop, management agencies need to support locations and land taxes for businesses so that businesses can boldly invest in construction in rest stops, shopping for tourists. tourists on national highways 1, 7, 8, 9, 14, 19, 25, 26, 27, 29... go through Vietnam and the central provinces - the Central Highlands. Connecting the traffic system along the East-West Economic Corridor connecting Laos and the Northeast region of Thailand. Strengthen professional training for staff working in tourism businesses; business enterprises need to develop price policies and seasonal promotions to support tourism service businesses of the provinces.

3.3.5. Promulgating a mechanism to operate linkages and cooperation in tourism activities

The Vietnam National Administration of Tourism has researched and launched tourism products, the "Central Heritage Road" tourist route, connecting the "Central Highlands Green Road" tourist route, becoming a cross-border route from the coastal provinces. Central Highlands to Central Highlands in order to exploit and link tourist attractions, landscapes, cultural heritages, festivals of the Central Coast region with natural and cultural heritages of the Great Highlands... Currently, this route has not fully promoted its value, as well as opportunities and potentials to stimulate tourism in the Central Coast - Central Highlands provinces. In order to effectively implement the program of cooperation and cooperation in tourism development among the above localities, it is necessary to issue a mechanism to operate linkages with clusters as the center for tourism development. There needs to be a "conductor" to coordinate and have a common voice for the development of the whole region. The Central Coast - Central Highlands provinces need to connect in clusters of industries to promote tourism promotion to domestic and international friends. Leverage common strengths. The provinces need to discuss to develop common tourism products for the Central Coast - Central Highlands provinces and specificities of each locality such as: food court, shopping mall for handicrafts, street vendors; entertainment area to meet the needs of many tourists; preserve and enhance culinary culture. It is recommended that the National Administration of Tourism, the Ministry of Culture, Sports and Tourism also need to regularly pay attention to professional guidance and continue to have policies and activities to support and support tourism in the coastal provinces. Central - Central Highlands.

3.3.6. Strengthening state management capacity and international cooperation in tourism

The local state management agencies in charge of tourism promote the role of leading businesses and communities in tourism activities towards sustainable development. Play an important role in formulating policies and strategies for sustainable tourism development. Disseminate, train, issue guidance materials, support local businesses and communities to follow the principles of sustainable tourism development. Organize seminars and training classes to raise awareness and exchange practical experiences during practice. Promote propaganda, encourage and honor examples of sustainable tourism development. Strengthen inspection and supervision, have sanctions to strictly punish the infringement of historical, cultural relics, scenic spots, discharge of waste, irresponsibility in waste treatment, causing environmental pollution, breaking the law. destruction of natural resources in the area.

The Central Coast provinces - Central Highlands, it is necessary to strengthen the expansion of international exchanges and cooperation, learn from experiences in developing community-based tourism, green tourism, responsible and environmentally friendly tourism; learn from the experience of handling environmental issues and responding to climate change of countries around the world. Take advantage of the support of countries and international organizations to contribute to ensuring the requirements of sustainable tourism development of the Central Coast - Central Highlands provinces.

4. Discussion and conclusion

Tourism is identified as a general economic sector with profound cultural content, interdisciplinary, inter-regional and highly socialized, the tourism industry is oriented by the Government to develop into a spearhead economic sector. , actively contributing to socio-economic development, bringing job opportunities and improving people's living standards, and at the same time enhancing the country's image in the international arena. In order to be determined to achieve the goal of turning the tourism industry into a spearhead economic sector with sustainable development, the Central Coast - Central Highlands provinces need to implement a synchronous and drastic orientation, grasping the awareness of the government to the people, turning awareness into concrete action. Accordingly, in order to ensure sustainable tourism links and cooperation, the most important issue is to know how to conserve and use resources rationally and effectively. To do so, tourism business activities must always have a sense of responsibility in the process of exploiting and using tourism resources. This not only contributes to the long-term sustainable tourism development of the tourism industry, but also creates conditions for each tourism activity of the Central Coast - Central Highlands provinces to develop continuously and sustainably.

A CHANGE IN CULTURAL LIFESTYLE IN PROCESS OF URBANIZING AND BUILDING NEW RURAL AREAS IN PHU XUYEN DISTRICT, HANOI CITY

Nguyen Thi Phuong
nguyenhaphuong110@gmail.com
Communist Review, Hanoi, Vietnam

Abstract

Based on the material of a field survey from 2019 to 2022 and some data from the economic and social reports in recent years of Phu Xuyen District (Hanoi City), this writing has analyzed the impacts on the process of urbanizing and implementing the Program on building the new rural areas and the cultural lifestyle of the local people. Through the analysis, the Phu Xuyen district people have still maintained their practicing the traditional culture, yet, they also have a change on the basis of being proactive in their adaptability, flexibility and creativity to be in conformity with the criteria of a new rural area and the influence in the process of urbanizing has been tremendously happening. Through this, this writing has discussed the challenges and had recommendations concerning the solutions with a view to maintaining the fine traditional cultural features to be conforming to the context of building the current new rural areas and the urban civilized lifestyle.

Keywords: *cultural change; cultura lifestyle; urbanization; rural areas*

1. Introduction

Through many visits and participations in experiencing a number of the residential communities in some communes of Phu Xuyen District, Hanoi City, we have recognized that the process of modernizing and urbanizing in this region is happening rapidly, the building of new rural areas has become ever more important in the rural-urban connectivity. Some cultural and spiritual aspects in the rural areas have happened in an extremely complicated and unpredictable manner and behind them is the diverse movement from habits, the way of life, livelihoods, family culture, the organization of cultural activities and so on. As far as these changes are concerned, the culture subject has manifested the adaptability to some new cultural factors, the flexibility and creativity so as to be in conformity with the concrete conditions. The arisen issues in the process of urbanizing and building the new rural areas in the cultural aspect need to be studied and on that basis, we can have a scientific base to see the adaptability and flexibility in the cultural practices of the rural residential areas before the impacts of the context of social change.

2. Theoretical framework

First of all, it is *the system of viewpoints, the way of accessing to the culture change*. When studying the culture change, the element that we have determined to have the most important role is the process of modernization based on the modernization theory) which

appeared and developed in the West from late 19th century to early 20th century. The important point of the modernization theory holds that the societies that have embarked on the modernization stage have got the very diverse forms, not only comprising industrialization, but also urbanization and the very high social mobility. The changes in the aspects such as education, gender, social welfare, job specialization are related to the cultural and social changes. The next way of getting access is *the subjectivity and the capacities of the culture subject*. According to the theory of social action by Max Weber, “social action is the action of the subjective in correlation with the action of the other person and oriented in the action of certain person in his subjective meaning concerning the premeditated goal. In other words, social action is the purposeful action of the subjective that is explained clearly in terms of motivation, goal and means on the basis of orientating in the action of other person and waiting for the response from that person” (Vu Hao Quang, 2016: 110). Weber mapped out 4 kinds of social action, consisting of the traditional action, sentiment and emotion, instrumental rationalism, purpose of rationalism. In which action of instrumental rationalism is the action implemented by the subject with the consideration, calculation, selection of instruments, means and purpose in such a way as to have the best effectiveness. This can be seen that whether it is in a traditional society or in a modern society, the subject always has a calculation and selection suitable to their capacities, levels, factual conditions of the society (it means that this also takes other people into account) so as to obtain productivity, quality, effectiveness and best interests.

3. Method

In the process of study, we have collected the summary reports in 10 years of implementing the Program on building the new rural areas and a number of emblematic communes, the latest reports on the economic and social development of Phu Xuyen District; books or materials recording the history and culture of villages and communes. Besides, the ethnographic fieldwork method is aimed at collecting the qualitative data for the subject. The point of time when the fieldwork was being conducted, COVID-19 pandemic broke out complicatedly, globally and in Vietnam. The impacts of the pandemic and the social distancing measures had made the travelling, contacts and friends making by the researchers with the local cadres and people had become more difficult. With the help of the district cadres, we could be able to get access to and have the interviews with a lot of objects. The total number of respondents was put at 35 people, in which the respondents of the district/commune cadres were 10 people, the heads of villages were 5, the villagers (from 20 years of age to 70 years old with different jobs) were 20 people. It depended on the different objects that the time and content of the questions for interview could be changeable in a flexible way so that the respondents could feel more comfortable in expressing their opinions and viewpoints. The close association of the ethnographic fieldwork method is the qualitative design, the information collected to get the deep insight of the issue from the perspective of the respondents (from the world outlook, from the subjective experience of the respondents and so on), collected by a lot of operations such as observations, note-takings, photo takings of the customs, habits, rituals and so on; the study of materials, files and materials on the tradition, customs, traditional jobs of the villagers in the areas under study.

4. Results

4.1. *The program on bulding the new rural areas in Phu Xuyen District*

According to the general assessment, “the animated building of new rural areas has become the extensive movement in the whole district. As of the end of 2019, Phu Xuyen District had 100% of communes which had met the standards for a new rural area; the district had reached 9/9 criteria of the new rural area; as mapped out by the roadmap, to the year 2020, the district would reach the standard of the new rural area” (deep interview, a man, 45 years of age, a district cadre). The agricultural production of Phu Xuyen District in the initial step had developed comprehensively in the direction of mechanized, high quality, concentrated commodities production. The outstanding result in Phu Xuyen is the amassing of rice fields and the implementation of the rice seedlings in trays and rice planting machines, making a contribution to creating a new vitality for the district’s agricultural production.

In the set of the National Criteria for the new rural areas ⁴¹, the culture criteria are divided into two kinds: the cultural material and spiritual basis (criterion 6); the cultural life (criterion 16). The two above criteria manifests the “requirement of reaching the standards of infrastructure, the cultural and sport institutions, while it poses the requirements of reaching the standards of the soft contents - the core value of culture” (the Ministry of Culture, Sports and Tourism, 2019:5). In the 2016-2020 stage, Phu Xuyen District concentrated on the perfection of the cultural material basis by taking a lot of proactive, flexible and crative measures in combination with the new building and renovation, transformation of the existing institutions such as the communal houses, pagodas, the meeting halls of the people’s committees. Especially, the district had paid much more attention to improving the quality and effectiveness of the activities of the cultural institutions, forming the clusters of sports - entertaining culture in association with the communal houses of culture of the communes and villages; empowering the residential communities in villages and hamlets to operate and manage them in such a way as to be the most practical and effective. Phu Xuyen District had also linked the Movement called “The entire people unite to build the cultural life” to the Mobilization entitled “The entire people unite to build the new rural area and the urgan civilization” in combination with the implementation of 19 criteria of building the new rural areas. The content of the programs have the integration of goals, tasks, the material and spiritual resources with a view to successfully implementing The National Goals Program on Building New Rural Areas.

¹ Based on Decision 318/QĐ-TTg, on March 8, 2022, of the Prime Minister on issuing the Set of National Criteria on communes of new rural areas and the Set of National Criteria on communes of upgraded new rural areas in the 2021-2015 stage, the Set of National Criteria on new rural area communes has 19 criteria. Specifically: the Planning group has 1 criterion (1-Planning); the Economic-Social Infrastructure group has 8 criteria (2- Communication; 3-Irrigation and prevention of natural disasters; 4- Electricity; 5- Schools; 6- The cultural material basis; 7- The rural trade infrastructure basis; 8- Information and communications; 9- Inhabitants’ houses; the Economic and Production Organization group has 4 criteria (10- Income; 11- Multidimensional poverty; 12- Labour; 13- Production organization and development of rural economy); the Cultural-Social-Environmental Group has 6 criteria (14- Education and Training; 15- Health; 16- Culture; 17- Environment and Food Safety; 18- The Political System and Access to Law; 19- National Defence and Security).

According to assessments, after 10 years of implementation, Phu Xuyen District has 25/25 communes which have fundamentally reached the criterion 16. In 2019, the whole district had 109/141 villages which were recognized as the “Culture Village”, reaching 77.3%; the number of families which were recognized as the “Culture Family”, reaching 95.1%. In 2020, there were 95.8% of villages being recognized as the “Culture Village”, 94.8% families being recognized as the “Culture Family”. That the culture families, the culture villages and the culture city wards have been built has promoted the nuclear role of each family in building the new rural culture. Phu Xuyen District has 345 relics, in which 120 historical relics have been recognized (38 relics have been classified as the national level, 82 relics as the city level); 58 traditional festivals of different sizes have happened annually (The Party Committee of Phu Xuyen District, 2020). The communes in the district have also mobilized the organizations, individuals and outside guests to build, repair the local communal houses and pagodas. The folklore festivals are organized annually together with the maintenance of the melodies of folk songs, the singing of heave-ho at the communal house’s gate, the singing of spiritual songs, the ceremonial song called *ca trù* and so on. The festivals are organized in accordance with the traditional rite, ensuring security, order, safety and healthiness, creating the enthusiastic atmosphere, serving the people’s requirements of religious and belief life. As recorded, of 19 criteria for building the new rural areas, there are only 2 criteria for culture, but these criteria imply almost all the remaining criteria. Because in the final analysis, if the criteria for building the new rural areas want to reach the sustainable result, they all stem from the consciousness and self-consciousness of the people and this is really the cultural lifestyle.

4.2. Changes in the cultural way of life in the process of urbanizing and building the new rural areas

a. Cultural activities are associated with building and operating the new cultural institutions

In a recent field trip, we are able to listen to the villagers telling about their building the village gate and the culture house in Đông village², Chuyên Mỹ commune. According to the villagers, about ten years ago, the village did not have their village gate, the culture house, “all the village affairs, community activities and movements had all depended on the material basis of the elementary school and the communal house. Therefore, it was impossible to have the conditions to rally the residents to popularize them with the general activities in a methodical way” (group exchange). Only until 2013, thanks to the joint efforts of the local authorities, the determination of the villagers, the contribution of both efforts and money of the households in the village, the spacious Culture House was built in an area of 4,000 hectares with a capacity of over 250 people and with sufficient loudspeaker system and the Internet. Since having the Culture House, all the community activities have been regularly organized, such as the Mid-Autumn Festival, the Children’s Festival, the volley ball competitions, the village festival and so on. According to the village headman and the

² The name of village has changed in accordance with the principle of concealing the name of the qualitative study. So all duplications are coincidental

women in the local women's union, in the time to come, the village's Culture House will be used to organize the wedding ceremonies, meetings and the proceeds from these events will be geared to the village's fund with a view to helping the community activities.

The culture houses of the villages have the Internet and the loudspeaker system, the radio to meet the requirements of information of the people in the localities. *"The Culture House was just inaugurated last year; the villagers had contributed their money and efforts, some contributed building materials such as sand, cement, stones, while young people in the village came to help the building work. On average, each month, the culture house has a meeting, such as the meeting of the local party cell, the activities of the old-age people, the clans' meeting, the meetings of the mass organizations and so on"* (depth interview, man, 72 years old, the village headman). Thanks to the culture house, the place for sport activities, the people have more conditions to meet each other and exchange experience in keeping the happiness of families, in building the culture families and in participating in the entertainment activities, in doing physical exercises to improve their health and to unite in the spirit of good neighbours in the village.

During the field trip in mid-August 2020, we had an opportunity to attend the cultural activities of the villagers at the cultural house in Đông Village, Chuyên Mỹ Commune. As shared by the culture cadre of the district, the cultural and art and sports movement in the villages and communes in Phu Xuyen District has developed vigorously with such games as martial arts, the nourishing sports, football, volley ball, badminton, chess, bicycle and so on. These are the main, modern sport games, conforming to the practical conditions of each locality. Ms Tâm³ told me: "Whenever the afternoon comes, I no longer "lingers" in the office to "try" to solve certain issues; on the contrary, I leave the office soon to take my child home from school and then "quickly" go to practice popular dancing with my villagers." She also says: *"In my village, all the cultural, artistic and sport activities are very animated. Whenever the afternoon comes after the school hours, the working hours, the yard of the culture house is crowded with people, looking so bustling. Some middle-aged people like to play the air volleyball, whereas young people and children like playing football or badminton and so on"* (depth interview, female, 54 years old, a communal cadre). The Mai Vàng Popular Dance Club (Đông Village) where Ms Tam has joined has been set up for two years. Every late afternoon, the yard of the Culture House is crowded with the village women to practice dancing, even there are spectators. Every month, the Popular Dance Club has the exchange with other popular dance clubs from other communes and they learn how to dance Zumba and other dances with each other. *"Every village has got an art team, a sport team and they have organized regular performances and competitions in the villages and in the whole communes"* (an exchange with a group of women, Đông village). Even though they have different jobs to do, so they are all busy with their jobs and as a result, the time to practice and play together is more difficult for them to arrange, and yet, in the end of the day they can be able to arrange the time to come in time to do things together. The activities in

³ To ensure the confidentiality in accordance with the principle of the qualitative interview, the name of the interviewer has been changed. All the duplications are accidental.

the culture house has always attracted young people, boys and girls, who are very enthusiastic with the badminton and air volleyball.

The aged people like to play table tennis, to dance Tai Chi Chuan callisthenics or the fan dance. The elementary school or junior secondary school children like to participate in the popular dance clubs or the aerobics clubs. According to Mr. Học - the headman of Vân Village, whenever the village has something to celebrate, such as the Vietnamese Teachers' Day, the Women's Day, the Children's Day or the International Aged People' Day, the above-said performing items are indispensable. These items are painstakingly trained, "all home-grown", and they are all organized inside the culture house or on the yard of the culture house.

b. The implementation of civilized lifestyle in weddings and festivals

Besides the conventions, the village rules, the village customs which have existed for a long time in the villages, the implementation of the civilized lifestyle in the weddings, funerals and festivals have contributed to promoting both the values of the traditional culture and to helping the family and neighbor relations become ever more closely attached. The villagers have the consensus in building the village's New Rural Rules. Now in the area of the whole district, there are 153/153 villages and residential areas having their new rural Rules built and approved. In general, these villages' rules have got concrete stipulations on implementing the civilized lifestyle in the weddings, funerals and longevity wishing ceremonies and in other religious activities.

Accordingly, *the wedding* has been organized in accordance with the provisions of the law on marriage and family, the registration of civil status and they are only carried out after the communal People's Committees supply them with the marriage registration certificates. As provided by the law, a ceremony to hand over the Marriage Certificate will be organized by the communal or ward People's Committees. During the handover event, a ceremonial rite is held with a representative of the local authorities coming to hand over the certificate and the members of the two families are present to witness it with the motto "Solemnity - Jubilance - Healthiness - Thriftiness". Almost all the weddings here are organized within one day, without any carousels. "Many families organized their weddings right in the village's culture house in a day without pitching tents with noisy music played through the loudspeaker system" (depth interview, male, 60, Vân Village). All the weddings in villages and communes of Phu Xuyen District are organized in conformity with the cultural tradition and customs of the localities in a way that the representatives of the families, clans, neighbours and friends and the representatives of the parents' offices and of the brides and grooms are invited to the weddings. The number of invited guests are not over 300. The dinner party is organized within the families and kinship clans, close friends with the limited number and the use of cigarettes and alcohol and beer is not encouraged. Nowadays, most of young people are busy with their work, that is why they find it unnecessary to choose the lucky days to organize their weddings. Most of them select Saturdays or Sundays for their wedding days because these days are suitable to the holidays, "*the relatives and close friends can be able to come and attend their weddings*" (depth

interview, female, 28, a worker). This is a great change in thinking, habit and cultural practice in the current rural areas. In recent years, the wealthy families in rural areas can be able to hire a wedding package, from the pitching tents, supplying tables and chairs, doing the cookings with sufficient bowls and dishes and even a master of ceremony was hired to come to play the host of the event. Some villages can use the meeting hall, the culture house and a certain place for sport and cultural activities to organize their weddings. The weddings can see the participation of the representatives of the local authorities, the mass organizations. They come to attend the weddings and on behalf of the commune, they present the bride and the groom flowers and a gift with a value of VND 1 millionm, while the village representative present a gift with a value of VND 500,000. The guests coming to the weddings also change their gifts. Intead of giving gifts both in cash and in kind as in the past, now they present mainly cash and the value of the gift depends on the closeness between the hosts and the guests as well as the place where the weddings are organized. The change in the wedding organization shows that the people in the rural areas have changed their awareness in the way of organizing the time and space, the cultural method of organization of the wedding in the rural areas, particularly in their following the civilized criteria of an urban culture and the rules of building the new rural areas.

Since there is the rule stipulating the organization of funerals in Phu Xuyen District, almost all have met the spirit of “Solemnity - Thriftiness - Attachment”. This low-lying summer rice region has seen the relatively great changes in organizing the furnerals. The villages, residential areas and so on have set up the funeral organizing board in order to unify the process and rites in conformity with the spirit of the Rules on building the new rural areas which can help save the money, express the concern and mutual assistance of the members of the communities when they are in difficulties and misfortunes. According to the Rules on New Rural Areas, the funeral is jointly organized right in the deceased’s family by the Head of the Funeral Organizing Board, by the party committee level, the representatives of the mass organizations and the families of the chief mourner. All the funeral rites have been cut down to be much simpler. The deceased must be shrouded withint 12 hours and then must be encoffined (all the bad habits which are no longer suitable such as the elimination of ghosts before encoffing the dead, called the Ghost Punishment Ceremony or casting a spell to chase or driving away evil spirits have been abandoned). Apart from maintaining the traditional procedures and rites such as the chosen time to encoffin, to bury the dead or the recite of prayers together with playing liturgical music and reading the funeral oration, the formalities of making offerings in 3 days, 7 days, 49 days, 100 days, the first death anniversary and the rebury ceremony are now organized within one day within the family of the dead. *“The state of organizing the superfluous, prolonged funerals, abundant feasts have been eliminated a lot. A lot of bad habits such as rolling on the road, hired mourning, gambling are almost no longer in existence”* (depth interview, male, 72, village headman). The eating and drinking in the funeral are organized only in the family together with close relatives, friends and neighbours, whereas friends and colleagues only come to pay respects to the deceased and never stay for the dinner.

One of the great changes in practicing the funeral beliefs is the change in the form of burying the dead, from burial to cremation, thus reducing a lot of formalities such as exhumation, thus limiting the state of environmental pollution. *“My village has got 4 deaths since the beginning of the year and the families of the dead are proactive in registering to have the dead cremated; it is very civilized in doing so now; no burial, no exhumation, as it was troublesome like in the past”* (depth interview, male, 65, the village headman). Many villages in Phu Xuyen District have still maintained two forms of burial and cremation, depending on the requirements of each family of the dead so that the rites to say good-bye to their dear ones to the other world can be carried out. Many families have recognized the strong points and limitations of each of the above forms, particularly when the Program on New Rural Areas has been implemented; the preferential policies in giving support of partial costs for cremation have gradually changed the people’s awareness. As compared to the burial habits in the past, *“the cremation and one-time burial have got much better advantages: no hardships for the living; not much time, human force, money to be spent; good hygiene conditions and so on”* (Bui Xuan Dinh, 2020: 140). Many families find that the above-mentioned forms help save time, efforts, costs, reduce some post-funeral rituals and keep safe hygiene for environment. The number of mourning wreaths has been much more limited, even some localities have used the mourning wreaths prepared by the Funeral Organizing Board so as to save money. The mourning delegations also come to pay respects to the deceased with a black ribbon inscribed with the name of the office attached to the mourning wreath prepared by the Funeral Organizing Board; no show-off mourning wreaths and embroidered hangings, especially there is no form of offering with cook food to the deceased. The organization of the festivals is provided for once in two years that falls on Lunar February 12 of the odd year. In the past, the festival was often organized on a small scale, within the villages and communes. (The festival of Đông Village was organized once in two years with the folklore games such as the tug of war, playing chess, the blindman’s buff). There are also art performances, the aerobics performing and so on. The longevity wishing ceremony is the fine trait of the tradition, reflecting the respect to the aged people. The authorities combines with the Fatherland Front and the aged people association to hold the longevity wishing ceremony for the old people of 70, 75, 80, 85, 90, 95, 100 years of age. The time to organize the event is associated with the annual traditional Tết day (the Lunar New Year) and it is organized in the communal house with no lavish banquet to cause costliness.

c. The activities to keep environmental hygiene in the residential areas

As usual, every week, young people of the Youth Union in Chuyên Mỹ Commune do the cleaning up of streets, roads, cemetery, the road around the office of the communal People’s Committee, the culture house and communal houses of the villages. The competition *“To keep the village, the street of the residential area to be clean, green, beautiful and safe”* has been launched, attracting the overwhelming participation of the young people, particularly the Youth Unions members of the other communes. According to the

assessment, *“the environmental hygiene in many villages and residential areas has become the good habit and it has been maintained regularly on weekly Saturday and Sunday”* (depth interview, male, 40, communal cadre). As shared by a cadre of the local women’s union, *“the internal road of the village, the culture and sport house in my village have been invested a few years before. The villagers are well aware of it and they have encouraged each other to do the cleaning up of the hamlets and village roads to look magnificent and clean”* (depth interview, female, 60, a retired cadre). Many villages have also maintained regularly the environmental sanitation in the central parts, in the public areas, mobilized even the middle-age people, young people, school children during their free time or in the year-end days, to take care and trim green trees, to plant the new trees and grow a lot of flowers on the either side of the village roads, thus creating the cool, airy, green and clean environment. In front of a number of families, the owners have also improved the look of their houses, planted green trees and assorted flowers in their house gates, along the fences and on the balcony to embellish more the village. Besides growing flowers and ornamental plants; some villages have also maintained their collection of wastes in the lanes and alleys. *“At first, the village authorities launched the movement of building key models. Day in and day out, the villagers are aware of classifying their daily life wastes and put them inside the house, so as to throw them away in time and in accordance with the schedule when there is the clang of the bell. Children are advised not to throw wastes on the roads, so the village roads and alleys are always clean”* (a exchange with a group of youth union members).

According to the Rules on building the new rural areas, all the members of all the families must have the sanitary works, the clean water system and the waste water must be treated before releasing it into the sewers and gutters of the blind alleys and lanes, village roads, ponds and lakes. They are held responsible to join the movement of keeping the general hygiene called *“It is clean from houses to alleys”*. They also have the responsibilities and obligations to protect the clean, green and beautiful environment of the village, to build and repair the village roads and alleys, to dredge the sewers and gutters to have them drained. In Chuyên Mỹ, all the households must participate in the general cleaning-up on Saturdays every week, and each family must have a barrel to contain wastes and the wastes must be dumped into the provided places. Each village has got a hygienic team to collect wastes every day and take them to the village’s dumping ground.

d. Some forms of new entertainments

After two years of being affected by COVID-19 pandemic, all the cultural, sport and other entertaining activities have almost come to a standstill due to the distancings. Only until early 2022, with the state policy on expanding the vaccination, all the activities could be able to come back to the *“new normal”* state. In August 2022, in a field trip in Phu Xuyen District, as we observed and found that the dike had been asphalted, looking clean and nice and people were busy going to work on it. In the past few years, that clean and nice dike has also been used for the *“race”* of the aged people who ride bicycles to train their physical exercises. At the foot of the dike, there are spontaneous football and volleyball fields for rent

and they have attracted a great number of young villagers to join. *“Every week, we have gathered here to play football. Each village has got one football team and have the friendly matches together. In each occasion, we young people have shared and connected our work, families so as to enhance our friendliness”* (group discussion, in August 2022). With an advantage of the low-lying summer rice land area with a lot of lakes and ponds, many rural households in Phu Xuyen have availed themselves to the situation to transform their own gardens, stagnant ponds by dredging them to breed fish, let alone they have also created some other services such as supplying drinks and cooking feasts and so on so as to do business by giving services in angling in their ponds. Of late, the movement of having entertaining angling has inclined to develop vigorously, because many villagers consider it as *“a new play ground”* and they can enjoy fully their relaxing time after the hard-working days. As shared by the couple of Ms Loan - the owner of the angling pond Trần Gia, *“the anglers here are our relatives and friends in the commune, or possibly some of them are the outsiders, even from Hanoi City and the areas around such as Hưng Yên, Hà Nam and so on. They all come here and rent the angling facilities”*. Some of the households find it profitable from the angling services, so they have set up some shops to sell the angling equipment with all sorts and sizes of facilities available. Many garden houses have also given food and drink services and there are some delicious food cooked from the fish caught by the “anglers” themselves and thanks to it, the services of renting the fishing pond and the fishing rods in Phu Xuyen in recent time have attracted a lot of customers.

In the process of our field trip in some villages and commune of Phu Xuyen District we have had conversations and observations with some groups of objects and we know that apart from the cultural movements organized by the district and commune authorities, the regular sport activities in the localities are consciously launched and organized by the local villagers. The objects who have initiated the movement are the village cadres, the women in the women’s union with the games of folklore character such as the popular dance, the fan dance, together with the sport games like aerobics, zumba dance or gymnastics. Most of the objects under interview have said the reason that *“they have taken part in the games for fun, unity and for training to improve their health conditions”* (depth interview, male, 45, commune civil official), while women do the physical exercises to *“keep their good shape healthy and create the joy in life”* (group exchange, the Popular Dance Club of Đông Village). The change of the daily habits of the peasants have reflected in part their adaptability to the urban way of life.

In the area under study, according to our observation, the appearance and development of food and drink services have become relatively popular, mostly in the alleys and lanes, markets, the pavements and so on. With the development of the Internet and other social communication means, the food and drink services have also been sold online with the ready made food and the goods are delivered right to the doors of customers. Many families, due to their work in agencies, companies or industrial parks, have chosen to have their breakfasts in food stalls, not at home. These families are mostly the young families with

young people and school students. With the current expansion of food stalls, the rural women are less laborious than before in preparing food for the families and they have got more time to take care of themselves. On the weekend days, the whole families go to have breakfasts and coffee, fully enjoying their relaxation after a busy week. At present in the countryside, even though people are geographically distant from each other, they still have the connectivity and keep contacts with each other through the social networking sites such as Zalo, facebook and so on to exchange and cooperate in production and business. “The life rhythm and activities in the rural areas are no longer leisurely or loafing; on the contrary, they have a busier, hastier life in a race with time, particularly for young people” (Nguyen Huy Phong, 2020).

5. Discussion and Conclusion

5.1. Discussion

At first, the process of urbanizing and building the new rural areas has made a contribution to forming a class of farmers in the new generation with the dynamic and modern mindset. The programs on agricultural - rural - farmers development of the State and localities have made great influences on the farmers’ life. The farmers have shifted from the mode of livelihoods based on agriculture and small-scale industry to the combination with many other kinds of livelihoods, from the working and earning their lives by the groves of village bamboos, now they have the mutual linkage and cooperation in the form of chains and unions to create the higher values in production development. Even there have appeared the farmers’ households have done the marketing of their goods online or they have gone abroad to learn experience in doing high-tech agriculture, thus helping agricultural production have a lot of positive changes both in productivity, quality, and income value over a farming unit has been improved much better than before. The use of machines, scientific and technical advances in some production links has helped the farmers get less laborious farming work. Income of individuals, households and production establishments has been improved, thus forming a class of dynamic owners of production establishments. “A part of farmers thanks to their knowing the way of doing business, getting access to the market, linking the economy, applying technologies and re-organizing labour has become *the farmers of the new generation*” (Đoan Minh Huan, 2022: 27). Besides the prestigious, old-aged people based on their experience, there have appeared the prestigious young farmers who are proactive in linking and cooperating closely with agriculture, cooperatives, the scientists and the centre for seedling services and they have become the better-off or wealthy farmers. The development of this farmer class can enhance the poor - the rich distance, but it has also created the motivation for economic growth, thus promoting the change in the cultural practices in the rural areas.

Secondly, the process of urbanizing and building the new rural areas has made a contribution to changing the thinking, lifestyle and way of life of the farmers. When they are proactive in selecting their jobs that are adaptable to the new background, the farmers can be able to take more parts in the cultural, sport and entertaining activities, and thanks to

them, their cultural and spiritual life has become more diverse and abundant. A part of villagers has gone to work in the distant areas or lived in other areas, yet, their families and relatives have still lived in the villages, so whenever the Lunar New Year days come, they have come home, bringing along the practices and values of the new culture from the areas and regions where they live and work, thus leading to the definite influences on the homeland's culture and society. The farmers have paid ever more attention to the conservation and promotion of the traditional cultural values, to the investment in upgrading the grass-root cultural institutions such as the village gates, the culture house, the communal houses, the pagodas and so on. The rural environment and landscape have been planted with green trees, creating the clean and beautiful views, embellishing the villages and the families and even they consider it a pride of the current rural residents.

Thirdly, the process of urbanizing and building the new rural areas have made impacts on the cultural change in the complicated direction alternated with the negative impacts. In many villages and rural areas, particularly in the places where the urbanizing speed has happened tremendously, the farmers' life is as rich as it is, but their way of life has also changed faster, the social evils such as lotteries, gambling, drinking, drug injecting, prostitute, social violence and so on have happened in a more complicated manner. Many restaurants and karaoke shops have mushroomed, hidden with the danger of social insecurity and safety and disturbances in the villages. Even though there are changes in livelihoods appearing in the new sectors and jobs which are more dynamic and ensure the maintenance of the farmers's life, sometimes the farmers are landed in the passive, confused positions before the immediate changes. A part of farmers who is less dynamic has fallen into the social evils or lured to the vices. The impacts from the process of urbanizing has made the core values of villages - the basic units of the rural organization, which have been accumulated and transmitted through various generations, gradually faded.

5.2. Conclusion

The countryside is not only the residential area of rural inhabitants and agricultural production, but also takes charge of the functions which the cities are unable to meet, in which there are the issues of conservation and development of the traditional cultural heritages, the maintenance and exploitation of the tangible and intangible cultural values, the humane values and human resources, the historical traditional values. On that basis, some recommendations which might be useful for the conservation and maintenance and promotion of the fine traditional cultural traits, conforming to the context of building the new rural areas and the current urban civilized way of life, they are:

It is necessary to diversify the rural cultural institutions, select and use most effectively the traditional cultural institutions and the new cultural institutions. To create conditions for the farmers to take part in building the planning and plans, programs, steps in building the new rural areas; to deploy the implementation of these programs, it needs to have the farmers' initiatives, contributions and participation in management.

To enhance the decentralization and empowerment to communes and villages, to be active and proactive in promoting democracy, mobilizing the participation of the people in the process of building the new rural areas; to empower the community to carry out the small-scale, uncomplicated activities with the mobilization of the contribution of the community, under the supervision of the community, ensure the openness and transparency.

To enhance the coordination between the state managerial agencies, the sectors, the levels and the relevant organizations, the rural communities, individuals to create the consensus of the community itself, the clans, families and the cultural subjects so as preserve and promote the cultural identities in building the new rural areas. To have the reasonable policy on making investments and on fostering cadres in charge of the cultural field and the folklore cultural artisans./.

Abstract

The study investigated the factors affecting the public procurement performance in Hanoi by using primary data collected through a survey of 300 questionnaires. Based on previous researched, the study added the procurement procedure variable to the model to assess the factors affecting public procurement performance. Research results show that procurement plan, staff competence, resource allocation, procurement procedures have a positive influence on the public procurement performance. However, contract management has a negative effect on public procurement performance.

Keywords: *Public Procurement, Procurement Performance, Hanoi.*

1. Introduction

The objective of study is to determine the factors affecting public procurement performance and then measure the effect of these factors on public procurement performance in Hanoi. Previously, relevant research only assessed the public procurement performance in Vietnam from a macro perspective. In fact, there are very few research papers evaluating the factors affecting public procurement performance from an internal perspective. The researches referenced by the research team have shown the factors affecting public procurement performance, but these reasearches have not yet shown the procurement performance measurement.

Further research papers should be conducted in other public entities to identify and find more influencing factors. So, we consider all the variables under Procurement Planning, Staff Competency, Procurement Procedure, Resources Allocation, Contract Management.

2. Literature Review

2.1. Public procurement

Procurement is defined as acquisition of goods, services, capabilities and knowledge required by businesses, from the right source, the right quality, in the right quantity, at the right price and at the right time to maintain and manage a company's primary and support activities (Triantafyllou 2007; Giunipero et al. 2006; Hines, 2006; and Van 2000). Public procurement is a government's activity that spends public budgets, it means the procurement of any goods, construction work or services implemented by government or state organizations (UNCITRAL, 2011).

2.2. Public procurement performance

Procurement performance is a measure of identifying the extent to which the procurement function is able to reach the objectives and goals with minimum costs. There are two main aspects of procurement performance effectiveness and efficiency. According to Knudsen (1999), procurement performance starts from purchasing efficiency and effectiveness in the procurement function in order to change from being reactive to being proactive to attain set performance levels in an entity.

2.3. The theory of constraints

The theory of constraints (Dr. Eliyahu M. Goldratt, 1988) is a method of identifying the most important limiting factor hindering the achievement of a goal and then systematically improving that constraint until it is no longer a limiting factor. Companies, whether in the manufacturing or service sectors, should focus more on understanding their own structure in terms of processes in order to survive the global competition. In such a situation, TOC has become an important problem in structure and solution, changing the way managers think (Zeynep Tugce Simsit, Noyan Sebla Gunay, Ozalp Vayvay, 2014).

2.4. The Theory of Planned Behavior

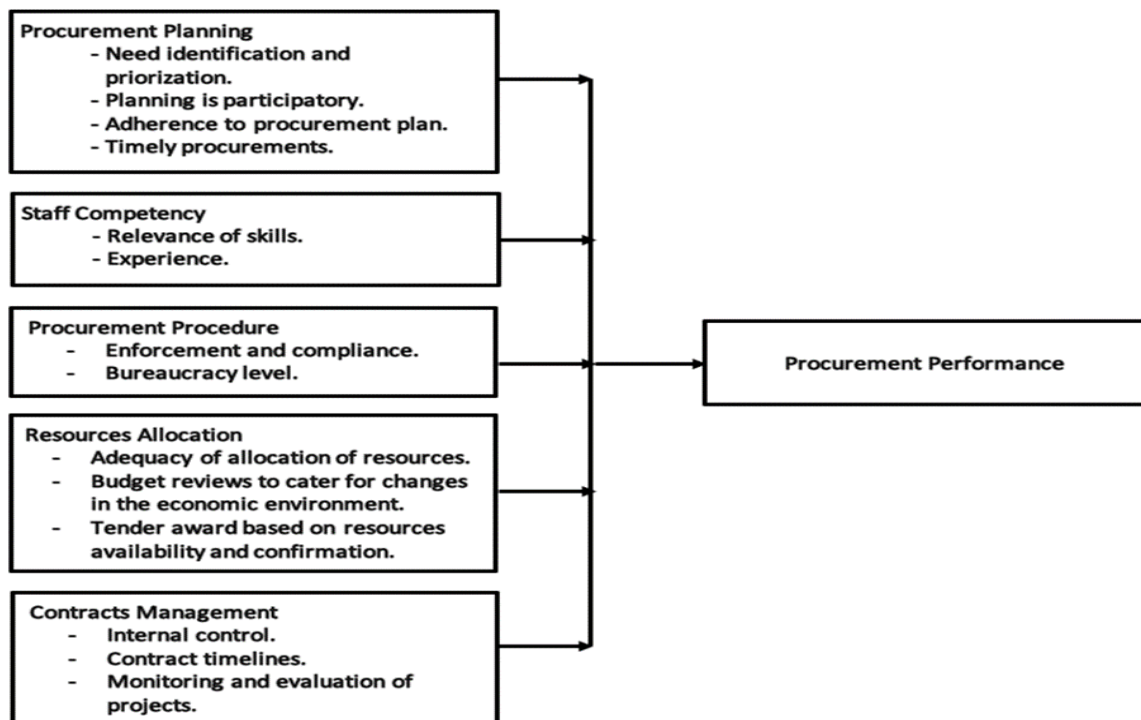

The Theory of Planned Behaviour (Ajzen, 1991) is the successor of the theory of reasoned action (Fishbein and Ajzen, 1975). The intention of an individual to perform a certain task is the central element in TPB. As a general rule, the more favorable the attitude towards the behavior and the subjective norm, and the easier the perceived behavioral control, the stronger the intention to engage in a behavior, and the more likely should be its performance, as Ajzen (1991) states. And if a degree of actual control over the behavior is large enough, they can execute the intent every chance they get. Three determinants formed the intention of an individual to perform a given behavior: attitude, subjective norm, and perceived behavioral control.

2.5. The Management Theory of Peter Drucker

The Management Theory of Peter Drucker shows the concepts of decentralization, knowledge work/knowledge worker, MBO and SMART model. According to Drucker, organizations need to focus on decentralizing or democratizing management in the

workplace that makes all employees feel valued and empowered and appreciated. Peter Drucker's second concept of the theory is knowledge work. Drucker wanted to foster a culture of working with employees who could not only provide labor, but also had insight and innovative ideas. In addition, his insistence on training and continuing education as the core of the workforce development philosophy is always mentioned. Drucker also argues that external training, such as through participation in industry seminars and exchange groups, is of particular value in workforce development.

From the study of Japheth Ocharo Kiage (2013) and the research of Senait Beyan Hamza, Asefa Gerbi & Seid Hussen Ali (2016), the research team proposes the following model:

2.6. Procurement planning

Procurement planning is the process used by companies or public institutions to plan purchasing activity for a specific period of time (Agaba and Shipman, 2007). Creating this plan helps entities avoid surprises and last-minute considerations. According to Burt et al (2004), procurement planning is the purchasing function through which an organization obtains products and services from external suppliers. An effective procurement plan needs to be created step by step. In each step, the procurement plan needs to provide detailed information and identify roles and responsibilities.

2.7. Resources allocation

Resource allocation is the process of choosing how to use the assets or resources that are now available to carry out a specific project. Companies use operational standards, strategic planning techniques, and the implementation of policies and procedures that advance the company toward the accomplishment of its goals in an effort to distribute

resources in a way that minimizes costs and maximizes profits (Shantanu et al, 2012). Ouma and Kilonzo (2014) found that the performance of the procurement process is impacted by resource allocation.

2.8. Staff competency

According to the Bidding textbook of National Economics University Publishing House (2018), the staff competency is one of the factors that directly affect the effectiveness of procurement activities. Research by Sultan Alkaabi (Mazoon University College) in 2018 with the topic "Internal Factors Affecting Procurement Process at Oman Airports Management Company in Oman" provides 6 criteria to evaluate the level of influence of internal factors. In which, there are 4 criteria within the scope of human resources, including: Accountability, accessibility to advanced technological equipment, competence and ethics.

2.9. Contract management

Liljegren argues that these constructs are interrelated and complex from an industrial network perspective (Liljegren 1988). Contract management is not an end in itself and it is important that all contracting decisions and actions focus on the outcomes that entities are seeking to achieve (Adrienne Watt, 2018) successful and efficient contract management practices are those that meet the needs of the company's stakeholders, achieve optimum conditions and value in regard to the allocation of scarce taxpayers resources (best value for money), ensure rational and efficient of funds available, (Benon C. Basheka, 2014).

2.10. Procurement procedures

According to Moncska et al (2010), procedures illustrate how the procurement job must work to accomplish planned objectives by providing guidance to employees on what to do in the implementation of operations, putting limitations on behavior and demonstrating how the procurement function would work. Procedural procurement ensures efficiency and order in any procurement department. Organizations need standard procurement procedures which cover all aspects of the procurement cycle, including supplier selection, contract negotiations, order placement and payment (Ouma and Jennifer, 2014).

2.11. Procurement performance

Procurement performance efficiency: According to Pfeffer and Salancik (1978), organizational efficiency is an internal performance criterion that is roughly a construct "for doing the right things." From the standpoint of resource reliance, efficiency is a separate metric for assessing organizational productivity: Production per used resource should equal 100% including losses.

Procurement performance effectiveness: Organizational effectiveness is defined as an external standard "of how well an organization is meeting the demands of the various groups and organizations that are concerned with its activities" (p. 11 Pfeffer and Salancik 1978) which approximately is a construct "for doing the right things" or having validity of outcome (Hines et al. 2000).

3. Method

Quantitative research method requires the researcher to make a survey (questionnaire) based on the research variable scale for each factor that has been mentioned in the model. Collected data will be through the use of digital software for scientific research.

For the purpose of conducting quantitative research, the research team conducted the following steps in turn:

Step 1: Based on an overview of previous national and international studies on the factors affecting public procurement efficiency, the research team provides theoretical concepts of variables including Procurement Planning, Staff Competency, Procurement Procedure, Resources Allcation, Contracts Management, Procurement Performance

Step 2: Build the Vietnamese version of the questionnaire from the original English version of the research variable scales that have been studied before. Add, adjust and supplement to suit the situation in Vietnam.

Step 3: Re-check the transparency, clarity and accuracy of the Vietnamese version, discuss in groups, then edit it accordingly and add observed variables.

The research team based on information gathered from documents including policies, laws, projects, and research reports related to public procurement activities in Hanoi over a period of time from 2018 to 2022. At the same time, the research team also collected information and statistics from the Ministry of Planning and Investment on the situation of public procurement in Hanoi. The collected data will be processed in a way that categorizes, synthesizes, and selects appropriate information to form a theoretical basis, making assessments and comments on the current situation of Hanoi in particular and Vietnam in general, thereby giving appropriate discussion points.

Primary data was collected by survey method by online questionnaire, thereby, giving an overview of the level of interest and status of public procurement activities in Hanoi. The questionnaire is designed with clear, easy-to-understand questions so that participants can answer by their thoughts and ensure acceptable reliability. The questionnaire will be sent online via Google Form to managers (mainly concentrated at People's Committees of Districts in Hanoi), procuring entities (state-owned enterprises), and bidders (private enterprises) during the period from November 2022 to February 2023.

The research team conducted preliminary quantitative research with 300 survey samples to test the model and standardize the questionnaire. During the survey collection process, the research team noticed shortcomings in the questionnaire and completed the complete questionnaire with the number of survey samples 300 samples, the number of valid votes collected was 243/300. Collected data will be processed by SPSS software with high accuracy.

4. Results

4.1 Reliability Analysis

The five constructs representing the independent variables recorded Cronbach's alpha statistics of more than 0.8. The reliability statistics are presented in below.

Table 1. Reliability Test

Independent variables	Cronbach's Alpha
1. Procurement planning	0.896
2. Staff competence	0.887
3. Procurement procedure	0.886
4. Resource allocation	0.894
5. Contract management	0.915

4.2. Exploratory factor analysis

Convergence of indicators: The average AVE is greater than 0.6, so the scales are all convergent. The convergence results of the variables are all qualified, demonstrating that the average parent latent variable will explain at least 60% of the variation of each child survey variable.

PER3						0.827
PER4						0.724

4.3. Correlation Coefficient

The all research question sought to establish the effect of all factors on procurement performance in Hanoi. Pearson Correlation Coefficient computed and tested. The result implies a positive relationship between procurement performance and each factor procurement plan, staff competence, procurement procedures, resource allocation and contract management ($r=0.355$, $r=0.284$, $r=0.514$, $r=0.714$, $r= 0.525$ respectively). Moreover, the researcher found the relationship to be statistically significant at 1% level for all factors.

4.4. Regression Analysis

The study conducted a multiple regression analysis to determine the relationship between independent variables and the dependent variable.

The adjusted R-squared value is 0.458. Thus, the independent variables explain 45.8% of the variation of the dependent variable.

Table 3. Model summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin - Watson
1	0.685 ^a	0.469	0.458	0.61852	1.744

The ANOVA table gives the results of the F-test to evaluate the hypothesis of model fit assessment. The F-test sig value is $0.000 < 0.05$ thus the model is statistically significant in predicting how the independent variables influence the procurement performance in Hanoi. The F calculated from the ANOVA table is 41.915, which is greater than the F critical (2.64). This shows that the overall model was significant.

The regression model was as follows:

$$PER = \beta_0 + \beta_1 PP + \beta_2 SC + \beta_3 PC + \beta_4 RA + \beta_5 CM + \varepsilon$$

Including:

PER is the dependent variable (Procurement performance),

β_0 is the regression coefficient/constant/Y-intercept,

$\beta_1, \beta_2, \beta_3, \beta_4$ are the slopes of the regression equation,

PP is the Procurement planning

SC is the Staff competence,

PC is the Procurement procedure

RA is the Resource allocation

CM is the Contract management while

ε is an error term at 95% confidence level.

Table 4. Factor coefficients Model

		Unstandardized Coefficients		Standardized Coefficients	T	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	0.117	0.318		0.368	0.713		
	Procurement Planning	0.174	0.055	0.168	3.154	0.002	0.791	1.265
	Staff Competence	0.226	0.081	0.168	2.788	0.006	0.619	1.616
	Procurement Procedure	0.390	0.061	0.359	6.373	0.000	0.704	1.421
	Contract Management	-0.199	0.085	-0.148	-2.340	0.020	0.563	1.776
	Resource Allocation	0.351	0.047	0.372	7.386	0.000	0.882	1.134

The regression was:

$$PER = 0.174PP + 0.226SC + 0.390PC + 0.351RA - 0.199CM$$

The above equation established that taking all factors into account (procurement planning, staff competency, procurement procedures and resource allocation) constant at zero, procurement performance would be 0. The findings further indicate that taking all other independent variables constant, a unit increase in procurement planning, staff competence, procurement procedures, resources allocation, will lead to a 0.174, 0.226, 0.390, 0.351 increase in procurement performance respectively and a unit increase in contract management - 0.199 will lead to a decrease in procurement performance. The all factors are accepted because their sig < 0.05.

5. Discussion and Conclusion

5.1. Discussion

In general, through the survey and research on "Factors affecting public procurement performance in Hanoi", we found that the majority of investors and participants in public procurement in Hanoi have quite the same perception and opinion in determining the importance of each factor for procurement performance. Our research team has determined 5 factors that are likely to affect the effectiveness of public procurement in Hanoi, which are: Procurement Planning, Resource Allocation, Staff Competency, Contract Management and Procurement Procedures. In general, almost all the observed variables have a positive impact. Contract Management is the only factor that has a negative impact on Procurement Performance.

It can be affirmed that this is an indispensable element in the process of implementing a public procurement project. Through that, the investment owner can grasp the most basic needs of the project as well as predicting the required budget and costs of each stage.

Planning can also ensure investment owners stay up to date on the project. Through that plan, we can consider and evaluate the functions of each implementation unit. This is a necessary duty for successful implementation of future projects.

Staff Competency is also an important factor, because the more the staff's skills are improved and cultivated, the more elaborate, thorough and timely the jobs in the procurement project will be. The more competent employees are, the less likely mistakes they would make.

There is a note that competent leaders are not enough, but also need certain attention and sympathy to the staff in their work. It can be said that working in an environment with enough pressure to avoid the case of employees being negligent, but not too strict to avoid creating heavy pressure on employees can help the project to be well developed.

When human resources are allocated appropriately and professionally, and the budget is divided into stages and jobs appropriately, the project will also be maintained continuously. This will save time, successfully execute the project, and avoid the allocation of too much or too little of resource, which would lead to the need to constantly change resources in the project. The wrong selection of staff or lack of expertise can also lead to inefficient procurement performance.

It is obvious that when implementing a procurement project, it is essential to follow a certain order, to ensure order for the procurement process, to comply with government policies as well as to help employees easily track the project progress. This has a positive impact on procurement performance's efficiency and effectiveness.

In theory as well as through the experience of survey participants, contract management is a factor that has a positive impact on public procurement performance. However, contract management has an inverse relationship with the procurement performance, that is, the better the contract management, the lower the procurement performance.

In fact, the relationship between contract management and public procurement performance can be influenced by the quality of the contract. If the contract is not detailed and specific, it will have gaps due to lack of experience in setting up and completing. As can be seen, contract management is an important factor, but it is highly risky.

Sometimes the public procurement performance is not as expected because of mistakes in choosing the form of contract or the influence of the signatories.

Through the reasons mentioned above, we can see that although it is an important factor, which is highly appreciated in terms of potential, but with its riskiness, how to have effective, accurate and appropriate contract management for each specific project in practice is still a dilemma.

5.2. Recommendation

5.2.1. Recommendations for state management agencies

Firstly, recognize the benefits of procurement planning toward public projects. It is necessary to plan in detail and adhere to the Bidding Law.

Secondly, proactively allocate the resources in the project by the state management agency, regularly checked and reviewed to suit the situation.

Thirdly, strengthen training, cultivate professional knowledge, legal knowledge, develop skills for cadres and civil servants under state management agencies. Staff standards need to be raised.

Fourthly, be observant and have clear awareness in choosing type of contract, avoid making mistakes in choosing the type of contract. Agencies should ensure transparency, clarity and compliance in contract management.

Fifthly, comply with the procurement procedures prescribed by the State.

Sixthly, strengthen quality control of public procurement projects.

Seventhly, agencies should have a link with and regularly update the situation of the bidders.

5.2.2. Recommendations for procuring entities

Firstly, focus on conducting research on requirements to ensure the principles of competition, fairness, transparency, and effectiveness in public procurement activities and the selection of bidders. Investor owners must regularly update and carefully study the system of legal documents on public procurement;

Secondly, select a consultant or set up a team of procurement experts to ensure eligibility, capacity, and experience according to current regulations. The contract between the procurement entity, the bidder, and the consultant must clearly stipulate the responsibilities of the consultant, and the binding conditions when the consultant violates or fails to ensure quality requirements.

Thirdly, improve management responsibilities in public procurement activities. Promote the implementation of online procurement to increase competitiveness and improve efficiency in procurement. At the same time, continue to strictly implement the posting of information on the National Procurement Network System, the Procurement Newspaper.

5.2.3. Recommendations for bidders

Firstly, bidders need to develop a specific procurement plan and also should start the procurement planning process early to allow sufficient time for a needs assessment, budgeting, and developing a procurement strategy.

Secondly, bidders need to optimize resource allocation to increase efficiency and reduce time by finding ways to optimize processes, use innovative technology and improve workflow. In addition, bidders should plan for contingencies by allocating

resources for unexpected events or delays that may arise during the procurement process. Furthermore, using project management software and tools increases accuracy and efficiency in resource allocation.

Thirdly, the bidder's staff needs to be equipped with the necessary competencies. Besides, performance management systems also should be implemented to monitor and evaluate the performance of bidders' staff.

Fourthly, public procurement contracts should ensure transparency in the procurement process and cover all legal and financial provisions related to public procurement, including the payment of taxes and other fees.

Fifthly, bidders should use technology to streamline the procurement process and make it more efficient. Additionally, bidders should use a variety of procurement procedures to increase transparency and efficiency in the public procurement process.

Sixthly, bidders should continuously evaluate their performance and seek to improve their processes and products.

5.3. Conclusion

Through the research process on “Factors affecting public procurement performance in Hanoi”, we have conducted a survey throughout all the districts of Hanoi so that we could determine the importance of Procurement Planning, Resource Allocation, Staff Competency, Contract Management and Procurement Procedures in affecting procurement activities. We can obviously conclude that, when implementing a , in order to achieve the highest efficient and effective procurement performance, investors need to consider and be thorough in each factor, so that the project can turn out as good as possible.

Our research team hopes that this study can become a reference so that public procurement performance in Hanoi in particular and the country in general can be implemented successfully, with maximum efficiency and effectiveness.

THE MECHANISM FOR ASSIGNING TASKS, ORDERING, BIDDING PROVISION OF PUBLIC SERVICES FUNDED BY STATE BUDGETS AT HIGHER EDUCATION INSTITUTIONS: OBSTACLES FROM THE SUPPLIER'S PERSPECTIVE

Assoc. Prof. Dr. Vu Minh Duc

ducvm@neu.edu.vn

Marketing Faculty, National Economics University, Hanoi, Vietnam

Abstract

The mechanism for assigning tasks, ordering, and bidding for the provision of public services using the state budget for higher education institutions has been implemented since 2008 and continues to be improved and implemented. Many problems have arisen during the implementation process related to policies, implementation organization, inspection and supervision mechanisms and capacity and capabilities of higher education institutions assigned to tasks, receiving orders, and receiving orders. contractor. The results of the study indicate that there are still too many obstacles and bottlenecks in the implementation of the mechanism for assigning tasks, ordering, and bidding for the provision of public services using the state budget for higher education institutions. That requires urgent solutions from the state agencies to solve this situation.

Key words: *public services; public services using the state budget; assigning tasks, placing orders, bidding for the provision of public services; higher education institution.*

1. Introduction

In Resolution No. 05/2005/NQ-CP, the guidelines of policy reform and management mechanism was determined as: “Renovating the mechanism of using state budget in the fields of education, health, culture, physical training and sports”; “studying, developing and gradually implementing the policy of bidding for the provision of services ordered by the state”. Also, in 2005, Decree No. 31/2005/NĐ-CP stipulates the methods of product supply, public utility services include planning delivery, ordering, and bidding along with three categories of products and services A, B and C (Government, 2005). By 2006, regulations on bidding, ordering, and assigning plans for production and supply of public products and services were promulgated in Decision 256/2006/QĐ-TTg. Regulations on conducting methods of bidding, placing orders, and assigning plans for production and supply of public utility products and services are shown in specific articles and clauses of the Regulation.

Next, the Regulation on bidding, ordering, and assigning tasks to provide public non-business services using the state budget was promulgated by the Prime Minister by Decision No. 39/2008/QĐ-TTg. This is the first document detailing the subjects and lists of public non-business services funded by the state budget for bidding or ordering services. This

Regulation also specifies the planning, organization, implementation, and supervision of the process of bidding or ordering the provision of public non-business services using the state budget. To implement the Prime Minister's Decision 39/2008, the Ministry of Finance has issued Circular No. 105/2008/TT-BTC detailing the process and content of implementing the procurement method. public career services.

After implementing the Prime Minister's Decisions 256/2006/QĐ-TTg and 39/2008/QĐ-TTg, in 2013, Decree No. 130/2013/ NĐ-CP on production and supply public interest services were promulgated, which specifically stipulates three methods of providing public products and services, including bidding, ordering and delivery of plans. The Decree also stipulates the conditions, grounds, organization for bidding, ordering, and assigning plans for production and supply of public products and services. In Decision No. 186/QĐ-TTg issued on February 10, 2017 on the list of public non-business services funded by the state budget in the field of education and training, public non-business services in the higher education service is defined to include bachelor's level training in a number of fields; work-study and distance-learning; training at the master's level; doctoral training in a number of fields.

By April 2019, with the issuance of Decree 32/2019/ NĐ -CP, the three modes of providing public products and services, namely task assignment, ordering, and bidding, were unified in the same legal document regulations based on the principle of selective inheritance and meeting development requirements in the new context; thereby, overcome the shortcomings, limitations and overlaps in the provisions of Decree No. 130/2013/ NĐ -CP and Decision No. 39/2005/QĐ-TTg.

To implement Decree 32/2019/ NĐ-CP, MOET has issued Circular No. 14/2019/TT-BGDĐT dated August 30, 2019, guiding the build, appraisal, and issuance of economic - technical norms and methods of setting training service prices applied in the field of education and training.

Most recently, in Decree No. 116/2020/ NĐ-CP issued on September 25, 2020, the Government stipulates that “agencies assigning tasks, ordering, or bidding have the need to decide on the implementation of tasks and assignments. Service, order or bid for teacher training with a teacher training institution in one of the following forms: Assigning teacher training tasks to affiliated teacher training institutions; order teacher training for teacher training institutions; tendering for selection of teacher training institutions providing teacher training services.” In Decree 71/2020/ NĐ-CP dated June 30, 2020, the Government has issued regulations on training to raise standards for teachers at education and training institutions using the state budget according to the regulations. forms of assignment, ordering or bidding based on the local annual plan and the unit price determined by the level of tuition fee that support pedagogical students according to current regulations.

Although the mechanism for assigning tasks, ordering, or bidding for public service provision in higher education institutions has just been implemented and is being continued for two years, the implementation process has many problems arisen. The main difficulties and shortcomings can be mentioned. In particular, the implementation of Decree

116/2020/NĐ-CP in the past 2 years at higher education institutions has encountered many difficulties and inadequacies leading to the fact that many higher education institutions for teachers training have not been assigned, ordered or assigned tasks, ordered in very small quantities compared to the capacity and supply capacity of the higher education institution. To better understand the difficulties and inadequacies of higher education institutions as educational and training service providers using the state budget, this article focuses on analyzing and evaluating current obstacles from viewpoints of higher education institution as providers of public services funded by state. On that basis, some solutions will be proposed to solve this problem.

2. Theoretical Framework

Public services are services provided by the State to the people through state organizations or through financial support to private service providers. The concept of public services is based on the idea that certain services should be regarded as the minimum right to which all citizens are entitled, regardless of economic background, because those services are related to the human right to access and have direct consequences for social development and public interest. In Vietnam, the concept of public service has been mentioned by several authors. According to Dinh Van An & Hoang Thu Hoa (2006), public services are activities that serve the essential needs of society, for the common interests of the community and society, which are directly undertaken or authorized by the state. and enabling the private sector to do so. According to Le Chi Mai (2004), public services are activities that serve the essential common interests, basic rights and obligations of citizens and organizations, which are directly undertaken by State or are authorized for non-state organization, to ensure social order and justice. The important characteristics of public services are reflected in the following aspects:

(i) Public services exist for public policy reasons. In a broad sense, public services are provided for public policy reasons, intended not to meet the goals or preferences of consumers or producers, but further goals that desired by policy makers. Public services can be related to government activities, but they are not limited to government and government does not include all those activities (Spicker, 2009).

(ii) Public services are provided to the public. However, public service is different from social service. Public services are a model of so-called "institutional" welfare, in which the provision of socially recognized needs has been accepted as part institutions of social life (Titmuss, 1974), Reisman, 1977). All citizens have the right to join public service at minimum level, as a subject of government service.

(iii) Public services are redistributed. It is provided for non-commercial purposes or, in a sense, for non-commercial purposes. Financially, public services are not intended for sale (Flynn, 2007), the payers are not necessarily the recipients of the public service.

(iv) The public service acts as a trust. The nature of public services is that they are provided as a trust. The common model in public service delivery is that the State pays a

selected organization to provide a service to a group of service beneficiaries. In economic terms, it is the policymakers, not the consumers, who buy services.

(v) From an economics perspective, public services are activities that provide society with public goods. In a narrow sense, a public good is a good that, once created, can hardly be excluded from its use; each person's consumption does not reduce the consumption of others.

In Vietnam, based on the nature and effects of the services provided, public services can be divided into three basic groups: Public non-business services; public administrative services; public service.

Public non-business services are activities that provide basic services to the people associated with state management activities in an assigned field. The current trend in the world is that the state only performs public services that society cannot or does not want to do, transferring part of the provision of this type of public service to the private sector and social organizations.

Public administrative service is a service provided by functional agencies and organizations at all levels in the process of handling administrative procedures related to matters in the field of pharmacy assigned to manage, not for profit purposes. Public administrative service is a type of public service performed by state administrative agencies to serve the basic rights and obligations of organizations and citizens (Hoang Ngoc Hien, 2006).

Public interest services are activities that provide basic and essential goods and services for people and communities such as: environmental sanitation, waste treatment, clean water supply, urban public transport. Public interest services are related to basic technical infrastructure such as power supply, electricity supply water, gas supply, urban transport, urban environment... These are paid services, subject to strict management by the State, and the state will decide the cost and output of public services. The State can provide public services by itself but also authorize entities to provide public interest service. Entities performing public service provision activities also pursue profit goals to ensure balance with social security factors and accessibility for all people.

Regarding the mode of public service provision, there are four modes of public service provision, including: assigning tasks, ordering, bidding and autonomously conducting service provision activities (Nguyen Quang Vy, 2012 and Le Thi Huong, 2019) as follows:

(1) *Assigning tasks*: This method is often applied to organizations in special important fields (such as defense, security, etc.) or strongly associated with functions, responsibilities, or missions of the State to ensure the normal and stable development of social life. This is the form in which the State will allocate part or all the implementation funding from the state budget.

(2) *Ordering*: This method is usually applied in areas where the ordered provider has certain conditions and is reliable enough for the state or public service beneficiaries. Providers operating in this field can have different forms of ownership and are often pre-determined by the state or the beneficiary. This is the form in which the state budget will be allocated part or all the implementation budgets.

(3) *Bidding*: A form of identifying public service-providing organizations through bidding activities. Organizations to participate in the bidding can have different ownership forms and are usually determined by the State or the beneficiary after the bidding has been conducted. This is the method in which the state budget will be allocated part or all the implementation budgets.

(4) *Autonomous conduct of service provision*: This method is applied in several fields that are closely related to the market. In addition to completing activities serving the public interest, the organization also combines business to aim profit. Investment capital can be invested by the state, or other entities or both.

Over the last three decades, the massification of higher education, coupled with the rising costs of training and research, has resulted in the inevitable consequence that higher education is increasingly dependent on student fees to survive. The subsidy policy of the State was no longer appropriate. Implementing the policy of socializing public service provision in the field of higher education, at the same time implementing the financial autonomy mechanism of public non-business organization, higher education institutions in general are allowed to participate providing a variety of public services that meet the needs of the people and are compatible with the capacity and capabilities of the higher education institution. According to the mechanism of using budget to provide public services, it is possible to classify public services provided by higher education institutions into two types: public services funded by the state budget and public services that do not use the state budget.

Public services funded by the state budget are basic and essential public services and public non-business services with specific characteristics of sectors and fields promulgated by competent authorities and guaranteed by the State. According to Decision No. 186/QĐ-TTg dated February 10, 2017, the higher education system providing public services in the field of higher education is distinguished into two groups. The first group includes public services for which the state budget covers all costs of service performance. The second group includes public services for which the state budget covers the portion of the cost of the service that has not yet been included in the price of services according to the pricing roadmap.

Methods of providing public services using the state budget in the field of higher education are specified in Decree 32/2019/ NĐ -CP, Decree 116/2020/ND-CP, Decree 71/2020 / NĐ-CP and some related legal documents. Accordingly, these methods include assigning tasks, placing orders or bidding.

(1) Method of assigning tasks: assigning tasks to provide public non-business services funded by the state budget shall only be applied to public non-business organization affiliated to superior management agencies which are allocated funding public service provision. At the same time, these organizations must satisfy the following conditions: (i) have the functions and tasks of providing public non-business services in accordance with the public administrative service provision activities assigned under the decision of the administrative authority licensed by a competent authority in accordance with the State's regulations; (ii) have been granted financial autonomy by the competent authority according

to the autonomy mechanism of public non-business organization in each field; (iii) the provision of public non-business services is a regular annual task of the unit, which has been and is being assigned by the superior management agency; (iv) List of public non-business services for which economic-technical norms and unit prices have not yet been established, based on quantity, volume and reasonable costs according to estimates approved by competent authorities.

(2) Ordering method: applied to public non-business enterprises directly under the management agency superior to place orders. Ordered enterprises must first satisfy the conditions (i), (ii), (iii) in applying the task assignment method, and at the same time, the list of public non-business services must have technical economic norms and unit prices of public administrative services that promulgated by competent agencies as the basis for ordering.

For other public service providers to be ordered, the following conditions must be satisfied. Firstly, the enterprise has registered business lines suitable to the field of public non-business services ordered; have sufficient financial capacity, facilities, equipment, machinery, technical qualifications, production technology, management qualifications and a team of employees to meet the order requirements. Second, the enterprise must be a service provider licensed by a competent authority in accordance with specialized laws. Third, public non-business services are specific because it is related to intellectual property or only one provider registers to perform. The ordering could be made in the following forms: Decision of the superior management agency to order affiliated public non-business organization to provide public administrative services using state budget funds; orders for other public non-business service providers shall be made in the form of contracts for ordering public non-business services using state budget funds.

(3) Bidding method: contractors may participate in bidding for the provision of public administrative services in the form of open bidding for the provision of public non-business services according to the provisions of Article 20 of the Law on Bidding; limited bidding to provide public non-business services as prescribed in Article 21 of the Law on Bidding.

The bidding method is also applied to teacher training provided by higher education institutions as stipulated in Decree 116/2020/ NĐ-CP, whereby tuition fees and a part of students' living expenses are covered from the state budget. Based on the need to recruit teachers according to qualifications, training disciplines of the locality and social needs, quality assurance conditions and training capacity of teacher training institutions, MOET identify and notify the quota for teacher training institutions to conduct enrollment. Based on the announced quota of teacher training institutions and local teacher training needs, the competent authority will decide to assign tasks, order, or bid for service provision. training teachers in one of the following forms: assigning teacher training tasks to affiliated teacher training institutions; order teacher training for teacher training institutions; tendering for selection of teacher training institutions providing teacher training services.

Public services have the following important characteristics:

First, a public service provided by higher education institutions is a public service that is exclusive, but encouraged for use, as a “recommended good” even though its use will reduce the associations to use other people's services if they have a need. In terms of limited supply, one person's enjoyment of higher education services will exclude the benefit of another.

Second, public services provided by higher education institutions are not pure public goods, they are humane services.

Third, there are necessary conditions to use the service. Beneficiaries must meet the minimum standards of education, health and working time (in certain cases) and pass a satisfactory entrance exam and assessment.

Fourthly, public services are provided by higher education institutions with great differences in the level, ability, and capacity of public service provision of higher education institutions. That deepens the disparity in the quality of public services in the higher education sector.

Fifth, public services are provided by higher education institutions of different ownership sectors.

3. Method

The data required for the research purpose of this article include both primary and secondary data. In which, secondary data on the implementation of the mechanism for assigning tasks to ordering and bidding for the provision of public services using the state budget at higher education institutions over the past time has been collected from various reports of the Ministry of Education and Training (MOET).

Primary data was collected by using qualitative and quantitative research. In which, the in-depth interview was conducted with 21 representatives of higher education institutions. Quantitative research was conducted through face-to-face and online interviews with 102 leaders of higher education institutions and related departments and 153 lecturers at 51 higher education institutions nationwide. The sample was prepared according to the convenience method. Most of the interviewees are those who have seniority in working and teaching at higher education institutions. The number of people working for more than 15 years is over 66% in the sample. The 5-level Likert scale is used to evaluate the mechanism for assigning tasks, ordering, and bidding for public service provision using the state budget. The average score of the scale above 3.4 is considered as agree. Data were processed and analyzed with the help of Nvivo 11.0 and SPSS 22.0 software.

4. Results and Discussion

Evaluation of the task assignment mechanism

Assigning task of providing public services using the state budget is the method applied to higher education institutions. In this way, the ministries, management agencies and local people's committees (the tasking party) often give priority to assigning the task of providing public services using the state budget to educational institutions (the party of receiving the task) under their management. Only when the affiliated organizations are not

fully functional, capable of performing or providing service, it could be considered for the selection of ordering or bidding.

Assigning the task is a form of involving parties with vertical linkages - higher education institutions are directly under the management of the assigning unit, in general, cooperation and communication between the parties is quite common. The operation method as well as the status of the units are well understood. The exchange and cooperation in solving arising problems (if any) and controlling the implementation and performance of tasks can be easier than in the form of ordering and bidding. According to the assessment of representatives of higher education institutions, conditions for performing tasks assigned are quite suitable. In particular, the evaluation of the conditions for the public higher education institution to be assigned the task received much approval, especially the condition of being an affiliated unit. The condition of economic-technical norms and unit prices are also supported (the average rating score is greater than 3.4). The condition of autonomy and regular annual tasks received less support (the score for autonomy was only 2.36). These results are also quite like the results of in-depth interviews.

Table 1. Assessment of conditions for assigning tasks to provide public services using the state budget

	Leader		Officials, lecturers	
	Average rating score	Rating level	Average rating score	Rating level
The university assigned the task is a public university directly under the superior management agency that is assigned funding to provide public non-business services.	4.08	Fits	3.87	Fits
A university that is assigned the task of being a public university has the function and task of providing public non-business services in accordance with the task of providing public services under a decision of a competent management agency.	3.61	Fits	3.62	Fits

Evaluation of the ordering mechanism

Ordering is also a popular method deployed when providing public services using the state budget. The results of the survey on evaluation of the leaders of the higher education institutions and the department staff on the conditions and grounds for ordering the provision of higher education services using the state budget are shown in Table 2. Similar to the mechanism for assigning tasks, the conditions for ordering the provision of services using the state budget also received a lot of support from the respondents. Most of the scores for the evaluation of regulations and mechanisms are over 3.4 points. In addition to the criterion of financial autonomy, for the ordering method, another criterion that the leadership group considers inappropriate is the payment and settlement requirements. The evaluations through the survey are consistent with those in the in-depth interviews with the leaders of the higher education institution and relevant departmental representatives.

Table 2. Evaluation of conditions for ordering public services using the state budget

	Leader		Officials, lecturers	
	Average rating score	Rating level	Average rating score	Rating level
A public university is ordered as a university directly under a superior management agency that is assigned funding for the provision of public non-business services.	3.88	Fits	3.64	Fits
The university is ordered as a public university with the functions and tasks of providing public non-business services in accordance with the public career services ordered by decision of the competent authority.	3.58	Fits	3.62	Fits
The public university is ordered to be a self-financed university	2.26	Not fits	2.23	Not fits
An ordered public university is one that has been and is being ordered by a regulatory authority	2.01	Not fits	2.32	Not fits
The university to be ordered has a list of public non-business services with economic and technical norms and unit prices and prices for public administrative services promulgated by competent agencies as the basis for ordering.	3.51	Fits	3.77	Fits
A non-public university may be ordered if it meets the following conditions: having registered for an appropriate training discipline; sufficient financial capacity, facilities, equipment, machinery, and teaching staff to meet the requirements; licensed to operate in the area that requires a license	3.44	Fits	3.50	
Non-public universities are ordered to provide public services that are specific because they are related to intellectual property or have only one registered provider.	3.42	Fits	3.47	Fits

Evaluation of the bidding mechanism

Regarding the method of bidding for the provision of public services using the state budget for higher education institutions, the number of schools participating in the bidding for the provision of services using the state budget accounted for 5.9% of the total number of higher education institutions surveyed.

However, according to the report on the survey results of higher education institutions by MOET (2021), higher education institutions think that it is difficult for local higher education institutions to implement bidding method because the bidding procedure is time consuming. Furthermore, the criteria for selection of contractors are unclear along with a lack of information on bidding and information on the needs of the local procuring entity. Newly established higher education institutions that do not have a reputation for providing services do not guarantee that the best quality training units are trained. The bidding method is a newly implemented method while higher education institutions have no experience in bidding and are confused in implementation. In addition, the management agencies have not set up a document system to guide the preparation of documents and specific implementation to higher education institutions.

Regarding the regulations related to the implementation of the bidding mechanism for the provision of public services using the state budget, the survey results show that there is high agreement in the regulations on the form of bidding, the independence of the public service provision. on the legal and financial aspects of the higher education institution with related parties, responsibility for providing information on the national bidding network of the bid solicitor, methods of acceptance and handover of products. On the contrary, many argue that the group of regulations on the planning and process of selecting contractors to provide public services, regulations on evaluation of bids, dossiers of proposals and bid-winning review and regulations on payment and settlement are not appropriate.

Table 3. Evaluation of the bidding mechanism for public service provision using the state budget

	Leader		Officials, lecturers	
	Average rating score	Rating level	Average rating score	Rating level
Both open bidding and limited bidding should be applied in bidding for public service provision using the state budget.	3.67	Agree	3.81	Agree
Do not apply the form of appointing contractors to provide public services using the state budget	3.88	Agree	4.22	Strong agree

Source: Summary of survey results, 2022

The reality of implementation and evaluation shows that there are still obstacles and inadequacies in the implementation of the forms of task assignment, ordering and bidding for the provision of public services using the state budget for higher education institutions.

Firstly, many ministries, branches and provinces do not have or have low demand for assignment, ordering and bidding for the provision of higher education services. While the number of people assigned tasks and orders is not enough to open classes in some specific training programs and has low social needs, the funding provided is only based on the number of people, not the training class.

Second, many higher education institutions have not yet established economic-technical norms and the unit prices of public products and services provided while many universities are still unclear about economic-technical norms for a variety of reasons.

Third, for localities when assigning tasks and ordering teacher training, some problems arise such as: (i) difficulty in identifying training needs; (ii) many difficulties in arranging jobs for students after graduation due to the Government's policy of reducing payrolls and regulations on the number of people on the payroll of the Ministry/Department of Home Affairs; (iii) difficulties in recovering support funds if students violate their commitments due to lack of mechanisms to control and monitor learners and binding conditions for trainees (iv) difficulty in arranging financial student support fees.

Fourth, there are too many stakeholders such as: MOET, Ministry of Finance, localities and ministries, higher education institutions, students; localities have not implemented synchronously. In theory, a locality can order many higher education institutions. Many localities together with the Government order training with a higher education institution. Funds from the central budget allocated under Decree 116 are not clearly allocated for support, living expenses, and tuition fees for students registered according to social needs.

Fifth, unequal competition between local affiliated universities and non-local universities; ordered training quotas are reserved for local higher education institutions. In the case of orders from non-local higher education institutions, ordering information is not publicly available. Many enterprises enter a joint venture with a higher education institution to bid at a low price to win the bid, then resell it to other universities at a higher price; the bidding mechanism is implemented in a formal manner.

Sixth, the system of guiding documents is incomplete and asynchronous, leading to bottlenecks and delays in implementation.

5. Conclusion

The actual implementation of regulations related to the mechanism of task assignment, ordering and bidding for the provision of public services using the state budget for higher education institutions in Vietnam shows that although achieving certain results have been achieved, there are still many shortcomings in the regulations on task assignment, ordering and bidding for public service provision. Inadequacies are reflected in the conditions and grounds for implementation and implementation of the mechanism. These inadequacies are the main reasons leading to the goal of gradually reducing the application of the form of assignment of tasks to applying the form of ordering or bidding for the provision of public services using the state budget for educational institutions. universities cannot be done, on the contrary, the assignment method is applied more commonly. That fact requires the Government and ministries to have unified and synchronous solutions to help the participants solve problems and remove barriers in implementing the mechanism for assigning tasks, ordering, and bidding for public service provision using the state budget for higher education institutions in the coming time. Some specific recommendations are presented below.

Firstly, perfecting the system of documents guiding the implementation of Decree 32, Decree 116 and related legal documents on building a system of economic-technical

norms, setting unit prices and prices of product, services in the list of public products and services funded with the state budget provided by higher education institutions in the method of task assignment, ordering or bidding; concretize conditions related to financial autonomy of higher education institutions; identify the needs of teacher training at all levels in the localities; responsible for recovering funds for students who do not comply with their commitments.

Second, improve the financial mechanism, solve the problem of providing funding to support tuition fees and living expenses for pedagogical students; perfecting the recruitment and downsizing policies for the education sector in line with the real needs of the education sector; complete the procedures for payment of funds between the ordering party and the training orderee.

Thirdly, guide the implementation of the form of bidding for the provision of public services using the state budget, ensuring the bidding in a substantive manner; overcome the situation of "circumvention of the law" with forms of joint ventures in bidding.

However, this research, as other studies, has some limitations. Firstly, the results are based on opinions from representatives of a small number of higher education institutions and might be different in other higher education institutions. Secondly, the data is not well mined for research purposes. Future research should develop the model by collecting data from a big sample and applying more in-depth data analysis techniques.

Abstract

This study focuses on the legal framework regulating the construction and development of eco-industrial parks as well as the evaluation of eco-industrial park practises in the application of these regulations. The research utilises qualitative research methods in conjunction with described statistical methods based on secondary data collected from current legal documents related to the establishment and development of eco-industrial parks, with a focus on Decree No. 35/2022/ND-CP and related Ministry of Planning and Investment research works and reports. The findings revealed a number of positive changes in the quantity and quality of eco-industrial parks, as well as some inaccessibility, such as: (1) some criteria are not yet quantitative; (2) compatibility with the Environmental Protection Law is not guaranteed; (3) preferential policies have not yet met the expectations of investors; and (4) administrative procedures are inaccessible. The study then suggests a number of settlement groups intended to overcome legal regulations' restrictions and incompatibilities, improve the effectiveness of law enforcement in establishment work, and build eco-industrial parks.

***Keywords:** Eco-Industrials Parks, Establishment and Development, Industrial park, Vietnam.*

1. Introduction

The eco-industrial park (EIP) is a new type of industrial park (IP). However, in the current economic context, it is viewed as targeted IP for planning and developing key IP. The development of the EIP was put forward to connect and collaborate in production to carry out industrial symbiosis operations. Furthermore, it not only promotes economic growth and attracts investment, but it also contributes to the planning and development of a cleaner industry, the most effective use and protection of natural resources, and natural resource conservation in order to protect and improve the environment, be suitable and meet the conditions for attracting investment, and develop IP in line with global trends.

The creation, operation, and development of the EIP are critical goals based on the roles and benefits that the EIP provides. To achieve this, national regulations and policies play a significant role in establishing a legal pathway for entities to follow. Decree No. 82/2018/ND-CP (Decree 82), dated 22 May 2018, is the first regulation on the EIP, together with the established activities, to develop this type of IP. Decree No. 35/2022/ND-CP (Decree 35), dated 28 May 2022, to ensure conformity with the overall development conditions of the country's economy and to satisfy the needs of international economic integration. However, during the implementation process, these regulations exposed numerous shortcomings, posing challenges for actors involved in the process of EIP transformation, planning, and development.

Therefore, in the context of globalization and international economics integration, the study and assessment of the content of regulations as well as analysis of the actual situation of the construction and development of industrial zones in order to propose a number of solutions to improve regulations and improve the efficiency of law enforcement, which are important in both theory and practice. With such an approach, the study not only perfects the legal system of Vietnam on the establishment and development of EIPs, but also ensures compliance with the spirit of sustainable development in international law, such as the Report “Our Common Future” in 1983 and the United Nations Conference on Environment and Development in Rio de Janeiro in 1992. It can be said that the study on the establishment and development of EIP closely links to the study of the growth of green industry, so that it helps save inputs of energy and materials, increase usage efficiency, reduce fuel industry imports while lifting the burden of the trade deficit for the economy, create more job opportunities in contribution to poverty, and assure the sustainability and well-being of the environment for future generations.

This study is structured into Seven parts: (i) introduction; (ii) literature review; (iii) method; (iv) some general issues about eco-industrial parks and the regulation of eco-industrial parks; (v) status of application of regulation in the establishment and development of eco-industrial parks; (vi) some solutions to improve regulation and enforcement efficiency in the establishment and development of eco-industrial parks ; and (vii) conclusion.

2. Literature review

Up to now, there have been a number of studies directly or indirectly related to the topic such as Nguyen Cao Lanh (2005) introduced the most fundamental notion of EIP. The author, however, does not discuss the establishment and growth of EIP in terms of legislative laws, instead focusing on offering basic recommendations and principles for the building and development of EIP in Vietnam. Pham Nguyen Ngoc Anh (2011), on the other hand, addressed the general theoretical difficulties of EIP and concentrated on examining EIP models from around the world. Following that, the author makes policy recommendations for Vietnam based on the experiences of other countries. Trinh Thi Tuyet Dung (2018) evaluated experiences in creating EIP in Korea and made some recommendations for the formation and development of EIP in Vietnam with the goal of achieving sustainable development. Or Tran Duy Dong (2020) has thoroughly examined the growth of EIP in

Vietnam; however, the author has yet to establish and visit the current legal restrictions connected to the establishment and development of EIP.

Regarding the legal aspect, Stucki Jérôme et al. (2019) referred to Decree 82 as a part of UNIDO's EIP Project (2014-2019). Instead of evaluating legislative laws, the writers focus on the issue of coordination and collaboration between UNIDO, the World Bank, and Vietnamese governmental institutions in order to execute the EIP legal framework. Guillaume Massard et al. (2018) provided legislation and policy to assess the standards requirements for developing EIP in Vietnam. Accordingly, those standards include: IP development, planning, and management (Decree 29/2008/ND-CP, Decree 164/2013/ND-CP, Decree 54/2015/ND-CP, Circular 35/2015/ TT-BTNMT); housing and well-being (Investment Law 2014, Decree 188/2013/ND-CP); cleaner production and resource efficiency (Decision 1419/QD-TTg in 2009, Decision 4135/QD-BTC in 2013); water management (Law on water resources 2012, Decree 67/2003/ND-CP, Circular 35/2015/TT-BTNMT); waste management (Decree 59/2007/ND-CP, Decree 38/2015/ND-CP, Decision 16/2015/QD-TTg, Circular 35/2015/TT-BTNMT); renewable energy (Decision 2068/QD-TTg). However, most of legal documents mentioned are no longer relevant to the present. Vu Thi Duyen Thuy (2021) assessed the reality of forming and implementing EIPs as well as Vietnam's regulations applied in this scenario and, at the same time, proposed several solutions to improve the related laws and improve the capacity for constructing and developing EIPs in Vietnam in the near future. Because the research was conducted when Decree 82 was still in effect and Decree 35 had not been issued yet, it is not suitable for the current situation.

The EIP model first appeared in Vietnam in 2014 as a result of collaboration between the Ministry of Planning and Investment and the United Nations Industrial Development Organisation (UNIDO) on the project "Implementation of an Ecological Industrial Park Initiative towards a Sustainable Industrial Park Model in Vietnam". However, Decrees 29/2008/ND-CP, 164/2013/ND-CP, and 114/2015/ND-CP are restricted and lack explicit EIP provisions. The concept and laws of EIP were first addressed in Decree 82 on the management of IP and economic zones. The decree defined EIP and industrial symbiosis, created criteria for establishing EIP, and encouraged and supported investors and businesses to use and develop the EIP model. However, after many years of implementation, the EIP legislation outlined in Decree 82 no longer reflects the current situation. As a result, Decree 35 superseded Decree 82, which continued to inherit and develop EIP adjustment regulations.

As can be seen, prior studies concentrated mostly on the analysis and evaluation of concepts, models, classifications, and basic characteristics of the EIP, with no special research works regulating the EIP's planning, building, operation, and development from a legal standpoint. Meanwhile, the authors observed that the law's provisions are critical for the transformation, formation, and development of EIP.

3. Method

This study utilises qualitative research methodology that combines descriptive statistical methodology based on secondary data from legal documents on the establishment and development of EIP, documents and resolutions of the Party, our State on policies and regulations on the establishment and development of EIP in Vietnam, Ministry of Planning and Investment reports, and related research works.

As a result, we may examine the state of domestic ecological development by utilising statistical approaches, comparative methods, and analytical and synthesis methods to analyse and clarify a number of legal concerns produced by the growth of EIP in the previous time. The assessments of the implementation of legal restrictions in the founding and development of EIP in the past were derived from there.

4. Some general issues on eco-industrial parks and the regulation of eco-industrial parks

4.1. Definition of the Eco-Industrial Parks

The EIP concept emerged as a model for inclusive and sustainable industrial development for existing parks and for planning new ones. The most common definition of an EIP was written by Lowe et al. in 1996: *“An eco-industrial park is a community of manufacturing and service businesses seeking enhanced environmental and economic performance through collaboration in managing environmental and resource issues including energy, water, and materials. By working together, the community of businesses seeks a collective benefit that is greater than the sum of the individual benefits each company would realise if it optimised its individual performance only”* (Côté and Cohen-Rosenthal, 1998; Lowe, 1997; Lowe et al., 1996). However, no standard definition exists. And according to Schalarb (2001), *“the construction of an eco-industrial park must be placed in a broader context, in which enterprises in the industrial park not only interact with each other but also with enterprises outside the industrial park as well as with the surrounding communities”*. On the other hand, in the EIP, industrial infrastructure is well-designed as the chain of ecosystems with harmonious compatibility with the contemporary natural ones, which minimise the amount of incurred pollutants while maximising the possibility of recycling materials and sources of energy. Additionally, the objective of EIP is to build industrial systems containing vast numbers of independent, self-sufficient factories, yet with voluntary cooperation, to form “symbiotic relationships” with each other and with the surrounding environment (Nguyen Cao Lanh, 2005).

In legal terms, EIP is defined in Decree 35: *“Eco-industrial park means an industrial park where industrial-park enterprises participate in cleaner production activities, efficiently use natural resources and cooperate with one another in production activities for industrial symbiosis; and satisfies the criteria specified in this Decree”* (Article 5.2).

From multiple perspectives, UNIDO gives a general definition that reflects the nature and meaning of this model as follows: *“An eco-industrial park is a community of businesses*

located on a common property in which businesses seek to achieve enhanced environmental, economic and social performance through collaboration in managing environmental and resource issues”.

In Vietnam, EIP development is based on industrial ecology theory and contributes directly to the national sustainable development strategy, which has three basic pillars: economic, social, and environmental. In particular, the development of EIP in Vietnam can address the current limited economic, social, and environmental benefits of IP development, meet the requirements of the country's overall sustainable development, and improve the economic and social effectiveness of enterprises. The development of EIP is a firm basis for the growth of IP, which is linked to maintaining sustainable efficiency and contributing to the implementation of the Vietnam Development Goals (VDG) and the National Strategy for Green Growth for the period 2011-2020, as well as the country's overall vision to 2050 (Tran Duy Dong, 2020).

4.2. Regulation of the Establishment and Development Eco-Industrial Parks

In terms of legal aspect, with the ongoing environmental problems caused by industrialisation, Vietnam has clarified the policies in sustainable industrial development toward the direction of greening the existing industries by laws. Accordingly, on 25/09/2012, the Prime Minister enacted 1393/QĐ-TTg to approve the national strategy on green growth, which considers green growth as one of the key points of sustainable development. In addition, the strategies for industrial development of Vietnam until 2025 and until 2035 are authorised by the Prime Minister (according to 879/QĐ - TTg on 09/06/2014), in which the importance of developing green industries sustainably and protecting the environment as well as focusing on promoting supporting ones are emphasised to help Vietnam join the Global Value Chain. Therefore, the model of EIP needs to be examined thoroughly and well-adjusted in order to better tackle environmental issues, to develop supporting industries, to play a role in realising the strategies of green growth and of industrial growth. However, implementation is facing the fact that regulations in Vietnam about operating and running IP are limited with rules on planning and on the system of policies on development. In fact, the lack of specific regulations on EIP has raised questions in the scenario that a few EIP are already put into work in several areas. On 02/11/2016, the Prime Minister assigned the tasks to the Ministry of Planning and Investment (written on the 9461/VPCP-KTN document), in which Decree No. 29/2008/NĐ-CP on IP, export processing, and economic zones are replaced; Decree No. 164/2013/NĐ-CP dated 12/11/2013 modified with additions the Decree No. 29/2008/NĐ-CP; Decree No. 114/2015/NĐ-CP dated 09/11/2015 improved parts of Decree No. 29/2008/NĐ-CP on IP, export processing, and economic zones. Accordingly, regulations on new model of IP including EIP would be taken into consideration.

As a result, on 22/05/2018, Decree No. 82/2018/NĐ-CP on managing industrial and economic zones was approved and announced. This event marked the crucial change in approaches of environmental laws in Vietnam about forming a connection between sustainable developments and greening industries. For the first time, problems related to EIP are officially addressed in a legal document. The aforementioned decree has clearly stated

three objectives in developing EIP: (1) improving the economic efficiency of businesses in the parks by applying clean methods of production, using resources with efficacy, and building the “industrial symbiotic relationships”; (2) improving the efficiency in protecting the internal and external environment regarding the parks by reducing the pollutants and waste, encouraging the use of clean technology and eco-friendly methods of production; (3) forming enterprise communities in the parks with fair competitiveness in the market, protecting and developing the living habitats for the surrounding communities, and putting the goals of sustainable development in practice.

However, after three years of implementation, several regulations are still far from reality, making it difficult or not facilitating the development of EIP in Vietnam (E-Journal of Business and Development, 2022). Some inaccessible points and basic obstacles need to be removed as they are not specified in the applicable criteria, design standards, or incentives for investors in the EIP (Hoang Quyen, 2019).

In response to Decree 82's limitations, the government published Decree 35 on May 28, 2022, restricting the operation of industrial and economic zones. Decree 35 is said to be more complete and preferential than Decree 82 when the provisions in the Decree's Articles are determined in accordance with reality, reducing administrative procedures for enterprises (E-Journal of Business and Development, 2022), adding provisions on policy support and development cooperation, criteria for determination, preferences, certification, sequence, and procedure for registration of certification of EIP (Bui Thi Kieu Phuong, 2022). Accordingly, Decree 35 regulates EIP, with contents such as:

First group: Regulations on Promoting the Development Eco-Industrial Parks

For the purpose of expanding the scale of EIP, the government of Vietnam has encouraged and supported organisations and individuals in investing in establishing and either wholly or partly converting the industrial parks approved by the competent authority into eco-industrial models. More specifically, investors who develop infrastructure, rent, and sublease the existing land in the parks are granted benefits on their future investments in IP, which include help with paperwork, technical consultation, investment promotion, and information on investment cooperation (Article 36).

The government of Vietnam also encourages the enhancement and completion of infrastructure, not only for the parks but also for the social and technical aspects, from the aforementioned investors. Besides, providing high-quality services and assisting enterprises in executing the “industrial symbiosis” for better conversion from traditional IP into EIP are also promoted. Additionally, companies in the IP are urged to improve management and operational systems while keeping the technological foundation up-to-date with cleaner practises, fewer pollutants, more efficient waste recycling, and more effective uses of resources. More than that, the enterprises are also encouraged to cooperate with each other and with third parties, not only for services but also for materials and other manufacturing inputs. Furthermore, each enterprise is allowed to recycle waste, scraps, and redundant energy to reduce the required costs while strengthening the operating efficacy as well as competitiveness (Article 36).

Second group: Regulations on Criteria of Eco-Industrial Parks

Similar to other enterprises, EIP requires not only strict compliance with laws in business, environmental protection, and labour but also thorough basic services as the first criterion. Additionally, several other specific criteria are laid out:

Regarding the investor implementing investment projects on the construction and commercial operation of infrastructure facilities in the IP: (i) complying with the laws in 3 years prior to the date of registration for certification of EIP; (ii) providing adequate basic services in the IP as specified by law, including: essential infrastructure services (electricity, water, communication, fire prevention and fighting, wastewater treatment, and other essential infrastructure services) and related services to support enterprises in the IP to implement industrial symbiosis; (iii) developing and implementing a mechanism on coordination in supervision of inputs and outputs with regard to the use of raw materials, materials, water, energy, chemicals, wastes and scraps in the IP; making and submitting to IP and Economic Zone Management Board annual reports on results achieved in efficient use of natural resources, cleaner production and emissions monitoring of the IP; (iv) annually, publicising a report on environmental protection and discharge of social responsibility toward the surrounding community and sending it to the IP and Economic Zone Management Board and posting it on the enterprise's website (Article 37).

Regarding the enterprises operating in the IP: (i) complying with the laws in 3 years prior to the date of registration for certification of EIP; (ii) implementing at least 1 industrial symbiosis and ensuring that enterprises participating in industrial symbioses in the IP apply the production and environment management system according to appropriate standards of the International Organisation for Standardisation (ISO); (iii) ensuring that at least 20% of enterprises operating in the industrial park apply solutions for efficient use of natural resources and cleaner production, resulting in conservation of raw materials, materials, water, energy, chemicals, wastes and scraps and reducing emissions to the environment (Article 37).

Regarding the industrial park: (i) the total land area of greenery, roads, technical facilities, and shared-use social infrastructure facilities of the industrial park accounts for at least 25% of the IP construction master plan approved by a competent state agency under the national technical regulation on construction master plans; (ii) having solutions to ensure housing, service, and public-utility facilities for workers in the IP (Article 37).

An investment project on the construction and commercial operation of infrastructure facilities in an EIP must meet the following conditions: (i) the investor implementing the investment project on construction and commercial operation of infrastructure facilities of the EIP registers industries and trades calling for investment in the IP; estimates the emission level for each industry or trade; determines the plan on industrial symbiosis in the IP, plan on formulation and implementation of a mechanism to monitor inputs and outputs of the industrial park regarding the use of raw materials, materials, water, energy, chemicals, wastes, and scraps, and plan on discharge of social responsibility towards the surrounding community in the project dossier; and commits to meeting the criteria for identification of

EIP for 8 years from the time the IP is established and clearly defines the implementation roadmap; (ii) the IP is identified by a competent authority as an EIP in the investment policy decision or investment registration certificate in accordance with the investment law, which shall serve as a basis for examination, inspection, and monitoring (Article 38).

The aforementioned criteria not only prove their importance in assisting investors and the government to have the necessary foundations to plan, invest in construction, and manage EIP but also serve as the basis to differentiate them from their existing traditional counterparts.

Third group: Regulations on Benefits for Enterprises in the Eco- Industrial Parks

The EIP is exposed to several incentives, such as priority in loaning capital from the Environmental Protection Fund of Vietnam, the Vietnam Development Bank, and other finance organisations, as well as from both foreign and domestic sponsors, for building technical infrastructure, implementing cleaner methods of production, using resources, and carrying out the idea of "industrial symbiosis" more efficiently. Furthermore, companies developing the infrastructure of the eco-industrial parks are prioritised in participating in programmes for technical support and investment promotions organised by the government. Additionally, enterprises in the EIP are also granted early access to information on the technology market and on the possibilities of cooperation to execute the plans of creating "industrial symbiotic relationships" (Article 39).

5. Status of Application of Regulation in the Establishment and Development of Eco-Industrial Parks

5.1. An overview of the Status of Eco-Industrial Parks in Vietnam in recent years

The EIP model was officially implemented by UNIDO and the Ministry of Planning and Investment in Vietnam in a number of provinces and cities in 2015, including Hai Phong, Dong Nai, Ho Chi Minh City, Da Nang, and Can Tho. According to the Preliminary Report of the Implementation of the Project Component of VNCPC at the Conference Development of Ecological Industrial Parks in Vietnam in the Direction of Approaching the Global Ecological Industrial Park Programme on September 15, 2022 in Ho Chi Minh City, 72 enterprises participating in the programme at three pilot industrial parks have adopted resource efficiency and cleaner production after three years of pilot implementation of the EIP model. Notably, this initiative saves 24.89 metric tonnes of CO₂ per year, 4 metric tonnes of chemicals, 3335 metric tonnes of solid waste, and 429 cubic metres of wastewater.

Since Decree 82 was issued with regulations on EIP, the 2022 Sustainable Development Goals (SDGs) of the Ministry of Planning and Investment were implemented in 2020, the Ministry of Planning and Investment has continued to coordinate with UNIDO to replicate the model of ecological industrial parks in localities such as Hai Phong, Dong Nai, and Ho Chi Minh City. As a result, 396 resource-efficient and cleaner production solutions have been proposed to 51 enterprises in the three IP, including Hiep Phuoc (HCM), Amata (Dong Nai), and Dinh Vu (Hai Phong).

With the benefits of EIP and the purpose of sustainable development, Vietnam has had industrial areas following the eco-industrial model, and here are the most noteworthy ones.

Nhon Trach 2 IP was established in 1997 in zone 2 of Hiep Phu and Phu Hoi communes with an area of 347 hectares and carries out several industrial fields in sewing, engineering, manufacturing construction materials and wooden products, food, chemicals and chemical cosmetics, household appliances, etc. Nhon Trach 2 has formed a system of using waste carton papers to make carton boxes, silks and scrap yarns to produce rags and cotton dust, etc. Aside from that, the external system is also built to recycle scrap plastic, papers, and cartons, while solid waste, toxic exhaust, and polluted water are processed to be reused in toilets for workers (240 cubic metres/day) and in watering plants (500 cubic meters/day), and the resulting liquid waste is estimated to be 7.500 cubic meters/day (Tien, 2014).

Bourbon An Hoa Industrial Garden was established on October 30th, 2009, and is considered the first IP in Vietnam that meets all the requirements of an EIP. The scale of this zone reaches up to 1.020 hectares in area, and it is able to hold hundreds of enterprises. In detail, industrial land only occupies approximately one-third of the total area, and 15% of the total area is strictly required for trees. Additionally, investors are forced to secure 30% of the land for planting grass and trees, which leads to increasing spaces of green grass. Besides, an A-tier centralised wastewater treatment plant is built with the obligation of processing partly-cleaned waste water from nearby manufacturers in the zone in order to dispose of it safely in the surrounding environment, with a total capacity of 30.000 cubic metres per full day (Nguyen, 2020).

Nam Cau Kien EIP was opened in Haiphong by Shinec JSC, currently being a highly-appreciated investor in the market. This zone follows the model of industrial area - park, which has proven to be eco-friendly. Not only that, the surrounding land is well-planned into a buffer zone and also serves the purpose of providing fresh food to the IP. With the remaining spaces after land acquisition, farmers are still well-off by receiving guidance from the investors in cultivation, cattle and poultry husbandry, fishery, etc. Furthermore, the resulting products are consumed by the IP at a stable rate (Vu Thi Duyen Thuy, 2021).

The above examples show that, until now, the number of EIPs in Vietnam is still insignificant compared to the total number of traditional ones, so, for the objective of exponentially scaling up the model, creating an appropriate legal system with details and consistency is highly recommended.

5.2. The Application of Regulations in the Establishment and Development of Eco-industrial Parks

Decree 35 provides the fundamental legislative foundation for implementing the EIP concept in Vietnam. Aside from the favourable aspects, the requirements of Decree 35 provide significant challenges for investors seeking to establish or convert to the EIP model. In particular, consider the following:

First, there are no clear guidelines for the criteria for eco-industrial parks. The EIP criterion system serves as the foundation for analysing, overseeing, and turning an existing IP into an EIP. As a result, Decree 35 merely halted the regulation of standards defining EIP in the absence of clear directions on guidelines, technical standards, or technical advice from national and international experts. Furthermore, in order to create a comprehensive index, a lot of indications must be broken down into qualitative indicators, particular quantitative indicators, important thresholds, and weightings for each indicator. (Tran Duy Dong, 2020). At the same time, in addition to the minimal criteria for EIP, awarding standards, such as levels of gold, silver, and copper for EIP that surpass the criteria and types of incentives for these EIP, must be defined (Central Economic Management Research Institute, 2018). EIP may be subject to some specified criteria, like as:

- More than half of industrial production facilities use cleaner production methods;
- EIP satisfy 70% of social housing demands for workers working in IP.

Second, Decree 35 is incompatible with the Law on Environmental Protection 2020. This is a general code for environmental protection in all fields, including all production-related activities, in order to accomplish sustainable development. Even though this law, which was recently amended in 2020 and went into effect in 2022, encouraged environmental protection activities, constructions and developments on the EIP are not included (Vu Thi Duyen Thuy, 2021).

Third, policies of support and incentives are insufficient to satisfy the needs of investors. Accordingly, government support programs and incentive policies focused at stimulating investment projects that build and transformation the eco-industrial park model are extremely confusing and of a too widely applicable character. For instance, the law does not contain clear provisions on exemptions, income tax reductions for IP and ecological firms, or promises of financial and technical assistance from the government as well as from development partners. The exemption policies, land lease reductions, and credit capital lending priority have not been precisely established or detailed but are nevertheless typically guided like other IP models. Without explicit, comprehensive pledges to beneficial financial policies, investors will have little motive to undertake building investments and transform the IP model to the EIP model.

In addition, the implementation process of implementing and applying the provisions of the law on EIP also encountered quite a lot of difficulties due to many other reasons, such as the fact that the administrative machinery and procedures in Vietnam are quite packed, with many steps and many procedures. This makes it difficult for investors to implement construction investments or transform EIP models.

6. Some solutions to improve regulation and enforcement efficiency in the establishment and development of eco-industrial parks

From the foregoing analysis, in order to ensure a precise, specified, and consistent legal structure for the formation and growth of the EIP in Vietnam, remedies to promptly solve the present issues are given forth below:

Firstly, it is necessary to give detailed instructions on the criteria for EIP. As mentioned above, these criteria should be expressed as indicators that are relevant, specific, quantitative, and a combination of three economic, social, environmental, and management aspects. In addition, political, technological, financial, informational, and connectivity mechanisms between domestic agencies and international organisations should be strengthened. Accordingly, further instructions on standards, technological standards of departments, and technical assistance from national and international specialists are essential, especially for industrial synchronous networks and circular economy solutions. This offers a stable base and the necessary information conduits for investors, notably international investors. Thereby, investors will be able to grasp state policies, particularly financial and technical policies for investment projects, construction, development, and expansion of EIP.

Secondly, complete the rules in the Law on Environmental Protection 2020 to stimulate the construction and development of the EIP. Adding new investment projects to promote the EIP as recipients of extra environmental incentives and assistance as outlined in the Law Environmental Protection 2020. Enacting supporting legislation on the search for and use of green technology systems, eco-friendly technological processes such as capital and technical help. This is a critical legal basis for adopting different types of incentives to help with construction as well as to promote EIP investment and development (Vu Thi Duyen Thuy, 2021).

Thirdly, specifying the forms and levels of incentives for activities of converting traditional IP into EIP. Therefore, the government must provide information on how businesses and land renters will be excused from paying land rent or paying it at a reduced rate when making investments in the development of EIP. Additionally, the government must specify in detail the conversion's form, degree of tax incentives, amount of capital, amount of land, and level of financial assistance. This is regarded as one of the key attractions for investors (Vu Thi Duyen Thuy, 2021).

Fourthly, simplifying the regulations on the orders of procedures will speed up the reform of administrative work. The development of the model of EIP requires the need to reform administrative procedures in the aspect of managing the country and the IP for a more favourable environment for businesses and investments, especially the application of the “inter-agency one-stop-shop mechanism” in the management board of the IP and the focal agencies in the provinces and city regions. At the present time, following the regulations, the management boards of the IP are authorised to implement specialised functions and tasks such as construction, labour, environment, and commerce. However, the authorisation processes in many local areas are not consistent, which poses many challenges in implementing state management towards the industrial parks as well as in assisting and handling obstacles for the investors. In light of the current authorization processes and the present administrative procedures in traditional IP, developing the EIP model likely faces many difficulties in attracting investors, for instance. Therefore, executing the administrative reforms in state management of the IP requires close cooperation among departments of all levels in order to generate promising results (Vu Thi Duyen Thuy, 2021).

7. Conclusion

It is clear that the EIP is a "community" of production firms working to preserve the environment and promote sustainable development, with economic and social interests inextricably linked. The evolution of the EIP model is no longer a suggested option; rather, it has become a must for those seeking high efficiency in recruiting investments, particularly from foreign investors. Thus, the refinement of the law's provisions pertaining to the EIP, particularly those relating to investment attraction, and the construction of the EIP will contribute to facilitating as well as enticing investors in order to target the popularity of the EIP model across the whole country.

FACTORS DETERMINING THE CAPACITY OF HUMAN RESOURCES MANAGEMENT IN PUBLIC NON-BUSINESS UNITS: THE CASE OF VIETNAM MINISTRY OF FINANCE

PhD Student. Nguyen Xuan Thang

thangift@gmail.com

*School of Business Administration, University of Economics and Business,
Vietnam National University, Hanoi, Vietnam.*

Abstract

This study aims to increase the understanding of capacity management within the public sector and how it can be used to cope with variations in demand. Determining a group of factors affecting management capacity at public non-business units under the Ministry of Finance in Vietnam. By comparing literature and the case presented in the study, the authors hope to achieve a contribution to the field of capacity management within the public sector and to identify managerial implications concerning capacity management for the specific case studied. Survey subjects are officials, management leaders, experts and employees at administrative and non-business units under the Ministry of Finance. The research model is in SEM form and measurement models are reflective scales, so this study applies SPSS 23.0 and AMOS 23.0 software. The author finds that two factors have a strong impact on human resource management capacity for the Ministry of Finance of Vietnam, including factors related to the working environment and development strategy factor in public organizations. The originality of this study is to provides an overview of human resource management capacity. Besides, the author also studies and points out the factors that have the greatest influence on management capacity for the public sector area in Vietnam.

Keywords: *Management capacity, human resource management, public sector, Vietnam*

1. Introduction

The great growth of the 21th century was the result of a new perspective on understanding the importance of investing in an organization's individuals and human resources, and implementing capacity building strategies in different organizations and societies. Human resources play a role and determine the existence and development of an organization in general or public organizations in particular. The quality of human resources is a decisive factor in the effectiveness of the work and operation of an organization. In the context of international integration, Vietnam faces many new challenges, especially in terms of human resource training for higher quality human resources.

Capacity can be defined as the ability of people, organizations and societies to successfully implement, define and achieve their goals, and change as necessary for the purposes of sustainability, and growth development and progress. Capacity development

is considered to be an endogenous dynamic process based on one's motivation, effort and persistence to learn and improve (Lopes & Theisohn, 2003) that enables organizations to change, grow, and thrive and develop. Some of the key competencies that enhance development include leadership development and knowledge networking (Lopes & Theisohn, 2003).

The European Center for Development Policy Management (ECDPM) explains its view of competencies based on five core competencies namely “ability to act and self-organize, ability to produce development results, capacity to ability to relate, adaptability and self-renewal, and ability to achieve coherence” (Ubels, Acquaye-Baddoo, & Fowler, 2010). Capacity development has a lot to do with the way the organization operates (Ubels et al., 2010). Culture represents an understanding of how an organization works, its procedures, beliefs and values; it is often influenced by the people working in it, past incidents, present influences and the type of work it has to undergo (Garratt, 1999). New skills, competencies and training are important characteristics required in an organization for capacity development; Physical resources such as equipment and capital assets are also needed for this purpose (Ubels et al., 2010). Capacity development and its impacts need to be continuously evaluated within an organization so that existing gaps can be filled to ensure continuous improvement. Neglecting capacity building programs can lead to a lack of growth and possibly failure.

The effectiveness, efficiency, and high-quality service provided by the public sector are still being debated. To improve their public image and reputation. "Historically, public sector organizations have been accused of bureaucracy, inefficiency and corruption. As a result of these glaring flaws, the public sector and citizens have a strained relationship."(Tangngisalu, Mappamiring, Andayani, Yusuf, & Putra, 2020). When compared to their private-sector counterparts, public-sector leaders encounter a number of distinct problems. Because citizens are typically opposed to additional taxation, public sector managers are expected to achieve ever-increasing performance without equivalent increases in revenues. As a result, it's critical to look into how government organizations build the leadership competencies and skills needed to deal with this and other complex issues. The purpose of this study is to give a quick overview of the complexities of public sector leadership in Vietnam. It explores how government organizations may develop leaders with the necessary communication skills and competences for long-term organizational efficiency and effectiveness.

This research relies heavily on the sociological survey approach, which includes questionnaires and in-depth interviews to gather primary data on leadership development. Officials, management leaders, professionals, and employees from the Ministry of Finance of Vietnam's administrative and non-business departments are among the survey's participants. As a result, the research employs an exploratory case study design (Teapitthay Amas, Sttipun, & Lakkanwanit, 2021; Venkatasubramanian, Rengaswamy, Yin, & Kavuri, 2003).

2. Literature Reviews and Theoretical Basis

2.1. Human Resource Management (NL)

Human resource management is a set of activities and methods aimed at managing people at all levels of a company in order to achieve organizational objectives (Byars & Rue, 2006). There has been a lot of discussion and writing on HRM, its content, practice, and application, and there has also been a lot of disputes recently about the responsibilities and tasks of Human Resource Management departments in organizations.

The management capacity of an individual in any organization is not only considered as a core factor to evaluate reward and empowerment, but also demonstrates the adaptability to changes in the context of international integration requires managers to have certain competencies (Levenson, Van der Stede, & Cohen, 2006; ZHOU, JIA, & YANG, 2022). Accordingly, administrators in the public sector often face challenges stemming from changes related to governance models, information technology, state legal institutions, etc. (Bhardwaj & Punia, 2013). Therefore, the administrative capacity of management in organizations has recently attracted attention not only to public organizations, but also exploited by human resource management researchers to contribute to diversity identification of the elements constituting managerial competence in human resource management theory (Lord, De Vader, & Alliger, 1986; McClelland & Steele, 1973). In Vietnam, there is research by (Khuong, Mai, & Phuong, 2020; Lê Quân & Khánh, 2012).

2.1.1. Knowledge Management (KT)

Rapid changes in technology and global competition require further innovation in organisations. This is based on strengthening employees' capacity and providing them with knowledge management support to accelerate the knowledge process and improve performance (Khawaldeh, 2020). Knowledge is defined as "a social invention that emerges from interactions between persons and information, particularly among groups engaged in communication, knowledge creation, sharing, and learning" (Gloet, 2006). HRM must be applied to managing human assets by developing organizational knowledge generation capabilities to improve operations and achieve competitive performance (Gope, Elia, & Passiante, 2018). Knowledge management based on their experiences and capacities, as well as their ability to adapt to the environment, is a vital source for promoting and developing performance (Zaim, Keceli, Jaradat, & Kastrati, 2018). As a result, the most important aspect in HRM is that people, their personal relationships, and their knowledge have all been recognized as valuable resources (Jung & Kang, 2016; Svetlik & Stavrou-Costea, 2007). The ability to leverage the invisible skills of individuals in an informal way, through cooperation, tacit knowledge, and informal learning, is critical to the success of human resource management in the knowledge economy (Thite, 2004).

2.1.2. Manager's Skills (KN)

Manager skills are interpersonal and behavioural abilities that are not related to a specific work function and are typically not learned through formal education (Weber, Lee,

& Crawford, 2020). "Soft talents are primarily ethereal, not related with a deliverable or a real outcome, and they are applied without the use of tools or templates," (Hendarman & Cantner, 2018) added. Character attributes that improve individual achievement are often known as soft skills (Robles, 2012). Soft talents, according to (Zhang et al., 2020), are generic skills "transferable to a wide range of tasks." Soft skills are vital for organizational performance and are required in interpersonal connections and work situations (AbuJbara & Worley, 2018). Although hard skills are essential to complete tasks, employers are more interested in employees who have a strong set of soft skills, as their value in the workplace grows (Cimatti, 2016). According to Cimatti (2016)'s research, hard skills account for only 25% of capacity of HRM, whereas soft skills account for 75%. Furthermore, IT managers regard soft skills higher than hard skills as a precondition for success in the IT business, according to a poll done by Aasheim, Williams, and Butler (2009).

2.1.3. Manager's Attitude (TD)

Manager attitude is critical to boosting performance and, as a result, putting businesses in the best possible position to compete and stay on top (Khan, Sarriff, Khan, & Mallhi, 2014). The development of organizations is demonstrated in the literature to be directly dependent on the performance of the human element as measured by the quantity, quality, and speed with which work is completed, which reflects the organization's overall performance. Manager attitude is a type of leadership style that belongs to the management series. It is a manager's capacity to influence subordinates to perform at their best. Aside from a slew of other factors, employee satisfaction with their manager's demeanour is regarded as the most crucial element that could influence employee performance (Alfandi, 2020)). Employee performance could be as low as zero or as high as maximum capacity, depending on the Manager attitude with them. Manager attitude has a significant impact on HRM capabilities, it also leads to increase productivity and output. Job productivity will increase if employees are stratified about their manager's attitude with them (Alfandi, 2020).

2.1.4. Standard Capabilities of Managers (NC)

By conducting the study in public organizations in Hoa Binh, Hung (2019) prove that the public administration area have some specific requirement, hence, there should be a standard competence framework for a strategic human resource management. Thoa (2020) pointed out that the moral and political awareness, attitude, and behaviour are essential factors as the requiring standard capabilities for the leaders. In her paper, Thoa (2020) demonstrated that the personal perspective and virtue of the leaders of public departments can intensively influence the subordinate's moral and political awareness, attitude, and behaviour which impact on the whole systems of public organization. According to the Ministry of Finance, Decision No: 2303/QD-BTC (2018); Ministry of Finance, Decision No: 789/QD-BTC (2019); Government, Decree No. 62/2020/ND-CP (2020), Vietnam Government also requires the workers in public sector to adhere the principles and discipline of the Party, State and public units and must have solidarity spirit in teamworking alongside

with proper manner and good political awareness, attitude, and behaviour. Based on that, building a standard competency framework for public administrators is necessary to have a well - developed human resource management abilities.

2.2. Management human resource development strategy (CL)

Becker and Gerhart (1996) asserted that organizational vision and objectives play an important role in human resource management especially in the system of public area. Their case study indicated the impact of vision and objectives on the development strategy of the whole organization in general, while in particular, it directly connects with the human resource development strategy. Quan (2009) proved that by researching the relationship between organizational common goals and the development of management strategy.

Besides, the market trend also has influence on the management strategy of public organization. Amit and Jean (2005) considered the alteration of market trend is a key which drive the process of performance evaluation and people development plan. Public departments must have adaptability to deal with the change of market trend and social demand (Wei and Lau, 2007). Therefore, the human resource manager are required to have high capability in handling the situation to implement proper strategy and development plan. Accordingly, the first hypothesis is proposed as follows:

Hypothesis 1 (H1): The impact of development strategy on HRM capabilities in public sector

2.3. Working environment (MT)

The working environment has extreme influence on the performance of employees as well as the management capabilities of the leader (Gunaseelan and Ollukkaran, 2012). It can impact on both positive and negative outcomes of employees' performance especially in the public organisations where full of law and regulations (Chandrasekar, 2001). According to Noble (2009), a toxic working environment can damage mental health of employees which caused anxiety and distressed leading to low working outcomes. A wholesome workplace environment includes the well - being of physical and mental conditions (Roelofsen, 2002). While physical condition derives from the demand of interior design, infrastructure, work equipment; mental condition derives from the demand of interaction and relationship among employees and employees, employees and manager, organizational regulations and rules or employees' entitlements, (Christabella Peter Bushiri, 2014). In short, to improve the performance of employees especially the public administrator in human resource management activity, organizations are required to have an ideal working environment. From here, the second hypothesis is proposed as follows:

Hypothesis 2 (H2): The impact of working environment on HRM capabilities in public sector

2.4. Human resource policy and remuneration (CS)

To build a strategic human resource development plan, it is indispensable to mention the crucial and critical impact of using people management policy and remuneration (Cardy

and Selvarajan, 2006). A proper policy and compensation can create higher working motivation for employees of public department. It is proven that creating work motivation will help employees to have their responsibility and obligation to fulfil organizational goals (Ryan and Connell, 1989, Ryan and Deci, 2000). This will improve the result of performance appraisal, leading to advanced human resource management capacities for public organisations. Moreover, it also helps retain old employees and attract newbies contributing on long - term development plan (Fry, 2003). Based on that, DeNisi and partners (2006) affirm that a well - developed human resource policy and proper performance - based reward are important factors which drive the success of human resource management plan as well as highlighting the capabilities in terms of people management of the public administrator. From the above analysis, the third hypotheses is proposed:

Hypothesis 3 (H3): The impact of human resource policy and remuneration regimes on HRM capabilities in public sector

2.5. Employee participation (TG)

Islam and Bin (2006) emphasized the importance of employee participation and engagement in the performance evaluation process in order to create human resource development plan. The results of the performance appraisal system can stimulate the working motivation by capturing the understanding and trust of employees. Sabrina, Derek and Patrick (2012) indicated that the subordinates are more likely to accept with the results of the performance evaluation even though it is not as good as they expect, thanks to the sympathy and trust from engaging on the evaluation process. Brad and partners (2014) explained that employees are tend to believe on the fair of the performance appraisal when they are enthusiasm in participating that they can consider it as a goals to achieve. As a result, the employees' engagement and participation especially the manager level have aggressive influence on the performance appraisal which is related to the context of human resource management capacities in public area. Based on this argument, the fourth hypotheses are proposed:

Hypothesis 4 (H4): The impact of employee participation on HRM capabilities in public sector

2.6. Organizational cultural environment (VH)

Boyatzis (2008) highlighted the impact of culture - related in organisational management especially the human resource development in public sector. The value of organisational culture will encourage employees to share their values, belief and working motivation to develop together in which same as the solidarity spirit of public sector. These values help the human resource manager to well - developed the management plan and strategic framework for standard quality of future managers. Moreover, by collecting the opinions about social - culture factors and practice such as gap of caste level, gender equality, gender discrimination, ...the human resource managers can deeply understand employees' perception, awareness, attitude and knowledge to contribute to the standard ability framework for well - developed human resource management plan (Quan, 2009). The value

of culture - related in public organization is undeniable that it can be considered as an orientation for the improvement of human resource management capabilities in terms of people appraisal and evaluation. From here, the following final hypothesis is added:

Hypothesis 5 (H5): The impact of organizational culture on HRM capabilities in public sector

3. Method

3.1. Data Collection Method

In this study, the sociological investigation method used surveys and in-depth interviews to collect primary data related to leadership development. The data were collected using a survey questionnaire. The survey is designed using a combination of closed and open questions, scales (identifier, interval and rate) and a 5-point Likert scale (1=Strongly Agree, 2= Agree, 3=Neutral, 4= Disagree and 5=Strongly Disagree). The survey subjects are officials, management leaders, and experts., employees at administrative and non-business units under the Ministry of Finance. According to Joe F Hair, Ringle, and Sarstedt (2011), as a rule of thumb, the sample size should be equal to or greater than 100 and the smallest sample should have the desired ratio of 5 observations for each variable ($n > 100$ samples and $n = 5k$, where k is the number of observed variables equivalent to the number of research questions). On the other hand, according to Bursi et al. (2006) the minimum sample size applicable in practical studies is greater 100 observations. With the author's research, there are 540 survey is suitable for a practical study.

The framework of this study applies to Vietnamese public sector. According to statistics released by the General Statistics Office of Vietnam in September (2018), Vietnam has nearly 70,700 public organizations. The objective of the study is to assess the impact of these factors on the human resource management capacity of public organizations in Vietnam. Survey subjects are officials, management leaders, experts and employees at administrative and non-business units under the Ministry of Finance with at least two years of experience to ensure that they fully understand enough about the research problem and the actual situation to fully understand the meaning of the questionnaire (Leech & Onwuegbuzie, 2007).

With 9 units with a total of 540 valid votes, the author gave statistics on research factors including: gender and age, marital status, education statistics, seniority position. and work and average income statistics. The results show that there are 230 female respondents (accounting for 42.6%) while the corresponding number and proportion of female are 310 (accounting for 57.4%), the proportion at undergraduate is 23 people, accounting for 4.3% and master, doctoral degree is 517 people, accounting for over 95%, over 60% of people in the survey hold management positions and the number of employees in the survey sample with a salary of more than 10 million dong accounts for the majority. The characteristics of respondents are described in Table 1.

Table 1. Description of respondents

	n	%
Sex		
Male	310	57.4
Female	230	54.0
Age		
35-40 years	65	12
40-45 years	107	19.8
>45 years	3668	68.1
Education		
Undergraduate	23	4.3
Master, doctoral degree	517	95.7
Working position		
Head, deputy of career unit	22	4.1
Leadership, management at department level	181	33.5
Team level management	337	62.4
Salary		
< 5 million VND	5	0.9
5 -7 million VND	59	10.9
7-10 million VND	185	34.3
>10 million VND	291	59.9

3.2. Data Analysis Method

After collecting data from the Ministry of Finance in Vietnam, the author cleaned the data, coded the necessary information in the investigation, entered and analyzed the data using SPSS 23 and AMOS 23 software. The imported data is analyzed according to EFA, CFA and analyse the linear structure model base on SEM structural model is widely used in the fields of psychological research (Anderson & Gerbing, 1988)), sociology (Lavee, 1988; Lorence & Mortimer, 1985), research child development (Biddle & Marlin, 1987) and extensively studied in the field of management (Tharenou, Latimer, & Conroy, 1994). After the model parameters have been estimated, the results of the implied model covariance matrix are then compared with an empirical covariance matrix or based on data. If the two matrices are unified, then the structural equation model can be considered as a plausible explanation for the relationship between factors (Hoyle, 1995).

4. Results

4.1. The Result of Exploratory Factor Analysis (EFA)

Methods of exploratory factor analysis (EFA) and multivariate regression were selected to analyze the data in the research. Coefficient KMO and Bartlett's Test are described in Table 2.

Table 2. Coefficient KMO and BT

KMO and Bartlett's Test		
Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.786
Bartlett's Test of Sphericity	Approx. Chi-Square	7057.056
	df	703
	Sig.	.000

The Kaiser-Meyer-Olkin Test (KMO) as a Measure of Sampling Adequacy was used in the present study (Table 2) to detect multicollinearity in the data to verify the appropriateness of carrying out a factor analysis. For our data, KMO was $0.786 > 0.5$. The results of our analysis for the Bartlett's Test of Sphericity showed a significance level of 0.00. It can be concluded that the relationship among variables is strong. Because there is no change in the names of the factors, the hypotheses proposed to test the previous section are kept for testing in the next sections.

Table 3. Pattern Matrix^a

	Factor								
	1	2	3	4	5	6	7	8	9
KN4	.855

CS2									.794
CS3									.646
CS1									.581

Extraction Method: Principal Axis Factoring.

Rotation Method: Promax with Kaiser Normalization.

Rotation converged in 6 iterations.

According to Joseph F Hair (2009), *Multivariate Data Analysis*, 7th Edition:

- Factor Loading at ± 0.7 : The observed variable has a very good statistical significance.
- Factor Loading at ± 0.5 : The observed variable has a good statistical significance.
- Factor Loading at ± 0.3 : The minimum condition for the observed variable to be retained.

As we can see, all the factors in Table 2 are satisfactory because they are greater than 0.5. Not only that, but there are also 14/19 factors with factor loading greater than 0.7, so the factors have a very good statistical level and satisfy the requirements to go to CFA analysis step.

4.2. The result of Confirmation Factor Analysis (CFA)

After performing exploratory factor analysis, the author conducts confirmation factor analysis, and obtained the results of the model as follows:

The coefficients CFI = 0.913, TLI = 0.903 and GFI = 0.863 are all greater than 0.8, reaching good values. PCLOSE=000 < 0.1, CMIN/df = 1.913 < 3, RMSEA = 0.049 < 0.06 all have good values, so the model is considered to be suitable with market data and guarantee unidirectional. The regression coefficient table shows that the P-values are all less than 0.05 and the results from the normalized regression weight table show that the weights are all greater than 0.5, so the scales are all convergent. All scales have good general reliability (CR > 0.5); total extracted variance (VA) >0.5. From 9 factors with 40 initial scales, which were initially evaluated, EFA analysis, CFA analysis were reduced to 38 scales, the scale set was included in the SEM model analysis to test the hypotheses. related to the factors affecting the capacity of management human resources.

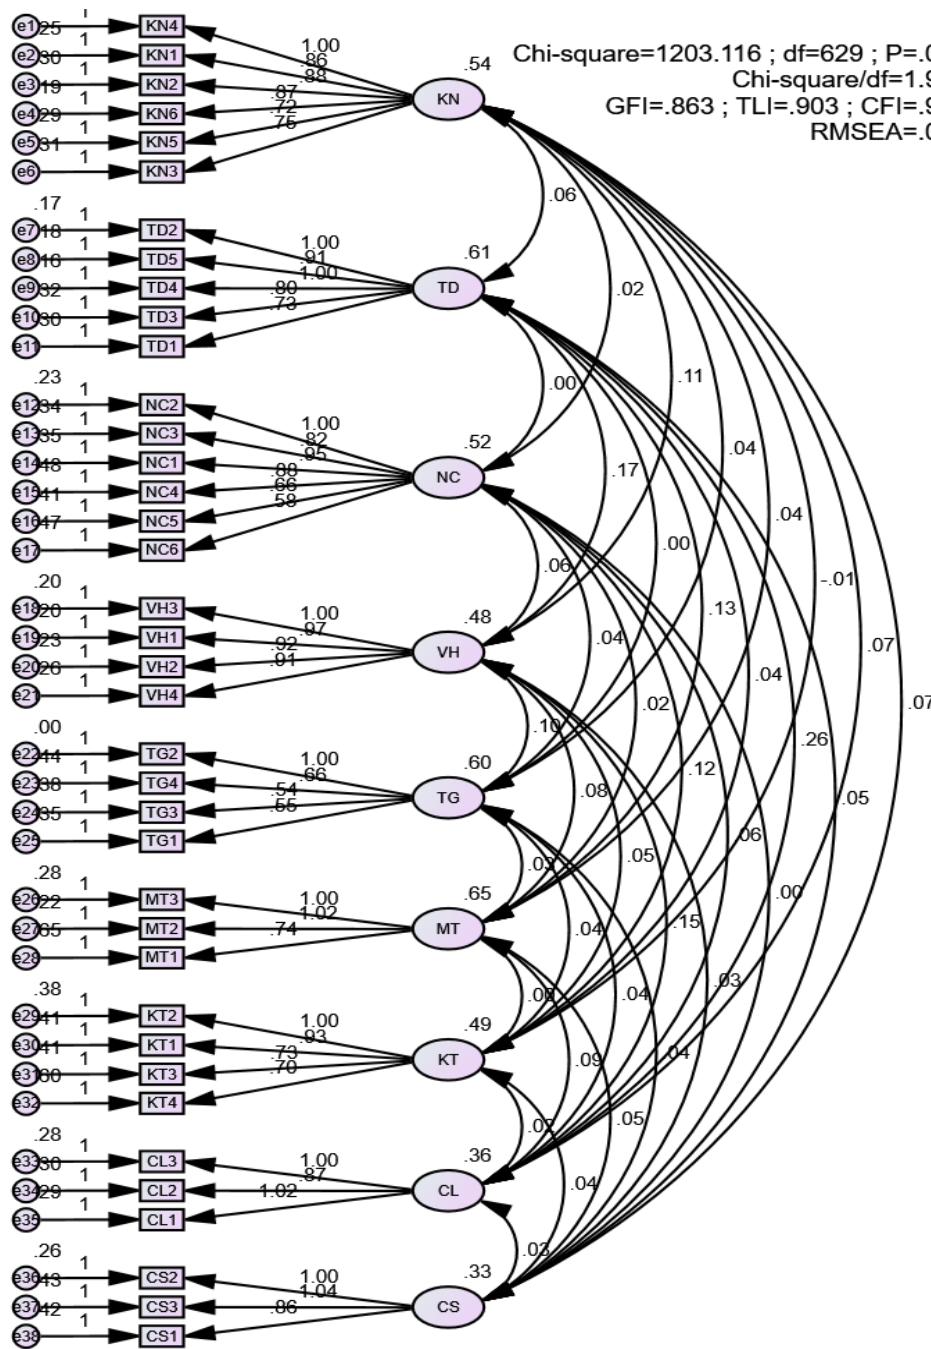

Figure 1. CFA Model

4.3. Structural Equation Modeling (SEM)

After finding the results of checking the suitability of the whole model, the author put all the observations and satisfied latent variables into the model to analyze SEM and test hypotheses. Analysis results of the linear structure model in the figure show that the values $Cmin / df = 1.918 < 3$, $TLI = 0.903$, $CFI = 0.912$ and $GFI = 0.860$ have achieved very good results because they are both greater than 0.8 and $RMSEA = 0.049 < 0.05$. As such the data is considered appropriate.

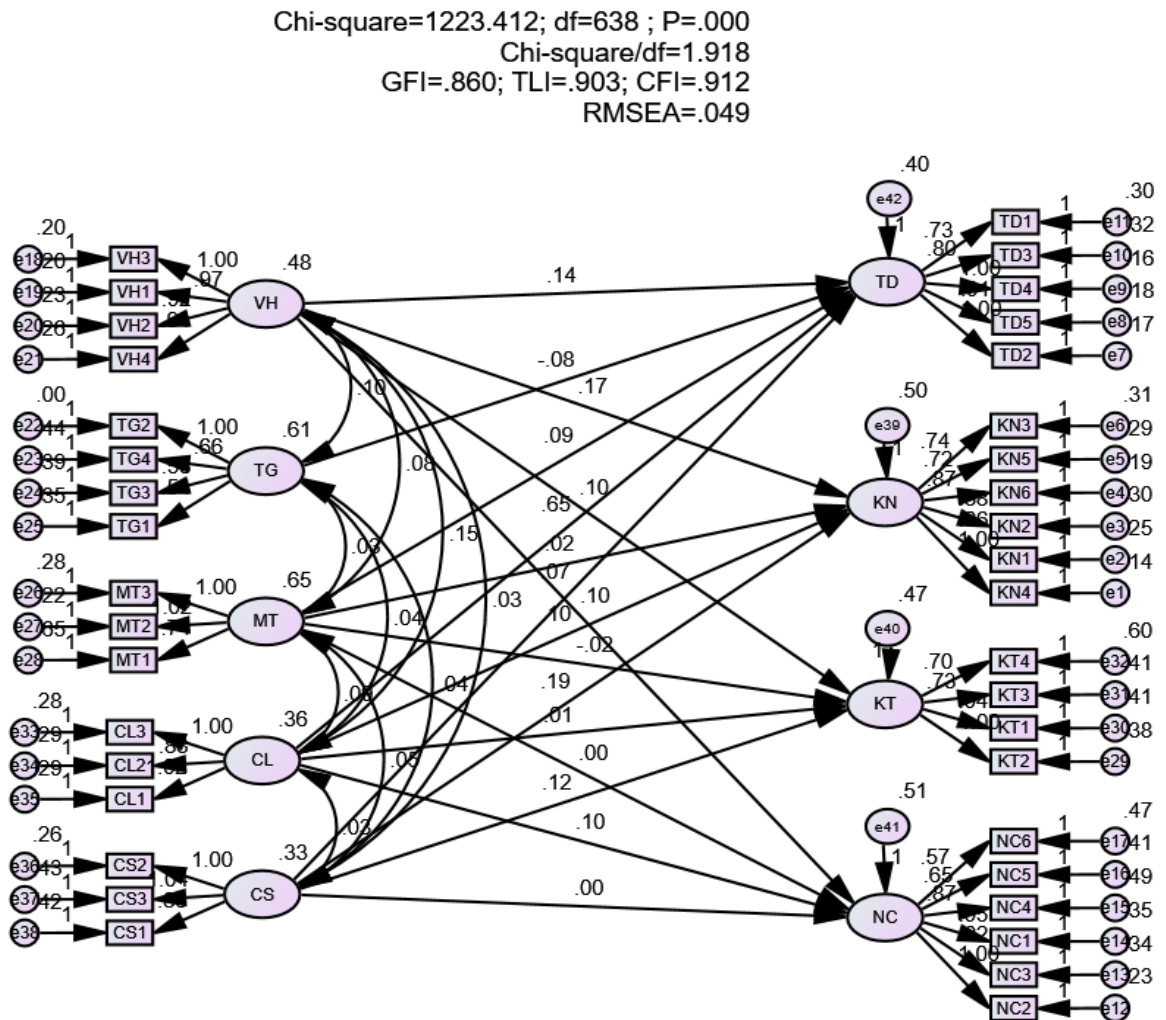

Figure 2. SEM Result

4.4. Results of Hypothesis Testing

4.4.1. Testing the Measurement Model

The reliability, convergence, and discriminant values are used in the test measurement model to evaluate the scales' value. The scales of the study concepts acquired a high value after two measurement model assessments. The measuring model's evaluation findings are reported in Table 3. When Cronbach's alpha greater than 0.6 and composite reliability agreed with 0.7, the scales' reliability achieved a high level. The AVE index is

accepted when all values are greater than 0.6 and satisfies the acceptable threshold of 0.5. The values of the two above indicators show that the scales of the research concepts reach a high convergence value. From the above results, it can be concluded that the scales of the research concepts have high values and can be used to test the structural model in the next step (Hair Jr, Sarstedt, Matthews, & Ringle, 2016).

4.4.2. The Result of Testing Mediate Variable

Structural modelling assessment is aimed at testing the predictability of the research model and testing the research hypotheses. The results of testing the direct relationships between the structures are presented in Table 4. The data shows that management capacity (NL: KT, NC, KN, TD) is significantly affected by five variables with significance less than 1% as follows: VH, TG, MT, CL, CS ($\beta = 0.307$; $p = 0.000$), TG ($\beta = 0.331$; $p = 0.000$), CL ($\beta = 0.302$; $p = 0.000$), VH ($\beta = 0.645$; $p = 0.000$) and MT ($\beta = 0.509$; $p = 0.000$) through the accepted hypotheses including H1, H2, H3, H4, H5.

Chi-square=224.875; df=174 ; P=.006
 Chi-square/df=1.292
 GFI=.947; TLI=.977; CFI=.981
 RMSEA=.028

Figure 3. Results of Hypothesis Testing

Table 4. The result of testing mediate variable

Hypothesis	Direct relationship	Path coefficient (β)	Standard Deviation	<i>p</i> values	Significance
H5	NL<--- VH	.486	.050	9.634	***
H2	NL<--- MT	.601	.055	10.899	***
H1	NL<--- CL	.633	.075	8.457	***
H3	NL<--- CS	.388	.052	7.532	***
H4	NL<--- TG	.333	.053	6.332	***

5. Discussion and Conclusion

Hypothesis testing results are obtained: The management capacity is affected the most by the strategic factor (H1), then the factor of working environment (H2) and employee participation factor is the least influential factor for management capacity with weight is 0.333 (H4). The research in this study has made both theoretical and practical contributions. First, in practical terms, the research results are the basis for public organizations and the government to plan policies to improve human resource management capacity in the Vietnamese public sector. Leaders of organizations at Vietnam's Ministry of Finance need to focus more on at least two factors, strategy implementation and employee involvement, to help improve the capacity of management personnel. Next, the study also built and tested a research model on management capacity in the public sector under the Ministry of Finance of Vietnam.

However, to do well in human resource management, it not only comes from efforts of the human resource management team, but also needs proper attention from the Party and the State of Vietnam. The author hopes that with these research results, it will partly help the public sector sectors in Vietnam have a clearer view and have a more correct orientation and strategy for improving management capacity.

This study has some limitations. Although the data is quite diverse, the sample size (540) is still quite small compared to the sample frame. We suggest that future studies should expand the sample size and increase the number of public institutions besides the Ministry of Finance. Next, the study shows five factors that have an impact on human resource management capacity, therefore, the following studies can expand the variables to diversify and evaluate more effectively for human resource management human resource management to make more accurate recommendations on Vietnam's public sector capacity.

APPLYING AND PROMOTING THE FOREIGN POLICY OF “BAMBOO DIPLOMACY” IN THE CURRENT CONTEXT OF VIETNAM’S INTERNATIONAL INTEGRATION

MA. Phi Thi Lan Phuong

phuongpl@neu.edu.vn

Faculty of Political Theory, National Economics University, Hanoi, Vietnam

Abstract

The Communist Party of Vietnam is constantly supplementing, developing, perfecting, and building a very unique and unique school of foreign affairs and diplomacy of the "Ho Chi Minh era", imbued with the identity of "Vietnamese bamboo". in the period of international integration. The study clarifies some contents of this "Bamboo diplomacy" bold foreign policy, analyzes achievements, and assesses some limitations in diplomatic activities, thereby proposing several tasks. services to be performed in the "bamboo diplomacy" to enhance its position and participate more and more deeply in the international integration process.

Keywords: *Diplomacy, Bamboo diplomacy, Communist Party of Vietnam*

1. Introduction

Diplomacy is the intersection of politics-security, economy, and culture-society, the link between the past and the present, between history and the future, and between the country and the world. Vietnam's diplomacy is now defined not only by Party diplomacy, State diplomacy but also by people's diplomacy, according to which all three pillars of diplomacy/foreign affairs above must be based on the people's culture. At any level, ethnicity and diplomacy/foreign affairs carry within themselves the connotation of national culture. In other words, the identity of Vietnam's diplomacy is a part of the national identity of Vietnam, forged through practice and the historical context of the ups and downs of the nation - nation, so that Vietnam can affirm its sovereignty. independent authority, increasingly prestigious, and deeply involved with key and important roles in regional and international organizations.

Inheriting and promoting the traditional foreign policy philosophies of our ancestors under the illumination of Ho Chi Minh's thought, along with the creative application of Marxism-Leninism, our Party has constantly supplemented and developed develop, perfect and build a very unique and unique school of foreign affairs and diplomacy of the "Ho Chi Minh era", imbued with the identity of "Vietnamese bamboo" in the period of international integration.

2. Method

To serve this article, the author uses the Marxist philosophical methodology, while also using the method of analyzing documents, observation methods, and logistic - logistic methods

3.1. Foreign policy with bold "Bamboo diplomacy"

In the context of deepening integration and globalization, Vietnam's diplomacy continues to carry out new missions, contributing to creating and maintaining a peaceful and stable environment and firmly defending the Fatherland; at the same time, flexibly and creatively find new ways to promote international cooperation, create favorable conditions for economic construction and development, raise the country's position and increase potentials...

Throughout the history of the Vietnamese nation, foreign affairs have always played an extremely important role, not only contributing to firmly defending independence, sovereignty, unity, and territorial integrity; but also contributing greatly to the country's construction and development. Implementing the motto of being ready to be "friends with all democratic countries" (HoChiMinh, 2011) of President Ho Chi Minh given right from the early days of independence, Vietnam has been and is really "a friend, a partner". reliable partner of all countries and an active and responsible member of the international community" (Communist Party of Vietnam, 2021).

During the course of revolutionary activities, on the diplomatic front, President Ho Chi Minh always thoroughly grasped the guiding view that one "must look broadly, think carefully" to know oneself, know others, and always master the situation. position; clearly understand Vietnam's strategic position about other countries; always advocate respect and save "face" for big countries; always have to "know the time, know the situation" to build a very special and unique school of foreign affairs and diplomacy: "Slender body, fragile leaves, why should you be strong, you should be bamboo!".

Determining the importance of diplomacy in the current national construction and development, at the National Foreign Relations Conference on implementing the Resolution of the 13th National Party Congress on 14 December 12, 2021, General Secretary Nguyen Phu Trong emphasized: "Determined to build and develop a modern Vietnamese foreign policy and diplomacy imbued with national identity - the "Bamboo tree" diplomatic school Vietnam" (Nguyen Phu Trong, 2022)

Over the past 90 years, under the leadership of the Party, based on Ho Chi Minh's thought, we have built a very unique and unique school of foreign affairs and diplomacy imbued with the identity of the "Vietnamese bamboo tree". Vietnamese Bamboo has "solid roots, strong body, flexible branches", imbued with the soul, character, and mettle of the Vietnamese people; that is: "Soft, clever, but very resilient, fierce; flexible, creative but very brave, steadfast and courageous in the face of all challenges and difficulties for the sake of national independence, freedom and happiness of the people. Solidarity and compassion, but resolutely and persistently protecting the interests of the nation - nation. Know soft, know hard; know the time, know that; know yourself, know people; know how to advance, know how to withdraw, "accidentally improvise", "soft and fasten" (Nguyen Phu Trong, 2022)

General Secretary Nguyen Phu Trong borrowed the image of the bamboo tree - a very rustic and simple symbol that is familiar to Vietnamese people, to convey a very profound but very close philosophical message. practical for the foreign affairs and diplomacy of Vietnam. Bamboo has "solid roots, strong bodies, flexible branches"; soft but resilient; flexible but brave; ... to protect the country's Jiangshan, independence, and sovereignty. The diplomatic tradition that his father left behind is very unique and has its own identity. But in the end, it exudes the spirit: Full of courage, rich in humanity, filial piety, respect for justice, justice, and righteousness: "Bring great justice to overcome cruelty / Use kindness to replace tyranny"(Nguyen Phu Trong, 2022). Those are "the ideas and philosophies beyond his father's time, forever still valid".

It can be said that in Ho Chi Minh's era, inheriting the unique methods of his father, flexibly behaved during the revolutionary process, along with other fronts, the diplomatic front played an important role in the development of the country. revolutionary career, contributing to the great victories, and glorifying the nation's history.

3.2. Achievements in diplomatic activities

After more than 35 years of renovation, inheriting and promoting the glorious tradition of the nation, especially Ho Chi Minh's thought, while creatively applying the basic principles of Marxism-Leninism, selectively absorbing and Filtering the quintessence of world culture and progressive thought of mankind, foreign affairs with the identity of "Vietnamese bamboo" has achieved many good results and achievements. Detail:

Firstly, by breaking the siege and embargo, we have created and consolidated more and more firmly the external situation of openness, multi-lateralization, and diversification of relations, favorable for the renewal process. Currently, Vietnam has expanded and raised its diplomatic level with all its neighbors, major countries, and traditional friends. As a result, it is widely accepted and supported by the international community. Up to now, "our country has had diplomatic relations with 189 countries out of a total of 193 UN member states, of which 3 have "special relations", 17 are "strategic partners" and 13 The country is a “comprehensive partner” (Nguyen Phu Trong, 2022) and is an active and responsible member of more than 70 important international organizations and forums, such as the United Nations, ASEAN, APEC, ASEM, WTO, etc. The Party, State diplomacy, people-to-people diplomacy, and foreign affairs of branches, fields, localities, and enterprises are increasingly expanding, proactive, active, and in-depth, contributing to political and national consolidation. room, security; economy, culture - society is promoted, thereby enhancing political trust and interweaving interests with partners.

Second, create a favorable international environment and mobilize external resources to promote industrialization, modernization, and socio-economic development. After transforming to a socialist-oriented market economy, our country's economy has extensive international links with most of the important economies in the world. Currently, Vietnam has signed 15 free trade agreements (FTAs), including 3 new generation FTAs with very high standards. “If 30 years ago, we only had economic-trade relations with nearly 30

countries and territories, now we have economic-trade relations with 230 countries and territories; Total import-export turnover has reached about 600 billion USD so far, about 120 times higher than in the first years of the doi moi period”(Nguyen Phu Trong, 2022). On the other hand, in the context of the complicated development of the COVID-19 pandemic, Vietnam has actively contributed responsibly to the joint international effort in COVID-19 prevention and control, and at the same time enlisting support. great international support for vaccines, medical equipment, and therapeutic drugs, making an important contribution to the prevention and control of the COVID-19 epidemic and recovery and socio-economic development.

Third, foreign policy has played a pioneering role in maintaining a peaceful and stable environment, making an important contribution to firmly safeguarding the country's independence, sovereignty, unity, and territorial integrity. Border issues with relevant countries have been gradually resolved, creating favorable conditions to protect sovereignty and territory and contribute to consolidating peace and stability in the region.

Well-implemented bamboo diplomacy, combining "hard" and "soft", promoting peace: "We always raise the flag of peace, cooperation, actively exchange and negotiate with relevant countries to control disagreements, seek fundamental and long-term solutions to disputes by peaceful means based on international law” (Nguyen Phu Trong, 2022).

Fourth, our country's position and international prestige in the region and the world have been increasingly enhanced, actively and responsibly contributing to the maintenance of peace, development cooperation, and progress in the world. gender. In many important international issues, Vietnam's voice, initiatives, and solutions in the spirit of equality, harmony, and humanity have received the sympathy and support of the international community. Vietnam's position and prestige are increasingly enhanced in the international arena.

It can be said that efforts and results in foreign affairs have made a significant contribution to the history of our country after 35 years of renovation: "Our country has never had the opportunity or potential. power, position, and international prestige as today”.

Besides the above achievements, our country's foreign affairs also have limitations, "foreign affairs and international economic integration are sometimes not very proactive and not very effective"; lack of synchronous and effective solutions to minimize negative impacts in the process of promoting international integration; awareness and practical direction sometimes cannot keep up with the rapid and complicated changes of the situation; the coordination and cooperation between branches, levels, and localities are still lacking; strategic research, situation forecasting is not very methodical, the results are not as expected. To overcome the shortcomings and promote the diplomatic tradition of his father, the General Secretary requested to master 5 lessons learned from many congresses.

In the coming time, in the context of many favorable opportunities, difficulties, and intertwined challenges, "the forecast of the situation in the world and the region will continue to have many rapid, complicated, and unpredictable changes. Peace, cooperation, and development are still a big trend, but they also face many obstacles, difficulties, and

challenges. Globalization and international integration continue to progress but are also threatened by the rise of extreme nationalism, strategic competition, economic competition, and fierce trade war. Due to the impact of the COVID-19 pandemic, geopolitical tensions are increasing pressure on foreign relations as well as affecting the economic and political situation of each country, and climate change is becoming more and more important. a systemic challenge. Therefore, policymakers need to consider three major trends - rising nationalism, deteriorating geopolitics, and increasing digitalization, the world is in a serious multi-faceted crisis. The Fourth Industrial Revolution has developed strongly, creating breakthroughs in many fields, and bringing both opportunities and challenges to all countries. Countries adjust their development strategies and methods to adapt to the new situation. The Asia-Pacific region continues to have an increasingly important strategic position. In Southeast Asia, the security environment and sovereignty disputes in the East Sea are still complicated...” (Communist Party of Vietnam, 2021).

3.3. Tasks of foreign affairs in the period of international integration.

To contribute to the successful implementation of the Resolution of the 13th Party Congress, striving to 2025 - the 50th anniversary of the liberation of the South and reunification of the country, our country is a developing country with modern industry. beyond the low middle-income level; by 2030 - the 100th anniversary of the founding of the Party, our country is a developing country with modern industry, and high middle income; and by 2045 - the 100th anniversary of the founding of the Democratic Republic of Vietnam, now the Socialist Republic of Vietnam, our country will become a high-income, socialist-oriented developed country. We need to fully grasp the Party's guiding ideology, foreign policy principles, and foreign orientation.

Instilling and promoting bamboo diplomacy, mastering the principle of "always immutable, immutable"; always "knowing oneself, knowing others", "knowing the time, knowing the situation" to "resolutely combine" for the supreme benefit of the nation"(Nguyen Phu Trong, 2022), foreign affairs in the coming time need to be done. Good at the following tasks:

Firstly, upholding the principle of "bamboo diplomacy", foreign affairs need to renew thinking, boldly break through and be creative, find new ways of doing things, expand into new fields, and seek new partners. New work, new direction. Therefore, it is necessary to be proactive, regularly monitor, research, and firmly grasp developments in the region, the world, and international relations to promptly propose appropriate solutions. Emphasizing this requirement, it is required that diplomats "must be sharp, dare to think, dare to do, have the spirit of proactive attack, dare to go beyond the framework of old thinking and familiar fields to have new ideas and thoughts. think and act beyond the national level, reaching the regional and international level” (Nguyen Phu Trong, 2022). However, even with innovation, it is necessary to firmly grasp the principle of "always immutable, immutable", must be based on "staying principles, firmness, prudence, steadfastness in goals and sincerity and humility". , bearing the true identity of the Vietnamese bamboo tree "thin body, fragile leaves" but full of bravery, resilience, "soft and tight tie".

Second, continue to deeply grasp and properly implement the foreign policy of independence, self-reliance, peace, cooperation, multi-lateralization, and diversification of relations, and proactive and active international integration. wide; strengthen cooperation, continue to create interweaving strategic interests between our country and other countries, prevent conflicts, avoid confrontation, isolation, and dependence for the sake of the nation-nation.

The overarching goal of current foreign affairs is to maintain a peaceful and stable environment and; at the same time resolutely and firmly defend independence, sovereignty, sovereign rights, territorial integrity, and legitimate interests by international law. Always persistent, calm, lucid, wise, and properly handling foreign relations. This is a very important and challenging task, requiring the whole industry to make efforts and try to perform well.

Third, actively and actively participate in contributing to, building, and shaping multilateral mechanisms to raise the level of multilateral foreign affairs, considering this an important strategic orientation. Promote the important results of the multilateral forums that Vietnam has participated in, especially in coordination with partners to promote the implementation of the adopted initiatives of Vietnam. It is necessary to play a pivotal role in the process of building the ASEAN Community and continue to actively participate in the framework of the United Nations, especially in the implementation of the Sustainable Development Goals and participation in the conservation force. United Nations peacekeeping.

Fourthly, expand and further improve the effectiveness of external activities, especially economic and cultural cooperation, and cooperation in the fields of politics, security - defense with other countries; continue to bring relationships with partners, first of all, neighboring countries and big countries, into depth, stability and effectiveness; Prioritizing maintaining stability and momentum of relations, enhancing political trust, promoting cooperation in all fields, and at the same time dealing with differences and arising problems in the spirit of cooperation and friendship, manage disagreements, based on international law and regional practices”(Nguyen Phu Trong, 2022).

Fifth, attach importance to and further improve the quality of strategic research and forecasting, focusing on carefully assessing trends in policy and relations among major countries, neighboring countries, and regions, as political, economic, cultural, and social trends in the world and the region, especially in the face of the stormy impacts of the Fourth Industrial Revolution, digital transformation, digital economy, and society. number and dangers of disease and climate change.

4. Conclusion

In the new context, inheriting extremely valuable traditions and experiences from their forebears, imbued with the philosophy of diplomacy of bamboo, with a firm, confident and wise bravery, under the leadership of the Party. Vietnam's diplomacy will be "comparable with other countries and international friends; wholeheartedly, wholeheartedly serving the Fatherland, serving the people", contributing to promoting the country's rapid and sustainable development.

COMPLETE COMPANY INCOME TAX POLICY: A POINT OF VIEW FROM SOCIAL RESPONSIBILITIES OF BUSINESSES IN THE CONTEXT OF INTEGRATION

PhD student. Nguyen Ngoc Minh

fosaminhkt@gmail.com

Visio Training Joint Stock Company, Vietnam

Abstract

The first requirements on tax commitments in the integration process are the gradual reduction of taxes, including corporate income tax (CIT). This is the general trend to attract international investment flows to Vietnam. However, from the perspective of national interests in the short term, the tariff reduction has had a significant impact on state budget revenue. To offset this revenue, in addition to reducing public expenditures or increasing property taxes, the most effective measure is to increase the social responsibility (CSR) of enterprises to offset the CIT amount. reduce. In the framework of the article, assess the current status of CSR implementation of FDI enterprises, on that basis, propose some solutions to enhance CSR implementation of these enterprises.

Keywords: *improvement, social responsibility, foreign direct investment, corporate income tax, international economic integration*

1. Introduction

When participating in international economic integration, it is required that the tax system in general and the CIT policy of each country in particular must be adjusted in accordance with international practices. In particular, protectionist barriers, such as tariffs and customs unions, need to be gradually removed and replaced by a variety of non-tariff barriers. Moreover, the deeper the integration process, the more interdependence between countries will increase. This raises the issue of double taxation between countries or tax competition between countries to attract foreign direct investment. In the competitive trend, all countries aim to reduce the CIT rate to attract foreign investments. Similar to the general trend of the world, recently in Vietnam, the CIT policy has undergone 4 stages of tax rate adjustment to enhance FDI attraction, specifically:

(i) Phase 1 (starting in the late 1980s), FDI enterprises are allowed to apply the common tax rate of income tax at 25%. Meanwhile, domestic enterprises apply income tax rates of 30%, 40% and 50% depending on business lines (Law on Income Tax 1990). In addition, FDI enterprises also enjoy preferential tax rates of 10%, 15% and 20% applied to projects encouraging investment; be exempt from income tax for up to 4 years from the beginning of the business, reduce 50% of the payable income tax for the next 4 years, depending on the investment industry or the area of operation.

(ii) Phase 2 (from 1995 to 2000), Vietnam implemented tax reform in the context of opening up its economy, with participation in a number of bilateral and multilateral free trade agreements. According to the 1997 Law on Corporate Income Tax, which took effect from January 1, 1999 to the end of 2003, FDI enterprises were entitled to the common tax rate of 25% while domestic enterprises applied the common tax rate of 32%. Regarding tax incentives, FDI enterprises are entitled to a 2-year tax exemption, a 50% reduction in tax payable for the next 2 years and up to 4 years if they meet many investment promotion criteria. For special cases of investment promotion, the tax exemption period for FDI enterprises is up to 8 years. In general, the level of CIT incentives for FDI enterprises in this period is higher than that of domestic enterprises.

(iii) Phase 3 (from 2001 to 2010), Vietnam implements tax reform in the context that the economy has made strong development steps after many years of attracting FDI and applying the Law on Investment Promotion. domestic private. During this period, Vietnam carried out tax reform with a focus on three objectives: simplicity, fairness and efficiency. This means that the attraction of investment capital in general and FDI capital in particular is not only based on tax incentives but also on the basis of comprehensive reform of the tax system to create a favorable business and investment environment. favorable and fair business. The 2003 Law on CIT, which took effect on January 1, 2004, has unified tax obligations and tax incentives between domestic enterprises and FDI enterprises. Accordingly, the common CIT rate applicable to all types of enterprises is 28%. This tax rate is adjusted down to 25% from January 1, 2009 according to the Law on CIT (amended) 2008.

(iv) Phase 4 (from 2011 to present). During this period, the domestic and international context had many changes. The application of a growth model based on exploitation of natural resources, low-quality and cheap capital and labor has made Vietnam's economic growth unsustainable. This requires Vietnam to change its growth model towards improving quality and ensuring sustainability. Accordingly, the tax system reform in this period is aimed at realizing the goal of changing the growth model. The most important change to increase tax competitiveness and attract investment is the policy of reducing the general corporate income tax rate. After the amendments and supplements in 2013 and 2014, the common CIT rate was reduced from 25% to 22% (from January 1, 2014) and to 20% (from January 1, 2016). The Law amending and supplementing a number of articles of the Law on Corporate Income Tax in 2013 has added incentives for investment in industrial parks (except for industrial parks in areas with favorable socio-economic conditions) and projects expansion investment.

Thus, in addition to creating an open investment environment, tax incentives and other incentives, foreign investment flows into Vietnam continuously increase. Accordingly, since joining the WTO in 2007, Vietnam has welcomed a large amount of FDI in 2008 with a registered capital of up to 64 billion USD, more than three times higher than 2007. However, due to the global economic and financial crisis in 2008 and the public debt crisis

in Europe in 2010 caused FDI into Vietnam in the period 2009 - 2012 to decrease significantly before recovering and stabilizing in the period of 2013. - 2019. Entering 2020, due to the impact of the Covid 19 Pandemic, the world economy as well as Vietnam were severely affected. Accordingly, investment capital flows abroad decreased sharply, especially FDI investment. The amount of FDI in 2020 into Vietnam reached 21 billion USD, down 6.7% compared to 2019 (Figure 1). The value of newly registered FDI capital in this period is always 2-3 times higher than the adjusted registered capital. In 2021, although the Covid-19 pandemic is still complicated, FDI into Vietnam will reach 31.15 billion USD, up 9.2% compared to 2020. New and adjusted registered investment capital both increased. compared to 2020, especially adjusted capital increased sharply to 40.5%. This result demonstrates Vietnam's remarkable efforts in FDI attraction policy, with the desire to improve productivity and improve economic growth.

Source: General Statistics Office (2022)

It can be seen that, with the preferential CIT policy to attract foreign investment, in the short term, it will affect the state budget revenue. In addition, the fact that FDI enterprises are taking advantage of these incentives to reduce tax obligations is increasing. To overcome this situation, in addition to closely managing and monitoring business activities and tax compliance obligations of FDI enterprises, it is necessary to increase the contribution of these enterprises through raising social responsibility to compensate. partial loss of state budget revenue from corporate income tax.

2. Conceptual Framework

2.1. The social responsibility of FDI enterprises

The term "Corporate Social Responsibility" (CSR) first appeared officially in 1953 in the book "Social Responsibilities of the Businessmen" by author Howard Rothmann Bowen. Its purpose was to promote and urge asset managers not to harm the rights and interests of others and to encourage philanthropy to compensate for the damages caused by businesses to society. Bowen (1953) initially proposed the concept that the duty of businessmen is to pursue policies, make decisions, and take actions that align with the goals and values of society.

Since then, numerous different definitions of CSR have emerged. Each organization, company, and government perceives CSR from its own perspective and viewpoint, depending on its conditions, characteristics, and level of development.

Davis and Blomstron (1971) made a new breakthrough by defining social responsibility as the obligation of an individual to consider the impact of their decisions and actions on the entire social system. Companies also exercise social responsibility when they take into account the needs and interests of those affected by their business activities. This implies that companies should go beyond their narrow economic and technical interests.

In the report on CSR public policy, the World Bank (2003) defines that "the CSR of an enterprise and its commitment contribute to sustainable economic development through activities aimed at improving the quality of life for employees and their families, benefiting the surrounding community and society as a whole, in a way that is advantageous for both the enterprise itself and the overall societal development. The World Bank's perspective aligns with the concept of CSR put forth by I. Maignan, O.C. Ferrell (2004), and Rettab B, Brik AB, Mellahi K (2009) where CSR aims to generate and balance various benefits for individuals and related organizations, and enhance community welfare through voluntary business activities and contributions from enterprises. According to the European Union (2011), corporate social responsibility is defined as a process by which companies integrate social, environmental, and ethical concerns into their business operations and their interactions with stakeholders, beyond legal requirements and collective agreements.

In reality, CSR is a complex domain and is defined in various ways. However, despite different verbal expressions, the underlying essence of CSR fundamentally shares a common point: alongside the individual development benefits for each enterprise in accordance with existing laws, it must also be interconnected with the overall development interests of the societal community. The substance of CSR encompasses multiple aspects related to the conduct of the enterprise towards relevant stakeholders and entities throughout its operations. This includes producers, marketers, consumers, suppliers of raw materials and on-site materials, as well as the company's personnel, employees, and shareholders. It involves responsibilities towards the protection of resources and the environment, which essentially constitute shared responsibilities with the interests of the social community. This

includes humanitarian activities, charitable initiatives, and contributions to the overall development of the country. Thus, in a comprehensive sense, CSR of an *enterprise is a domain that reflects the awareness and actions towards the goal of societal benefits and values by the entity as a responsible member of society.*

Currently, research related to CSR of FDI enterprises is very limited. Among different groups of enterprises (domestic enterprises, joint ventures, FDI enterprises), there will exist specific differences in terms of scale, organization, and culture, which will lead to different approaches to the same specific issue, such as CSR. Considering social pressures, FDI enterprises often originate from developed countries investing in less developed countries, thus stakeholders in the host country usually have higher expectations and higher standards for the activities of FDI enterprises. In terms of economic pressures, FDI enterprises, with their cross-border operations and advanced scientific and technological capabilities, are expected to contribute more to the economic development of the host country. Thus, CSR of FDI enterprises can be understood as the FDI enterprise's implementation of activities to demonstrate responsibility towards stakeholders. These responsibilities *are entirely voluntary and encompass economic, legal, ethical, and philanthropic aspects. Implementing CSR not only brings benefits to society (through fulfilling responsibilities towards stakeholders) but also benefits the FDI enterprise itself (by enhancing its reputation). Therefore, FDI enterprises should proactively carry out CSR to balance the interests of both society and their own business. Only then can enterprises achieve sustainable development.*

2.2. The relationship between the responsibility of FDI enterprises and stakeholders

The theory of stakeholders associated with CSR provides a basis for identifying the most important stakeholders of an FDI enterprise and determining their concerns regarding the CSR of the company. Businesses, in the course of their operations, face various pressures from stakeholders such as shareholders, customers, employees, governments, etc. Particularly, for each stakeholder, the enterprise needs to have different responsibilities, including economic, legal, ethical, and humanitarian responsibilities. However, the resources of the enterprise are limited, and it is not possible to fulfill all responsibilities and satisfy all stakeholders simultaneously. Therefore, the implementation of CSR by the enterprise requires adjustment and changes based on prioritization, importance, and urgency determined by the subjective demands of each stakeholder. For example, at this time, the enterprise needs to carry out more CSR activities to satisfy the stakeholder group of employees, but at another time, the enterprise may need to focus on different CSR activities to meet the expectations of the community or shareholders. For FDI enterprises, which are foreign businesses investing and operating in the domestic market, their most important stakeholders are customers, employees, government, and the community. In summary, the stakeholders of FDI enterprises in implementing CSR are: Government, Employees, Customers, and the Community. The relationships in the implementation of CSR by FDI enterprises with stakeholders are illustrated in Figure 2 below.

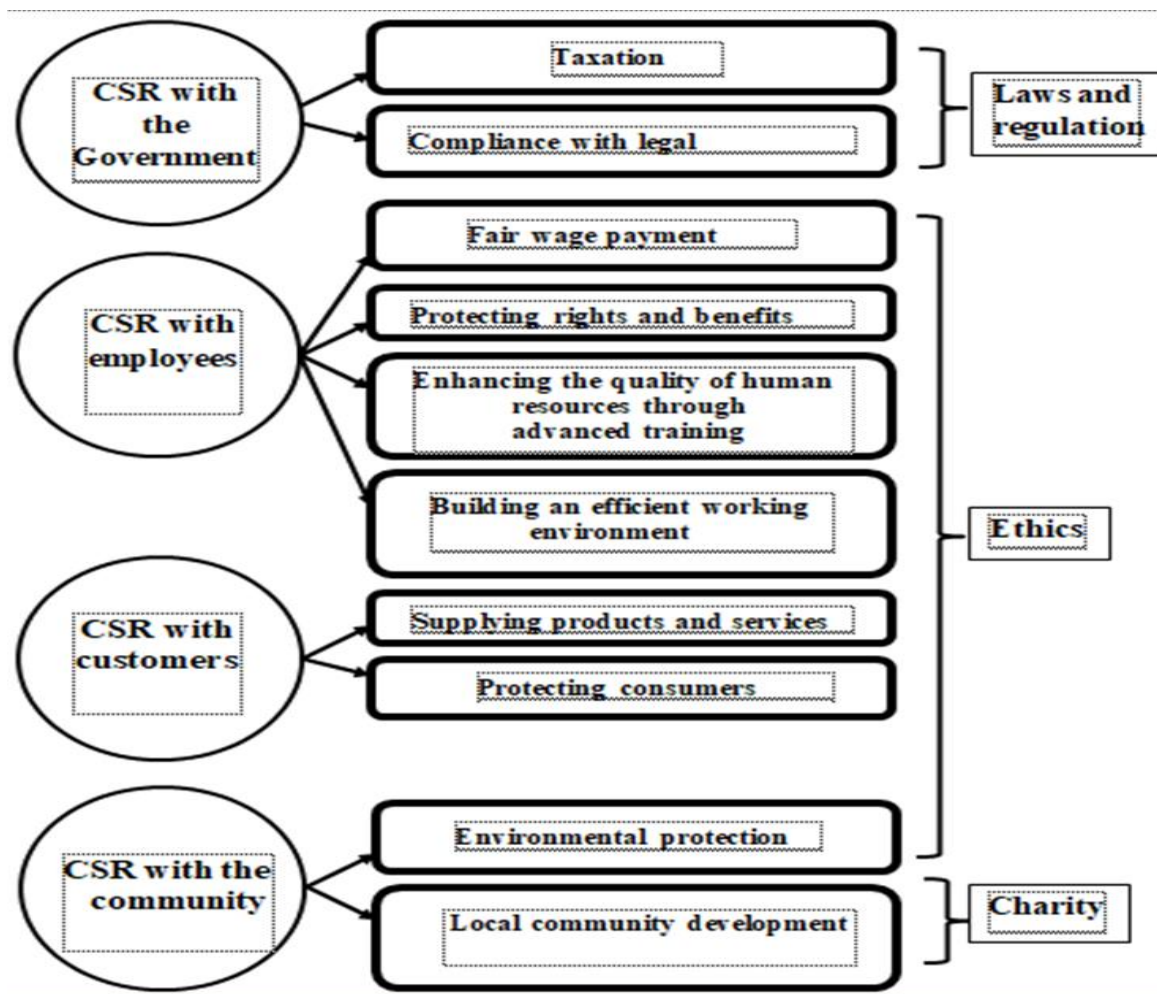

Figure 2: The relationship between CSR and stakeholders of FDI enterprises

3. Results

3.1. Social responsibility of FDI enterprises in Vietnam

Social responsibility of FDI enterprises is implemented in 4 aspects, including:

3.1.1. Social responsibility towards the Government

This responsibility is expressed through the obligation to pay taxes and comply with legal regulations, specifically the legal regulations related to customers and employees.

For tax payment obligations. The increase in capital flows of FDI enterprises into Vietnam leads to an increase in tax obligations of enterprises. However, the phenomenon of FDI enterprises taking advantage of loopholes and incentives in Vietnam's CIT law to find ways to reduce tax obligations is on the rise. According to the report of the Ministry of Finance, in 2020, there are 10,125 FDI enterprises with full-year production and business results, accounting for 40.2% of reported enterprises. But there is a problem, despite the fact that production and business activities of FDI enterprises still maintain stable growth, the number of FDI enterprises declaring losses is higher than the national average. Specifically,

the total accumulated loss on the financial statements of FDI enterprises by the end of 2020 was recorded at 623,337 billion VND, equal to 44% of the owner's investment capital. This figure in 2020 increased by 12% in the number of FDI enterprises with accumulated losses and by 20.1% in total accumulated losses compared to 2019. Domestic revenue (excluding crude oil) of FDI enterprises sector 2020 is 206,088 billion dong, down 6,111 billion dong compared to 2019. This is the first year in the period 2016-2020 that the state budget revenue of FDI enterprises has decreased compared to previous years. Due to great incentives in terms of corporate income tax, land use levy, land rent and other incentives (excluding transfer pricing and tax avoidance), the proportion of FDI enterprises' contribution to the budget is still lower than that of FDI enterprises. contribute to GDP. Typically, the tax payment figures for 2020 of some large FDI enterprises, such as Samsung Electronics Vietnam (the largest FDI enterprise), are lower than that of Gia Lam Urban Development and Investment Company (Vin Group Gia. Lam), higher than Techcombank; tax of Honda Vietnam, HEINEKEN Vietnam is lower than that of Bank for Agriculture and Rural Development of Vietnam. Among the top 30 largest tax paying companies, there are 23 Vietnamese enterprises (76.67%) and 7 FDI enterprises (23.33%), the top 3 largest tax paying companies 100% are Vietnamese enterprises.

For the responsibility to comply with legal regulations during the implementation of investment projects in Vietnam, FDI enterprises also violate regulations on labor and environment. In general, the enforcement of labor contracts between employees and employers in FDI enterprises is quite good. However, there are still many FDI enterprises that have not taken seriously their commitments in the contract, violating workers' rights, leading to labor disputes or collective cessation of work. The violations mainly focused on the following issues: salary, bonus, attendance; excessive overtime, unsafe working conditions, no social insurance contributions, behavior and management of employees... Of the total number of labor contracts executed at FDI enterprises, the number of labor contracts with indefinite term accounted for only 33.4%; Number of labor contracts from 1 year to less than 3 years, accounting for 55%; the number of contracts from 3 months to less than 1 year accounted for 8.7% and under 3 months accounted for 1.4%; The remaining 1.5% is the number of employees working in FDI enterprises without labor contracts (Nguyen Thi Viet Nga, 2020). As reflected by employees, in order to avoid paying social insurance premiums, some employers have switched from signing labor contracts to signing service contracts, consulting, and collaborators for some employees. frequent job. Although, FDI enterprises all apply working time of 8 hours/day, 48 hours/week, however, the number of overtime hours is relatively large, on average each employee works overtime 275.8 hours/year. The number of overtime hours is especially high in textile, footwear and electronics enterprises. Many businesses have overtime hours of up to 500-600 hours/year/employee. Department of Labor, War Invalids and Social Affairs of Ho Chi Minh City. Statistics from Ho Chi Minh City: The average overtime of employees is 0.89 hours/day, 22 hours/month, 260 hours/year for 90% of employees. Thus, the number of workers who have to work overtime is very large. The average total overtime hours in the year is about 30% higher than the provisions of the Labor Code.

In addition to the positive contributions, the FDI sector has also been creating many negative impacts on the sustainable development of the country, namely negative impacts on the ecological environment causing great damage to the property and health of the community. The environmental violations of FDI enterprises that are often encountered during the inspection process are violations of environmental standards on emissions, wastewater, and solid waste. Some typical enterprises are not self-conscious in complying with regulations on environmental protection, so they have had negative impacts on the environment such as the waste discharge case of Vedan Company in Dong Nai, Tung Kuang Company in Hai Duong, Long Tech Company in Bac Ninh, Taiwan Fomosa Company in Ha Tinh... More and more FDI enterprises in the fields of environmental pollution expanding investment in Vietnam is also a worrying trend. These enterprises often have low technology, high energy consumption and high emission capacity. The most concentrated industries and fields are: textiles, chemicals, electronics, paper, cast iron - steel. This is completely contrary to the expectation as well as the statement of bringing advanced technologies and applications into production in Vietnam of FDI enterprises. In fact, many industrial parks have come into operation but have not yet implemented the construction of a local wastewater treatment system or have but do not operate or operate inefficiently or degraded. The number of FDI enterprises with advanced and modern technology is very low, only about 5%. Currently, FDI projects in Vietnam mainly have medium technology, about 80% of enterprises, of which 30-40% use technology of Chinese origin. Currently, the number of FDI enterprises using outdated technology accounts for about 15%, leading to risks and challenges of energy consumption and resource depletion. According to the inspection results of the General Department of Environment (Ministry of Natural Resources and Environment) in 28 northern provinces in 2017, 2018 and 2019, the rate of FDI enterprises violating regulations on environmental protection increased in years. Specifically, in 2017 there were 12/27 violating enterprises, accounting for 44.5%; In 2018, there were 14/25 violating enterprises, accounting for 56% and in 2019 there were 13/19 violating enterprises, accounting for 68% (Bui Hang, 2022)

3.1.2. Social responsibility for employees

Criteria for assessing the implementation of social responsibility for employees include fair wages, non-discrimination, good remuneration and training policies, and favorable working environment.

Basically, FDI enterprises have performed well on social responsibility in terms of paying fair wages to employees; the actual salary is 14 - 15% higher than the salary stated in the contract; the actual salary paid tends to increase from 10 - 25%/year; the difference between the actual wages paid to the laborers with the highest technical expertise and the unskilled workers is 3.5 times; the average income per employee in FDI enterprises is higher than that of state-owned enterprises and non-state enterprises; 95 - 96% of FDI enterprises participate in paying social insurance for employees; working conditions and occupational safety and health are relatively good because it is newly established and has modern equipment and machinery; 3/4 of surveyed enterprises have a trade union with 80% of

employees joining a union; 56% of enterprises have a collective labor agreement and 45% have a grassroots mediator (Ngo Thanh Loan, 2022). In addition, there are still some disputes about salary and bonus between employees and FDI enterprises on issues such as slow adjustment of wages when the State increases the minimum wage; wages between different types of labor are not clearly regulated, especially between simple and technical workers, between people who have worked for many years and those who are new to the profession, the difference is not significant; work overtime, overtime beyond the prescribed time but pay inadequate salary.

About protecting the rights of workers: Workers in many FDI enterprises are also increasingly interested in and protecting their interests. Typically, through the review and assessment of the Labor Confederation of Bac Giang province, up to 80% of agreements of FDI enterprises in the province are beneficial to employees, outside the mandatory provisions of the law. labor law. Some enterprises strictly implement new signing, re-signing or supplementing arising appendices with favorable terms for employees such as: Nichirin Vietnam Co., Ltd (Quang Chau industrial park) has a clause allowing workers to breaks between shifts to relieve stress; Viet Pan Pacific Co., Ltd (Bac Giang City) rewards active employees on a weekly and monthly basis; Haem Vina Co., Ltd (Song Khe Industrial Park - Noi Hoang) distributes vitamins to pregnant female workers and advances the salary for 6 months of maternity leave for female workers giving birth to ensure living expenses... In addition, some FDI enterprises still have some shortcomings in building relationships with employees, affecting the interests of employees. Many FDI projects still have social insurance debt, labor disputes, with thousands of strikes demanding benefits in terms of salary, bonus, overtime, breaks and welfare regimes. (low wages, unsecured housing, poor quality meals, travel expenses, child support allowance, seniority allowance ...) between employees and employers.

Regarding the issue of training to improve the quality of human resources, according to the survey results of VCCI in the PCI 2017 report, the cost of labor training of FDI enterprises has increased a lot since 2014. Specifically, the average cost of this activity accounted for only 3.6% of business expenses in 2013, but then spiked to 5.9% in 2014 and at 5.7% in 2020. The increase This training cost may be due to the enterprise's shift towards producing higher value-added products, requiring workers to receive more specialized training. This also shows that FDI enterprises are very interested in and spend a lot of money on training and building human resources in order to improve the quality of their labor, thereby improving productivity and product quality, and improving business efficiency.

On the issue of building a safe and effective working environment for employees. According to the assessment of the authorities, in ensuring labor safety at enterprises, FDI enterprises perform better than domestic enterprises. The reason is that these enterprises have better financial potential, so there is a greater investment in occupational safety. With multinational corporations, they always have a set of safety standards to perform at factories. However, in Vietnam, recently, there are still many serious occupational accidents and unsafety incidents at FDI enterprises. Typically, the accident caused by a scaffolding

collapse in March 2015 that killed 13 people and injured 29 people at the casting of sinking tanks, the construction site of production and installation of gravity tanks at the Formosa Project of the Company. Hung Nghiep Formosa Ha Tinh Iron and Steel Company Limited.

3.1.3. Social responsibility towards customers

Customers are the most important strategic business partners of enterprises in general and FDI enterprises in particular, determining the growth rate, revenue, profit and success of enterprises. Therefore, in the matter of providing products and services, most FDI enterprises have well done their distribution role, in order to bring products and services to customers, thereby bringing in revenue for the company. However, for the quality of products and services and ensuring the safety of customers, many FDI enterprises have let a series of events related to agricultural products and food not occur. ensure food hygiene and safety and cause negative consequences to customers. Cases of production of food containing substances harmful to human health, such as soy sauce containing the carcinogen 3-MCPD, phosmol-containing noodle soup, foods containing fenugreek, milk containing melamine, production and import of drugs fake,...The situation of fake goods, imitation goods, poor quality goods all prove that FDI enterprises that produce it do not strictly implement social responsibility for customers.

3.1.4. Social responsibility towards the environment

This responsibility is demonstrated through environmental protection and community development activities

Environment is also one of the most prominent and pressing issues in the society of FDI enterprises today. In fact, many FDI enterprises are considering social responsibility to the environment as a "burden" or just a way of marketing activities, creating an image to benefit businesses. Outdated technology transfer In more than 30 years of attracting FDI, it can be seen that 80% of the technologies of the FDI sector to Vietnam are still medium technologies that have a great impact on the environment, high technology accounts for only 6%. In addition, FDI enterprises' indiscriminate exploitation and lack of planning of mineral resources from oil and gas to coal, ore... have been causing great loss of Vietnam's non-renewable resources.

Community development. For the community in general, the first responsibility of an FDI enterprise is to protect the environment, and then to contribute to the development of the local community where the enterprise operates. In particular, doing charity is a honorable act of businesses to develop the community, help the poor, and build an image. Typical charitable activities through charity include granting scholarships, building charity houses, building schools, providing clean water, visiting and donating essential equipment and supplies, recruitment. periodically, providing free medical services, supporting and supporting areas affected by natural disasters or disasters, etc. Depending on each FDI enterprise, it has done well to different levels. However, one thing in common is that FDI enterprises often not only perform CSR as a simple volunteer activity, but they also regularly deploy these activities to be able to support more areas in need. through cooperation with

society and the locality. Korea and Japan are currently the two countries with the largest total investment capital among 115 countries investing in Vietnam, accounting for about 50% of total foreign investment in Vietnam. Korean and Japanese enterprises are also pioneers in charitable programs as well as contributing to the community.

3.2. Some raised issues

Firstly, there still exist many FDI enterprises that consistently report losses in their business operations and engage in transfer pricing practices, which regulatory authorities have not been able to detect, resulting in damage to the state budget and an unhealthy competition environment among enterprises.

Secondly, FDI enterprises continue to violate regulations on labor and environmental standards, while these regulations are relatively lower compared to the countries they originate from. These enterprises take advantage of the incomplete development of Vietnam's legal framework, intentionally evade compliance, employ cunning tactics, and lack self-awareness in adhering to labor and environmental regulations. Moreover, many enterprises still perceive CSR regarding labor and the environment as a burden or merely a marketing tool to create a favorable image for their own benefit.

Thirdly, there are still FDI enterprises that do not pay sufficient attention to protecting the rights of workers. Some of these enterprises focus on exploiting cheap labor with minimal training, even resorting to probationary periods to continuously replace workers. Many enterprises have a high proportion of female labor, but with low wages that may lead to occupational diseases. Furthermore, many FDI projects experience issues such as accumulated social insurance debts and labor disputes, with thousands of strikes demanding rights related to wages, bonuses, overtime, break times, and other welfare benefits between employees and employers.

Fourthly, environmental issues are also among the most prominent and concerning problems in the FDI enterprise's current society. A series of events related to the operation and production activities of these enterprises have had severe consequences on the environment, such as wastewater discharge causing water and air pollution, noise pollution, and soil contamination. Moreover, many FDI projects employ outdated technologies and lack self-awareness in complying with environmental protection regulations, resulting in negative impacts on the environment.

4. Discussion and conclusion

4.1. Discussion

Solutions to improve the implementation of social responsibility of FDI enterprises in Vietnam towards perfecting the corporate income tax policy in the context of integration

In order to improve the social responsibility of FDI enterprises, it is necessary to have synchronous solutions from the state management agencies in creating and perfecting the legal system and FDI enterprises themselves in developing specific action strategies. Accordingly, the following recommendations are made:

4.1.1. For state management agencies

Firstly, to develop a comprehensive and complete legal system to harmonize the interests of employees and enterprises, and national interests, in line with the international integration process in order to facilitate and encourage enterprises to integrate actively incorporate CSR programs into their business strategy. At the same time, it is necessary to soon complete legal policies, especially the Law on Environmental Protection; reviewing and amending inappropriate contents between the Law on Environmental Protection and other specialized laws in order to ensure the uniformity and consistency of the legal system, and promptly remove difficulties and obstacles in practice. Promulgate regulations on pollution prevention and reduction and environmental monitoring, regulations on emission limits; Enterprises must publicly disclose information about the environment and solutions to treat emissions.

Second, promulgating and implementing policies to support enterprises and encourage enterprises in the implementation of social responsibility. The Government needs to strengthen forms of encouragement, encouragement and reward for businesses that are self-conscious and well perform social responsibilities, such as social responsibility awards, "green" brands, and granting certificates to businesses to ensure they requirements related to CSR standards in the applicable codes of conduct... Besides, the Government can also issue policies to encourage and support enterprises to implement CSR.

Third, clearly delineate responsibilities and strengthen coordination among functional agencies. The coordination between the State management agencies and other relevant subjects also plays a very important role, because the social responsibility of enterprises is only valued and becomes urgent when there is a synchronous monitoring mechanism, there is a combination between the government and civil forces in society, especially associations, NGOs and the media and press. Thereby awakening the interest in CSR of enterprises, and thus through the market, encouraging enterprises to integrate social responsibility in parallel with business strategies, and at the same time commit to fulfill this responsibility properly and fully.

4.1.2. For FDI enterprises

Firstly, it is necessary to further improve and change the perception of FDI enterprises on social responsibility. Accordingly, the first is to change the perception of the implementation of social responsibility for the team of senior managers in the enterprise. The implementation of CSR is not simply a matter of business ethics or charitable activities in the traditional sense; are not activities that require businesses to spend costs without bringing economic benefits. On the contrary, implementing CSR will help businesses gain many advantages in competition in the market. Therefore, enterprises need to implement a training plan and disseminate understanding of CSR for employees and management team through courses and participation in practical experiences such as environmental protection programs to improve the quality of life. increase the awareness of enterprises on the issue of social responsibility.

Second, build and comply with the internal code of conduct. The internal code of conduct of enterprises is based on core values and includes universal principles in the United Nations Global Compact. Through this set of rules, enterprises can express their views on the definitions of social responsibility according to the policy of the collective interests of enterprises, must go hand in hand with the interests of society and towards long-term and sustainable development.

Third, develop a strategy to implement social responsibility. Enterprises need to have a long-term strategy in developing and implementing CSR standards. The implementation of social responsibility in the full and true sense is not a simple problem and lies within the immediate ability of most FDI enterprises in Vietnam, because of the limitation of awareness and of the source factors. resources, including financial, technical and human resources. Therefore, enterprises need to develop an appropriate roadmap in step by step implementation of CSR contents that are not only consistent with common standards, but also accepted by relevant stakeholders, actively contributing to the implementation of social responsibility activities. The development of Vietnam's economy is in the process of deeper and deeper integration into the regional and global economy.

4.2. Conclusion

In general, FDI enterprises operating in Vietnam in the past time have relatively fully implemented the CSR aspects in their business activities. However, there are many limitations to achieving real value, bringing sustainable development to the environment, society, workers and economy of the host country. In order to strengthen the implementation of social responsibility of FDI enterprises in Vietnam in order to perfect the CIT policy, it is necessary to have a synchronous solution from the state management agencies and FDI enterprises themselves in encouraging policies, voluntarily implementing and consider this as a focus towards sustainable development.

Abstract

Implementing the Party's policy at the XIII Congress on digital transformation, the Party Committee of Thai Nguyen province has pioneered implementing digital transformation in the whole province. After more than 2 years of implementation, in Thai Nguyen province, there have been many changes in areas such as public services, agricultural economy, population management, etc. The results achieved in these fields are proving that implementing the policy of the Party Committee of Thai Nguyen province is correct. By the method of history, logic, analysis and evaluation, this article contributes to clarifying the results achieved in a number of fields from which to draw some initial experience in leadership and direction activities. Local economic development is associated with the implementation of digital transformation of the Party Committee of Thai Nguyen province.

Keywords: *digital transformation, the Party Committee of Thai Nguyen province, leadership, application, economy*

1. Introduction

Digital transformation is an inevitable and objective trend that plays a very important role for all countries, especially for developing countries that need to apply scientific and technological achievements in production. This is also a phrase that has been mentioned a lot in recent times in Vietnam, especially after the 13th Party Congress affirmed that it must "strongly promote national digital transformation, develop the digital economy and digital society to create breakthroughs in improving productivity, quality, efficiency and competitiveness of the economy" [6, p.46]. The Vietnamese government has promoted the application of digital technology in various fields of social life in order to strongly develop our economy in the coming years. Implementing the policy of the Central Committee, the Party Committee of Thai Nguyen province has urgently developed a plan to implement digital transformation in the whole province and become the leading province in implementing digital transformation in Vietnam. This is a new policy and is still in the process of implementing this policy, so there has been no research on the leadership of the Party Committee of Thai Nguyen province for digital transformation.

2. Conceptual framework

Thai Nguyen is an economic, political - social center of the Northern Midlands and Mountains, it has an important position in the country's socio-economic development strategy. In 2022, Thai Nguyen is the leading province in implementing digital transformation under the Prime Minister's Project 06 on "Development of population data, electronic identification and authentication for national digital transformation". period 2022 - 2025, vision to 2030".

Recognizing the importance of digital transformation for the socio-economic development of the province, starting from 2021, after the Provincial Party Committee issued Resolution No. 01-NQ/TU "On the program digital transformation of Thai Nguyen province, period 2021 - 2025 with orientation to 2030" on December 31, 2020. On the basis of assessing the current situation, situation as well as development trends of the country in the following years, the Provincial Party Committee has pointed out the importance of digital transformation for economic development. provincial society. From there, affirming the need to digitize all fields to bring about high efficiency in social management. Regarding the importance of digital transformation, the Provincial Party Committee commented: "Digital economy initially contributed to the economic development of the province; digital technology is being applied in industries, agriculture, healthcare, education and services; appeared many new forms of business and services, based on digital technology and the Internet, contributing to job creation, income improvement and people's quality of life" [2].

However, the digital transformation process in Thai Nguyen still faces many difficulties, revealing many limitations such as: Technical infrastructure has not been synchronously invested (in 2019, ranked 36th out of 63 provinces and cities); many enterprises in the province have not actively approached, applied and developed modern technology; digital economy scale is still small; Digital transformation poses many challenges both economically and socially, especially in disadvantaged areas, mountainous areas, highlands, ethnic minority areas...etc .The fight against crime in space network, ensuring network safety and security is still difficult and challenging.

The Party Committee's Executive Committee pointed out that the causes of these difficulties are: The awareness of digital transformation among cadres, civil servants, public employees, people and in social life is still incomplete; investment resources for information technology have not met development requirements; thinking in digital transformation is slow to innovate, has great inertia; State management of digital transformation has not kept pace with reality; The coordination between agencies, units and localities is not really close.

Since then, the Provincial Party Committee has set a general goal in Resolution No. 01-NQ/TU that is: To fundamentally and comprehensively renovate the management and administration of the State towards building a digital government; develop the digital economy and digital society, and promote production and business activities in the direction of digital technology application, forming digital technology enterprises that are competitive in the market; strive to turn Thai Nguyen into a digital transformation center of the Northern Midlands and Mountains, by 2025 in the group of 15 leading provinces and cities nationwide

in digital transformation, contributing to the successful implementation of the Great Resolution 20th Provincial Party Congress, term 2020-2025, creating a premise to 2030 in the group of 10 leading provinces/cities nationwide in digital transformation. On the basis of the overall goal, the Resolution has stated that the basic goal by 2025 is to develop digital government with over 90% of online public services at level 4, 100% of the reporting regime among the various levels of government is completed splicing; develop the digital economy in order to improve the competitiveness of the provincial economy; develop digital society to close the digital gap. The basic goal by 2030 is that over 90% of people and businesses are satisfied with the province's public services, the digital economy accounts for over 30% of GRDP, strive to have more than 3,000 digital businesses, universalize broadband internet services, widen fiber optic cables and universalizing 5G mobile networks.

On the basis of objectives, the Resolution has set out specific tasks and solutions to achieve the set targets, namely:

- Strengthen the leadership of Party committees at all levels, improve the effectiveness and efficiency of State management, raise awareness about digital transformation: Party committees and authorities at all levels strengthen leadership and practical direction. implement the directives and resolutions of the Central Government on digital transformation, especially: Resolution No. 52-NQ/TW dated September 27, 2019, of the Politburo on a number of guidelines and policies to actively participate in the Revolution fourth industrial network; Decision No. 749/QĐ-TTg dated June 3, 2020, of the Prime Minister approving and promulgating the National Digital Transformation Program to 2025, with a vision to 2030.

- Promote propaganda, mastery, study and raise awareness of all levels, sectors, officials, party members, business community and people about the necessity and urgency of digital transformation. The heads of party committees and administrations at all levels are directly responsible for digital transformation in their respective agencies, units, organizations, domains and localities; pioneering, taking the lead in digital transformation to improve the leadership, direction and administration capacity of their localities and units; consider the implementation of the Resolution as one of the criteria for evaluating the performance of tasks of heads of Party committees, authorities at all levels and departments, agencies and units.

- Develop mechanisms and policies to promote the digital transformation process of the province, promote the development of comprehensive, effective digital transformation enterprises that are suitable for the digital environment; create favorable environment and conditions to promote start-up and innovation activities; actively attract digital enterprises to invest in the province; develop human resources for the digital transformation process, focus on training, fostering and attracting high-quality information technology human resources ready to participate in the digital transformation process of the province.

- Focus on investing in technical infrastructure to meet digital transformation such as upgrading the internet, mobile networks, building digital government, developing digital economy and digital society, ensuring network safety and security.

The policy of digital transformation in Resolution No. 01 of the Party Committee of Thai Nguyen province shows the determination to deploy digital technology application in three basic areas: government, economy and society to create a change in development socio-economic development and improve management efficiency of all levels of government in the province.

3. Results

3.1. Digital transformation in agriculture

Digital transformation in agriculture has been identified by the Party Committee of Thai Nguyen province as having a particularly important role in the development of modern large commodity agriculture. Implementing Resolution No. 01-NQ/TU dated December 31, 2020, of the Executive Committee of the Provincial Party Committee, Thai Nguyen Department of Agriculture and Rural Development soon established a Steering Committee, developed a plan and coordinated with other departments, branches, and localities to organize implementation. In which, focus on a number of main contents: Applying Digital Transformation to serve administrative reform and improve the efficiency of state management of the industry; to step by step digitize and build a system of sectoral data on land, crops and livestock, and to plan concentrated production areas in service of state management and to attract investment in agriculture and rural areas; increase the posting and dissemination of information on agriculture and rural areas through the Department's website.

Implementing the goals and tasks set out, the Department of Agriculture and Rural Development has implemented online conferencing solutions, built a management and operating system to carry out the work. In 2021, the Department of Agriculture and Rural Development received and processed 13,819 level 4 dossiers out of a total of 29,945 dossiers, reaching 46.1%; In the first 6 months of 2022, 11,073 level 4 dossiers were received and processed out of a total of 11,771 dossiers, reaching the rate of 99.42% [3]. Tree management software "ThaiNguyen SmartTrees" continues to be managed and operated effectively with over 4.9 million trees attached with QR codes, fully updating tree information such as tree type, planting time, tree coordinates on a digital map, images of trees, etc. Application of specialized software for forestry activities such as Software to monitor changes in forest resources. Management software for wildlife farming with over 150 farms, 50 species, and 27,470 individuals. Effectively exploiting and using parameters at 29 automatic rain gauge stations and 06 online camera monitoring systems at some dikes and river basins in the province to coordinate and provide forecast bulletins, disaster warning for Thai Nguyen Intelligent Operation Center. From February 1, 2020, collecting rural water bills by electronic invoices on software helps save costs, time, and manage information and data.

Besides that, the Department of Agriculture and Rural Development is also developing data management software for more than 500 enterprises and cooperatives engaged in agro-forestry-fishery production and trading, including information on production scale, production process (VietGAP, organic), the process of harvesting, processing, packaging, self-declaration of products, documents proving that the

establishment is qualified for food safety, traceability of agricultural products; Training and guiding 50 enterprises and cooperatives to update information on smartphones themselves, the state management agency is responsible for monitoring and handling violations. Up to now, agricultural product production and trading establishments in the province have used over 4.5 million QRCode traceability stamps, helping consumers easily look up product records, thereby creating the trust for agricultural products of the province. In the province, there have been 250 pig and poultry farms that have partially or fully applied information technology in providing water and feed for livestock, automation in the supply of drinking water, feeding troughs..., monitor temperature and humidity in the livestock farm by smartphone, via internet-connected camera; Use solar energy to power the farm. There are about 72 agricultural cooperatives in the province that apply IT in management, administration, production and business activities such as using QR codes for traceability, some cooperatives are granted planting area codes to monitor and control controlling production situation, applying accounting software through MISA ASP service accounting platform, using electronic invoice software; digital conversion applications to sell goods through electronic exchanges such as postmart.vn, voso.vn, thainguyentrade.gov.vn, etc .Some typical cooperatives in IT application, digital transformation such as Hao tea cooperative Dat, Tam Tra Thai Cooperative, La Bang Tea Cooperative, Tan Cuong Midland Tea Cooperative. In order to promote the development of the agricultural and rural digital economy in the province, the Department of Agriculture and Rural Development has coordinated with the Department of Information and Communications, Thai Nguyen Post Office, Viettel Thai Nguyen, etc, agricultural production households on the e-commerce platform with more than 80,000 households having been guided and trained in digital skills; nearly 75,000 households can open booths on the e-commerce floor and are provided with digital payment accounts; nearly 2,000 agricultural products have been put on the e-commerce floor, along with organizing traditional trade promotion and promotion activities, the Department of Agriculture and Rural Development also supports and encourages OCOP subjects to promote activities. promote and introduce products on social networking sites (Facebook, fanpage, Zalo, e-commerce sites), the provincial portal, the website of the Department and its affiliated units. Up to now, most businesses and cooperatives have advertised, introduced and sold products on digital platforms and social networking sites. In 2021, guided to build scripts and livestream techniques to sell agricultural products on social networks directly to 500 people and thousands of people by online form; support product trademark registration; design packaging, labels, product catalogs; support registration of codes, barcodes and website to promote products for 132 businesses and cooperatives. There are 129 OCOP products of the province that have been introduced, promoted and sold on platforms such as C-Thai Nguyen, VnPost, Voso, Sendo, Lazada, Shopee, etc.

3.2. Developing a digital technology business

The policy of the Party Committee of Thai Nguyen province is to develop digital technology enterprises with modern digital technology products and services, forming competitive digital enterprises in the market to support the digital transformation process;

promoting the development of the information technology industry, making an important contribution to the development of the digital economy and the growth of the province's GRDP; strive to turn Thai Nguyen into a digital transformation center of the Northern Midlands and Mountains region. Therefore, the province has focused on developing digital businesses, in order to bring businesses in the province to catch up with large domestic and international enterprises.

Up to now, Thai Nguyen has 324 digital technology enterprises focusing on the following fields: Information Technology Services; trading and distributing information technology; digital content; manufacturing hardware, electronics, etc. The province's total digital economic revenue in 2022 is estimated at about \$26 billion. In which, there is the contribution of digital technology enterprises in the province. Thai Nguyen province's e-commerce trading floor integrated on CThaiNguyen platform has reached over 5 million visits with more than 2,200 products.

In addition to developing digital technology enterprises, the province also sets out policies and guidelines to focus on supporting businesses, especially small and medium enterprises, in digital transformation. Implement Plan No. 84/KH-UBND dated May 10, 2022 of the Committee of Thai Nguyen province on the implementation of the project to determine the index to assess the level of digital transformation of enterprises and support digital transformation enterprises in the locality of Thai Nguyen province. Department of Information and Communications cooperates with MISA Joint Stock Company to support businesses to experience and use digital platforms to develop the digital economy. Organized 33 training courses/classes, training skills in using and exploiting digital platforms through online and face-to-face conferences for 172 businesses/individuals with over 1,200 attendees; organized 02 seminars on solutions to digital transformation of enterprises, cooperatives, and business households for over 160 people; organizing 7 training courses, supporting the use of software for businesses and business households. Coordinating with the Association of Young Enterprises, Small and Medium Enterprises to pilot the assessment of the level of digital transformation of enterprises (DBI) for 06 enterprises, advising businesses to choose digital platforms in the SMEdx program to experience and implement digital transformation. The Department of Information and Communications has built a .vn domain name registration portal in Thai Nguyen province and supported the free deployment of 15 websites for businesses and cooperatives to promote the development of local digital businesses. The Department of Information and Communications held a business dialogue conference with enterprises representing the Union of Cooperatives, the Provincial Business Association; associations, business associations, entrepreneurs and over 80 enterprises operating in the field of Information and Communication, enterprises applying digital in production and business activities in the province.

3.3. Application of digital technology in population data management

As of 2022, the province has completed 11/11 public services (confirmation of ID number when issued with a citizen ID card, Level 3; Re-issuance and change of CCCD card, Level 3; Permanent residence registration, etc.) Registration of temporary residence, Level

3; Declaration of temporary absence, Level 4; Notice of residence, Level 4; Seal, Level 3; Registration and issuance of license plates for motorcycles and motorcycles level 3; Collection of fines for handling administrative violations in the field of road traffic through video recording devices (cold fines) level 4; Issue, re-issue, amend and supplement ordinary passports). 10/14 public services have been performed (birth registration, death registration, marriage registration; judicial records have been integrated with public services on the Thai Nguyen provincial public service portal and public services) new electricity supply from the low-voltage grid; procedures for changing the subject of power purchase and sale contracts through the national public service portal level 4; registration for the national high school graduation exam and university and college admissions; Registering for the first time, registering to change tax registration information with taxpayers who are households and individuals; Settlement of unemployment benefits; Integrated deduction of payment deductions in the renewal of health insurance cards per household). Regarding the progress of bringing public services to the national public service portal and the resident public service portal, Thai Nguyen has 1,231 administrative procedures at 3 levels at level 4, of which: At the provincial level, there are 1,072 administrative procedures under 18 fields; district level has 115 administrative procedures in 07 groups of fields; At the commune level, there are 44 administrative procedures in 04 groups of fields.

The province has completed the construction of the "Software to digitize and manage the results of administrative procedures", complete the integration of the function of digitizing records and guide units and localities to implement the digitization process records and results on the electronic Single Window Information System, software to digitize and manage results of administrative procedures; issue 6,450 government-specific personal digital signatures to state agencies of the province, in which 100% of officials, leaders, civil servants and public employees are directly involved in the process of handling administrative procedures. issued and guided to use digital signatures. Starting from June 1, 2022 at the Provincial Public Administration Service Center, digitization of records and papers in receiving and handling administrative procedures for people and businesses has been carried out. administrative.

For the group of utilities serving socio-economic development, Thai Nguyen's digital citizens have also performed well a number of key tasks such as:

- Integrating social insurance and health insurance information into chip-based citizen ID cards and VNEID application implemented by Vietnam Social Security and the Ministry of Public Security; Health insurance medical examination and treatment facilities in the province shall cooperate in welcoming patients for medical examination and treatment covered by health insurance with their citizen IDs with a chip or via the VNEID application (applicable to public employees). people have successfully registered an electronic identity account provided by the Ministry of Public Security).

As of June 27, 2022, in Thai Nguyen, there are:

- + Number of citizen IDs synchronized with valid health insurance cards for medical examination and treatment with citizen identification: 488,995/1,206,275 health insurance card.

+ Total number of searches: 1,519 times.

+ Total medical examination and treatment establishments that have received medical examination and treatment with health insurance by citizen identification: 110/223 establishments.

+ Issued: over 6,616 children's health insurance cards through data communication with the Ministry of Justice. Implement electronic identification accounts for citizens in the province according to Plan No. 2433/KH-CAT-PC06 dated March 17, 2022 of Thai Nguyen Provincial Police, until July 28, 2022. 58,816 accounts for citizens.

- As of July 28, 2022: Issued 982,460/1,039,299 CCCD with chip with 94.53% - Issued citizen identification for the age group 2004 - 2007 (time 17/3/2022 - 2/7// 2022): The Ministry of Public Security assigned the provincial police to issue 9,676, has granted 9,130 cases, reaching 94.4%, and 545 cases have not been issued.

3.4. Performing public services online

Providing high-level online public services is always a key task in e-government development towards digital government; improve the effectiveness, efficiency, publicity and transparency of activities of state agencies. From there, it will reduce time and costs for organizations and individuals when carrying out administrative procedures. To promote online public services, it is necessary to focus on innovative solutions and promote the application of information technology in state management, especially in handling administrative procedures. On July 20, 2022, the Provincial People's Council issued Resolution No.11/2022/NQ-HDND stipulating the rate of fee collection for level 4 online public service provision in Thai province. Accordingly, Thai Nguyen province will reduce 50% of the fee for 06 activities providing online public services at level 4 in the province. This is an important policy, encouraging and motivating people to use online public services; propagating and guiding to raise people's awareness and digital skills so that people can actively and actively use online public services for e-government in the process of digital government building.

In the past year, the Committee of Thai Nguyen province continued to grant new and amend information on specialized digital signatures for the Government for units and localities; deploying integrated remote digital signature solution on the online public service portal of the province for officials involved in handling administrative procedures and to facilitate people in using administrative procedures provided by agencies. provided by the state in the province, while ensuring the integrity and authenticity.

The province has completed providing 100% of administrative procedures (1,231 procedures) that are eligible to level 4 provided on the Thai Nguyen provincial public service portal, including 1,072 provincial-level public services, 115 district-level public services and 44 public services commune. Integrate and provide 1,036 information services in Thai Nguyen province to the National Public Service Portal at <http://dichvucong.gov.vn> to serve people and businesses. On August 19, 2022 received 627,616 dossiers; processed 612,911 records; the rate of dossiers resolved on time reached 99.82%. The rate of administrative

procedures files handled online at level 4 as of August 19, 2022 in the whole province reached 78.29%, an increase of 29.6% compared to April 2022 when the Committee of Thai Nguyen province had not yet issued decision 793/QĐ-UBND dated April 15, 2022 of the Committee of Thai Nguyen province.

It can be seen that the provision of electronic public services not only creates favorable conditions for people and businesses to receive information, provide faster and more convenient services, and less need to come in person state management agencies (saving time and costs) but also contributes to reducing the pressure of paperwork on the state management agencies themselves, increasing transparency in the operation of state agencies, limiting the phenomenon causing troubles for people and businesses, creating a positive influence on changes in the way local governments work, thereby improving the level of satisfaction of people and businesses, improving the quality indicators of local governance, etc, contributing to promoting socio-economic development of Thai Nguyen province.

4. Discussion and Conclusion

4.1. Some initial experience

Digital transformation is a major policy of the Government of Vietnam in order to build an integrity and constructive government. From 2021, Thai Nguyen province has focused on developing digital infrastructure to effectively implement the country's socio-economic development goals. Although it has only been deployed in the province for more than 2 years, it has transformed many aspects of social life in the province. From the leadership and direction of the Party Committee of Thai Nguyen province, some initial experiences can be drawn which are:

Firstly, always thoroughly grasp and strictly and fully implement the resolutions of the Provincial Party Committee. Departments and branches in the province must actively implement the guidelines of the Party Committee on digital transformation. Be consistent with the set goals and have a high degree of determination in implementing the resolution.

The strict implementation of the Party's policy is extremely important, so it is necessary to promote propaganda, study and raise awareness of all levels and branches, taking the implementation of the Resolution as a among the criteria to evaluate the performance of the leader's duties.

Secondly, implement digital transformation in a comprehensive, synchronous, and inherited manner in all fields of industry, agriculture, and services. Building a synchronous digital infrastructure in the whole province is an important issue for successful digital transformation. Attention should be paid to investment in developing technical infrastructure to meet the requirements of digital transformation.

Thirdly, promote the creative spirit and responsibility of departments, agencies and sectors throughout the province, recognizing new contributions to help the digital transformation process in the province achieve high efficiency. Promote the role of the Fatherland Front and socio-political organizations in mobilizing the masses to respond to the implementation of the Party's guidelines.

Finally, in the process of implementing digital transformation, it is necessary to have appropriate policies to help localities with difficulties access the achievements of digital technology, thereby creating a change in people's awareness and helping people benefit from the provincial policy.

4.2. Conclusion

From 2021 up to now, the implementation of Resolution No. 01 - NQ/TU "On the digital transformation program of Thai Nguyen province, the period of 2021 - 2025 with orientation to 2030" in Thai Nguyen province has had positive changes. in all spheres of social life. Digital technology is applied to help change the lives of people in the province, helping people to have equal opportunities to access services and social science advances to improve the quality of life. It can be seen that the policy of digital transformation of the Party Committee of Thai Nguyen province is being directed in the right direction and has achieved important initial achievements. Across the province, the fields of digital technology application have made positive changes, bringing economic and social efficiency. That has shown the great significance of digital transformation in today's era, especially in developing countries like Vietnam. In the following years, in order to fulfill the goals set out in Resolution No. 01, all levels and sectors in the province must further raise their determination to make Thai Nguyen one of the leading provinces in digital technology.

CONTROL OF THE AGREEMENT ON VALUATION TO RESTRICT COMPETITION IN VIETNAM: VIEWED FROM EFFICIENCY STANDARDS OF ECONOMICS

LLM. Tran Thi Nguyet

nguyett@neu.edu.vn

Faculty of Law Department, National Economics University, Hanoi, Vietnam

Abstract

The article presents in detail the basic theoretical contents of price-fixing agreement, provides analysis by drawings, graphs and specific examples, and discusses price-fixing agreement acts, including direct price-fixing agreement, indirect price-fixing agreement, price-using agreement to consolidate positions in the relevant market. From these theoretical contents and analysis, the author offers a number of assessments and proposes solutions to adjust Vietnam's competition laws in order to control price-fixing agreements to restrict competition, viewed from the efficiency standards of economics. Some of the issues discussed are: (1) Perfectly competitive market and monopoly market; (2) Direct price-fixing agreements to restrict competition from the viewpoint of economic efficiency; (3) Indirect price-fixing agreements to restrict competition; (4) Price-using agreements to consolidate its position in the relevant market. After offering analysis, discussion and research on issues of price fixing agreements, the article has made a number of author's recommendations on effect assessment content or the ability to cause significant anti-competitive effect of price fixing agreement to restraint competition in Vietnam.

Keywords: *Competition Law 2018, Vietnam competition law, price-fixing agreement, price-using agreement, competition restriction.*

1. Introduction

A price-fixing agreement is any agreement between competitors to increase, decrease, fix or maintain the prices of products, goods and services on the market. Price-fixing agreement is an agreement aimed at abolishing, eliminating or restricting price competition among enterprises. A price-fixing agreement may include implicit or public agreements to increase, decrease, or contain prices of products, goods and services on the market¹. Price-fixing agreement is one of the common types of anti-competitive agreements. The general character of these agreements is the eliminated price competition among the parties to the agreement that set by the parties through the setting of a common price or through indirect price fixing forms. The nature of agreements that use prices to restrict competition is to simulate the position of a monopolist and act in the manner of a monopolist. On the other hand, by adding up the market power of enterprises participating in the

¹ Duong Viet Phuong (2019), "Agreement on restraint of competition under Vietnam's Competition Law 2018".

agreement, anti-competition agreements have limited price competition among the participating enterprises. The agreements thereby distorted the inherent laws of movement of the market. The two objects directly and deeply affected by these agreements are consumers and competing businesses that are not one of the parties to the agreement.

A price-fixing agreement to restrict competition is a serious violation of competition law and on the top of the prohibited list of law in controlling anti-competitive agreements of countries, including Vietnam. In order to control price-using agreements to restraint competition, the scientific solution of this problem is to combine economic thinking and legal thinking closely. We can based on the efficiency standards of economics to assess the risk of the agreement. Only in this way, the objective of enhancing the effectiveness of competition law enforcement can be achieved. The author has studied from the opposing point of view of the perfectly competitive market and the monopoly market by using the methods of analysis, commentary, interpretation, systematization and synthesis, comparative juridical method in order to make a statement: monopolies set prices at the same time as select the quantity to supply in the market. When businesses conduct price-fixing agreements to restraint competition, they abolish and eliminate price competition among the negotiated enterprises. The economics view divides the price-fixing agreement into two groups: the direct price-fixing agreement group and the indirect price-fixing group. The article focuses on analyzing direct price-fixing agreements, indirect price fixing agreements and price-using agreements in order to consolidate its position in the relevant market. Thereby the author has commented, evaluated, proposed solutions to adjust the law, control this type of agreement by the relevant and effective competition laws in Vietnam. The issue of evaluation authority and the basis for assessing the anti-competitive effect or the ability to cause anti-competitive effect of price-fixing agreements has also been studied and proposed by the author to complete the research objectives and research tasks of the topic.

The article gives the following research questions:

First, what are the definition and characteristics of perfectly competitive markets and monopoly markets?

Second, What ara the definition, classification off direct price-fixing agreements in order to restrain competition from the viewpoint of economic efficiency and the nature of direct price-fixing agreements from a practical situation?

Third, what are the differences between agreement on price reduction and agreement on preventing, stopping, eliminating?

Fourth, the definition, classification and contents related to indirect price-fixing agreement?

Fifth, what are the definition, identification signs and legal content of the price-using agreements aimed at strengthening the position in the relevant market?

Sixth, the Competent Authority assesses the competition restriction effect, the basis of assessing the anti-competitive effect and some proposals related to the price-fixing agreements to restrain competition are considered as not causing or not being able to cause a significant anti-competitive effect?

2. Method

The research methods used to study the topic of controlling price-fixing agreements to restrict competition - are viewed from the economic efficiency criteria as follows:

- Method of interpretation

This method is applied to study the basic theoretical issues controlling the price-fixing agreements to restrict competition; to study the views of economics when considering price-using agreements.

- Methods of analysis, comment

This method is applied to present the specific provisions of the international legal system as well as the Vietnamese legal system on price-fixing agreements to restrict competition.

- Method of comparing jurisprudence

This method is also used to study the provisions of international law, to study international case law, the laws of different countries and to compare with the provisions of Vietnam's competition law in order to evaluate compatibility, thereby getting experience and specific solutions in the laws of countries. On that basis, the author proposes a solution to improve Vietnam's competition law in the control of price-fixing agreements to restrict competition.

- Systematization and synthesis method

This is the research method used to generalize and draw conclusions and basic proposals about the author's new contributions to the improvement of Vietnamese law on controlling price-using agreements to restrict competition.

3. Results

3.1. Perfectly competitive market and exclusive market

In business, enterprises are always interested in two factors: marginal revenue and marginal cost. But depending on the market model (perfect competition or monopoly), enterprises will have different profit maximizing points. For the State, the State's laws and regulations should ensure competition and restrict monopoly. One of the important principles when developing economic policies is to promote competition, increase opportunities for users to choose services or buy and sell goods and minimize the risk to generate monopoly².

3.1.1. Perfectly competitive market

Competitive (perfect) market is a market with the following three basic characteristics:

- *There are many buyers and sellers in the market;*
- *Goods sold by these sellers are essentially the same;*
- *Enterprises are free to join and withdraw from the market.*

² Vietnam Chamber of Commerce and Industry - VCCI (2019), "Report on the flow of Business Law 2019", Hanoi, December 2019.

In the business process, enterprises are always interested in two factors: marginal revenue and marginal cost. However, depending on the market model (perfect competition or monopoly) that businesses will have different profit maximizing points. In a competitive market, one can look at how businesses determine their profit-maximizing points through the following diagram:

Accordingly, the cost curve of an enterprise will have three factors:

The marginal-cost curve (MC) is an upward sloping line. The average-total-cost curve (ATC) is an U-shaped line. The marginal cost curve will cross the average cost curve at the minimum point of ATC. The figure above also shows a horizontal line at the market price (MP). MP is a horizontal line because in a competitive market, businesses are price takers. The output price of the business will correspond to the total output that the enterprise decides to supply. Therefore, the price will be equal to the average revenue (AR) and its marginal revenue (MR).

Look at the image above to find the output to achieve maximum profits. Let's imagine that the business is producing at an output of A_1 . At this level of output, marginal revenue is greater than marginal cost. That is, if the business increases its output by 1 unit, then the additional revenue (MR1) will exceed the additional cost (MC1). Profits, equal to total revenue minus total costs. Therefore, if the marginal revenue once is greater than the marginal cost, as in point A_1 , then the enterprise can increase its profits by producing more.

The same principle applies when performing an analysis on point A_2 . At that time, the marginal cost is greater than the marginal revenue. If an enterprise reduces 1 unit of output, the saved cost (MC2) will be more than the lost revenue (MR2). Accordingly, if the marginal revenue is less than the marginal cost, as in A_2 , the enterprise can increase its profits by reducing production.

So, when does this production adjustment process end? Let's acknowledge businesses starting with low output (like A_1) or high output (like A_2), they will adjust output so that total output will reach A_{max} . This analysis draws three general rules for profit maximization:

- *If the marginal revenue is greater than the marginal cost, the business should increase output*

- *If the marginal cost is greater than the marginal revenue, the business should reduce output*

- *At the maximum profit output level, marginal revenue and marginal cost are equal.*

3.1.2. Monopoly market

Monopoly market is the market in which businesses do not have competitors. Monopolies will have an impact on the price of the products they produce. While enterprises in the competitive market are price takers, monopolies are price makers.

The main difference between a competing and a monopoly business is its ability to influence the price of goods. A competitive enterprise is too small in relation to the market it is operating in, and therefore does not have the capacity to influence prices. Businesses must accept prices that are determined by market conditions. In contrast, because the monopoly is the only producer in the market, it can change the price of goods by adjusting the quantity it provides to the market.

Imagine that the business is producing at an output of B1. In this case, the marginal cost is less than the marginal revenue. If the business increases an unit of product, the increase in revenue will be more than the additional cost that the business spends and thus the profit will increase. Thus, when the marginal cost is lower than the marginal revenue, the business can increase its profits by producing more.

The approach is similar, but starting from a high-yield place, like B2. In this case, the marginal cost is higher than the marginal revenue. If an enterprise cuts production by one unit, the cost reduction will be more than the lost revenue. So, in case the marginal cost is higher than the marginal revenue, the business can increase profits by reducing output.

Finally, the business can adjust its production scale when the quantity supplied reaches Qmax, where the marginal revenue is equal to the marginal cost. Thus, the level of

output at which the monopolist maximizes profit is determined by the intersection of the marginal revenue and marginal cost curves. In Figure 2, the intersection point is X.

As mentioned above, enterprises in the competitive market will also choose the total supply output to the market where the marginal revenue is equal to the marginal cost. To maximize profits, this principle applies to both businesses in competitive markets and monopoly markets. But there is a fundamental difference between two competing and monopoly market models: Marginal revenue in a competitive market is equal to price, while marginal revenue in an exclusive market is smaller than the price.

Competing Business	$P = MR = MC$
Monopoly Business	$P > MR = MC$
<i>In which:</i> <i>P: Price</i> <i>MR: Marginal Revenue</i> <i>MC: Marginal Cost</i>	

The problem is how can monopolies determine the price to maximize profits? The demand curve will answer this question, because the demand curve is related to the total output that consumers are willing to pay to buy the product. Thus, after the monopoly has determined that output is equal to marginal revenue and marginal cost, it will use the demand curve to determine the highest price that it can price for the output just determined. In Figure 2 above, the maximum profit price is Y.

In a monopoly market, the firm has no supply curve because the supply curve shows that the total output that businesses are willing to supply at any given price. In a competitive market, a business is a price taker, but as a monopoly it is a price maker. It makes little sense to ask for the total output produced by a monopolist at any price because the monopoly has set prices at the same time as selecting output to provide in the market.

3.2. Direct price-fixing agreements to restrict competition from the viewpoint of economic efficiency

3.2.1. Definition of direct price-fixing agreement

Direct price-fixing agreements are agreements that unify actions among competitors to eliminate price competition among enterprises participating in the agreement. An important feature of these agreements is that the parties have directly established a common price through the agreement, thereby eliminating the ability of customers and consumers to choose the price. The purpose of a direct price-fixing agreement is to increase the selling price of goods and products, in order to quickly and directly increase profits according to the price calculation of the enterprise participating in the agreement.

3.2.2. Classification of acts of direct price-fixing agreement

Acts of direct price-fixing include:

- Applying uniform prices to some or all customers.
- Increasing or decreasing prices at a specific level.
- Applying the formula of general price calculation.
- Maintaining a constant ratio of prices of related products.
- Using an uniform price at the time the price negotiations start.

In particular, the agreement on *uniform application of prices to some or all customers* is a typical agreement for the direct nature of the price-fixing agreement and clearly disclosing the nature of exploitation of customers. Accordingly, businesses conduct agreements to set uniform prices for customers. The difference between agreement on *uniform price application with some or all customers* and agreement on increasing or decreasing prices at specific level is: If agreement on uniform price application is an agreement aiming to stabilize at a price, an agreement on increasing or decreasing prices at a specific price direct towards prices change. But this prices change must be consistent, thereby eliminating unnecessary reactions that affect the agreement group's ability to increase profits.

3.2.3. Studying and analyzing typical case studies

The following case studies and analysis of typical price-fixing agreements in order to limit competition have deeply demonstrated the nature of exploiting customers in direct price-fixing agreements applying uniformly the prices with some or all customers. The nature of exploiting customers in the agreement on uniform application of prices to some or all customers is clearly shown in the situation of price-fixing agreements of 19 Insurance enterprises of Vietnam in 2008. Specifically, On September 15, 2008, the Vietnam Insurance Association organized the 6th Non-life General Directors Conference. At this conference, 15 non-life insurers signed a cooperation agreement between insurers in the field of motor vehicle insurance and the provision of auto insurance premiums for cars (Agreement). On September 18, 2008, four more Insurance enterprises also signed the Agreement, increasing the number of enterprises participating in this agreement to 19.

According to the Agreement, 19 Insurance enterprises agreed to apply a common charging formula with specific insurance premium rates in order to eliminate competition on insurance premiums among insurance enterprises participating the agreement. Specifically, the car physical insurance premium for a year (excluding VAT), according to the standard terms is calculated as follows:

<i>Standard cost</i>	=	$1,56\% \times \text{Sum Insured}$
<i>Insurance cost for freight cars</i>	=	$1,83\% \times \text{Sum Insured}$
<i>Insurance cost for intercity passenger transportation cars</i>	=	$2,07\% \times \text{Sum Insured}$
<i>Insurance cost for cars with refrigerated cargo</i>	=	$2,62\% \times \text{Sum Insured}$
<i>Premiums for tractors</i>	=	$2,84\% \times \text{Sum Insured}$
<i>Premiums for taxi</i>	=	$3,95\% \times \text{Sum Insured}$

Meanwhile, the agreement on increasing prices or decreasing prices at a specific level is considered to be a flexible agreement. This agreement includes two options: either to increase prices or to decrease prices. Especially this agreement not only includes prices increase but also the discount price at a specific level. Choosing to raise prices or reduce prices but still meet the increase of the profit objectives of the parties to the agreement, as analyzed above related to the elasticity of demand. At first glance, the discount deal will not be exploitative. However, when viewed from an economic perspective, it is easy to clearly identify this exploitation nature. Behavior can be visualized through the following diagram:

Suppose the market price of goods is at the price of P_1 as shown in the picture. Corresponding to that price level, the total output of the whole market is Q_1 . At this price, the total revenue of the businesses before joining the agreement will be equal to the price multiplied by the output: $P_1 \times Q_1$ (is the OP_1AQ_1 quadrilateral). Given the characteristics of goods with high price elasticity of demand, an increase in selling price will cause a decrease in buying. Therefore, businesses can increase production by reducing prices from P_1 to P_2 . Accordingly, when prices fall, consumers will be stimulated to buy more. As a result, demand increased from Q_1 to Q_2 . At this point, the revenue of the participating businesses will be equal to the new price multiplied by the new output: $P_2 \times Q_2$ (is the OP_2BQ_2 quadrilateral). The difference between the quadrilateral OP_2BQ_2 and the quadrilateral OP_1AQ_1 is the incremental revenue of businesses.

Therefore, lawmakers should take a reasonable approach when determining the economic nature of the agreement. With the same purpose of changing prices to exploit customers, but depending on the specific characteristics of goods, businesses will proceed to increase or decrease prices. Businesses will increase prices if they are trading goods that have low elasticity but they will not achieve the goal of increasing profits when applying the price increase for goods with high coefficient of elasticity. So, as analyzed, price-fixing agreements and output controlling agreements are closely related. And because of that, that is the exploitative nature of the discount agreement explained in terms of the economics of demand elasticity. This principle is similar to the monopoly business maximizing profits. Because the demand curve is related to the total output that consumers are willing to pay to buy a product. So, after the monopoly has determined that output is equal to marginal revenue and marginal cost, it will use the demand curve to determine the highest price that it can price on a given quantity of output.

3.2.4. Studying and analyzing the difference between agreement on fixing-price reduction with agreement on preventing, stopping, eliminating

The agreement on a specific price reduction and agreement to prevent, restrain or prevent other enterprises from participating in the market or developing business (hereinafter referred to as preventive agreement) and the agreement to exclude from the market enterprises which are not parties to the agreement (hereinafter referred to as the removal agreement) are also the same discount agreements, but they are completely different in terms of economic nature. Specifically, the containment agreement is divided into two groups as follows:

a) 1st Group:

* An agreement to prevent, restrain or prevent other enterprises from participating in the market is the unification of not conducting transactions with enterprises not participating in the agreement or acting in one of the following forms:

- Requesting, appealing, inducing their customers not to buy, sell goods or use services of enterprises not participating in the agreement;

- Buying and selling goods and services at a price sufficient for enterprises not participating in the agreement not to participate in the relevant market;

- An agreement to prevent, restrain or prevent another enterprise from developing its business is the unification of not doing business with an enterprise not participating in the agreement or acting in one of the following forms:

+ Requesting, appealing distributors and retailers who are dealing with them to discriminate when buying or selling goods of enterprises not participating in the agreement in a way that makes it difficult to sell goods of this business;

+ Buying and selling goods and services at a price sufficient for enterprises not participating in the agreement not to expand their business.

Logically, the nature of the preventive or eliminating price must be a price that is lower than the market price or even lower than the production cost. The nature of these two types of agreements aims to create a price race, thereby causing harm to rival businesses, so that they can not expand markets, develop business or even more harsh is forced to withdraw from the market.

b) 2nd Group:

The agreement applying the general pricing formula to maintain a fixed price ratio of the product concerned with a different economic aspect from the above two agreements. The economic aspect of the two agreements that apply the formula to calculate the overall price and maintain a fixed price ratio of the product is related to the individuality of the product and the difference in the production costs of enterprise. The individuality of the product is perceived in that although the businesses being considered in this case, are initially defined as being in the same relevant market, which means that the products of the businesses must be able to replace each other in terms of characteristics, purposes and prices.

However, this determination of fungibility is only relative. In order to compete, manufacturers always try to personalize their products. It is these certain differences that help businesses make a difference in prices compared to other businesses that sell similar products in the market. At the same time production costs of businesses will be different. Production cost is the value of everything a seller has to spend on the production of a good. The average production cost of each manufacturer will depend on the technology that the manufacturer owns and the cost of hiring and buying production factors such as labor and raw materials... For each manufacturer, these factors are different, leading to different

production costs of manufacturers. Consequences of different production costs will result in different prices on the relevant market. Therefore, if the agreement sets prices without taking this factor into account, businesses will be in a state of conflict over the benefit sharing aspect. Because of this, many scientists considered the product's homogeneity or uniform standard of products as one of the favorable conditions for anti-competitive agreements.

Therefore, from the perspective of businesses involved in the agreement, they will also make changes so that the pricing agreement becomes easier to implement and brings many benefits to participating businesses. Accordingly, the act of applying the general price formula to maintain a constant price ratio of related products is to solve these differences. Through agreements that do not specify prices but only determine the formula to calculate prices or maintain a fixed ratio, participating enterprises have agreed not to change the correlation of prices that the parties have set in advance in the relevant market, but merely adds a certain percentage to the price of the parties in order to make a higher profit.

3.3. Indirect price-fixing agreement to restrict competition

3.3.1. Indirect price-fixing agreements are understood as agreements that unify the actions of competing enterprises in the same relevant market, related to supporting factors of goods and services prices, through which impact to the price applied to customers, distributors, in order to increase profits.

3.3.2. Indirect price-fixing agreements include agreements such as no price discount or uniform price discount, credit limit for customers, and no discount if not notify to other members of the agreement.

The nature of the *discount* and *credit limit* factors for customers are considered to be complementary or related to the price of goods and services. Measures to use discounts or credit limits for customers are particularly useful in the context of publicly available commodity price information. It will be difficult for businesses to decrease or increase prices locally without affecting the rest. Therefore, the discount policy is understood as the discount based on the widely announced price.

Typically, discounts occur in the relationship between a manufacturer and a distributor. From the perspective of the production chain, goods are delivered to consumers through the stages: Manufacturing - Distribution - Final consumption. The cost of distribution is calculated as one of the production costs. Therefore, through the application or non-application of discount, businesses have a direct impact on costs. Therefore, although the price of goods is constant (applicable to final users), whether or not to benefit customers through the application or non-discount policy has indirectly affected to the actual price that customers have to pay for the products.

Meanwhile, *giving credit limits to customers* is understood as giving customers a certain amount of money for buying behavior. It can be simply understood that buyers will be deferred for a certain period of time when they buy a certain volume/value of goods. This deferred payment may apply to the entire shipment or part of the shipment, depending on

the policy that the business wants to apply to its customers. Credit is one of the types of production costs. Purchase with deferred payment is a financial incentive for customers. Therefore, even without a discount, the credit line is a benefit that customers enjoy.

In Vietnam, the final agreement in the group of price-fixing agreements is the non-discount agreement without notifying other members of the agreement. Accordingly, businesses negotiated that they will only reduce prices with conditions which they have notified other businesses in the agreement. The nature of this agreement is the price information exchange element.

This comes from the peculiarity of conventional price-fixing agreements that always sell at a higher price than the market price. When an anti-competitive agreement is made, the following two things are true. The first one is because agreements are always geared to cutting production, so businesses always sell less than they sell before the deal and perhaps less than their own production capacity. The second is that the selling prices in the deals are always profitable.

Meanwhile, businesses will have the incentive to sell off and sell more, thereby achieving higher profits. The nature of the act in this case is the act of betraying the agreement, the betraying enterprise will benefit from the damages of other businesses when selling at lower prices. To resolve this conflict, the solution is that businesses have the right to reduce prices, but only if the remaining enterprises in the agreement have to know in advance about this discount decision. Thereby, it will avoid damage to the remaining businesses and ensure consistent price action among businesses.

In Vietnam, the introduction of the Competition Law 2018 replacing the Vietnam Competition Law 2004 when the provisions on agreements to fix prices of goods and services directly or indirectly have changed in the approach. Accordingly, the Vietnam Competition Law 2018 has two important changes. The first change is that price-fixing agreements are not only agreements between enterprises in the same relevant market, but also include agreements between businesses operating at different stages in the same chain of production, distribution and supply for a certain type of goods or services (Clause 1, Clause 4, Article 12 of the Vietnam Competition Law 2018)³. The second change is that for direct or indirect price-fixing agreements of goods and services conducted by enterprises in the same relevant market, lawmakers have determined that this is a serious violation agreement and distorting the market so this agreement will be strictly banned without taking into account market share factors as defined in the Vietnam Competition Law 2004.

³ ***“Article 12. Anti-competitive agreement is prohibited***

1. Agreements on restraint of competition between enterprises on the same relevant market prescribed in Clauses 1, 2 and 3, Article 11 of this Law.

...

4. Agreement on restraint of competition between enterprises doing business in different stages of the same chain of production, distribution and supply for a certain type of goods or service specified in Clause 1, 2, 3, 7, 8, 9, 10 and 11 of Article 11 of this Law when such agreement exerts a significant impact or is likely to exert significant competitive restraint in the market.”

3.4. The agreement about using price aiming to consolidate its position in the relevant market

3.4.1. Viewed from the market structure of the price-using agreement among businesses

The long-term goal of the business is to increase profits. However, businesses only achieve this goal when there are necessary conditions in terms of market structure. A market with many businesses, the pressure of competition will prevent businesses from achieving high profits as expected. Therefore, in order to serve the purpose of increasing profits in the long term, enterprises in some cases will have to take actions to prevent other enterprises from participating in the market, developing business or removing competitors from the relevant market. Theoretically, there are two options for businesses to prevent market entry, expansion of business, or the elimination of other businesses from the market either individually or in parallel: (i) low-price sales strategy (ii) boycott strategy.

3.4.2. Price-fixing agreement aiming to consolidate its position in the relevant market

From the perspective of price theory, price-fixing agreements aimed at strengthening the position in the relevant market are understood as agreements in which enterprises use low-price selling methods to prevent other enterprises from expanding business scale, participating the market or removing competitors from the relevant market, thereby consolidating or expanding market share in the relevant market. Thereby, the price-using agreement can be identified for the purpose of strengthening the position in the relevant market through three signs. The first is that the subject of the agreement is enterprises in the same relevant market. The second is the tool used by businesses in low-price agreements in order to make it impossible for other businesses to get profits large enough to scale up, not attractive enough to enter the market or become more dire that are long-term losses and withdrawing from the market. Thirdly, the purpose of the businesses participating in the agreement is to consolidate their current position at the risk of losing market share by competitors in the relevant market or by entering the market of new businesses or increase profits through destroying competitors.

A price-using agreement aiming to prevent the market entry of a new competitor is understood as an agreement to agree on action among competitors, through a price reduction aimed at preventing the market entry of new competitors. In Vietnam, the agreement to prevent, inhibit or not to allow other enterprises from participating in the market is the agreement not to conduct transactions with enterprises not participating in the agreement or act together in one of the following forms: requesting, appealing or inducing their customers not to buy or sell goods or to use services of enterprises not participating in the agreement; purchase and sell goods and services at prices sufficient for enterprises not participating in the agreement not to participate in the relevant market.

The price-using agreement aimed at preventing, restraining or preventing other enterprises from developing their business is understood as the act of agreeing on actions between competitors enterprises in the relevant market, by using low-price sales strategy, making the business that is not a party to the agreement cannot develop or expand business activities.

In Vietnam, the agreement on preventing, restraining or not allowing other enterprises to develop their businesses is an agreement not to conduct transactions with enterprises not participating in the agreement or acting in one of the following forms: requesting, appealing, seducing distributors and retailers dealing with them to discriminate when buying or selling goods of the enterprises not joining the agreement in a way that makes it difficult to sell goods of this enterprise; Buying and selling goods and services at prices sufficient for enterprises not participating in the agreement not to expand their business.

In Vietnam, agreements prevent market entry and agreements prevent other enterprises from developing business have different subjects. If the agreement prevents the entry into the market of a potential competitor enterprise, which has not been established or has been established but has not operated in the relevant market, the object of the agreement preventing the other enterprises from developing business is the competitor businesses operating in the same market. However, from an using strategic perspective, both of these agreements use either of the two types of acts *Boycott* or *Low price sales*.

From the price perspective, the fixed price must be a price that is sufficient for an enterprise that is not a party to the agreement to enter the relevant market or at a price that is sufficient for a non-party entity to expand further business scale.

Price-using agreements aiming to remove from the market those enterprises which are not parties to the agreement are understood as agreements to agree on actions between competitors in the relevant market, by using use low-price sales strategy, aiming to eliminate competitors from the relevant market. The agreement to remove from the market enterprises which are not parties to the agreement is the agreement not to deal with enterprises not participating in the agreement and act in the form of asking, calling, seducing customers not to buy, sell goods, do not use services of enterprises not participating in the agreement.

Agreement to prevent, restrain or prevent other enterprises from developing their business is the agreement not to conduct transactions with enterprises not participating in the agreement or acting in one of the following forms:

- Requesting, appealing and enticing distributors and retailers dealing with them to discriminate when buying and selling goods of enterprises not participating in the agreement in a way that makes it difficult to sell goods of this business.

- Buying and selling goods and services at a price sufficient for an enterprise not being a party to the agreement to not expand its business, or buying and selling goods or services at a price sufficient for the enterprise not to participate in the agreement have to withdraw from the relevant market. *From this rule, there are a few things to clarify:*

First, the object of the agreement is a competitor enterprise that already exists in the relevant market.

Second, the strategy used in the deal is still a boycott and low-price sales strategy. However, compared with the agreement that prevented the development of business, the agreement to eliminate other enterprises was more fierce. In the agreement to prevent, only

one of the two strategies is implemented; in the elimination agreement, enterprises implement simultaneously both boycott strategy and low-price sales strategy.

Third, the selling price in this case is the low price. Selling goods or providing services below the total cost in order to eliminate competitors means the sale of goods or provision of services at prices lower than the total costs constituting the production of goods or services or the purchase prices of goods for resale; cost of circulation of goods and services.

In order to implement a comprehensive framework of neutral competition, Vietnam has made great progress in the transition from a developing country with a centrally planned, socialist economy to the economy. market economy which is rapidly industrializing. In the process of implementing the competitive evaluation mechanism, Viet Nam has made significant progress in significantly improving the quality of its legislative and legislative processes, including the questioning efficiency⁴. In the current economic and social context, the Vietnam Competition Law 2018 has clearly shown the viewpoints to improve the legal framework, create a fair and fair competitive environment for business entities. The great value of this law is that it was built in a way that combines economic thinking and legal thinking, emphasizing the effective growth goal for law enforcement, including laws governing price fixing-agreements to restrict competition⁵. The Vietnam Competition Law 2018 with respect to price-using agreements for the purpose of consolidating the position in the relevant market follows the same approach. The Vietnam Competition Law 2018 with respect to price-using agreements for the purpose of consolidating its position in the relevant market follows the same approach. Accordingly, Article 11 of the Vietnam Competition Law 2018⁶ also in turn stipulates two types of agreements: agreements preventing, restricting, not allowing other enterprises to participate in the market or developing business and agreements to remove from the market businesses that are not parties to the agreement. Thus, despite the different names, the price-using agreements aimed at strengthening the position in the relevant market are essentially agreements that sacrifice short-term benefits to prevent the

⁴ OECD (2018), OECD's review of Competition Law and Policy, <http://oe.cd/vtn>

⁵ Tran Thi Nguyet, "Discussing the core values of the Competition Law 2018", Journal of Human Resources and Social Sciences, No. 5/2020, 2020.

⁶ **"Article 11. Anti-competitive agreement**

1. Agreement on fixing prices of goods and services directly or indirectly.
2. Agreements on division of customers, division of consumption markets, supply of goods and provision of services.
3. Agreement to limit or control the quantity and volume of production, purchase, sale of goods or provision of services.
4. Agreeing to one or both parties to the agreement win the bid when participating in biddings in the supply of goods or provision of services.
5. Agreement to prevent, restrain or prevent other enterprises from participating in the market or developing business.
6. Agreement to remove from the market enterprises which are not parties to the agreement.
7. Agreement on restriction of technical and technological development, restriction of investment.
8. Agreement to impose or impose conditions on the signing of contracts to buy and sell goods or provide services to other enterprises or to agreements to force other enterprises to accept obligations not directly related to the subjects of contract.
9. Agreement does not deal with parties not party to the agreement.
10. Agreement to restrict the market of products, sources of goods and services provided by the parties not party to the agreement.
11. Other agreements that cause or are likely to cause anti-competitive effects. "

market entry, market expansion or even eliminating competitors from the relevant market. But as mentioned above, from an economic perspective, businesses have no incentive to agree on a unified sale of goods under the average variable cost to destroy their rivals. Instead of that, when they want to consolidate their position in the relevant market (preventing the entry of new competitors' market or preventing the development or elimination of existing competitors), businesses tend to use other tools instead of sacrificing benefits by reducing prices. US practice, as long as there is a price agreement, is considered as an act of price-fixing agreement, regardless of whether the price is high or low. Agreements between competitors are almost always illegal, regardless of whether the price is set to a minimum, maximum or a range of fluctuations. With the provisions of Clauses 5 and 6, Article 11 of the Vietnam Competition Law 2018⁷ in terms of language, it does not allow us to conclude whether the provisions on the agreement to prevent and eliminate competitors involve the use of low prices as in the Competition Law 2004 or not, these agreements are boycott agreements, thereby increasing the cost of production of competitors, which is a way that helps businesses to participate in restrictive agreements and compete for market dominance. However, from an economic perspective, the author supports the US approach, which means that price agreements, regardless of whether they are high or low, are included in the group of price-fixing agreements. The implications of agreements that prevent market entry, market expansion, or the agreement to remove other enterprises from the market only include strategies that are not related to price instruments.

3.5. Research proposal

The following are the studies and recommendations of the author on the content of effect assessment or the ability to cause significant anti-competitive effects of the price-fixing agreement to restrain competition in Vietnam. After obtaining research results on acts of direct price-fixing agreements, indirect price-fixing agreements, price-using agreements in order to consolidate the position in the relevant market, the proposals of author on ***the authority to assess and the basis for assessing*** the effect or the ability to cause significant anti-competitive effects of the price-fixing agreement in order to restrict competition focusing on important issues. as follows:

3.5.1. Competent authority assesses anti-competitive effects

In Vietnam, the authority that assesses the significant effect or likely to exert significant anti-competitive effects on price-fixing agreements to limit competition is the Vietnam National Competition Commission.

The Vietnam National Competition Commission is an authority competent to assess *the effect* or the ability to cause significant anti-competitive effects of anti-competitive agreements in cases where anti-competitive agreements **are prohibited** under the provisions

⁷ ***Article 11. Anti-competitive agreement***

5. *Agreement to prevent, restrain or prevent other enterprises from participating in the market or developing business.*

6. *Agreement to remove from the market enterprises which are not parties to the agreement. "*

of Clauses 3 and 4, Article 12 of the Vietnam Competition Law 2018⁸, including a price-fixing agreement to restrict competition.

3.5.2. Bases for evaluating anti-competitive effects

In Vietnam, the basis for the Vietnam National Competition Commission to assess the effect or the ability to cause significant anti-competitive effects of the price-fixing agreement in order to restrict competition

The evaluation of the effect or the ability to cause significant anti-competitive effects of the price-fixing agreement in order to restrict competition by the National Competition Commission of Vietnam is based on one or a number of factors as follows:

a) Developments and trends in changing the market share of enterprises participating in the agreement are evaluated in relation to other enterprises that are competitors not participating in the agreement;

b) Barriers to market entry and expansion are assessed to determine the effect or the ability to cause significant anti-competitive effects of the agreement based on factors affecting the decision of the enterprise upon accession., expanding markets, including:

b1) The legal barriers created by the laws and policies of the state include regulations on import duties and import restrictions; technical regulations; conditions and procedures for producing and trading in goods and services; regulations on use of goods and services; professional standards and other administrative decisions of state management agencies.

b2) Financial barriers include costs of investment in production and trading of goods and services, access to capital, credit and other financial sources of the enterprise.

b3) Initial costs of entering the market which enterprises cannot recover when withdrawing from the market.

b4) Barriers to access and hold supplies and essential infrastructure for production and business; distribution network, consumption of goods and services on the market.

b5) Consumer practices.

B6) Business practices.

b7) Barriers related to the exercise of intellectual property rights of individuals and organizations, including copyright and rights related to copyright, industrial property rights and rights to plant varieties as prescribed. of the law on intellectual property rights and other barriers to market entry and expansion.

⁸ ***Article 12. Anti-competitive agreement is prohibited***

3. Agreement on restraint of competition between enterprises on the same relevant market stipulated in clauses 7, 8, 9, 10 and 11 of Article 11 of this Law when such agreement exerts an impact or is likely to cause an impact limit competition significantly in the market.

4. Agreement on restraint of competition between enterprises doing business in different stages of the same production, distribution and supply chain for a certain type of goods or service specified in Clause 1, 2, 3, 7, 8, 9, 10 and 11 of Article 11 of this Law when such agreement exerts a significant impact or is likely to exert significant competitive restraint in the market.”

c) Restricting research, development, technological innovation or limiting technological capacity assessed to determine the impact or potential impact of anti-competitive agreements on research and development objectives. developing, renewing technologies or raising technological capabilities in the relevant branches and domains;

d) Decreasing accessibility and holding of essential infrastructure is assessed based on the critical level of infrastructure for production and business activities and costs and time for enterprises. A competitor who is not a party to the agreement can access, hold that infrastructure or similar infrastructure;

d) Increasing costs and time of customers in purchasing goods and services of enterprises participating in the agreement or when switching to buying other related goods and services determined by comparing expenses and time necessary time of customers when buying goods and services of enterprises participating in the agreement or when switching to buying goods and services of enterprises being competitors before and after such agreement;

e) Interfering with competition in the market through controlling specific factors in the industry or fields related to the enterprises participating in the agreement determined based on the level of dominance of such particular factors. for the competitive activities of enterprises in the market.

3.5.3. The author's proposal on price-fixing agreements in order to restrain competition is considered not causing or not likely to cause significant anti-competitive effects.

According to the study of price-fixing in order to restrain competition in terms of the effect of economics, by thinking of economic efficiency standards, if the price-fixing agreements are in one of the following cases, they will be considered not to cause or is unlikely to have the ability to cause significant anti-competitive effects:

a) For agreements restricting competition between enterprises in the relevant market, when the combined market share of enterprises participating in the agreement is less than 5%;

b) For agreements on restraint of competition between business enterprises and different stages in the same production, distribution and supply chain for a certain type of goods or service, when the market share of Each enterprise participating in the agreement is smaller than 15%.

Therefore, in the process of assessing the anti-competitive effects and the anti-competitive ability of the agreement, the National Competition Commission of Vietnam has the right to consult agencies, organizations, relevant individuals and request businesses to enter into agreements to provide necessary information and documents.

4. Discussion and Conclusion

Regarding the handling plan, Vietnam has quickly regulated the sanctioning of administrative violations in the field of competition by issuing Decree 75/2019/ND-CP of September 26, 2019. Accordingly, for acts of agreement on restraint of competition of enterprises in the relevant market, the measure of a fine of 1% to 10% of the total turnover

in the relevant market in the financial year preceding the year. committing acts of violation of each enterprise being the parties to the agreement for acts of agreeing to fix goods or service prices directly or indirectly⁹. The fine level is from 1% to 5% of the total revenue on the relevant market in the financial year preceding the year of committing acts of violation of each enterprise being the parties to the agreement for acts of price-fixing agreements on goods and services directly or indirectly, when such agreements affect or have the ability to cause significant anti-competitive effect in the market¹⁰. This is a fine for acts of restricting competition from businesses operating in different stages of the same production, distribution and supply chain for a certain type of goods or services. In addition to the policy of sanctioning administrative violations, Vietnam's criminal law also criminalized acts of anti-competitive agreements by fixing prices. The Vietnam Penal Code 2015 has set aside Article 217 to regulate this sanctions¹¹ With such a strict treatment, the punitive and deterrent nature, the crime prevention of price-fixing agreements to restrain competition has been guaranteed. But breaking the price-fixing agreements to restrain competition is the advantage of a leniency policy that was first initiated and regulated by the Vietnam

⁹ See: Article 6, Clause 1 of Decree No. 75/2019/ND-CP of the Vietnamese Government stipulating sanctions against administrative violations in the field of competition

¹⁰ See: Article 7, Clause 1 of Decree No. 75/2019/ND-CP of the Vietnamese Government stipulating sanctions against administrative violations in the field of competition

¹¹ “**Article 217. Crime of violating competition regulations**

1. Those who commit one of the following acts, causing damage to others from VND 1,000,000,000 to under VND 5,000,000,000 or gaining illicit profits from VND 500,000,000 to under VND 3,000,000,000, shall be sanctioned. a fine of from VND 200,000,000 to VND 1,000,000,000 shall be imposed for non-custodial reform for up to 02 years or imprisoned from 03 months to 02 years:

a) Agreement to prevent or restrain other enterprises from participating in the market or developing business;
b) Agreement to remove from the market of enterprises not the parties to the agreement;
c) Agreement on restraint of competition when the parties to the agreement have a combined market share of 30% or more in one of the following cases: agreements on fixing prices of goods and services directly or indirectly; agreements on dividing consumption markets, sources of supply of goods and services; Agreement to limit or control the quantity and volume of production, purchase and sale of goods and services; agreements restricting technical and technological development, limiting investment; Agreement to impose on other enterprises conditions for signing contracts for the purchase and sale of goods or services or forcing other enterprises to accept obligations not directly related to the subjects of the contract.

2. Committing the crime in one of the following circumstances, the offender shall be liable to a fine of from VND 1,000,000,000 to VND 3,000,000,000 or face a prison term of between 1 and 5 years:

a) Committing the crime 2 times or more;
b) Using sophisticated and cunning tricks;
c) Abuse of market dominance or monopoly position;
d) Gaining an illegal profit of VND 3,000,000,000;
d) Causing damage to another person of VND 5,000,000,000 or more. ”;

3. Offenders may also be imposed a fine of between VND 50,000,000 and VND 200,000,000, banned from holding certain posts, practicing certain occupations or doing certain jobs for between 1 and 5 years.

4. Commercial legal entities committing offenses specified in this Article, shall be sanctioned as follows:

a) Committing the crime as prescribed in Clause 1 of this Article, a fine of between VND 1,000,000,000 and 3,000,000,000;

b) Committing the crime as prescribed in Clause 2 of this Article, a fine of between VND 3,000,000 and VND 5,000,000,000 or suspend operation for a period of 06 months to 02 years;

c) Commercial legal entities may also be imposed a fine of from VND 100,000,000 to VND 500,000,000, be banned from operating in certain fields or raising capital for 01 - 03 years. ”

Competition Law 2018. This is the policy that the State of Vietnam has granted exemption to members participating in price-fixing agreements in order to restrict competition, which has proactively declared, provided documents and evidence proving the existence of price-fixing agreement and real cooperation with competition management agency. The subjects who are a party to this agreement, when receiving leniency, will be exempted from part or all of the administrative or criminal sanctions that they should have incurred¹². This is also the conclusion and value and suggestive meaning of the author for future studies.

In summary, like other anti-competitive phenomena, the agreement on fixing prices to restrict competition is a negative phenomenon but it exists as an indispensable part of Vietnam's economic life. From an economic perspective, the agreement on the use of prices in particular and the agreement on restraint of competition in general is the first step of businesspeople in the process of capital accumulation and concentration - requiring centralization and unifying action in the marketplace. From an economic perspective, agreements that unite actions between businesses eliminate independent action among businesses participating in the agreement. Vietnam's laws governing anti-competitive agreements have made progress when it is clear that the impact of agreements on the use of prices to restrict competition is clear. The Vietnam Competition Law 2018 is a new step in the legislative work in order to effectively adjust and control anti-competitive agreements, including price-fixing agreements. From the perspective of effective standards of economics, indeed, price-fixing agreements to restrict competition are serious violations of competition law, distorting the market and leading the banned list in Competition law of countries in general and Vietnam in particular.

ENHANCING ECONOMIC LEADERSHIP CAPABILITIES OF KEY DISTRICT-LEVEL OFFICIALS IN THE MARKET ECONOMY IN PRESENT-DAY VIETNAM

MSc. Truong Thi Thu Ha
thuhahienninh@gmail.com

PhD. Nguyen Van Duy
nguyenvanduydhqb@gmail.com

Faculty of Law, Quang Binh University, Quang Binh, Vietnam

Abstract

Nowadays, in the context of Vietnam transitioning from a centrally planned economy to a market-oriented economy, the role of key district-level officials becomes extremely important in guiding and managing the local economy. However, to meet the demands of a complex and challenging business environment, the economic leadership capabilities of key district-level officials need to be enhanced to meet the requirements of development and competition in an increasingly competitive market economy. Economic leadership capabilities require not only in-depth professional knowledge but also effective management skills, strategic orientation, creative thinking, and the ability to adapt flexibly to market changes. In this context, this article focuses on researching and proposing measures to enhance the economic leadership capabilities of key district-level officials in the current market economy in Vietnam.

Keywords: *Capability, officials, key, economic leadership, market economy.*

1. Introduction

Proud of notable achievements in driving the transition from a traditional economic model to a market-oriented one, Vietnam has witnessed outstanding growth and emerged as one of the fastest-developing economies in the Southeast Asian region. To continue achieving sustainable success and comprehensive development, the economic leadership capabilities of key officials at the district level play an indispensable role. These officials play a crucial role in managing and directing economic activities at the local level. Currently, the team of key district-level officials has matured in terms of professional expertise and qualifications. However, to meet the increasingly high demands of the economic environment, particularly in the field of economic management, enhancing management capabilities is a crucial requirement. Key district-level officials need to continuously improve their economic leadership capabilities.

2. Method

The object of the research is the economic leadership capacity of key officials at district level in the market economy. The study mainly examines the contingent of economic leaders at the strategic level in Vietnam.

Research tools ensure scientific principles. Thoroughly researching theoretical perspectives associated with practice, viewed from the perspective of economic philosophy to serve the construction of Vietnam today.

Collecting and analyzing data from specific research methods are: comparative research method, specific historical synthesis, field survey and systematic method.

Methods of researching documents and texts; observation method; methods of processing data collected by mathematical statistics. Observational and interview methods are used to detect research problems.

3. Results

3.1. Some Fundamental Concepts

3.1.1. Officials, Key District-Level Officials

Cadres are Vietnamese citizens, elected, approved and appointed to hold positions and titles according to terms in agencies of the Communist Party of Vietnam, the State, and central socio-political organizations. in provinces and centrally run cities (hereinafter referred to as provincial level), in districts, urban districts, towns and provincial cities (hereinafter referred to as district level), in the payroll and salary from the state budget. State (Law on cadres and civil servants, 2019).

Key officials at the district level are the heads and deputy heads of political and social organizations, departments, divisions, etc. of the district. They are the ones who directly lead and manage the implementation of the Party's guidelines and guidelines, the State's policies and laws; at the same time, is responsible for setting and organizing the implementation of development guidelines, programs and plans of the unit and locality under his/her charge.

3.1.2. Concept of Capacity, Leadership, and Economic Leadership Capacity

The terms "capacity" or "work capacity" are increasingly used in various fields, and there are different definitions depending on the research purposes and specific fields. According to authors Bernard Wynne and David Stringer (1998), capacity to perform includes all the accumulated skills, knowledge, behavior, and attitudes that an individual applies to complete tasks. According to Bernard Wynne (1997), capacity is the skills, knowledge, behavior, and attitudes accumulated by an individual to achieve desired work outcomes. According to the research conducted by author Tran Van Thanh (2019), capacity consists of three fundamental characteristics: knowledge, skills, and attitude/behavior.

Thus, we can understand that capacity is the combination of unique psychological attributes or qualities of each individual that act as internal conditions facilitating the effective integration with the knowledge and skills of individuals to perform a specific type of activity successfully.

Leadership:

According to the Vietnamese dictionary (Hoàng Phê, editor-in-chief, 2000), "Lãnh đạo" is defined as "setting directions and organizing motivation for implementation."

According to the Chinese dictionary, "Lãnh đạo" means "to guide and lead in a specific direction" (as quoted by Trần Thị Vân Hoa, 2011).

There are multiple definitions of the concept of leadership. Leadership is a process in which an individual takes on a leading role and guides individuals within a group to do the right things, build a cohesive team, and operate smoothly in order to achieve common goals.

The concept of leadership capability can be defined as the ability of an individual or a group to guide, motivate, and manage resources to achieve common goals. Leadership capability encompasses the integration of knowledge, skills, and personal qualities to shape and facilitate effective leadership. It not only enables the direction and management of a group, but also drives change, development, and success within an organization or community.

Economic leadership capability is the ability of an individual or a group to manage, oversee, and guide economic activities. It includes the ability to apply economic knowledge to analyze market conditions, make strategic decisions, manage finances and resources, drive economic development, and address economic challenges and risks. Economic leadership capability requires an understanding of economic principles, economic management processes, and market trends. It also calls for management skills such as resource management, strategic planning, communication, negotiation, and performance evaluation. Thus, economic leadership capability is the ability of leaders to shape and promote economic development, foster competitiveness, and achieve success in the business and market environment.

The economic leadership capability of district-level key officials is the ability to execute and manage the implementation of decisions and directives from higher authorities, while organizing and ensuring the implementation of programs and development plans for their respective units and localities. The economic leadership capability of district-level officials including knowledge of economics, economic management skills, communication skills to foster collaboration and economic development, and strategic thinking in local economic development issues.

3.2. The role of key district-level officials in economic leadership in Vietnam's market economy today

Key district-level officials are the leaders and deputy leaders of political and social organizations, departments, and committees at the district level. They directly lead, manage, and implement the Party's guidelines, state policies, and laws. They are also responsible for formulating and implementing strategies, programs, and development plans for the units and localities under their jurisdiction.

In the context of Vietnam's transition from a centrally planned economy to a market-oriented economy, the role of key district-level officials has become extremely important in guiding and managing the local economy. This role is manifested in the following ways:

Firstly, economic development orientation. Key district-level officials have the task of directing the economic development of the locality based on their understanding of the economic situation and development potential. They need to identify the sectors and

economic areas in which the locality has competitive advantages and create policies and programs to encourage and support the development of these sectors.

Secondly, economic management and operation. Key district-level officials are responsible for managing and operating economic activities in the locality. They need to monitor and evaluate the effectiveness of economic projects and programs, ensure the implementation of economic policies and decisions that yield results, and address issues and difficulties that arise during the implementation process.

Thirdly, creating a favorable business environment. Key district-level officials have the task of creating a favorable business environment for enterprises. They must promote administrative reforms, reduce procedural barriers, and create favorable conditions for business activities and investments in the locality. They need to demonstrate strong leadership abilities, provide motivation for economic development, and promote the improvement of the quality of life for local residents.

Fourthly, building partnerships and cooperative relationships. Key district-level officials establish and maintain partnerships and cooperative relationships with businesses, local communities, non-governmental organizations, and other entities. They establish partnership relations to attract investment, seek resources, and support the economic development of the locality. This is an essential factor in managing and developing the local economy.

3.3. The current status of economic leadership capabilities of key district-level officials in the market economy in Vietnam

According to the report on the implementation of the 8th Central Committee's Resolution on cadres' strategy, the cadre team at all levels has made progress and development in various aspects, with improving quality, gradually meeting the requirements of the period of industrialization and modernization of the country. The cadre team demonstrates firm ideological positions, political courage, moral integrity, simple lifestyles, exemplary behavior, organizational discipline awareness, and continuous self-improvement and capacity enhancement to strive and fulfill assigned tasks. Many cadres are dynamic, creative, adaptable to the trends of integration, and capable of working in an international environment. The majority of Party, State, and Front leaders at all levels possess competency, good qualities, and credibility. Strategic-level cadres have political courage, steadfastness in Marxism-Leninism, Ho Chi Minh's ideology, goals, ideals of national independence and socialism, innovative thinking, and the ability to formulate direction, policies, and provide leadership and guidance for implementation. Most of the leaders of the armed forces have been trained and tested through practical experience, remain loyal to the Party, and are ready to fight and sacrifice for the nation and people. Many scientific cadres are dedicated and enthusiastic in research, making positive contributions to the country. Some leaders and managers of state-owned enterprises quickly adapt to market mechanisms, organize efficient production and business (Resolution of the 7th plenum of the 12th Central Committee). These achievements apply to the general cadre team in our country, including key district-level officials.

However, there are currently several challenges to the economic leadership capacity of key district-level officials. These include the complexity and diversity of the business environment, rapid technological changes, globalization trends, as well as intense competition from other localities and international economic rivals. The economic management capacity of key district-level officials has not met the requirements. They are lacking in economic management capacity:

First, there is a lack of economic knowledge. Some key district-level officials have received training in economics, possess basic knowledge of economic management and economic policies, and are able to apply economic knowledge to their leadership duties. They understand fundamental economic concepts and principles, can analyze markets, assess economic potential and risks, and accordingly make appropriate economic decisions and policies. This enables them to provide direction, promote and create favorable conditions for businesses, and drive local economic development.

However, there are still some key district-level officials who have not attained the necessary level of knowledge to meet the requirements of modern economic leadership. They lack comprehensive knowledge and expertise in economics and management, practical experience, and updates on economic knowledge. This affects their ability to make informed decisions and address complex economic issues.

Second, there is a lack of economic management capability. In reality, although some key district-level officials have good management skills and possess basic knowledge of planning, implementation, and evaluation of economic activities, there are still difficulties in applying modern management methods and shaping economic development strategies.

One of the main challenges is shaping the local economic development strategy. This requires consensus and the ability to accurately identify development priorities based on thorough analysis and evaluation of the locality's potential and limitations. However, some key district-level officials may encounter difficulties in identifying and shaping appropriate strategies, as well as a lack of ability to generate innovative and creative solutions to promote economic development.

Furthermore, in the application of modern management methods, some key district-level officials also face challenges. They may lack the necessary knowledge and skills to apply advanced management methods such as quality management, risk management, project management, and strategic management. This can affect the effectiveness and sustainability of local economic activities.

Third, some key district-level officials lack the ability to provide direction and innovation in economic management. While some officials have the ability to identify potential industries and sectors and propose solutions and policies to encourage their development, many officials are not confident and flexible in directing and promoting economic development. When key district-level officials lack confidence and flexibility in economic development direction, the process of decision-making and policy implementation can become slow, leading to missed opportunities and loss of competitiveness with other

localities. Additionally, these officials may not fully leverage the potential of the locality, which can impact investors and businesses.

Thus, the limitations in the economic management capacity of key district-level officials can affect the economic development of the locality. Enhancing the economic leadership capacity of these officials becomes an urgent task. Weak economic management capacity can create uncertainty and lack of reliability for investors and businesses. Without accurate direction and the ability to leverage the potential of the locality, investors and businesses may lack trust and willingness to invest. Furthermore, when key district-level officials lack the necessary capacity and knowledge to provide direction and promote economic development, the locality may miss important development opportunities. Potential projects and industries may not be fully exploited and developed according to their potential.

The limitations in the economic management capacity of key district-level officials can be attributed to several main reasons: lack of specialized knowledge, insufficient training courses and programs on economic management and economic policies, and inadequate investment resources for training and capacity development. These reasons mentioned can contribute to the limitations in the economic management capacity of key district-level officials.

3.4. Solutions to enhance the economic leadership capacity of key district-level officials in the current market economy in Vietnam

To address the limitations and ensure the economic development of the locality, key officials need to enhance their economic leadership capacity. Here are some solutions:

First, invest in training and development.

Organize training courses and programs related to economic management, economic policies, and economic leadership. These training courses can include both basic and in-depth knowledge of economics, financial management, enterprise management, accounting, and business strategy. Ensure that the training courses are designed to be relevant to the reality and needs of the locality. Particularly, emphasize the cultivation of historical and cultural knowledge, professional expertise, and practical skills in economic management, state management, social management, science and technology, foreign languages, and computer literacy. The training and development should be closely linked to the functions and tasks of key district-level officials, enabling them to have the competence, knowledge, experience, and problem-solving skills to fulfill their assigned tasks and meet the economic and social development requirements of the locality.

Second, build networks and exchange experiences.

Promote the establishment of networks and the exchange of experiences among key district-level officials, as well as with other levels of management, businesses, research organizations, and experts. This can be done through organizing seminars, conferences, regular meetings, or establishing working groups to discuss and share experiences. This may involve sharing successes, failures, and lessons learned from practical cases, valuable insights, and effective management methods. Through these activities, the capacity to manage and plan the economy at the local level can be enhanced.

Third, harness self-motivation in enhancing economic management capacity

When key officials recognize the importance of economic management capacity, they tend to proactively enhance their own capabilities. Key officials should acquire knowledge, skills, and modern management tools. This will strengthen their ability to plan, implement, and evaluate local economic activities, thereby improving efficiency and productivity. At the same time, an appropriate mechanism should be in place to encourage continuous learning, self-improvement, and knowledge accumulation.

4. Conclusion

In the context of the strong development of the market economy in Vietnam, enhancing the economic leadership capacity of key district-level officials is an urgent requirement. While the team of key district-level officials is growing, there is still a need to strengthen their management capacity to meet the increasingly high demands of economic and social realities. Through measures such as investing in training and development, building networks and exchanging experiences, and harnessing self-motivation in enhancing economic management capacity, key district-level officials can become outstanding leaders capable of adapting to changes, making intelligent decisions, and providing strategic direction for the comprehensive development of the market economy in Vietnam. Only through relentless efforts and collective solidarity can we build a strong and sustainable market economy that contributes to the prosperity of the country.

COMPLETE VALUE-ADDED TAX POLICY FOR E-TRADE ACTIVITIES TO INCREASE TAX COMPLIANCE ACTIVITIES OF TAXPAYERS

PhD student. Giang Thi Thu Huyen

fosahuyenkt@gmail.com

Hanoi University of Natural Resources and Environment, Vietnam

Abstract

E-commerce transactions are taking place in an increasing number and increasingly complex, using intensive information technology (IT) applications, resulting in fraudulent acts. The payment of value added tax (VAT) of taxpayers (NNT) has created significant challenges for state management agencies, especially tax agencies. The framework of the article studies the factors affecting the VAT compliance behavior of taxpayers, thereby completing the VAT policy for e-commerce activities in order to create a favorable environment for this activity to develop and promote the trend. towards digital consumption in the economy and increase taxpayers' compliance with tax obligations.

Keywords: *e-commerce, policy, taxpayers, tax compliance behavior, value-added tax*

1. Introduction

In Vietnam, e-commerce activities have made strong progress with many models, participants and supply chains. Accordingly, e-commerce activities have contributed significantly to the commercial sector in particular and the economy in general. E-commerce increasingly asserts its role in promoting the digital economy, creating a favorable environment for the application of business models and becoming a new development trend in the future. Besides the benefits of e-commerce contributing to the economy, this activity also entails many challenges for state management agencies, including tax authorities. In all e-commerce transactions, VAT arises and this is considered the most difficult tax to manage because it arises between many participants, such as: state agencies, goods and service suppliers (HHDV) and consumers. Although in the initial stage, the tax authority has made certain moves in implementing management such as adjusting and supplementing a number of current tax laws as well as detailing in circulars and resolutions. specified in the VAT policy. However, these initial moves of the tax authorities have not yet met the strong development of e-commerce activities, the loss of VAT revenue in this business is still increasing continuously. There are many reasons leading to this situation and prominent among them is the sense of tax compliance of taxpayers. Thus, studying taxpayers' compliance with tax obligations to proactively improve VAT policies towards promoting e-commerce development and generating revenue for the state budget is essential in the current context.

2. Theoretical basis and research model

VAT management for e-commerce activities is influenced by many internal and external factors, which are:

(i) *Management of tax registration, declaration and collection.* Tax authorities manage tax registration, determine tax payable and tax collection of enterprises (tax declaration, tax payment, tax assessment, tax refund, tax exemption, tax reduction and other contents related to tax collection). The better and more efficient management of tax registration, declaration and collection, the better the quality of tax services. Therefore, the study hypothesized the following:

Hypothesis H1: Tax registration, declaration and collection management has a positive impact on tax service quality.

(ii) *Technology application in VAT management for e-commerce activities.* E-tax will support tax authorities' management processes, including system workflow and electronic information recording management, information management, and automatic risk analysis to assess the level of risk. reliability of tax returns (Makolm and Orthofer, 2007). The application of technology in tax administration brings many important benefits such as reducing administrative costs and tax compliance costs, increasing service quality for taxpayers and preventing corruption (OECD, 2010). The application of technology in the tax industry can also reduce taxpayer resistance to the tax system and can increase their tax compliance (Schaupp et al., 2010). Research results of Gerger et al (2014) show that taxpayers believe that applying technology will help reduce errors in tax administration and improve the quality of tax services. From that, it can be understood that the more effective the application of technology in tax administration, the more convenient it will be for taxpayers in complying with tax procedures, as well as enhancing the ability to manage taxes, limiting the taxpayers' risk of non-compliance. Therefore, on that basis and inheriting previous research results, the research hypothesizes:

Hypothesis H2: Technology application in VAT management has a positive impact on tax service quality

(iii) *Tax inspection and examination.* There are many studies on the influence of factors related to tax inspection and examination on the quality of tax services and the effectiveness of tax administration. Research results of Kamdar (1997) show that tax compliance of enterprises has a positive relationship with the rate of likelihood of being subject to tax inspection. Studies by Marrelli and Martina (1988), Gordon (1990), Cremer and Gahvari (1993), and Joulfaian (2000) show that the ability to be tested is negatively related to tax evasion. According to Marrelli and Martina (1988) and Gordon (1990), firms evade taxes less if the rate of tax audit is high. The research model of Wang and Conant (1988) gives the results that a high rate of tax inspection reduces the level of tax evasion of enterprises. On the other hand, some studies show that the level of tax compliance decreases immediately after the taxpayer is first inspected, and then the level of compliance increases again (Guala and Mittone, 2005). In general, many previous research results show that the

increased likelihood of tax inspection will increase the quality of tax services, thereby increasing the awareness of enterprises (Kirchler, 2007). Inheriting from previous research results, the study builds the following hypothesis:

Hypothesis H3: Tax inspection and examination have a positive impact on tax service quality

(iv) *VAT payment support services.* Support is when an organization or individual helps to add to another organization or individual a certain amount of resources so that the organization or individual receiving the support can achieve the desired results. In tax collection management activities, tax collection management agencies support taxpayers, which is understood as additional help for taxpayers to properly understand, fully understand and timely understand the provisions of tax law; at the same time, helping taxpayers master the skills of tax calculation, tax declaration and procedures related to tax payment and tax finalization. In other words, supporting taxpayers is the task of providing specific guidance on Tax Laws, providing and answering questions about the procedures and contents of taxes for taxpayers so that they can comply and perform well. tax policy of the State in each period. On that basis, the author proposes the following hypothesis:

Hypothesis H4: Support to pay VAT has a positive impact on tax service quality

(v) *Tax service quality.* Ott (1998) argues that tax administration in modern society needs to provide services to citizens and the process is increasingly specialized. Ott (1998) also concludes that the goal of any tax administration system is to provide better services to taxpayers. According to research by author Parasuraman (1988, 1991) shows that: service quality includes 05 components: empathy, reliability, tangible means, service capacity, responsiveness; and all these five components have a direct impact on service quality. According to Bird (2003), an effective tax management system should consider taxpayers as “customers”. Tax administration makes it easy for taxpayers to comply with taxes including factors such as improving service to taxpayers by providing clear instructions, providing easy-to-understand return forms, and providing information report, help them when needed. OECD (2004) identifies common services that tax authorities provide that can be classified into three categories, including informational, interactive, and transactional. In which transaction is considered the most important service, information and interaction services are only used to support transaction services. According to research by Feld and Frey (2006), the way tax authorities provide services to taxpayers affects their sense of tax compliance. Torgler (2007) argues that the willingness of taxpayers to cooperate with tax authorities will increase if tax authorities consider themselves to be service providers, providing quality services and treating them as service providers. with taxpayers as its partner. The OECD (2010) has a similar view. Tax authorities in many countries such as Australia, France, Switzerland, the United Kingdom and the United States have restructured their approach to taxpayers by paying more attention to their tax service needs and viewing them as customers (Kirchler, 2007). Therefore, on that basis and inheriting previous research results, the author develops the hypothesis:

Hypothesis H5: Tax service quality has a positive impact on corporate consciousness

(vi) *Communication on VAT collection for business activities generating e-commerce revenue.* Communication is one of the important factors contributing to the quality of tax services. The more attention is paid to communication, the higher the quality of tax services will be. In addition, tax communication is the content of Tax Administration, which is prescribed in the Law on Tax Administration of Vietnam. Tax offices are responsible for propagating, disseminating and guiding tax laws; publicize tax procedures at the head office, the website of the tax authority and on the mass media; responsible for explaining and providing information related to the determination of tax obligations to taxpayers. Especially in e-commerce activities, there are many peculiarities. Therefore, the more the tax authorities diversify forms of propaganda, the higher the tax compliance awareness of enterprises. On that basis, the author proposes the following hypothesis:

Hypothesis H5a: Communication on VAT collection has a positive impact on tax service quality

Hypothesis H5b: Communication about VAT collection has a positive impact on corporate consciousness

(vii) *Characteristics of VAT collection for e-commerce activities.* Factor Tax collection characteristics have been used in many research models on factors affecting taxpayer's consciousness. Research results of OECD (2004), Nguyen Thi Le Thuy (2009), Noor et al (2014) show that tax collection characteristics have a positive influence on the consciousness of taxpayers. E-commerce activities take place in cyberspace, so the management of tax collection for this activity is more complicated than in traditional business forms. Therefore, based on the characteristics of tax collection management for e-commerce, it helps tax authorities not only control revenue sources but also create conditions to support businesses with revenue from e-commerce activities to have a development environment, improve their sense of tax compliance. The research hypothesis is put forward as follows:

Hypothesis H6: The characteristics of VAT collection for e-commerce activities have a positive influence on the awareness of enterprises

(viii) *Handling of violations of the VAT law for e-commerce business activities.*

There are many researchers who have conducted research on the relationship between the level of tax compliance of enterprises and the level of penalties for tax violations. However, the research results on the relationship between fines and tax awareness are not always the same. According to Marrelli and Martina (1988), Wang and Conant (1988), Gordon (1990), firms evade taxes less if the fines for compliance violations are high. Some studies show that fines have little impact on tax compliance consciousness (Friedland et al., 1978; Park and Hyun, 2003). However, the research results of Virmani (1989) show that the rate of tax evasion can increase as the penalty for tax violations increases. Virmani (1989) argues that businesses deal with the penalty for violations by declaring a decrease in taxable revenue, in order to reduce the possibility of tax inspection, that is, increasing the level of penalty for violation makes the level of tax evasion more difficult, more tax fraud. Meanwhile, research

by Kamdar (1997) did not find evidence to show a relationship or impact between the level of fines and the sense of tax compliance of business subjects. Several studies confirm the view that fines have a stronger impact on tax compliance awareness if combined with a high rate of tax audits (Alm et al., 1995). Therefore, on that basis and partially inheriting previous research results, the hypothesis is put forward as follows:

Hypothesis H7a: Handling of violations of the law on VAT has a positive impact on the consciousness of enterprises with e-commerce revenue.

Hypothesis H7b: Handling violations of the law on VAT has a positive impact on the tax compliance behavior of enterprises with e-commerce revenue.

(ix) *Consciousness of enterprises.* The awareness factor of enterprises is also a factor used in many research models on factors affecting tax compliance of taxpayers. Research results of Bordignon (1993), Falkinger (1995), OECD (2004), Kanybek (2008), Nguyen Thi Le Thuy (2009), Dang Thi Bach Van (2014), Noor et al (2014), Bui Ngoc Toan (2017) shows that corporate awareness has a positive influence on tax compliance of taxpayers. On the basis of inheriting previous research results, the author develops the hypothesis:

Hypothesis H9: Enterprise awareness has a positive influence on tax compliance behavior of enterprises with e-commerce revenue.

On the basis of inheriting theories, empirical studies, results of interviews with experts and representatives of enterprises, and the research objective is to determine the factors affecting tax compliance behavior of enterprises with high tax compliance. In e-commerce business, the proposed research model is as follows:

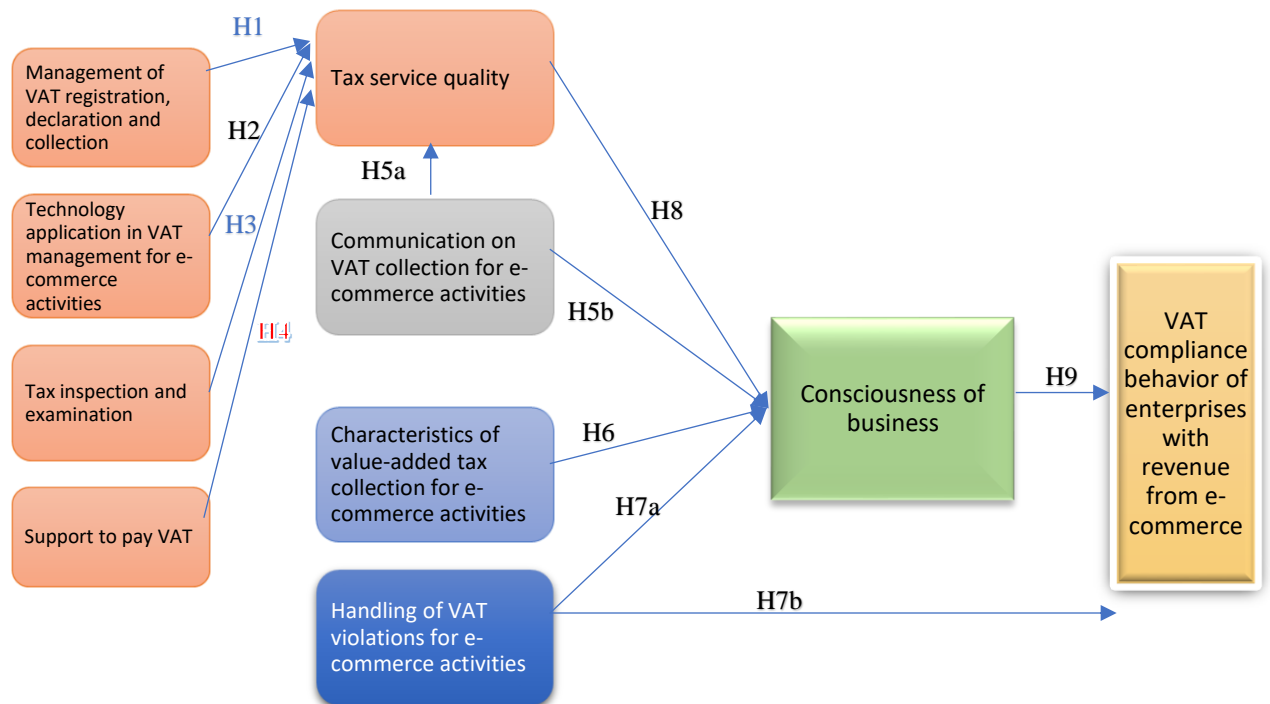

Figure 1. Proposed research model

Source: Study author's proposal

3. Method

This study consisted of two main steps: (1) preliminary research and (2) formal research. Preliminary research using qualitative and quantitative methods. The study formally used a quantitative method. The unit of analysis is the corporate taxpayer. The object of the study is an enterprise that generates e-commerce revenue in Hanoi and Ho Chi Minh City. To ensure the effectiveness of the questionnaire, the author conducts a test by sending the questionnaire to experts who specialize in tax research, including scientists and tax officials (10 specialists). countries) and e-commerce businesses with large turnover in Hanoi (10 enterprises). The main purpose of the pilot study is to ask respondents how well they understand the questions, and at the same time ask for their opinions on the content of the questionnaire and other comments to revise and improve the questionnaire in order to improve the quality of the questionnaire. survey efficiency. After the pilot test, the author made necessary adjustments and modifications to ensure the meaning of the question. At the official research stage, the author uses google form and mail tools to send survey questions to e-commerce businesses in Hanoi and Ho Chi Minh City.

Sample selection is very important in determining the quality of a scientific study. According to author Yates et al. (2003), the research sample is a collection of members representing a population obtained through different selection methods for the purpose of collecting scientific research information. According to author Smith (1993), sample surveys are often asynchronous, but researchers still have to choose a suitable and large enough sample size for the study to be representative of the population. According to Hair et al. (1998), the minimum sample size given is 5 times the total number of observed variables. In this study, we have 58 observed variables, so if we use the exploratory factor analysis (EFA) method, calculated according to the 5-fold principle according to Hair et al (1998), the minimum sample size is 290 factors. According to authors Tabachnick and Fidell (1996) the minimum sample size for multivariate regression is $50 + 8 \times m$ (m is the total number of independent factors), so based on this formula we have $50 + 8 \times 7$ (7 independent factors) = 106 observations. According to authors Hoang Trong and Chu Nguyen Mong Ngoc (2008), the minimum sample rate in the study is 4 to 5 times higher than the total observed variables. According to the research of Cormrey and Lee (1992), there are some views corresponding to the sample size in the study as follows: From 1,000 samples or more is excellent; 500 samples is great; 300 samples is good, 200 samples is rather good. Therefore, for a questionnaire with 58 observations, the sample size is 577.

However, due to time and budget limitations when implementing the research topic, the author followed the convenient sampling method by directly interviewing the survey subjects with the official questionnaire and sending the questionnaire to the respondents. Survey questions via email, Google form tool. In order to increase the generality of the research results, before selecting a random sample, the author selects a sample list based on the percentage of state budget contributions of e-commerce businesses in Hanoi and Ho Chi Minh City. After 6 months of survey, with 650 votes distributed, after screening, cleaning and eliminating, the author obtained 577 survey questionnaires corresponding to 88.8% qualified for analysis and valid questionnaires reach the required sample size for the study.

4. Results

a. Check the reliability of the scale

In the research, the author has built scales that reflect the factors. Re-checking the reliability of the scale to remove the indicators that are not really consistent with reality. The results are shown in Table 1 below:

Table 1. Results of testing the reliability of the scale

Symbol	Variable - Sum correlation	Cronbach's Alpha if no variable
Management of VAT registration, declaration and collection $\alpha = 0,886$, N = 4		
QLT1	0,799	0,837
QLT2	0,829	0,823
QLT3	0,617	0,906
QLT4	0,774	0,844
Technology application in VAT management for e-commerce activities $\alpha = 0,952$, N = 5		
UDCN1	0,835	0,946
UDCN2	0,898	0,935
UDCN3	0,864	0,941
UDCN4	0,879	0,939
UDCN5	0,860	0,942
Tax inspection and examination $\alpha = 0,946$, N = 4		
TTKT1	0,885	0,925
TTKT2	0,881	0,926
TTKT3	0,857	0,935
TTKT4	0,864	0,932
Support to pay VAT $\alpha = 0,872$, N = 5		
HTNT1	0,771	0,829
HTNT2	0,815	0,817
HTNT3	0,501	0,900
HTNT4	0,708	0,843
HTNT5	0,750	0,832
Communication on VAT collection for e-commerce activities $\alpha = 0,918$, N = 4		
TTTT1	0,821	0,890
TTTT2	0,851	0,879
TTTT3	0,779	0,904
TTTT4	0,795	0,899

Symbol	Variable - Sum correlation	Cronbach's Alpha if no variable
Characteristics of value-added tax collection for e-commerce activities $\alpha = 0,886$, N = 5		
DDTT1	0,686	0,870
DDTT2	0,739	0,858
DDTT3	0,754	0,854
DDTT4	0,681	0,871
DDTT5	0,760	0,853
Handling of VAT violations for e-commerce activities $\alpha = 0,927$, N = 6		
XLVP1	0,679	0,927
XLVP2	0,826	0,908
XLVP3	0,807	0,910
XLVP4	0,858	0,903
XLVP5	0,842	0,906
XLVP6	0,713	0,923
Tax service quality $\alpha = 0,953$, N = 5		
CLDV1	0,869	0,942
CLDV2	0,874	0,941
CLDV3	0,892	0,938
CLDV4	0,838	0,947
CLDV5	0,874	0,941
Consciousness of business $\alpha = 0,933$, N = 5		
YTDN1	0,791	0,925
YTDN2	0,790	0,926
YTDN3	0,823	0,918
YTDN4	0,879	0,909
YTDN5	0,848	0,914
VAT compliance behavior of enterprises with revenue from e-commerce $\alpha = 0,922$, N = 5		
TTT1	0,823	0,899
TTT2	0,733	0,917
TTT3	0,832	0,897
TTT4	0,869	0,890
TTT5	0,740	0,917

Source: The author checked the data using SPSS software

Thus, the results of testing the reliability of the factor scale show that the conditions of a good scale are satisfied. Cronbach's Alpha coefficient is greater than 0.7, all observed variables have a total correlation coefficient greater than 0.3. In other words, the observed variables are used to measure the necessary reliability scales for use in the research.

b. Exploratory factor analysis

The analysis results after excluding observed variables that converge to other theoretical factors but are not appropriate (QLT4, HTNT3) in terms of internal values show that observed variables converge into 9 main components as shown in Fig. theoretical model. KMO coefficient > 0.5 (0.932), explanatory variance is greater than 50% (78.918%), the factor loading coefficients of the main components are all greater than 0.5. This shows that using exploratory factor analysis is appropriate. The measurement structure of the factors established from the observed variables is the same as the theoretical model without adjustment.

The analysis results with the dependent variable VAT compliance behavior of enterprises with e-commerce revenue show that the KMO coefficient > 0.5 (0.876), Bartlett test has statistical significance (p-value < 0.05), observed variables have factor loading coefficient greater than 0.5, explanatory variance greater than 50% (76.484%). The observed variables converge to a single factor. This shows that using exploratory factor analysis is appropriate.

Observed variables	Main factor
	Factor loading coefficient
TTT4	0,922
TTT3	0,897
TTT1	0,892
TTT5	0,830
TTT2	0,828
KMO	0,876
TVE (%)	76,484
p-value	< 0,001

c. The analysis results confirm the factor

The data is further tested by confirmatory factor analysis to assess the appropriateness of the model with experimental data. Confirmatory factor analysis with measurement models was used to assess the appropriateness between the theoretical model and the collected data. The results of the model analysis are presented below:

Figure 2. Results of confirmatory factor analysis with variables

Source: Author's calculations with the support of AMOS software

The results of confirmatory factor analysis with variables show that the model is compatible with actual data: Chi-square/df = 2.873 < 3, CFI = 0.939, TLI = 0.932, IFI = 0.939 are all greater than 0.9, and RMSEA = 0.057 (Figure 2)

The analysis results also show that the factor weights of the observed variables in each research concept are greater than 0.6, showing that the scales reach the convergent value. The combined reliability coefficients greater than 0.7 and the mean extracted variance greater than 0.5 show that the research concepts in the model have the necessary reliability (table 3).

d. Structural model and testing of research hypotheses

To test the research hypotheses, the thesis uses analysis by linear structural model (SEM). The analysis results show that the proposed research model is compatible with actual data: Chi-square/df = 2.879 is less than 3, CFI = 0.922; TLI = 0.917; IFI = 0.923 are all greater than 0.9, RMSEA = 0.057 is less than 0.08 (Figure 3)

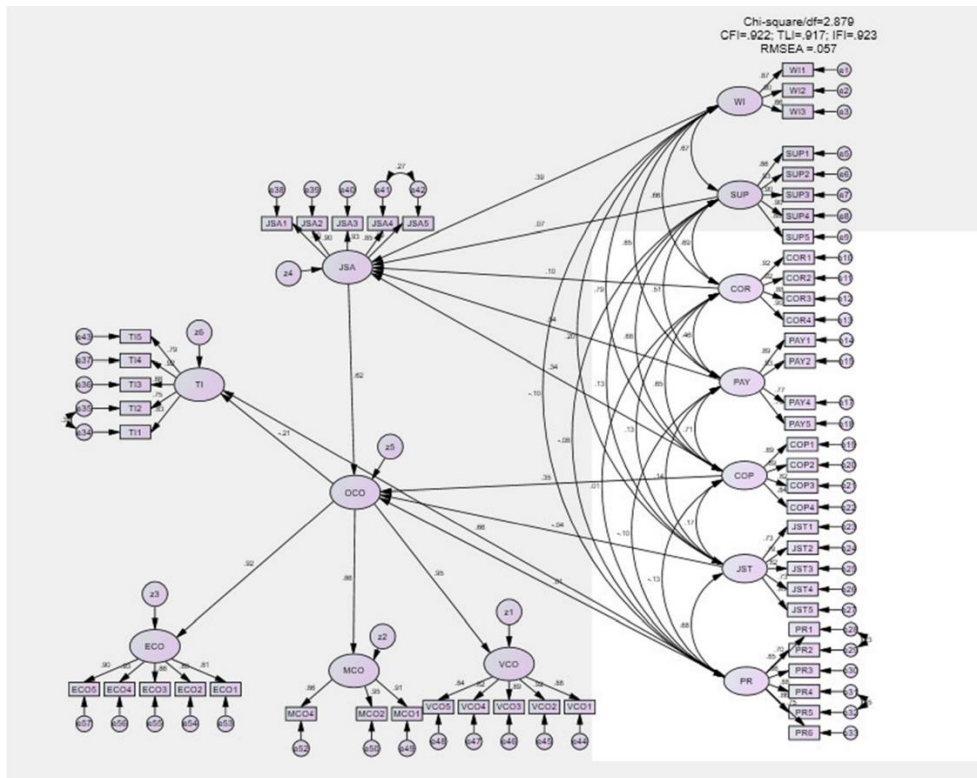

Figure 3. The analysis results of SEM model

Source: Author's calculations with the support of AMOS software

The estimated results show that the relationship that is not supported in the model is the relationship between the characteristics of VAT collection on e-commerce activities and the awareness of enterprises (p-value = 0.168 > 0.05). 5). Thus, hypotheses H1, H2, H3, H4, H5b, H7b, H8, H9, H5a, H7a are accepted and hypothesis H6 is rejected.

Table 2. Estimation results by linear structural equation

Relations between variables			Standardized Beta coefficient	S.E.	C.R.	p-value
QLT	----->	CLDV	0,125	0,066	2,107	0,035
UDCN	----->	CLDV	0,147	0,033	3,867	< 0,001
TTKT	----->	CLDV	0,142	0,042	3,38	< 0,001
HTNT	----->	CLDV	0,119	0,042	2,821	0,005
TTTT	----->	YTDN	0,344	0,036	9,308	< 0,001
TTTT	----->	CLDV	0,024	0,048	2,589	0,01
DDTT	----->	YTDN	-0,033	0,024	-1,38	0,168

XLVP	----->	TTT	0,660	0,062	13,534	< 0,001
XLVP	----->	YTDN	0,383	0,055	6,991	< 0,001
YTDN	----->	TTT	0,546	0,056	10,376	< 0,001

Source: Author's calculations with the support of AMOS software

5. Discussion and conclusion

- The sanctioning factor for VAT law violations for e-commerce activities has the greatest influence on the VAT compliance behavior of e-commerce enterprises with a standardized Beta coefficient of 0.660. That means that if the management and sanctioning of violations of the VAT law is strengthened and improved, the VAT compliance behavior of enterprises will also be correspondingly improved. In order to strengthen the sanctioning of tax law violations, a number of policy implications can be made, including: (i) the need for clear guidance on the assessment of circumstances to apply reasonable fines ; (ii) it is necessary to handle or coordinate to completely and comprehensively handle related tax issues, limit the handling of many times, many times, which is ineffective and psychological and takes time for enterprises. ; (iii) it is necessary to take advantage of technology applications (management software, electronic tax data,...) to promptly detect violations and improve objectivity in handling violations.; (iv) monitoring and statistics on the compliance status of enterprises that have been sanctioned, the possibility of recidivism and the level of compliance with tax laws of enterprises to serve as a basis for reference to the next management steps to be appropriate. fit.

- The factor of tax service quality affects the awareness of e-commerce enterprises with a standardized Beta coefficient of 0.630. This factor has the same effect and the second largest influence in the research model. When the quality of tax services is more appreciated by enterprises, the sense of compliance with tax obligations of enterprises will increase accordingly. In order to improve the quality of tax services, tax authorities need to: (i) focus on building and renovating their offices and working equipment to be advanced, modern and synchronous; (ii) conduct specific research, regularly survey and discuss with enterprises to understand their needs, especially newly established enterprises.

- Factor's awareness affects the VAT compliance behavior of e-commerce businesses with the third largest standardized Beta coefficient of 0.546. This shows that when the awareness of enterprises increases, their VAT compliance behavior also increases. In order to increase the awareness of businesses, it is necessary to improve the quality of tax services, especially propaganda to support taxpayers to grasp and understand new tax laws, circulars and decrees, simplify tax procedures.

- Media factor of VAT collection affects the consciousness of e-commerce enterprises with the fourth largest standardized Beta coefficient of 0.344. This factor has the same effect as the awareness of enterprises, that is, when the communication of tax collection increases, the awareness of enterprises is also raised. From there, the policy implications of improving the communication factor for VAT collection are proposed, including: (i) diversifying forms of propaganda, suitable for each group of taxpayers; (ii) it is necessary to add detailed instructions, explanations, specific regulations, reference situations so that enterprises can better understand the regulations and know how to apply them appropriately; (iii) develop business support services through cooperation mechanisms with organizations and individuals outside the tax authority, the tax intermediary system, especially tax agents; (iv) Tax officers need to have solid tax law knowledge, experience in tax law enforcement, a complete reference library system to promptly support businesses when they encounter problems.

- The factor of technology application in tax administration affects the quality of tax services with a standardized Beta coefficient of 0.147. This is the 5th most influential factor and has the same direction as the quality of tax services. When increasing the application of technology in VAT management, the quality of tax services will also be improved. Tax authorities need to build a complete, accurate, centralized and unified taxpayer database nationwide; Developing IT applications in tax administration activities with high integration and automation, closely associated with the process of reforming tax administrative procedures and applying electronic tax; building IT technical infrastructure, advanced, modern and synchronous equipment.

- Tax inspection and examination factors affect the quality of tax services with a standardized Beta coefficient of 0.142. This is the sixth most influential factor in the same direction as the quality of tax services. When tax inspection and examination work is enhanced, the quality of tax services will also be improved. Issues that need to be focused on to strengthen tax inspection and examination for enterprises include: (i) improving the quality and sense of responsibility and professional ethics of the contingent of inspection and audit civil servants. tax investigation; (ii) apply risk management methods in all stages of inspection and inspection; (iii) comprehensively renovate inspection and examination activities in the direction of uniformity, modernity and regularity; (iv) it is necessary to have alignment and unification, to avoid the cases of inspection and examination with the same age and content.

Abstract

This article analyzes the characteristics of the changing circumstances and clarifies this concept, showing that it is an important legal-economic phenomenon that needs to be thoroughly adjusted in the contract law in Vietnam. The conditions for determining the circumstances of fundamental change are also discussed. Thanks to the comparative jurisprudence method, the evaluation of the contractual legal framework on this issue is also analyzed. The article analyzes the provisions of The Civil Code 2015 on contract performance when the circumstances change fundamentally. The condition determines the fundamental change of circumstances with the causes and timing of the change of circumstances; unpredictability of changing circumstances; circumstances change dramatically; The obligation to repair damage is carefully analyzed and evaluated. Besides, the issue of renegotiation and dispute settlement authority and consequences of unsuccessful negotiation are also carefully studied. On the basis of comparison with the Unidroit Principles on international commercial contracts, the European Code of Contract Law and the regulations of some typical countries, the author draws valuable comments about The current legal situation of Vietnam serves as the basis and foundation for the improvement of the law.

Keywords: *legal status, basic changing circumstances; contract performance, contract*

1. Introduction

Contracts are always the central institution in the civil legal system in general and commercial business in particular. The purpose of contract law is to protect the free of the parties. A legally concluded contract is binding on the parties, and the parties must respect and perform it. However, in the process of implementing contracts, especially long-term contracts, traders may cope with unusual risks from nature, society, economy, politics, and people... which can make the performance of obligations extremely difficult, even

impossible. In such events, not all events are force majeure events for which the aggrieved party can be discharged from obligations or terminate the contract, but are subject to a fundamental change of circumstances for the purpose of the party modifies the contract so that the contract can be continued and tries to maintain a balance of interests for both parties.

Performance of a contract when there is a fundamental change in circumstances is first explicitly recorded in The Civil Code 2015. In legal practice, there have also been disputes regarding the requirement to adjust the contract when circumstances change but the lack of legal provisions has caused many difficulties in the settlement process. In international commercial practices and the laws of certain countries, there are provisions on contract adjustment when the circumstances change fundamentally. However, this provision is also not understood and applied in the same way in different countries, so it becomes even more urgent to learn about this provision to learn from experience for Vietnam.

2. Method

This study used descriptive, analytical, commentary and comparative jurisprudence methods.

3. Results

3.1. Circumstances have changed fundamentally

A fundamental change in circumstances is an objective event that occurs beyond the expectations of the parties when entering into a contract, which makes the performance of the contract extremely difficult or seriously unbalances the interests of one party. or the contract is no longer meaningful if the contract continues to perform as originally committed. The changing circumstances have the following characteristics:

First, the contract is materially affected by a substantially or substantially changed circumstances. Because, the principle of pacta sunt servanda (immutable validity) is one of the basic principles of contract law. Respect for the agreement entered into as a supreme principle. Only when a very substantial change in circumstances occurs, which could be a change in circumstances that would seriously unbalance the interests of the parties to the contract or make the performance of the contract too difficult, only then will the contract be considered for adjustment.

Second, the event creating the changed circumstances must have occurred or become known only after the conclusion of the contract. If the event has happened or is known in advance, it means that the parties have accepted the possible consequences and must accept the disadvantages brought about by the circumstances.

Third, the parties cannot reasonably anticipate the change of circumstances at the time of entering into the contract. That is, the event that changes the circumstances affecting this contract is not recognized by the parties in the contract or expected by the parties at the time of signing. This event was unexpected for both sides. Unforeseeable must be reasonable because there are contracts that by its nature have inherent risks that cannot be said to be unforeseen, such as participating in trading on the stock market, entering into contracts with other investors. co-insurance...

Fourth, the disadvantaged party does not deserve to suffer such heavy losses. Or it can be said that the consequences are so great that, if known in advance, the contract has not been concluded or will be concluded with completely different content.

3.2. Conditions for determining the circumstances of fundamental change

The application of the variable circumstances clause is very limited because its application is an “exception” to the principle of binding validity of the contract. When circumstances change, the Court will first consider the “traditional” provisions, such as the force majeure clause, consider the fault of the parties, consider the interpretation of the contract... to apply. And only when none of the “traditional” terms are satisfied does the “exceptional” clause be considered as the circumstances of a fundamental change. Therefore, the conditions for determining the situation of fundamental change are also very strict. Accordingly, the basic conditions for identifying changing circumstances include: the cause and timing of the change in circumstances, the unpredictability, the extent of the change, and the affected party's willingness to remedy the consequences. benefits, particularly:

3.2.1. Causes and timing of changing circumstances

Point a, Clause 1, Article 420 of The Civil Code 2015 stipulates: “The change of circumstances due to objective causes occurs after the conclusion of the contract”. Circumstance change is essentially a flexible legal term because it occurs in different forms, so it is not possible to list all the situations that are said to be changed circumstances. Anyway, the circumstances considered difficult are usually: performance of the contract would jeopardize the safety of persons or property; increased risk of financial ruin of the debtor; opportunity costs; windfall gains; the futility of purpose¹. Some of the facts listed by the International Chamber of Commerce (ICC) in the model terms of the substantive change of circumstances can be referenced²:

War (whether declared or not), military conflict or threat of similar occurrence (including but not limited to counterattack, siege, military embargo), hostilities, invasion, hostile action, total military mobilization;

Civil war, rebellion, military force or appropriation, rebellion, chaos or civil disorder, violence, acts of civil disobedience.

Acts of terrorism, vandalism or robbery.

The act of a competent authority, whether legal or not, law or order, rule, regulation, government directive, curfew, expropriation, requisition, nationalization;

Acts of God, plagues, natural disasters such as hurricanes, tornadoes, hurricanes, tornadoes, blizzards, earthquakes, volcanic activity, landslides, tidal waves, tsunamis, floods, damage or destruction by lightning, drought;

² ICC Force Majeure Clause 2003/ICC Hardship Clause 2003, *ICC - International Chamber of Commerce (blog)*, accessed August 29, 2018, <https://iccwbo.org/publication/icc-force-majeure-clause-2003icc-hardship-clause-2003/>.

Explosion, fire, destruction of machinery, equipment, plants or any type of installation, prolongation of transit time, telecommunications or electrical currents;

General labor disturbances such as boycotts, strikes, factory closures, labor strikes, occupation of factories and facilities. The events listed above are not only economic fluctuations but also include political and legal factors...

The change of circumstances must be due to objective reasons. The Civil Code does not stipulate how objective causes are to be understood, but usually, *“this objective factor is assessed in relation to the contract performer. In order to be considered an objectively occurring event, it must pass the control of the party that has to perform the contract and as such it can be a natural event such as a natural disaster but can also be caused by humans. perpetrated by the act of a third person”*³. For the parties in the contract, objective causes are causes beyond the awareness of the parties when entering into the contract, such as natural disasters, wars, great fluctuations in the socio-economic situation, etc. determining whether those causes are objective or not need to stand on the point of view of an ordinary person in that situation being aware of a certain event that will happen or not. If the answer is no, the fact is considered objective to the parties to the contract.

In most countries, the conditions for identifying the changing circumstances are basically objective. If the parties are aware, it is no longer considered objective. Because, if aware, the parties have foreseen in the contract or will agree with other terms or the law on errors is also prescribed. Therefore, only when circumstances are due to objective causes can this condition be taken into account. Particularly for Germany, this cause includes both objective circumstances and subjective factors (see Article 313)⁴. To explain this, it can be explained that the German civil law only regulates confusion caused by one party's fault, but there is no law on confusion of both parties when entering into a contract. So maybe this is a supplement to that absence⁵.

The time when such objective circumstances must occur after the conclusion of the contract is considered as the fundamental change of circumstances. This is explained in the same way as above, the applicable law will be the law of fault because the affected parties or parties have "ignored" it, so it will not be determined as a fundamental change in circumstances. In The 2015 Scientific Comment on Civil Code, the author said that *“the time of the change of circumstances is after the parties have entered into the contract, because if it happens before or at the time of entering into the contract, it is mandatory for the parties to enter into the contract. must be aware to agree on the content of the contract or not to establish a contract to ensure each other's interests”*⁶. The question is, if the changed

⁶ Nguyen Van Cu, Tran Thi Hue (2017), *The 2015 Scientific Comment on Civil Code of Vietnam*, People's Public Security Publishing House, p.635.

circumstances happened before the parties entered into the contract but both parties did not know, is it considered that the circumstances occurred after the contract was concluded? If the event has happened and the parties are still in agreement, can it be considered a mistake/mistake of one or both parties.

Referring to the PICC, according to comment at Point a, Paragraph 1, Article 6.2.2 of the PICC⁷ on “*events occurring or known after the conclusion of the contract*”, “*events causing hardship must have occurred or been caused by the affected party.*” *known disadvantage after the conclusion of the contract. If the disadvantaged party had known of the above facts at the conclusion of the contract, they could have reviewed the contract at the time of conclusion and then they could no longer invoke hardship.*” Thus, the PICC determines not only the time “after the conclusion of the contract” but also the time “known after the conclusion of the contract”. Similarly, the law of North America, England⁸ also follows this view while the law of Italy, the event must not exist at the time of conclusion even if the circumstances occurred at the time of conclusion but the parties do not know. German law like Vietnam only recognizes changing circumstances that occur after the conclusion of the contract. The Law does not refer to the time, but only to “unforeseen at the time of the contract” (Article 1195). As such, different countries also have different regulations, fundamentally changing circumstances may occur before, during or after the conclusion but the parties do not know or cannot know⁹. Unlike the provisions of some other laws, Vietnam stipulates that the cause must be objective and the time when the change of circumstances occurs is after the conclusion of the contract. French law does not refer to the time, but only to “unforeseen at the time of conclusion”¹⁰ (Article 1195). As such, different countries also have different regulations, fundamentally changing circumstances may occur before, during or after the conclusion but the parties do not know or cannot know. Unlike the provisions of some other laws, Vietnam stipulates that the cause must be objective and the time when the change of circumstances occurs is after the conclusion of the contract.

3.2.2. Unpredictability of changing circumstances

Unpredictability is a prerequisite but perhaps the most difficult determining factor, because it is an internal subjective factor derived from the perception of the subject in the contract. According to Point b, Clause 1, Article 420 of the 2015 Civil Code, it is stated that “*at the time of entering into the contract, the parties cannot foresee the change of circumstances*”. Unforeseeability, or in other words, they cannot reasonably be accounted for or anticipated by the affected party. Unpredictability includes two aspects, that is, the unforeseeability of the event that will happen, and the unforeseeable consequences. Here,

⁹ R.A Momberg Uribe (2011) “*The effect of a change of circumstances on the binding force of contracts - Comparative perspectives*”, truy cập tại <https://dspace.library.uu.nl/handle/1874/204792>, accessed 05/03/2021

¹⁰ French Civil Code (2006), https://www.trans-lex.org/601101/_/french-civil-code-2016/

unpredictability is understood as the parties could not have anticipated or could not have known about the changing circumstances at the time of entering into the contract. According to the above regulation, there are two things that need to be considered: what is unforeseeable and neither party nor parties can be unforeseeable.

Firstly, the unpredictability at the time of contract

Article 400 of The Civil Code 2015 stipulates that the contract is concluded at the time the offeror receives the acceptance to enter into the contract. The time of accepting the contract depends on the form of a verbal, written contract or a silent agreement as a response to the acceptance of the contract. Specifically, in case the parties have agreed that silence is the answer to accept the conclusion of the contract within a time limit, the time of entering into the contract is the last time of that time limit. The time of entering into a verbal contract is the time when the parties have agreed on the content of the contract. The time of entering into a written contract is the time when the last party signs the document or by another form of acceptance shown in the document. Where a contract is entered into orally and then in writing, the time of contract conclusion is the time when the parties have agreed on the contents of the contract. Disputes that require the application of changing circumstances are usually long-term and high-value contracts, so the parties will choose a written contract. It will be difficult to find oral contracts or silent agreements in these types of contracts because the provability of such forms of contracts is very weak.

The law stipulates that at the time of entering into a contract, the parties cannot anticipate changing circumstances. This can be understood that at the time of concluding the situation may not have happened or has happened but the parties could not have foreseen it. Circumstances that have not occurred are not difficult to prove, but events that have occurred that the parties did not anticipate in many cases are not easy to produce proofs. Predictability needs to be considered in the particular situation that a person in a similar situation would perceive. The assessment of the change of unforeseen circumstances should be considered based on the nature of the circumstances, the cognitive ability of the parties in the contract and in the absence of grounds to assess the perceptions of the parties, it is still must be based on the perception of an ordinary person in a similar situation.

So how to determine the predictability or unpredictability in a reasonable way. Although predictability is subjective, the assessment cannot be based on the opinion of the affected party. To assess whether the parties anticipate or not need to be based on many factors, such as the "quality of the subject, the type of contract, the nature of the contract, the market conditions surrounding it and the standards other similar standards." Accordingly, events under normal conditions must be excluded.¹¹ For example, contracts for buying and selling shares on the stock market, contracts for payment in foreign currencies (the exchange rate may change unpredictably)... The parties are forced to anticipate possible changes or in other words, foreseen but the disadvantaged party did not consider them so must be

¹¹ Nong Quoc Binh (2012), *Some theoretical and practical issues for force majeure clauses in international sale and purchase contracts*, Jurisprudence Journal No. 5/2012.

responsible for its own negligence. In many cases, even though the contract is volatile, it means that the parties must anticipate change. But not in all cases is not considered, because the change is unusual compared to the ability to predict. Therefore, when considering, it is also necessary to determine the contractual circumstances to determine the predictability. Foresight is not about anything that can be found but what is reasonable in the circumstances.

Unpredictability is one of the requirements encountered in most provisions of national and international law regarding the underlying circumstances. Unforeseeable can be understood as under the actual conditions at the time of signing the contract, the parties' inability to predict the circumstances will be changed. The point of note is that Point b, Clause 1 of Article 420 does not clarify whether the unforeseen but unreasonable is accepted as unforeseen or not. In order to evaluate the reasonableness of the unforeseen factor, it is necessary to base on the characteristics of the changed element, the nature of each type of contractual relationship, the contract's circumstances, etc. For example, often the main change is policies, laws of the state, or natural disasters such as tsunamis, earthquakes are unpredictable. However, fluctuations in exchange rates or inflation rates are not always considered to be unjustifiably unpredictable but depend on the characteristics of each type of contract. Thus, to determine whether a change is foreseeable or not needs to be based on many factors, not only the magnitude of the effect but also the circumstances at the time the parties signed the contract. to assess the reasonable extent to which the parties can anticipate.

Second, about the unpredictable subject

Another question is, is it not possible for the parties to the contract to anticipate the changing circumstances or is it just that one party does not anticipate? The author believes that it is reasonable to stipulate that the parties are not a party because if one party knows and still intentionally enters into a contract to the detriment of the other party, the applicable consequences may be that the contract is void. due to deception, not the underlying change of circumstances. Article 6.2.2 of the PICC holds that “*the disadvantaged party did not reasonably take such facts into account when entering into the contract*” refers to the fact that the disadvantaged party did not anticipate the changing circumstances. While PECL does not explicitly stipulate that one or the parties do not anticipate “*the possibility of a change in circumstances that cannot be reasonably foreseen at the time of entering into the contract*”. The same provision of The German Civil Law “*...the parties would not have entered into a contract or otherwise had entered into it if they had known of the change in advance*” also refers to the parties and The French Civil Law hidden subject “*if there is a change of circumstances that cannot be foreseen at the time of signing the contract...*”. In the UK, only one of the parties needs to anticipate. Referring to the above regulations, there are regulations specifying parties, regulations specifying disadvantageous parties, and regulations hiding the subject of unpredictability. But the common point is all about "unpredictability".

Vietnamese law only recognizes that unpredictability must come from both sides. “Impossible” here is understood to be unable to know and not obligated to know about the circumstances of the fundamental change. Because if it can be known or forced to know, this

situation is not called unforeseen. And if foreseen, the parties will have to foresee in the contract the changing circumstances or suffer the consequences due to the breach of contractual obligations prescribed by law. As such, unpredictability is an important condition for determining whether an event is a changing circumstance. Unforeseen must not be specified in the contract or expected by both parties. In order to evaluate the reasonableness of the unforeseen factor, it is necessary to base on the characteristics of the changing factor, the nature of each type of contractual relationship, the contract signing circumstances, etc. Normally, people will evaluate the validity of the contract. unforeseeable by listing events that can be considered unforeseeable or excluding cases that cannot be considered unforeseeable. Unpredictability must come from both parties to the contract and at the time of entering into it neither of the parties could have foreseen the changing circumstances. It can be seen that Vietnamese law does not have regulations or criteria on what is predictable or unpredictable.

3.2.3. *Circumstances changed dramatically*

Points c and Points d have the same criteria for assessing whether the situation is fundamentally changed or it can be said that the situation has changed significantly. Score c refers to the degree of change in circumstances and point d refers to the extent of damage. This change must be at what level to be considered a condition for identifying the situation of fundamental change. Point c, Clause 1, Article 420 of The Civil Code 2015 stipulates: *Circumstances have changed so much that if the parties had known in advance, the contract would not have been concluded or was concluded but with completely different contents.* The threshold of major change is defined quite abstractly as *"if it was known in advance, the contract would not have been concluded or was entered into but with completely different content"*. This condition is based on the will of the parties by making an "if" presumption. And the circumstances must be so "big" that the parties will not enter into or enter into other content. "In order to confirm whether the degree of change in circumstances is "big" enough, it is necessary to put the conclusion of the contract in a new context with the assumption that: with the changed circumstances, the parties will not enter into the contract because it is not to gain benefits, or to have benefits, the parties must agree on a completely different contract content; In addition, if the contract is continued to perform without any suitable modification of the contents, the party affected by the change of circumstances will suffer serious damage."¹²

Substantial change is not only reflected in the "significant" magnitude of the damage, but also in the extent of the damage that a party should not have suffered. What must be the extent of the damage to be able to be identified as an identifying factor in a fundamental change of circumstances? Point d, Article 420 of The Civil Code 2015 stipulates that *"Continuing to perform a contract without changing the contract content will cause serious damage to one party"*. Serious damage is also difficult to assess, because each case is

¹² Le Minh Hung (2010), *Validity of the contract in accordance with Vietnamese law*, Doctoral thesis in jurisprudence, Ho Chi Minh City Law University.

different, the extent is different, each type of damage is different, or each different subject is not the same. Usually, the way to assess damages is that the parties compare the results of performance under the contract and the results after changing circumstances if the performance of the contract continues. From there will consider the extent of damage for each party. It must also be added that serious damage does not mean that the benefits desired by the parties are not achieved when entering into a contract. For example, when entering into a contract, A expects a 20% difference in profit, but in fact, due to market price changes, A only makes a profit of 5% or even no profit, then A cannot say that the loss is serious because of the failure to meet the demand. get benefits. But if the market price fluctuates by half, if continuing to perform the contract will cause great disadvantage to the obligor, this case is considered as serious damage. However, to consider how serious the damage is, it is necessary to consider many factors, not just by a certain quantity. For example, the severity of the damage may be related to an economic factor such as a significant increase in the cost of performing the obligation, a large unanticipated drop in profits at the conclusion of the contract, or can be damages related to people, business reputation in the market, long-term development strategy of the business... The assessment of damage instead of fixing price fluctuations, the assessment should be based on the impact and consequences of that change, such as the duration of the contract, the purpose, experience, and financial ability of the parties to the contract.

Points c and d are currently two independent conditions for identifying a fundamentally changing situation. This is an inadequacy of the law because, these two conditions have the same criteria when talking about the "significant" of the damage. Furthermore, point c, clause 1, Article 420 of The Civil Code 2015 determines the extent of damage, but does not show the relationship between the changing circumstances and the contract content. Therefore, it only needs to be specified that the circumstances change significantly to satisfy this factor. Furthermore, stipulating the two conditions would also make it more difficult to prove the changed circumstances and it would not be necessary to separate them into two separate clauses. Thus, if according to the legal rules or the parties have agreed in the contract on the assignment of risks in a particular case, it will not be allowed to invoke the provision of fundamental change of circumstances to request a replacement. change or terminate the contract. Circumstances change dramatically when it comes to the "magnitude" of the change and how severe the damage is. However, determining the extent of change and the extent of damage is difficult to give a certain threshold that depends on each specific case.

3.2.4. Obligation to repair damage

This is also a condition that determines the changing circumstances in order to limit the abuse of this provision to request modification or termination of the contract to avoid performance of obligations. Point dd, Clause 1, Article 420 of The Civil Code 2015 stipulates: *"The affected party has applied all necessary measures within its ability to permit, in accordance with the nature of the contract, but cannot prevent or minimize it. the extent to which benefits are affected"*. Stemming from the principle of goodwill and honesty

during the performance of the contract, in the event of an unexpected event affecting its interests, the aggrieved party must make every effort to minimize the damage. The aggrieved party must demonstrate that it has made every effort in its ability and condition to prevent and minimize the damage. In case the party with influential interests, although having the ability to prevent or minimize the level of influence, does not make efforts to do so, it must bear the risks itself. This provision is also intended to prevent abuse of fundamental change circumstances to request an amendment or termination of a contract. Refer to the regulations on the principle of compensation for damage outside the contract, "the party whose rights and interests are infringed shall not be compensated if the damage occurs due to the failure to apply necessary and reasonable measures to prevent or limit damage to yourself".¹³ In short, the principle of immutable validity of the contract is the basic principle in the process of contract performance. The parties must respect and commit to perform their agreement even in case the contract purpose is not as desired. Only when the "rigorous" conditions of the substantive change are satisfied, will the contract be considered for modification or termination.

3.3. Renegotiate

When a contract is determined to be subject to a fundamental change in circumstances, one party has the right to request the other party to renegotiate the contract, and in case no agreement is reached, one of the parties may request the Court to amend the contract. or terminate the contract. Clause 2, Article 420 of the Civil Code 2015 of Viet Nam stipulates: "*in case of a fundamental change in circumstances, the party with affected interests has the right to request the other party to renegotiate the contract within a reasonable time*". During the contract performance, both parties have the right to renegotiate the contract on the basis of good faith and honesty, without having to wait until there are fundamental changes to have a reason to request negotiation. Regulations on renegotiation when circumstances fundamentally change have some specific contents as follows:

3.3.1. The other party's right to request negotiations or the other party's obligation to participate in negotiations

Vietnamese law reserves the right to request renegotiation to the party affected by the fundamentally changed circumstances. This is also easy to explain because the affected party is usually the one who needs to change the contract to reduce or eliminate the damage. The question, however, is, is the other party obligated to participate in the negotiations? Vietnamese law also does not have clear provisions.

There is a view that the parties should not be forced to renegotiate because it can waste time and effort, concerned that one party is easily put at a disadvantage in the renegotiation process. The inefficiency of the renegotiation process is justified from the perspective of behavioral economics, which assumes that renegotiating terms in the face of adverse circumstances is less likely to succeed because at that time , the will of the parties is highly likely to be nailed by the inherent agreements of the contract and has the mentality of

¹³ Clause 5, Article 585 of The 2015 Civil Code.

avoiding losses. Human behavior studies also show that bargain over losses is less likely to succeed than bargain over gains because of the side will make less concessions. There are two main reasons why the requested person does not accept to participate in the negotiation because firstly, they think that no changing circumstances have occurred, or even when they think that there is a change in circumstances, they are also concerned. that accepting renegotiation could lead to difficulty defending before the Court if negotiations fail. Therefore, if the parties want to terminate the contract, they should not provide for the obligation to renegotiate to reduce costs, instead they should be terminated, then freely renegotiate or find another suitable partner. new circumstances to maximize benefits.

3.3.2. Time limit for requesting renegotiation

Article 420 of the Civil Code 2015 of Viet Nam stipulates the right to request the renegotiation of the contract "within a reasonable time", but the civil law does not provide any explanation or regulation on what is a reasonable time or how long is a reasonable time. Find out other provisions in the Civil Code 2015 of Viet Nam, there are also other laws that also mention the reasonable time limit, which are Articles 142, 143, 249, 300, 394, 424, 443. For example, Article 394: "*When the claimant party If the request does not specify the time limit for reply, the reply of acceptance shall only be valid if it is made within a reasonable time*". Article 424: "*Where the obligor fails to properly perform an obligation and the obligee requests performance within a reasonable period of time but the obligor fails to perform, the obligee may cancel the contract.*" "...

The unclear regulation of the time limit for requesting renegotiation when the circumstances change fundamentally can easily lead to abuse of the changed circumstances, or create difficulties for the later settlement process, or lead to disagreements even under similar circumstances. The negotiation time is the time within the contract's term, but not too long to avoid more serious damage.

3.3.3. Content of renegotiation

According to Clause 3, Article 420, "*in case the parties cannot reach an agreement on the modification of the contract within a reasonable time...*". The content of the amendment can be understood without limitation, the requesting party can ask to negotiate about anything. This means that the parties can renegotiate all content as long as it does not violate the prohibition or violate social ethics. Such unrestricted and generic regulation can make negotiations more difficult or at least more time consuming. Because, the disadvantaged party wants to minimize the damage while the other party wants the contract to be performed as originally agreed. Whether the limits of the content of the edits are the factors that influence the circumstances of the fundamental change. Moreover, if there are no provisions limiting the content of the agreement, the parties can completely terminate the signed contract and sign a new contract to replace the old one.

Can the parties agree to terminate the contract? According to Article 422 of the 2015 Civil Code, the contract terminates in the following cases: "2. As agreed by the parties; 6. The contract is terminated according to the provisions of Article 420 of this Code".

Therefore, the parties are completely entitled to terminate the contract according to the agreement without being limited by the scope of renegotiation.

3.3.4. Obligation to provide evidence

In addition to the limitation of a reasonable period of time for making a request for renegotiation, it also does not imply that the party requesting the renegotiation is obligated to provide grounds to demonstrate a fundamental change in circumstances. The current provisions of the Civil Code 2015 of Viet Nam do not provide for the case where the disadvantaged party only makes a request without stating any grounds, which easily leads to the abuse of difficult circumstances to delay the performance of the obligation, and at the same time causes difficulties for the client. requested party.

3.4. Authorize to settle disputes and consequences when negotiations fail

Clauses 3 and 4, Article 420 of Civil Code 215 provide as follows:

“3. Where the parties cannot agree on the modification of the contract within a reasonable time, one of the parties may request the Court:

a) Termination of the contract at a definite time;

b) Modify the contract to balance the legitimate rights and interests of the parties due to the fundamental change in circumstances.

The court may only decide to amend the contract in cases where the termination of the contract will cause more damage than the costs to perform the contract if it is amended.

4. In the course of negotiation, amendment and termination of the contract, and the court settles the case, the parties must continue to perform their obligations under the contract, unless otherwise agreed.

According that, if the parties cannot agree on the modification of the contract within a reasonable time, one of the parties may request the Court to terminate the contract at a specified time or amend the contract. Although the law only mentions the jurisdiction of the Court, it should be understood that the Court includes the Arbitrator. The Civil Code 2015 of Viet Nam, Article 14 stipulates that *“where civil rights are infringed or disputed, the protection of rights shall comply with procedural law at Court or Arbitration”*.

Both parties have the right to ask the Court to resolve the dispute, however, provided that "it is not possible to agree on the modification of the contract within a reasonable time". This provision can lead to the understanding that only in case it is not possible to agree on the amendment of the contract, the parties have the right to request the Court to settle. If the parties cannot agree on the termination of the contract or reach an agreement on termination but cannot agree on the time of termination, one of the parties has the right to ask the Court to settle or not. The above provisions can also be understood that the parties are forced to negotiate before asking the Court to settle. So, if the non-disadvantaged party does not accept the request for contract renegotiation, does the disadvantaged party have the right to request the Court to settle it? The *Undroit Principles* stipulate that *“if the parties **cannot reach an***

agreement within a reasonable period of time, each party has the right to request the Court to settle it” (Art 6.2.3 (3))¹⁴. This provision also includes that if the parties fail to negotiate or one party does not accept to renegotiate the contract, one of the parties has the right to request the Court to settle.

Regarding the consequences, in case circumstances change, one of two outcomes will occur: the parties continue to perform the contract with some modifications to suit the new circumstances or the parties are released from their rights and obligations. by termination of the contract.

First, about the Court's authority to amend or terminate the contract

According to the provisions of Clause 3, Article 420 of the 2015 Civil Code on the Court's jurisdiction, the Court has the right to terminate or amend the contract. However, this regulation has 5 issues to consider:

Firstly, Clause 3, Article 420 of the Civil Code 2015 of Viet Nam allows the Court to have the right to amend or terminate the contract. Specifically, *"The Court may only amend the contract in the event that the termination of the contract will cause more damage than the costs to perform the contract if it is amended"*.

Accordingly, the condition to amend the contract is only if the performance of the contract after the modification has a smaller cost than the termination of the contract. From that, it can be understood that in all cases where the contract termination causes damage less than the contract performance cost, if it is amended, the Court must choose the contract termination option. This regulation is similar to the approach of the Civil Code of the Russian Federation. Clause 4, Article 451 of the Civil Code of the Russian Federation 2003 states: *"A modification of the contract in the event of a significant change in circumstances will be made by decision of the court in exceptional cases, when the termination of the contract contract is contrary to the public interest, or to the detriment of the parties, substantially exceeding the costs, performance of the contract on terms as amended by the court is necessary."* When commenting on the provisions of the Civil Code of the Russian Federation, some scholars argue that this rigid regulation limits the initiative of the court in choosing the most suitable solution, either terminating or changing the contract, for each case¹⁵.

Thus, the Court can only base on comparing the cost of performing the contract to choose to amend or terminate the contract while many other factors can be considered such as the parties' desire to maintain the contract. maintain contracts to protect interests other than economic ones, even though the modification results in greater damage than the termination costs. Therefore, if the Court rules only on costs to decide to terminate or amend the contract, it does not guarantee flexibility and flexibility in each case¹⁶.

¹⁶ Dam Thi Diem Hanh, Le Thi Kim Oanh (2018), Some comments on Article 420 of the Civil Code 2015: Contract performance when circumstances change fundamentally, *Journal of the State and Law*, No. 7(363) 2018.

Second, it is stipulated that “*The Court may only decide to amend the contract in the event that the termination of the contract will cause more damage than the costs to perform the contract if it is amended*” (Clause 3, Article 420).). Such a provision leads to the understanding that the Court gives preference to contract termination over contract modification. It can also be understood that “*the Court can **only** decide...*” means that the Court can only declare either to amend the contract or to terminate the contract without having the right to offer another option.

Considering by reference to the provisions of the PICC¹⁷, the Court has the option of termination or modification without the preferential conditions applicable. The Court will consider the application of consequences that are most effective and reasonable. Comment No. 7 of Article 6.2.3 emphasizes that if both of the above options are unreasonable, there will be a situation where the court does not terminate or amend the contract but chooses one of two ways: Either require the parties to restart the negotiation process on the revision of the contract; or acknowledge the inherent terms of the contract. Asking the parties to renegotiate when the court cannot terminate or change the contract is a solution that allows the court to act as an arbitrator to help the parties in the negotiation process to come to a common solution, especially when the self-negotiation process of the parties becomes deadlocked.¹⁸ Compared with the provisions of the Civil Code of Vietnam, the PICC's regulations are more flexible, allowing the court to apply more flexibly the right of self-determination to apply one of the solutions. This shows that the Judges have great power in deciding the fate of the contract. However, the Judge must be responsible for making decisions on the basis of an objective and fair assessment of the consequences. Although the law allows for a choice, judges must still act according to the principles of the law plus professional ethics.

In the Netherlands, the 1992 Civil Code (Article 6.258) allows the Court to adjust the validity of a contract or to terminate part or the whole of a contract when the circumstances have changed so substantially that it is no longer possible for a party to continue performing the current contract. The Peruvian Civil Code of 1984 (Article 1432 and the following ones) prioritized contract adjustments instead. The termination of the contract is only acceptable when it is impossible to continue performing the contract, and also provides that the termination does not affect the obligations that have been fulfilled.¹⁹

Third, still related to the right to request the Court to settle in case the negotiation fails, Clause 3, Article 420 of the Civil Code 2015 of Viet Nam allows one of the parties to have the right to request the Court to terminate the contract or amend the contract. This means, the requesting party has the right to ask the Court to either terminate the contract or

¹⁷ *Uindroit Code of International Commercial Contracts, (PICC)*

<https://www.unidroit.org/instruments/commercial-contracts/unidroit-principles-201617>.

¹⁸ Alexei, “*Hardship in Contract: The Approach of the UNIDROIT Principles and Legal Developments in Russia*”, trang 503.

¹⁹ Ngo Quoc Chien (2015), *Adjusting contracts when circumstances change fundamentally and amending the Civil Code 2005*, Journal of Legislative Research No. 15 (295), August 2015.

amend the contract. The question here is, if one party makes a request to terminate the contract but the Court finds it necessary to amend the contract, can the Court amend the contract? If the answer is yes, the Court again violates the right to decide and self-determination of the involved parties specified in Article 5 of the Civil Procedure Code 2015, specifically that the Court "*only deals within the range of lawsuit petition*"²⁰. If the answer is no, it is not guaranteed that the role of the Court is to protect citizens' rights, bring about the principle of fairness in trial and the purpose of Article 420 of the Civil Code 2015 of Viet Nam is to re-establish the balance of the contracts. agreement and ensure fairness for the parties. If so, it will no longer make sense to make a request to the Court.²¹

Fourth, the Court can terminate the contract at a definite time. there is no specific guidance about when is the definite time. The following times can be considered: the time of entering into the contract (similar to the consequences of contract cancellation); the time when the circumstances of fundamental change began to appear; the time to request renegotiation; the time of unsuccessful negotiation; the time of requesting the Court to settle; the time the judgment takes effect... This is a very important content that needs guidance because the time of contract termination will affect the interests of the parties.

Fifth, the purpose of the contract amendment is "to balance the legitimate rights and interests of the parties due to the fundamental change in circumstances". This paragraph does not mention how to "balance the legitimate rights and interests of the parties". When entering into a contract, both parties want to achieve certain benefits. Due to unexpected objective circumstances, the original goal was not achieved. Therefore, in principle, only those aspects of the contract that affect the failure to achieve that purpose, which make the contract unreasonably unreasonable, and cause serious damage to one party, should be brought to the notice of termination. out to negotiate amendments. It is recommended to amend only the terms affected by a change in circumstances, such as price terms, term terms, etc. Thus, not every change of circumstances has the right to request a contract modification with those completely new content, unrelated to the previous contract.

Second, about the obligation to continue to perform the contract

Clause 4, Article 420 of the Civil Code 2015 stipulates: "*During the course of negotiation, amendment and termination of the contract, the Court settles the case, the parties must continue to perform their obligations under the contract, except for cases where otherwise agreed.*" The rationale here is the unique nature of the circumstances of the underlying change and the potential for abuse.²² This provision is construed, unless

²¹ Dam Thi Diem Hanh, Le Thi Kim Oanh (2019), "*Regulations on changing circumstances from the perspective of comparing Vietnamese and French laws - Some proposals and recommendations*", Proceedings of the international conference "Civil liability and contracts: Experiences of Vietnam and the European Union, University of Law, Hue University", June 27, 2019, http://hul.edu.vn/hop-tac-quoc-te/ky-yeu-hoi-thao-quoc-te-trach-nhiem-dan-su-va-hop-dong-king-king-hiem-cua-viet-nam-valien-minh-chau-au_4315.html.

²² Unidroit Principle of International commercial contract (2016), International Institutes for the Unification of Private law (Unidroit), Rome, p 225.

otherwise agreed by the parties, in all cases the parties are still required to perform their contractual obligations. This regulation is quite rigid in that it does not introduce the same exceptions as the PICC. Accordingly, comment 4 to Article 6.2.3 of the PICC states that suspension of performance is only acceptable in exceptional cases. Although this provision shows the limitation of allowing temporary suspension of obligations, at least it still creates an open direction for the Court and not only depends on the agreement of the parties.²³

The expression of the principle of good faith is also quite clear in that, the requesting party must not take advantage of the circumstances to prolong the time limit for performance of the obligation, nor can the requested party find a reason to delay. The renegotiation and extension of time may cause further damage to the other party. Both sides have a good faith will make the settlement easier and minimize the potential damage. Therefore, the principle of good faith must always be the top priority of the parties in the entire contract performance process. However, this clause should still supplement the obligation to participate in negotiations and the obligation to compensate for damage if delay or abuse of the changed circumstances causes damage to the other party.

In conclusion, the provisions of Article 420 have some shortcomings that while giving the affected party the right to request renegotiation, it does not mention the obligation of the requested party to participate in renegotiation. Besides, Article 420 only stipulates that if the parties cannot agree on the modification of the contract within a reasonable period of time, one of the parties may request the court to resolve without specifying the case. If the parties cannot agree on the termination of the contract or if the requested party refuses to negotiate, one of the parties may ask the court to resolve the dispute. Article 420 of the Civil Code 2015 allows the parties to renegotiate the contract by themselves or ask the court to resolve it in case circumstances change so dramatically that implementation becomes too difficult. However, this law has many shortcomings, which are reflected in the lack of clear and rigid regulations. Analysis of Article 420 of the 2015 Civil Code shows that Vietnam follows the German doctrine of "Geschäftsgrundlage", that is, changes the basic circumstances of the contract but has not yet had a specific explanation. The core element of the changing circumstances is that the basic foundation upon which the parties entered into the contract is broken. This provision is also the concretization of the principle of fairness and goodwill in civil law. Article 313 of the German Civil Code amended in 2002 has inspired the contract law of many countries around the world, including Vietnam.

4. Discussion and Conclusion

The analysis and assessment of the law on contract performance when conditions are fundamentally changed in Vietnam at present, effectively contribute to the improvement of civil and commercial law in the coming time. By method of description, analysis and comparison of jurisprudence, the article has solved the following problems: clarifying what

²³ Dam Thi Diem Hanh, Le Thi Kim Oanh (2018), *Some comments on Article 420 of the Civil Code 2015: Contract performance when circumstances change fundamentally*, Journal of the State and Law, No. 7(363)/2018, page 23.

is contract performance when the circumstances change fundamentally. The article analyzes the provisions of the Civil Code 2015 of Viet Nam on contract performance when circumstances change fundamentally on the basis of comparison with the Unidroit Principles on international commercial contracts, the European Code of Contract Law and regulations of some typical countries. In general, the provisions of Vietnamese law are quite similar to those of "soft laws" as well as advanced countries in the world, which are mainly countries in the civil law tradition. Accordingly, regulations on contract performance when circumstances change fundamentally include the following conditions: In addition, the article also points out the limitations and inadequacies in the legal regulations such as not making clear what the circumstances of the contract are, what the circumstances are fundamentally changed; the basic conditions for determining the changing circumstances are still general and difficult to determine because the regulations are qualitative and need to be explained and guided for consistency in perception; regulations on renegotiation are not clear; Regulations on consequences when negotiations fail cause many different interpretations.

DISCUSSION OF LAW ENFORCEMENT ON EDUCATION AT VIETNAM PEOPLE'S ARMY ACADEMIES UNDER PRESENT CONDITIONS

MA. Ta Thi Ngoc Lien
tangoclien104@gmail.com

Vietnam Military Medical University, Hanoi, Vietnam

Abstract

In the present day of international integration, education in our nation must assure long-term development and continually enhance its quality to meet the demand for high-quality human resources for the country's industrialization and modernization. Efficient law enforcement in the sphere of learning in Vietnam in general, and at People's Army institutions, is the main answer for improving educational quality. Due to this, the author evaluates the significance of law enforcement in education at military academies in this essay, contributing to the development of perspectives and comprehension regarding the application of the law in education. In addition, the author makes several suggestions for enhancing the effectiveness of the law on education at military institutions with the goal to protect the rights and interests of participants, promote the training of high-quality officers, and fulfilling the army's new tasks in an era of international integration.

Keywords: *academies, education legislation, education law implementation, Vietnam People's Army.*

1. Introduction

Education has an essential function in the growth of every nation. This is the vital and determining factor in the development of the country throughout history. "Educational development is the primary national policy," is our Party's guiding principle, which is enshrined in the 2013 Constitution¹ and the 2019 Education Law² to foster the general growth of the Vietnamese people, by nurturing human resources, promoting talents, and serving as a foundation for national construction and defense.

The system of military schools and academies in the People's Army is where for instruction, training, develop, and providing officers and executives for the whole army. Facing the challenges of army development, defense consolidation, and national defense in the present setting, the quality and abilities of cadres and commanders have been exceedingly critical. As a result, military organizations in general, and academies, are taking steps towards enhancing educational and training quality. One of the steps taken is to

¹ National Assembly (2013), Constitution 2013, National Political Publishing House of Truth, Hanoi, Clause 1, Article 60, p.5

² National Assembly (2020), Education Law 2019, National Political Publishing House of Truth, Hanoi, Clause 1, Article 4, p.1

accelerate the enforcement of the education legislation to protect the needs of subjects related to educational activities. This group of educational administrators, professors, and students.

Affirming and raising awareness about the significance of education law implementation in military academies in present times will contribute to bringing legal constraints on education into life, carrying the value of education law into full effect in enhancing the quality of academies and providing as a source of high-quality human resources for the Vietnam People's Army throughout the period of international integration. This is the foundation for resolutely forwarding the cause of education, achieving the goal of increasing people's understanding, educating human resources, cultivating talents, and fulfilling the demands of national development and defense in today's circumstances.

2. Method

The article uses the dialectical materialism and historical materialism methodology, in addition to interpretative and inductive methodologies to evaluate and explain the notion of applying educational law at the Vietnam People's Army Academy; analysis and synthesis methods for examining the features and duties of execution at military academies; logical approach to guarantee the logic of the contents in the research subject matter.

3. Results

3.1. The concept and features of educational regulations application at Vietnam People's Army academies

Law implementation is a key step in the legal regulating procedure due to how it enables the State's regulations to be put into action. This is the stage following the promulgation of legislation by authorized state officials that regulate social connections that arise in daily life. This phase is represented in the legal subjects' deliberate actions in line with the requirements of legislation, for the purpose to carry out the regulations.

Education and education in Vietnam People's Army academies are the foundations for advancement, confronting the difficulties of the 4.0 revolutions and integrating into the world. Enhancing the standards of human resources and human development is an essential aim for education in our country in the future years as we prepare for the fourth industrial revolution and globalization. This is also the purpose of the Vietnam People's Army Academy's educational and training reform. One of the main approaches to achieving the goal of increasing and updating education and training activities at military academies will be a full and synchronized legal system of education. The law is an essential instrument for the state to control social connections beginning from academic endeavors at military academies, establishing a legal corridor in the acknowledgment and assurance of students' rights and duties. It also specifies the functions and responsibilities of state management organizations and individuals in the implementation of the legislation on education in Vietnam's People's Army academies.

However, for the demands of the Education Law to be implemented rapidly, properly, and comprehensively, the Vietnam People's Army Academy must participate effectively in

the implementation of the Education Law. This is the basis for the legislation to promote its standing as a driving force for educational growth; fulfill the Party's, the Central Military Commission's, and the Ministry of National Defense's perspectives on the growth of education in the present situation.

This means the application of the education legislation at academies in the Vietnam People's Army is a set of actions intended for putting the requirements of the education law into practice. It expresses itself in the real and legal activities of legal subjects throughout the process of organizing and operating military academies. Assisting in the training of a detachment of cadres and officers to fulfill the fresh requirements and responsibilities of army building.

Law enforcement operations on education at Vietnam People's Army academies can variously forms. It is the adherence, usage, and implementation of educational laws. The process of implementing the education laws has the following features due to the peculiarities of the Academy structure in the Vietnam People's Army:

To begin with, regarding the implementation of the law on education at military institutions

Individuals (educational administrators, lecturers, students) and organizations immersed in educational activities are among the subjects applying the law on education at military academies, according to the provisions of Article 1 of the Education Law 2019 and Article 1 of the Law on Higher Education 2012, amended and supplemented in 2018.

Men and women involved in the execution of the laws on education at academies function in a complicated and demanding military educational environment and participate in direct army warfare. The group of instructors and educational administrators is comprised of well-trained military professionals who receive ongoing training in political traits as well as their work manner. The instructional interaction between lecturers and students, on the other hand, has its own peculiarities. It is a teacher-student relationship, a comrade friendship, and a superior-subordinate relationship simultaneously. Consequently, an instructor is a teacher, a teammate, and a pupil's leader. For this reason, they must always provide an example in terms of teaching, working, and living for learners to emulate. It has since helped to nurture and promote the traits and personality of Uncle Ho's force for military cadres.

Additionally, law enforcement students at academies primarily consist of officer training learners, master's students, and graduate students. Further, certain institutions include pupils who are high-ranking military officers. Students at the Academy fulfill the criteria of health, politics, ethics, and education through carefully selected input. They are all boarding schools that spend their time in a consolidated and unified manner and are tightly regulated in line with army management laws. Because of this, during their education, students are continuously educated in the awareness and habit of respecting the rules of the government as well as the discipline of the army. Students' sense of self-discipline and law adherence to education is progressively recognized, produced, developed, and smoothed by the implementation of education and training activities, together with the practice of maintaining the prescribed regimens on study and living. They understand and are conscious of their educational rights and duties, along with the societal ideals enshrined in the

legislation. Since then, there have been constructive behaviors, including comprehending how to apply the law to preserve legitimate rights and interests and combat misconduct and violations of the law within the context of education.

Organizations as the topic of enforcement on education at academies in the entire army are as distinct and rich as individuals. Aside from the state, other subjects including party organizations, socio-political groups, economic organizations, and press agencies are all subjects of this activity. Party organizations play an essential function in driving the execution with the goal to accomplish the Party's overall and direct leadership in all parts of the Army and law enforcement actions in the Academies. Furthermore, there is an association between the Ministries of National Defense and Education and Training in guiding the consistent, precise, and thorough execution of the regulations on education at military academies.

Secondly, the features of the setting in which the education legislation is applied.

The author examines the execution of educational regulations at the Vietnam People's Army Academy in this research. The Central Military Commission and the Ministry of National Defense administer this educational system, which is professionally directed by the Ministry of Education and Training. The military academies system presently contains six large academies under the Ministry of Defense (National Defense Academy; National Academy of Politics; Army Academy; Military Technical Academy; Military Academy of Logistics; Military Medical Academy) and several academies were assigned to the General Departments, Army, and Vietnam Border Guard, The Government Cipher Committee (Military Science Academy; Naval Academy; Air Defense - Air Force Academy. ; Academy of Cryptography Techniques). Military Medical Academy and Military Technical Academy are two of the nation's finest universities. The Academy's training purpose is to offer excellent staff members for the army in a variety of fields such as command and administration, politics, military medical, logistics, engineering, and so on. The provided items are selected according to criteria and situations, and the process is scheduled according to a program. Trainees receive instruction to satisfy the needs of the army, and following completion, they will be deployed to units across the army, according to a predetermined plan.

Moreover, the education process at the Academies is performed not only in the lecture hall but also in the field, and the training ground, using practice materials that are comparable to the realities of training and combat preparation. In addition to fundamental scientific information and specialized facilities, the training curriculum incorporates military, political, and legal expertise following the Ministry of National Defense's instructions, goals, projects, and plans. The state budget, through the defense budget, entirely guarantees funding for education at academies. Students do not have to pay tuition, receive guarantees on the costs of clothing, food, housing, and study materials, and have the right to tiered allowances and other predetermined regulations. Academies, on the other hand, continually concentrate on developing regular and excellent units. Therefore, the training process is always accompanied by strict discipline, and all activities, from study to daily living, belong to the military disciplinary leadership. This feature has facilitated the adoption of the law on education at military training centers.

3.2. The impact of law enforcement on education in Vietnam People's Army academies

The implementation of the education laws at military academies is essential to strengthening the role of social relations management in educational and training operations at academies. Contributing to the preservation of order, discipline, and the rights and interests of both groups and individuals. The following factors demonstrate the influence of law enforcement on education at military academies:

Firstly, the execution of the legislation on education at military institutions has put into reality the Party's, Central Military Commission's, and Ministry of National Defense's educational development instructions and policies.

Over the years, the Party's resolutions have continuously highlighted the significance of investing in education. Demonstrating an ongoing policy of perceiving education and training as an important national objective and a crucial driving factor in the country's growth. The Party continues to underline the place and significance of education and academic development goals in the years to come in the Document of the 13th Party Congress to develop the Vietnamese comprehensively and to generate outstanding human resources to accomplish the tasks of national building, protection, and development.

Military, defense, and homeland defense missions of the Vietnam People's Army force have established new and higher standards for Vietnamese military personnel with education and training in the face of challenging world circumstances and challenges of international integration. Since then, the Central Military Commission and the Ministry of National Defense have continually fully grasped the spirit of fundamental and comprehensive innovation in education and training in military schools, adhering to Resolution No. 29-NQ/TW dated November 4, 2013, of the 8th Plenum of the 11th Central Committee on fundamental and comprehensive reform of education and training and the Resolution of the XIII Party Congress on army construction: "By 2025, it is necessary to fundamentally build an elite, neat, and powerful army with the objective to establish a solid premise and strive to establish an Army that is not only revolutionary, standard, but also sophisticated, intelligent and modern from 2030"³. Including Central Military Commission Resolution No. 109-NQ/QUTW dated February 11, 2019, regarding establishing a force of Army officers to satisfy needs and duties in the present scenario; Strategy on Education and Training Development in the Army for the period 2011-2020, featuring a Vision to 2045; A project on building a force of teachers and educational leaders to fulfill the demands of the fundamental and comprehensive reconstruction of training and education in the Army for officers at the campaign and strategic positions in the period 2020- 2030. The Central Military Commission's Resolution No. 1657 - NQ/QUTW, dated December 20, 2022, established the primary goals and solutions in the fields of education and training reform, along with the recruiting, usage, and treatment method. The collection of abilities is the foundation for creating a cadre and officer force to carry out the mission of rebuilding the

³ Communist Party of Vietnam (2021), Document of the 13th National Congress of Deputies, volume 1, National Political Publishing House of Truth, Hanoi, p. 158

army in the present scenario. Resolution 1657 highlighted that "Education and training in the armed force are one of the essential and crucial political tasks of the Party Committees and leaders at all levels; is one of the key, breakthrough, and significant stages in the procedure of establishing a force of professional and technical officers and employees to contribute to the revolutionary, standard, and elite of a Vietnamese People's Army, that will modernize, strengthen national defense, and should be emphasized in collecting and allocating resources for development one step ahead."⁴

The Party's education standards and policies, in addition to those of the Central Military Commission and the Ministry of National Defense, have been formalized in legal documents. The legal activities of subjects will contribute to the execution of the regulations on general education through the process of utilizing law at the Military Academy. It will guarantee the Party's, the Central Military Commission's, and the Ministry of National Defense's leadership in the field of Army education. Simultaneously, the demands of the law in this sphere are precisely and comprehensively executed, giving circumstances for legal relations to evolve in the intended trajectory of the State and society.

Secondly, the execution of the legislation on education at Army academies promotes the protection of participating subjects' lawful rights and interests. Particularly for instructors and students

The subjects engaged in the utilization of educational laws at the Military Academy are groups and individuals engaged in social connections controlled by education law. Subjects participating in the execution of the legislation on education at the Military Academy are highly diversified, according to the provisions of Article 1 of the Education legislation in 2019, Article 1 of the Law on Higher Education in 2012, updated and supplemented in 2018, and Article 1 of the Law on Higher Education in 2012. Individuals (administrators, professors, students) and organizations are included. In which instructors and pupils are the main subjects of the educational process, and the primary factor defining the reputation and quality of education at Army academies. Lecturers play a key part in imparting information, and practical experience, and promoting growth in capacity to trainees, thereby assisting the military's mission in today's scenario. To encourage the active involvement of professors, duties in the new period include safeguarding their lawful rights and interests, in addition to raising awareness of the need of creating competent and talented lecturers within Party committees as well as at academies. This team must follow the laws of the nation on standards, duties, and basic rights. The strategy of training and retraining to increase political, professional, and professional qualifications, in addition to the teacher compensation policy, are critical answers to improving the quality of lecturers for academies.

Aside from academics, students are the Army's primary manpower resource after graduation. Attracting, training, and valuing talents in the army is urgent and crucial in the cause of force construction, defense consolidation, and defense of the Socialist Republic of

⁴ Central Military Party Committee (2022), Resolution No. 1657 - NQ/QUTW dated December 21, 2022, of the Central Military Party Committee, Ministry of National Defense on education and training work to fulfill army building tasks team requirements in a new situation, Hanoi, p.2

Vietnam in the framework of the Fourth Industrial Revolution. The solid collaboration between enhancing student quality and utilizing their abilities will be an essential component in expanding the army and the Academy's reputation. Excellent policy and regulatory execution on learner rights and duties will contribute to establishing an incentive to recruit high-quality pupils. Due to this, the Army and academies' education and training possess higher quality.

The application of the legislation on education at the Military Academy is a deliberate activity of the subjects that carry out the requirements of the rules for the benefit of the State, the Army, and the subjects took part in this activity. As an outcome of the implementation, the subjects' legal rights and interests are protected. This directly affects motivating people to take an active role in and further the advancement of training and educational innovation in the Army in the modern era.

Thirdly, through arranging the execution of educational legislation at academies through legal instruction and dissemination activities, students will develop a legal conscience.

A component of the process of organizing and implementing the law at academies is propaganda and teaching on the content and spirit of legal documents. From here, those participated in legal education interactions will have the circumstances to comprehend, accurately, and fully understand the provisions of education law. Knowing what acts should be taken, must be taken, may be taken, and cannot be taken... As a result of this, the subject will be self-aware and handle his conduct, and perform properly. This is both a requirement and a criterion for assessing the efficacy of the law's implementation in academies.

Cadets and lecturers are the subjects who are directly connected to the process of establishing programs, content, forms, and means of dissemination that are appropriate for each student. Educational activities in academies, on the other hand, differ from those in non-military universities. This is a military-specific exercise that requires a lot of hard effort and mental and physical strain intending to develop political and military abilities. From there a strong defense personnel resource is being created. To achieve this educational purpose, individuals, particularly students, must be informed and taught about the People's Army's State laws, orders, charters, and regulations of Vietnam, the fundamental elements of individuals' rights and duties regarding national defense tasks, including the establishment of a revolutionary, regular, and modern army. This will contribute to the formation and enhancement of self-discipline in following the law, improve political bravery, and contribute to the effective implementation of the Party and State's guidelines and policies on the task of building national security and protecting the Fatherland, as well as the development of education in the new situation.

Fourthly, the implementation of the education law at military academies has the responsibility of preventing, restricting, and rapidly dealing with infractions of the education law, and of strengthening communist legislation.

Everyone is equal under the law in a socialist society. Therefore, organizations and individuals engaged in legally regulated social relations are required to implement legal

provisions enforced by the State. That is also the spirit of socialist legality; in addition to a comprehensive legal system, everyone in society, including the State, state agencies, economic and social groupings, units, armed forces, and individuals, uphold and fully employ the law. Acts that contravene the law and harm the interests of the State, collectives, and citizens are identified and dealt with in line with the law.

As previously discussed, the distribution and education of the regulations in the application of the legislation on education lead to enhancing topic self-discipline, particularly for students at Vietnam's Army Academies. It has the effect of deterring and minimizing infractions of the law and military discipline from there. Including breaches of educational legislation. Meanwhile, oversights in the process will be detected and handled promptly throughout regular activities of inspection, examination, and supervision by competent agencies and individuals, ensuring that the law is implemented efficiently and consistently in the procedure for organization and implementation.

On the other hand, by study, practical evaluation, process review, and experiences gained, the legislation on education could potentially be improved. It provides essential details for the future development and enhancement of the law's impact on education at once.

4. Discussion and Conclusion

Based on evaluating the purpose and significance of enforcing the law on education at military academies, strengthening the efficacy of the law enforcement activities is *đội* is one of one of the most important and pressing issues. Education law must be followed to establish circumstances for subjects to take an active role in educational activities to develop and enhance education and training in line to construct "Smart schools to prepare for the fourth industrial revolution" in the armed forces. This is the foundation for developing a force of military personnel with adequate virtue and abilities to handle the demands of responsibilities in the new situation. Therefore, in the current era, the execution of education legislation is an urgent demand, and it must concentrate on performing several basic items specified as follows:

To start with, advance the leadership and direction of all levels of party committees, organizations, and commanders. Promote awareness about the law's application in military academies simultaneously. This is prerequisite solution to subject unity in activity implementation, ensuring the right direction, guidelines, and policies of the Party and State, the Central Military Commission, and the Ministry of National Defense on educational development. Only when the Party committees and commanders at every level are adequately led will the participants comprehend the position, role, and significance of the law on education. Since then, this effort has proven highly successful since the subjects are aware of their responsibilities and rights and actively engage in education and training. Simultaneously, it will limit law violations, strengthen socialist legislation in the field of education, and contribute to the spread of law enforcement and discipline education in academies as well as throughout the army.

Secondly, improving educational legal provisions. This will be the foundation for implementation at military academies. A whole, finished, unified, and highly practicable

legal framework will be simple to apply in daily life. As an outcome, it is vital to overcome our country's existing constraints, particularly higher education legislation. In which the competent authorities should concentrate on early policy promulgation that is realistic; re-review the normative documents in every unit of the army and academies to swiftly eliminate those that lack potential and are not practicable and recommend to the State and competent agencies to modify and perfect laws and regulations accordingly.

Furthermore, improve the credentials, capacity, and quality of the Academy's management and lecturers. They are the primary focus of educational law enforcement behaviors, and they are the determining factor in the quality and effectiveness of this activity. Academies are required to concentrate on choosing and organizing the hiring of leadership personnel and lecturers to enhance quality and comply with the demands of current activities. In which, frequently pay attention to their physical and mental behavior, ensuring that they have adequate working and housing situations. In particular: "Focusing on cultivating and enhancing political bravery and revolutionary morality; developing the quality and tradition of "Uncle Ho's troops"; strongly against individualism for teachers, educational administrators, and students".⁵

Fourthly, broadening the range of legal education propaganda in academies. The influence of law enforcement on education at military academies is significantly affected by legal propaganda and legal instruction. This serves as an important solution for subjects to raise consciousness, generate awareness, and develop the habit of learning and respecting the law. Thus, academies must proactively identify important resources, select relevant propaganda options, and prioritize mastering subjects' knowledge regarding the importance and worth of the law in the sphere of education in line with the unit's practice. Apply Party, State, Central Military Commission, and Ministry of National Defense educational development guidelines and policies; broaden common methods of legal education; successfully encourage the function of key participants in the aforementioned activities, consider legal education as political agencies, law lecturers, officials performing the task of law dissemination and education... Promote the use of technological advances in legal education in particular, and collaborate with organizations and forces within and outside the military to foster the cooperation of society as a whole in legal education propaganda.

Lastly, the Academy's financial resources should be reinforced to investing in facilities and supplies for law enforcement activities. Infrastructure is important for increasing the success of law enforcement in general and educational law execution at academies. So, academies must be built in a smart, contemporary manner that is appropriate for the country's economy. Academies must invest in building a structure of lecture halls, laboratories, training grounds, procurement of equipment, practical and effective teaching equipment and means, preventing waste and negativity, and so on to allow for participants to take an active role in activities and exercise their rights and obligations.

⁵ Central Military Party Committee (2022), Resolution No. 1657 - NQ/QUTW dated December 21, 2022, of the Central Military Party Committee, Ministry of National Defense on education and training work to fulfill army building tasks team requirements in a new situation, Hanoi, p.7

The basis for bringing educational laws into practice will be synchronous and effective solutions in the application of the law on education at the Academies. The objective of increasing the quality of education and training, cultivating cadres, setting up a regular and modern army, and satisfying the obligations of national construction and defense in the present situation will be noticed in conjunction with solutions for building military institutions.

Abstract

Bidding is a highly competitive commercial activity that has been recognized in the Commercial Law 2005 and the Law on Bidding 2013. The legal nature of bidding is to select a partner by a competition, the very field of bidding is fertile ground for agreements to limit competition in order to suppress this competition. Agreements restricting competition in the field of bidding are controlled and regulated in accordance with the Competition Law and the Law on Bidding. The article focuses on analyzing the legal characteristics of bidding activities; identification of agreements limiting competition in the field of bidding in accordance with the provisions of law and international recommendations; analyzing and commenting on the law controlling agreements to limit competition in the field of bidding in Vietnam today. From there, the author proposes a number of ideas on the improvement of the law in both aspects: the direction of completion and specific solutions to improve the effectiveness of the law to control agreements limiting competition in the field of bidding.

Keywords: *Bidding, agreements to limit competition in bidding, collusion in bidding, Law on Bidding.*

1. Introduction

Bidding is known as a method of selecting partners to provide goods and services that brings great economic benefits. However, the reality of bidding in recent years has generated a lot of negative issues such as selling bids, fake bidding, collusion, devaluation of bids, bias in evaluating bids... has reduced competition among contractors, making bidding activities ineffective. The act of collusion in bidding or agreement to limit competition in the field of bidding is an act that always has a limited nature of competition, disrupts competition in bidding activities, causing great damage to the economy. Many countries have banned this type of behavior in legal documents. Some countries even use strict sanctions, including the use of criminal sanctions to deal with subjects who commit acts of collusion in bidding. In Vietnam, the act of collusion in bidding is regulated and controlled by the Competition Law 2018 and the Law on Bidding 2013. However, up to now, the competition management

agency has not detected and investigated a single case related to collusion in bidding, although this phenomenon has been common in bidding in Vietnam.

This study used descriptive, analytical, commentary and comparative jurisprudence methods.

2. Results

2.1. Bidding: legal concept and characteristics

The concept of bidding has been recognized in two legal documents: The Commercial Law 2005 and the Law on Bidding 2013. Accordingly, the Law on Bidding 2013 acts as a legal tool for state management of bidding for projects related to spending activities, use of State capital in the procurement of goods, provision of consulting services and construction and installation. Bidding is the process of selecting contractors to sign and perform contracts for the provision of consulting services, non-consulting services, procurement of goods, construction and installation; select investors to sign and implement investment project contracts in the form of public-private partnerships, investment projects with land use on the basis of ensuring competition, fairness, transparency and economic efficiency¹.

The 2005 Commercial Law governs the management of bidding for goods and services in trade. Accordingly, bidding for goods and services is a commercial activity whereby a party purchases goods and services through tendering (called the tenderer) in order to choose from among the traders participating in the bidding (called bidders) traders who best meet the requirements set by the tenderer and are selected to sign and perform the contract (called the winning bidder)². The 2013 Law on Bidding and the 2005 Commercial Law both stipulate that bidding is the process by which the tenderer selects a contractor (bidder) who satisfies its requirements to sign and perform a contract. Therefore, bidding is a race, competing between bidders to win bids, to be signed and to perform contracts with tenderers. Contract freedom has given people the right to choose partners in the relationships they want to establish. It is also a premise for promoting and leading people to methods of finding partners using competition and competition between business entities. One of the methods chosen by business entities and evaluated effectively is bidding as defined in the above two statutes. In essence, bidding activities have the following basic characteristics:

Firstly, bidding is always associated with the relationship of buying, selling goods and providing services.

Bidding is only held when entities wish to purchase goods or use services for the purpose of selecting the best suppliers of goods and services. In essence, bidding is only a pre-contract period for the provision of goods and services between the parties to the contract. The bidding results are the basis for the parties to negotiate the contract for sale and purchase of goods, provide services and the details of the bid dossier will be included in

¹. Clause 12 Article 4 of the 2013 Law on Bidding.

². Article 214 of the 2005 Commercial Law.

the contract content (at the end of the bidding process, the winning bidder and the tenderer must sign the contract for sale and purchase of goods, services).

Second, bidding is a multi-subject process.

In the bidding process, there are always two parties, the tenderer and the bidder. The tenderer is the party (which may be a trader, may not) wish to procure goods and use services, while the bidder is a trader capable of providing goods and services for the bidding package. In principle, the number of contractors attending a tender should always be more than one. According to this principle, tender designation is an exception to bidding. In the bidding relationship the third subject often appears to be consultants - they are present as a factor in ensuring that the bidding process is taken seriously. In addition to the above subjects, there are additional entities and individuals competent to appraise and approve bidding results to ensure that the bidding process takes place in accordance with the order and procedures, quickly detect and correct errors in the entire process and check for the last time before entering the signing and execution stage.

Third, bidding is a fair, open and transparent competitive process.

When participating in bidding activities, the bid solicitor shall put forward his requirements in advance so that the bidders can base on that to set prices for the provision of goods and services. Therefore, bidding is a competition between bidders. And the competition between the bidders must comply with certain principles and requirements, ensuring fair competition among the bidders: there are many bidders; bidders must be independent of each other and the bid solicitor; at the same time, the bidders must enjoy equal conditions and opportunities in the bidding process, without creating any discrimination; there is no agreement between the bidders that leads to the falsification of the bidding results. All of this has created transparency in the whole bidding process - the lack of the above conditions will disable the competition mechanism. When the competitive mechanism in the bidding is invalidated or not properly operated, the original purpose of the bid solicitor is not achieved, the bidding becomes meaningless, even leaving many consequences for the economy, socio-economically; especially when the capital used to buy goods and services is State capital, ODA capital, etc.

Thus, before going to the stage of negotiation and signing of the contract, the contractors must go through a period of considering the ability, experience, finance and technology to meet the requirements of the bid solicitor, whether the project is feasible or not. To prove their ability, contractors wishing to implement the project must go through the bidding phase. Through fair, open and transparent competition in bidding, the bid solicitor will better understand the capacity of each contractor and select suitable partners for cooperation. However, considering the legal nature of bidding is to select partners by competition, it is the bidding field that is fertile ground for anti-competitive agreements to eliminate this competition. And they are often implicit agreements, very difficult to detect, investigate and handle.

2.2. Identification of agreements limiting competition in the field of bidding and the legal situation

Typical of negative acts in bidding activities is collusion in bidding. Collusive tendering is an illegal agreement. In which competitors link together to raise the price of goods and services offered in the bidding with potential customers. It may also include the sharing of business opportunities among agreement participants. This can also be called the act of suppressing (obstructing) bidding. Accordingly, the act of collusion in bidding is limited to subjects who are competitors of each other, with the content being the association between these competitors in order to raise the prices of goods and services in the auction, and share bidding packages... (*Business Dictionary*).

According to the Organization for Economic Co-operation and Development (OECD)'s "*Guidelines for the detection and handling of collusion in public procurement*", bid fraud (contracting in tendering) occurs when companies that should be competing against each other occur. compete with each other, but secretly agree to raise the price or reduce the quality of goods or services for the buyer (the buyer wants to buy goods or services through bidding). In addition, the OECD also recognizes that procurement collusion can be particularly harmful if it affects public procurement with the intention of depriving buyers and taxpayers of resources, undermining the confidence of businesses in public procurement. competitive process and undermine the benefits of a competitive market. Collusion in tenders is illegal in all OECD member countries. Thus, the OECD has indirectly recognized collusion in bidding as acts carried out between competitors.

In Vietnam at present, the prohibition of anti-competitive agreements is regulated in the direction of prohibiting on the principle of implicit violation of serious anti-competitive agreements. And prohibiting according to the principle of reasonable impact assessment for other forms of agreement behavior³ (including bidding). The Competition Law 2018 as well as the Law on Bidding 2013 only stop at listing the acts that are considered as collusion without giving a specific concept of this behavior. However, if analyzing Clause 4 "agreement for one or the parties to agree to win the bid when participating in the bidding for the supply of goods and services"⁴ of Article 11 of the 2018 Competition Law, the collusion in Bidding is understood as the fact that the bidders arrange and agree to act together so that one or more of them wins the bid in the provision of goods or services. Thus, in terms of the nature of an agreement to limit competition in the field of bidding, it is an agreement between the bidders, whereby the parties agree to arrange for one or more contractors to participate in the agreement. winning bids, in order to eliminate or impede the competitive mechanism in the bidding.

According to the provisions of the current competition law, the subject of collusion in bidding must be the bidding enterprises. They have agreed upon the will when performing the act. This agreement of will can manifest itself in the form of a tacit or public agreement

³. Tran Thi Nguyet (2020), *Discuss the core values of the Competition Law 2018*, Journal of Human Resources and Social Sciences, Issue 5, 2020.

⁴. Clauses 4 Article 11 of the Competition Law 2018.

(usually tacit agreements), it can be orally, by action or in writing... but arranged to one or another number of bidders participating in the winning contract. Next, the behavior of the bidders leads to the consequences of hindering and distorting the competitive mechanism that the bid solicitor wishes to create.

Acts of agreement to limit competition in the field of bidding always occur between bidders. The content of the agreement is that the enterprises participating in the bidding agree to one or several enterprises participating in the agreement to win the bid in the provision of goods or provision of services. When the content of the agreement is implemented, the bid winner is not selected by the competition mechanism but by the subjective will of the bidders. Co-contractors withdraw from or do not participate in the bidding to give the remaining bidder a chance to win, and they may receive subcontracts or supply contracts from their nominated winning bidder for distribution. divide the proceeds from the illegal settlement.

From the perspective of competition theory, the anti-competitive agreement in bidding has nullified the goal that the bid solicitor has made efforts to create. The purpose of the competitive bidding process is that the buyer can select a contractor to provide goods and services at lower prices, with better quality and innovative techniques only if the bidders are truly competitive together. Agreement to restrict competition in bidding is illegal.

The legal regulations on bidding were created to build and protect the competition mechanism in bidding, to ensure that the bidding taking place is substantive and true to its nature, thereby protecting the public. investors when they spend money to buy goods and use services through bidding. Therefore, the act of negotiating to limit competition in bidding with the nature of an agreement to break the competition mechanism in bidding is always considered illegal in many countries.

Paragraph 1 of Article 81 of the Agreement Establishing the European Community⁵ considers this agreement to have anti-competitive purposes and is outright prohibited. Depending on the assessment of the seriousness of the behavior, national laws will have certain sanctions for this type of dangerous behavior.

For countries that have not yet promulgated the Competition Law, the act of "collusion in bidding" is also prohibited in other legal documents, even many countries consider this act to be a criminal law violation. and the subjects participating in bidding collusion must bear quite heavy penalties.

Agreements to restrict competition in bidding are often secret, difficult to control and cause great consequences. Agreements to restrict competition in bidding often take place in the form of implicit agreements, which exist secretly between the parties to the agreement, so it is difficult to find evidence.

An agreement to restrict competition in the procurement sector is not a vertical anticompetitive agreement. Because vertical agreements are agreements related to the resale of products from manufacturers or suppliers, so it takes place between businesses at different

⁵. Agreement establishing the European Community.

stages in the production and distribution process. products as agreed between the manufacturer and the distributor. Vertical agreements do not create the ability to dominate the market. Vertical dissemination agreements often have the following contents: exclusive territory distribution, exclusive transactions, forcing businesses to join the manufacturer's distribution network, fixing resale prices. Therefore, the agreement to restrict vertical competition does not apply in the field of bidding.

In essence, this is an agreement to limit horizontal competition. Because a horizontal agreement is an agreement between enterprises of the same line of work operating in the same relevant market, such as an agreement between manufacturers or between wholesalers or between retailers of different industries selling similar products. The content of the agreement related to fixing prices for goods and services, dividing the market, colluding in bidding, limiting or controlling the quantity and volume of production, purchase and sale of goods and services, or an agreement to coordinate certain actions for a certain period of time to prevent competition from other enterprises. Horizontal anti-competitive agreements are defined by three characteristics: restrict the freedom of competition of other enterprises in the relevant market according to one or more different parameters; there is a written or non-written agreement (coordination of action) between enterprises that are competing (or will compete) in the market; the enterprises participating in the agreement operate independently of each other.

Bidding collusion is part of horizontal agreements and is considered an act that causes or is likely to have a material adverse effect on competition. Collusion in bidding means any agreement between individuals and businesses engaged in the production or sale of the same or similar products or services, which affects the exclusion of eliminate or reduce competition for tenders or adversely affect or manipulate the procurement process. It is a form of unification of prices and market allocations, often done when contracts are decided to invite bids, for example, in government construction contracts. Common forms of bid collusion are as follows:

- Subcontracting collusion occurs when several parties agree not to submit bids, or formally submit bids so as not to win, provided that certain items of the contract of the other party The winning bidder will subcontract to them. In this way, they share benefits with each other.

- Bidding occurs when some participants agree not to submit bids in order to help other bidders win the bid.

- Complementary bidding, also known as covert bidding or courtship bidding, occurs when some bidders bid too high or have conditions they know the solicitor will not accept or find agreeable.

- Rotating bidding occurs when the bidder becomes the predetermined winner in turn. Each participant is predetermined to be the winner for certain contracts, while the other parties are predetermined to win in other contracts. This is a form of market division, when collaborators allocate or divide markets, products, customers or geographic areas so that each party will get an equal share of the total business market, without really competing in that business. These forms of bid collusion are not mutually exclusive, and two or more of

them can occur at the same time. For example, if a participant in a bid collusion is destined to win a certain contract, provided that the other parties will not win the bid by not participating (bid), or by submitting a bid with a higher price (formal tender). From the above analysis and commentary, we have a comprehensive view of the correct legal nature of the agreement to limit competition in the field of bidding. Removing them from the market is essential by means of legislation and enforcement mechanisms.

2.3. Perfecting the law on competition - restricted agreements in the field of bidding

2.3.1. The improvement of the law to improve the effectiveness of the competition agreement in the field of bidding

The law amending the competition agreement in the bidding sector must conform to the characteristics of the economy. Suitable to the characteristics of the economy is one of the requirements for improving the effectiveness of the competition agreement in the field of bidding. The issue of competition and monopoly control is extremely important for any country with a market economy and especially for developing countries such as Viet Nam. When there is no equality, there will be no principle of ensuring honest competition, fair, competitive mechanism and the positive surface of the market economy cannot be developed.

The law amending the competition agreement in the field of bidding must conform to international practices. Most international treaties to which we conclude or be a member of Viet Nam require the general Vietnamese law and the law on the competitiveness of the vi and the healthy business environment in the middle of the country and the healthy business and business environment in the country and the healthy business environment between countries. Therefore, the construction and enforcement of competition legislation should be placed within the vision and thinking of the integration process, only when the domestic market is secure, then we can attract more domestic and foreign investment sources for the industrialization of the country.

The law on the adjustment of the competition agreement in the field of bidding must prevent the agreement from bidding. Bidding is the commercial operation, the special transaction method. Bidding for two main goals is to ensure competitiveness and profit. The law amending the competition agreement in bidding should supplement the basis of the experience of a number of countries in the world to ensure the objectives of the bidding, preventing the competition agreement in the field.

To supplement the subjects of the competition agreement in the field of bidding. Now, according to the law, only the collusion between the tenderers has narrowed a lot of the holders to each other. Accordingly, the competition agreement in bidding outside the bidder may also occur among other entities involved or involved in the bidding process. There is a collusion link between consultants - contractors, or projects using private capital with collusion between investors - contractors. The agreement between hosts is badly detrimental to the competitive environment, as well as causing large consequences to the economy, even

the impact of the competition, and impact on greater bidding. For example, in the process of participating in consultants' participation in a different manner. If there is a collision between the contractor or the investor and the investor, the consulting position shall be in the position of the investor in the direction of the investor. However, the consultants in many cases may agree with the bid enterprise by committing different acts of violation such as the information for bidders, to falsify the bidding results to deceive the investor.

2.3.2. Proposed solutions for improving the law on adjustment of the competition agreement in Vietnam currently

First, need to supplement the concept of competition agreement in bidding in the competition law

Because the introduction of a unified concept of the act of agreement limiting competition in bidding in a legal document serves as a premise, the basis for other legal provisions that can be enforced. In particular, we need to regulate in the direction of targeting the anti-competitive nature as well as covering the general characteristics of the types of agreements limiting competition in bidding so that when acts of agreement to limit competition appear, there is still a legal basis to handle. If it is only stopped at the scattered listing of some acts of tendering as in the provisions of the Competition Law and the Law on Bidding, it will lead to the omission of other acts that are also of the nature of "tendering" in practice but are not regulated by law. For example, it may be stipulated that an agreement to limit competition in the field of bidding is an agreement that takes place in any form between the entities participating in the bidding process with each other in which the parties agree to arrange for one or more bidders to enter into a winning agreement in order to eliminate or impede the competition mechanism in the bidding.

Second, the Competition law and the Law on bidding should be consistent with the form of expression of behavior

Concretize the acts of tendering and expand the subjects governed by the law controlling agreements to limit competition in the field of bidding. First of all, Clause 3, Article 89 of the 2013 Law on Bidding should provide additional forms of collusion in bidding in accordance with the provisions of the Competition Law.

Non-compete in the field of bidding is often difficult to detect because they are secretly implemented. Therefore, according to experience in the long-term, competitive countries such as the United States, Japan, or European Union (EU), building a strict system of sanctions is not sufficient to succeed in adjusting competitive agreements. The biggest problem with competition management agencies when dealing with limited competition agreements agreed to deal with competition. The biggest problem with competition management agencies is dealing with the general collection of evidence and information necessary to serve as a basis for the investigation of limited competitions.

Vietnamese law has rules about the form of agreements restricting competition in the field of procurement, but these rules are not really complete, the acts of collusion in bidding

in fact. Especially when comparing Competition Laws in Vietnam, with Competition Laws of a number of countries in the world such as Japan, the United States, European Union, South Korea... we see behavior that this regulation is the act of collusion in bidding, but Competition Law in Vietnam is not specified. For example, acts of collusion to divide the bid according to geographical area. So, first of all on competition law in Vietnam as well as tender laws, need additional forms of agreement to divide the package according to the geographical areas to avoid omission of acts of collusion in bidding, and in accordance with international practices. At the same time competition law in Vietnam needs to have rules to be more specific about defining behavior that impedes competition, breaking the competitive environment...These acts make the competition mechanism not operating normally, all must be subject to adjustments of this Law. Competition law 2018 is now just adjusting the behavior of agreements restricting competition in bidding between the contractor with each other then this is missing the point. Competition Law in Vietnam needs additional adjustments all the acts of collusion between consultants - contractors, tender side - contractors for compliance with theoretical and practical control law agreements restrict competition in bidding.

Thirdly, building law enforcement behavior control agreements restrict competition in bidding in an efficient manner.

In the construction of mechanisms to enforce the law, then those issues need to be solved dissection as follows:

- Transfer bidding to specialized agencies for implementation

The current bidding in Vietnam is still a large part of two-way or 2.5-party bidding, one-party investor, one-party contractor, or one-party investor plus consultant and contractors to one side.

According to the experience of countries around the world, forms such as bidding service centers, bidding transaction offices, and bidding management companies are very popular. If the Bidding Law is still only around two-party or 2.5-party bidding, it is not possible to completely deal with negatives such as collusion in bidding, green troops, red troops, embezzlement, bribery...The irresponsibility of the investor is not the real owners of investment projects is also a fact exists. Why are bidding activities at groups, agencies, state organizations, and projects using state budget is still not effective? In the group of private capital, the opposite is true, after all, it is also from the investor's benefits and the investor's responsibility for the capital invested. Therefore, the author thinks that the Law on Bidding needs to be regulated in the direction of only stipulating the basic principles, along with expanding authority, increasing responsibility for investors, and strengthening post-audit work. The investor has the right to actively decide on the form of contractor selection, provided that such contractor is judged to be the most optimal at the time of selection. Along with that Competition Law should be prescribed to handle heavy the behavior of agreements restricting competition in bidding loss of state assets.

- It is necessary to strengthen the implementation of online bidding in a systematic and large-scale manner

The national bidding network system needs to ensure publicity, without restricting access to and access to information. Building a system to ensure continuous, stable and secure operation of information. At the same time the regulation of bidding the current should be modified in the direction of creating the legal framework for the operation bidding via the network to reduce time, save cost, while enhancing transparency, competition in bidding, contributing to the prevention of corruption, waste, control agreements restricting competition in bidding and improving the efficiency of use of funds of the state. Because online bidding will almost reduce and eliminate the meeting between the parties involved in the bidding process, so that the opportunity to collude and negotiate agreements between the parties also becomes more difficult.

- Transparency and publicity of bidding information activities

The authorities need more interested in posting the information on bidding particular is a violation of tender, the contractor violations dealt with... to education, effective contractors from the actual work service, at the same time, once all of the information about the tender from the actual work service, at the same time, once all bidding information (plan a tender notice inviting pre-qualification, tender notice, bidders list to be invited to participate in the tender; the results of selection of contractor; information processing in violation of the tender is invited to participate in the tender; the results of selection of contractor; information processing in violation bidding...) be made public on the means of mass information, the tacit agreement in bid also has little chance to survive more. Mrs. Lindset Marchessault, parts contracts, public Service Management, The world Bank stated point of view: to effectively prevent fraud and corruption in the investment project, the need to perform the contract public, to strengthen the publicity and participation in the contract at all stages of the process the contract and the type of contract from the planning, formation, awarded the contract, deployment and termination of the project⁶.

4. Discussion and conclusion

The Competition Law needs to stipulate to deal severely with the acts of anti-competitive agreements in bidding that cause loss of state property, so the amendment of the Competition Law in this direction should closely follow the objectives, using Which sanctions are strong enough to deter, prevent as well as suppress the most dangerous and harmful acts for this competitive environment?

One of those elements to achieve the effect of the tender is to ensure the rule is competitive according to market mechanisms. The laws of the market economy can operate effectively, commercial activities take place in an orderly manner, the state should design and build the system of legal documents complete and a mechanism to ensure enforcement, especially the writing system the laws that regulate bidding activity in general as

⁶ . <https://muasamcong.mpi.gov.vn/>

procurement Law, commercial Law, Competition Law... Doing this requires the competent authorities need to revise, review and summary of theory as well as practice of the work of building control legislation, acts of agreements restricting competition in bidding, in particular, to improve the legal framework in a synchronous manner, complete with the strict rules, avoid the negative happens, create conditions for active bidding healthy development.

On the basis of analysis of the legal characteristics of the tender, clearly see the nature of commercial activities or happen agreements restricting competition, this recognition agreements that restrict competition in the field of procurement and real estate law, the commentaries and suggestions towards improving the law to regulate this area is useful and urgent. The author wishes to receive comments and valuable contributions of scientists and entrepreneurs.

THE ECONOMIC FUNCTIONS OF THE GOVERNMENT FROM THE POINT OF VIEW OF PAUL ANTONY SAMUELSON AND RECOMMENDATIONS IN VIETNAM

Assoc. Prof. Dr. Nguyen Thi Thanh Hieu

hieunt@neu.edu.vn

Faculty of Political Theory, National Economics University, Hanoi, Vietnam

MA. Do Minh Duc

ts4218ct@st.neu.edu.vn

PhD Student of National Economics University, Hanoi, Vietnam

Abstract

The article briefly mentions the role of the Government in the mixed economy from the point of view of Paul Antony Samuelson; from which it points out the remaining problems in the process of implementing the economic role of the Government, and proposes solutions to complete the economic functions of the Government in the socialist-oriented market economy.

Keywords: *the role of the Government, the economic role of the Government, Samuelson, the socialist-oriented market economy.*

1. Introduction

In the history of economic theories, when it comes to the role of the Government in the market economy, there are two major schools of economic thought: one side emphasizing the role of the market (the Trong-Nong school, the Kinh-Nong school), and another side emphasizing the role of the State (Mercantilists, Keynesian school...). In the 60s and 70s of the 20th century, the Modern Main school appeared as a compromise between the two previous trends.

In this article, the authors briefly mention the economic role of the Government in the mixed economy from the point of view of P.A. Samuelson.

Paul Anthony Samuelson (1915-2009) was the first American to win the Nobel Memorial Prize (1970) in Economic Sciences. He is one of the most famous economists of the 20th century. Ben Bernanke, who served as the 14th chairman of the Federal Reserve from 2006 to 2014, praised this former professor of Massachusetts Institute of Technology as "an extraordinary intellect in economics".

P.A. Samuelson is the author of the most unique and widely used economic textbook "Economics", which was first published in 1948, and has been the best-selling book in American history throughout 30 years.

According to P.A. Samuelson, when discussing the role of government, we often take for granted that government is the one who makes the "rules of the road". But

government has three distinctive functions including efficiency, equity, and stability. Samuelson analyzed the functions of the state (government), economic goals, and methods of achieving those goals.

Government action in terms of *efficiency* is trying to correct market failures. Government programs to promote *equity* take measures to reflect society's concern for the poor and disadvantaged. *The stabilization policy* is aimed at smoothing the business cycle, which is fraught with ups and downs, reducing unemployment and inflation and boosting economic growth.

Efficiency

Under the condition of natural monopoly, the government has many strategies including taxation, price control and nationalization which are the three strategies rarely used nowadays; “the two main tools are regulation and anti-trust laws” (p. 196, vol.2). To increase the effectiveness of the imperfectly competitive market system, the government introduced antitrust and economic laws.

According to P. A. Samuelson, it is necessary to prevent negative external influences; but to orient towards and encourage the production of public goods.

The state budget is one of the most important leverages to improve the efficiency of the national economy. The most important elements of the state budget are financial, fiscal and monetary policies.

Equity

Even if the market system works perfectly, it is not ideal:

First, it should be recognized that an efficient market system can cause great inequality. In order to reduce income inequality, progressive taxation can be used, in which the rich are imposed higher tax rate on their higher taxable incomes than the poor.

Second, the Government can build an income support system for the elderly, the disabled, and those who have to raise children, as well as provides unemployment insurance for the unemployed. The Government sometimes subsidizes consumption for low-income groups by handing out food stamps, providing medical aid programs and cheap housing.

The main programs for poverty alleviation are welfare benefit, food stamps, medical aid, and a number of smaller or less focused programs. To establish a more efficient and equitable program, economists have proposed a “negative income tax” that provides a basic subsidy and then imposes a tiny fraction of every types of income.

Stability

In addition to its role in promoting efficiency and equity, the Government also has the macroeconomic function of promoting economic stability during the cyclical ups and downs of inflation (price rise) and recession (very high unemployment rate).

Since a general economic equilibrium is possible even when the labor force does not have a job, the Government needs to encourage production growth to maintain “social

stability”, in which P.A. Samuelson mainly concentrate the attention on the stabilization (mechanism) adjustment.

Thanks to the intellectual contributions of John Maynard Keynes, his followers and even his critics, we have a much better understanding of how to manage the ups and downs of the business cycle. We understand that prudent use of the monetary and financial power of the government can affect output, employment and inflation. The government's financial power is the power to tax and spend. The monetary power involves regulating the currency and banking system to determine interest rates and credit conditions. By these two central tools of macroeconomic policy, the government can have influence on an economy's output, employment, and prices.

The economic theory model of P.A. Samuelson is a combination of two categories "economic efficiency" and "fairness". He believed that economic efficiency could not be boasted unless it was supplemented by a balanced distribution of society's income. He advocated a market economy that solves social problems and ensures the welfare of all workers. The theory which was composed on the basis of careful calculation plan at the macro and micro levels has a great practical significance.

By examining the three roles above of government, which promote efficiency, equity, and stability, it can be seen that the market mechanism determines prices and output in many areas, while the government regulates market by tax, spending and regulatory programs. Both market and government are essential. Running an economy without a government and a market is like trying to clap with one hand.

2. Method

The authors have collected the data and information on the remaining problems in the process of implementing the role of the Vietnamese Government, then have used statistical analysis methods combined with data analysis and processing to propose solutions and recommendations to complete the economic functions of the Government in the socialist-oriented market economy.

3. Results

Remaining problems in the process of implementing the economic role of the Vietnamese Government

3.1. In establishing legal frameworks

Since 2013, many basic laws and other important legal documents have institutionalized the basic principles of rule of law and democracy of the 2013 Constitution. The economic legal system has contributed to creating a favorable legal environment for the private economy sector to grow and mobilize FDI capital; and to recognizing the diversity of property rights. Vietnam has established legal frameworks for the application of international institutions and standards on safe business, currency, credit to encourage business and healthy credit activities. Obviously, the economic legal system creates a legal environment for business freedom, a fair and equal competition mechanism in compliance

with WTO's criteria. Especially it creates a common legal ground for domestic and foreign investment. Vietnam has been recognized by ASEAN countries and other countries in the world as having a market economy.

However, the establishment of a legal environment for business activities is still inadequate. The legal system is not really synchronous, the consistency is not high, especially in the conditions of investment, business and planning. Besides, it is still cumbersome with many forms of documents issued by many competent agencies with conflicting contents, for example, among the Electricity Law, the Investment Law and the Construction Law; Petroleum Law with Construction Law, Investment Law, Public Investment Law, and Law on management and use of state capital to invest in manufacture and business at enterprises in electricity, oil and gas sectors...

3.2. In remedy function for the efficient operation of market and for ensuring the social justice, and macro-economy stabilization

Several remarkable achievements:

In general, the economic growth rate has been continuously improved. The average GDP growth rates reached as follows: 4.5% per year in the period 1986 - 1990; 7% per year in the period 1996 - 2000; and 7.5% per year in the period 2001 - 2005. In the context that the world economy is facing great challenges, rapid and unpredictable fluctuations; inflation at a multi-decade high; strategic and geopolitical competition between major countries; military conflicts between Russia and Ukraine...however, Vietnam still achieved a high GDP growth rate in 2022 at 8.02% over the previous year, which is the highest increase of years in the period 2011-2022.

Figure 1. Vietnam’s economic growth 2005-2022 (Unit: billion USD)

Source: General Statistics Office of Vietnam

An important criterion showing the socialist orientation of the market economy is to direct its development towards improving people's living standards. After over 35 years of renovation, Vietnamese people's income has improved significantly. In the early 1990s, Vietnam was still a poor country with its per capita income in 1992 at 140 USD. However, in 2008, it reached over 1,000 USD. At this income level, Vietnam has surpassed the threshold of a low-income country and has become a middle-income country. By 2022, the per capita income at current market prices was about 95.6 million VND per person, equivalent to more than 4,100 USD, increasing by nearly 400 USD compared to 2021; 29 times higher than in 1992.

The social security and social welfare in the period 2001 - 2010 was better and better guaranteed, making an important contribution to the improvement of the Vietnamese people's material and spiritual life, stabilizing and developing the economy - society of the country. The system of social security and social welfare policies has been increasingly synchronized and completed in hunger eradication and poverty reduction, job creation, development of the insurance system, and incentives for people with meritorious services to the country, social assistance, public social service expansion, enabling people to enjoy more culture, health and education.

The most obvious difference between the period before 2011 (from 2007 to 2010) and after 2011 is that the macro-economy in Vietnam is gradually stabilizing. The role of the Government in the economy is increasingly evident in the promulgation and implementation of policies. Despite being strongly affected by the COVID-19 pandemic in 2020, the macro-economy is more stable; inflation is controlled at a low level; the economic growth is quite close to growth quality; and the major balances of the economy are improved. GDP growth for the whole Socio-Economic Development Strategy period 2011-2020 reached 5.9% per year, belonging to the group of high-growth countries in the region and in the world; in which the average growth rates reached as follows: 5.9% per year in the period 2011 - 2015, and 6.8% per year in period 2016 - 2019.

Existing problems

The assurance of social security and social welfare is still inadequate. The living of a part of the population, especially in the highland and remote areas, is still difficult with the large income gap between classes. Resources for social security and social welfare mainly depend on the state budget; but its coverage and support allowance are still low. The forms of insurance have not met the diverse needs of the people. The service quality is still low with many negative troubles.

Figure 2. Poverty Rate in Vietnam 2010-2022 (Unit: %)

Source: General Statistics Office of Vietnam, Statistical Yearbooks of several years

In addition to the achievements, it is obvious that the results of poverty reduction are not sustainable, the re-emergence or emergence of poverty is still high, especially in mountainous areas, ethnic minority and areas often suffering from natural disasters. The average rate of poverty re-emergence for 4 years (2016 - 2019) was 4.09% per year compared to the total number of households escaping from poverty (the poverty re-emergence rate of the previous period had been about 12% per year). The average rate of poverty emergence was relatively large, accounting for 21.8% of the total number of households escaping from poverty in the period of 2016-2019. The underemployment rate in rural and urbanized areas, and the unemployment rate in urban areas are still large.

Table 1. Unemployment and underemployment rates of labour force by age group (Unit: %)

	Unemployment rate				Underemployment rate			
	General	15-24	25-49	50+	General	15-24	25-49	50+
2013	2.18				2.75			
2014	2.10	6.26	1.18	3.52	2.35	3.18	2.22	1.76
2015	2.33	7.03	1.49	0.86	1.89	3.05	1.72	1.46
2016	2.30	7.43	1.46	0.84	1.66	2.57	1.58	1.21
2017	2.24	7.50	1.36	0.86	1.62	2.12	1.57	1.38
2018	2.19	6.92	1.49	0.99	1.4	2.23	1.27	1.26
2019	2.17	6.51	1.59	0.70	1.27	2.19	1.19	0.82
2020	2.48	7.21	1.99	0.99	2.52	4.05	2.41	1.86
2021	3.20	8.55	2.66	1.86	3.10	3.89	3.10	2.61
2022	2.32				2.21			

Source: General Statistics Office of Vietnam, Statistical Yearbooks of several years

Due to negative impacts of the Covid-19 pandemic, millions of Vietnamese workers have lost their jobs, taking a layoff, and quit jobs or have to reduce their working hours, reduce their income, ... It is the first time in the past 10 years, the economy Vietnam witnessed a serious decline in the number of people participating in the labor market and the number of people having jobs. Therefore, the average income of employees also has a deficit. The indicators of unemployment and underemployment rates have increased, contrary to the trend of decline in recent years.

The progress of restructuring the economy in general and restructuring the banking system in particular is still slow compared to the set plan. In both short term and long term, there are still many issues that have not reached expectations and requires handling in the near future.

Figure 3. CPI Growth Rate of 2016-2022 (Unit: %)

Source: General Statistics Office of Vietnam, Statistical Yearbooks of several years

According to IMF, the global inflation reached the peak in 2022, increasing from 4.7% in 2021 to 8.8% in 2022. The average consumer price index of Vietnam in 2022 increased by 3.15% compared to 2021.

The published figures by the State Bank of Vietnam shows that the internal bad debt ratio at banks increased from 1.4% at the end of March 2022 to 1.9% in August 2022; and by the end of 2022, this figure was 1.92%. Deputy Governor of the State Bank of Vietnam (SBV) Dao Minh Tu said that bad the debt ratio of credit institutions - or the bad debt ratio of the economy tended to increase at this time. The difficulties of the economy as well as of the enterprises, and the people may be shown more clearly in the coming time. Then, the internal bad debt ratio at banks is forecast to increase continuously. Dr. Can Van Luc, Chief Economist of BIDV and Head of BIDV Training and Research Institute forecast that the bad debt ratio of the economy in 2023 will increase along with the prudent monetary policy of the State Bank. The internal bad debt ratio may reach over 2%, and the total bad debt rate may be about 4%.

Furthermore, the relationship between economic growth and environmental protection has not been resolved well. Experts say that if the environment is not protected,

“the price” that Vietnam will have to pay for the destroyed and polluted environment will account for 6% -7% of GDP. If the medical costs for disease treatments are included, the total amount will be up to 8% -10% of GDP.

3.3. Causes

Firstly, the awareness of the economic role and function of the socialist government has not kept up with the development of the country. We have paid more concentration on high and fast growth goals; have given priority to the quantity in attracting foreign investment. Guidelines and policies for managing the state economic groups; land policies; science and technology policies are still limited and inadequate.

Secondly, the socialist-oriented market economy institution has not yet been completed in the direction of modernity, synchronization and integration. Priorities in performing the government's economic functions according to each period of economic development have not been set.

In case of limited resources, first of all, the role of creating a stable environment for subjects in the economy must be prioritized; then the function ‘efficiency’ need to be done; and the last thing is equity or justice. Inequality must be accepted in a certain period; then when the economy has developed to a certain extent, social justice can be taken into account.

Thirdly, the organization of the state management apparatus is still cumbersome and overlapping; its effectiveness and efficiency are not high. Besides, the capacity to direct, administer and the qualification of civil servants have not yet met the practical requirements.

4. Discussion and Conclusion

Solutions to improve the role of the Vietnamese Government in the socialist-oriented market economy

4.1. Clear awareness of the role and economic function of the Government in the new period

Developing the socialist-oriented market economy is one of the fundamental issues of development philosophy in Vietnam. From a very early age, we have affirmed that the economy we are building *must be administered by the Government*. In Vietnam, the role of the Government in the economy not only comes from the common requirements of the development of the market economy, but also comes from *the specificity* of the social-oriented market economy. In order for the Vietnamese Communist Party's guidelines, viewpoints and guiding ideas to turn into reality of economic movement; they must be institutionalized into a legal system, socio-economic development programs and plans; approved, implemented and administered by the Government. The laws, programs and plans for socio-economic development of the Government are only correct when they accurately reflect the objective development requirements of the market, *taking market laws as the basis*. This needs to be reflected in all three areas: ownership, administration and distribution.

The existence of three basic forms of ownership including the entire people ownership, the collective ownership, and the private ownership; is an objective requirement of the market economy; but needs to be specifically regulated, especially for land.

In administration, the Government *creates a legal framework for efficient production and business activities*. Only the Government has and can do this function. The more synchronous, correct, consistent and punctual the economic legal system of the government is, the more positive impacts it will have on the economy operation. It is necessary to define the administration mechanism for economic groups; and to avoid the government directly doing business, or managing the business activities of state enterprises, interfering the business autonomy of enterprises including transformed state-owned enterprises, directly deciding on investment projects and then assigning them to state-owned enterprises to implement; causing scattered, inefficient investment, and basic capital debt...

The functions and tasks between the central government and the local government must be defined clearly in the management of natural resources and national resources in the following direction: The central government focuses on building and completing economic institutions, building and organizing the implementation of strategies, master plans and plans for general socio-economic development of the whole country, implementing macro-regulatory measures for the entire economy. The local governments need to be more fully decentralized with powers and responsibilities in the implementation of economic laws promulgated by the Central Government, in developing and implementing strategies, master plans and plans for socio-economic development of their respective localities, also supporting and facilitating the production and business activities of people and enterprises in the area.

It is necessary to build and form a thinking system on socialist orientation in economic development as a basis for further improvement of economic and civil policies and laws. Moreover, it is important to eliminate discrimination between economic sectors; to distribute benefits fairly, to implement social security well; to constantly renew thinking in state administration of the economy; and to establish a basis for controlling the interests of different groups of people in the legislative process.

Based on the correct awareness of the requirements of the rules in the market economy, the Government needs to turn those requirements into laws, policies and plans for socio-economic development, and to determine the right steps to actualize them. This is a factor that has a direct impact on promoting the movement of the market economy in compliance with its internal rules.

4.2. Consistently prioritizing macroeconomic stability, speeding up economic restructuring in the new context

The Government has well implemented Resolution No. 31/2021/QH15 dated November 12, 2021 of the National Assembly on the Economic Restructuring Plan for the 2021-2025 period with the main tasks and solutions focusing on completing the objectives of restructuring public investment, the state budget, the system of credit institutions and public non-business units; developing different types of markets, improving the efficiency of resource usage and allocation; developing enterprise force; promoting connections between enterprises of all economic sectors; innovating and developing collective economy, cooperatives.

Vietnam is restructuring its economy in the context of the fourth industrial revolution. After more than two years of Covid-19, at the beginning of 2023, most of the studies considered that it is inappropriate to mention herd immunity to the COVID-19, and it is not possible to determine the eradication or elimination of this pandemic. The Russia-Ukraine war has accelerated the global energy crisis and the skyrocketing global inflation. Therefore, the global economy faces the risk of recession. Many countries are launching economic stimulus packages to increase aggregate demand, causing higher price, which may affect inflation in the near future. Therefore, the economy restructuring should be associated with the Master Program on economic recovery and development.

4.3. The Government needs to complete and use the system of macro-regulation tools efficiently

The macro-regulatory objective and its overall requirements identified in the development plan must be the main basis for the regulation of financial and monetary policies in order to promote economic growth, to stabilize the domestic currency value, to optimize and regulate income, and to implement poverty alleviation...

The primary focuses of economic reform for the period 2022-2025 are as follow: improving elements of the business environment in the direction of reducing the number of bureaucracy procedures, time, costs and risks for enterprises; cutting down the list of conditional investment and business lines and reforming the conditions of doing business in Vietnam; removing barriers for investment and business activities due to overlapping, contradictory, unreasonable and different legal regulations; continuing to promote the reform of specialized administration and inspection of imported and exported goods; speeding up the reform of land registration and renewal of land administration; promoting digital transformation in sync with administrative reform; promoting decentralization and empowerment to local governments, and supervision of this activity; focusing on solutions to support people and enterprises to recover production and business and to overcome the negative impacts of the COVID-19 epidemic; creating institutions to encourage innovation and creativity.

Besides, the government should pay attention on promoting the reform of civil service and improving the qualification of civil servants; strongly implementing the construction and development of e-government and digital government; continuing to promote reform of administrative procedures, applying digital technology to improve all processes and procedures of administrative and public agencies.

4.4. Remedies for defects of the market economy

Firstly, it is necessary to promote the implementation of socio-economic development programs associated with job creation. Encouraging all economic sectors and all types of enterprises to strongly develop their manufacture and business to create more jobs, and at the same time enabling people to have jobs and increase incomes are solutions for hunger eradication and poverty reduction and ensuring the social security positively, efficiently and sustainably.

Secondly, the Government should develop synchronously, diversify and improve the quality of the insurance system, and at the same time should have appropriate support policies for people to actively participate in the system under negative impacts of the market economy, climate change, natural disasters, epidemics, which tend to increase.

Thirdly, in order to effectively implement the sustainable poverty reduction program, it is necessary to accelerate the implementation of socio-economic development programs, in which the focus is on the efficient implementation of the National Target Program on sustainable poverty reduction in the period of 2021 - 2025; and to continue mobilizing the support of the business community and the whole society, encouraging the poor people and poor areas to make an effort to get out of poverty sustainably and to get rich.

Fourthly, it is important to well implement preferential policies for people with meritorious services and social assistance policies for social protection beneficiaries.

It is necessary to continue to complete policies and improve the preferential regime for people with meritorious services, in line with the economic development; at the same time, support families with meritorious services to develop production and business to increase their income; mobilize the whole society to participate in the movement of "reciprocating gratitude", ensuring that people with meritorious services have a higher standard of living than the average standard of the population in the same area. Besides, the Government should complete the policies and develop a flexible social assistance system to effectively respond to risks and catastrophes along with increasing regular and unexpected assistance from the state budget. We also must promote socialization, diversify channels and forms of social assistance and voluntary and humanitarian social relief based on the community with the large participation of enterprises, society and our overseas compatriots in foreign countries; and also enlist the help of the international community.

4.5. Ensuring equity and justice through a variety of public services and improving social welfare

Ensuring better and better social security and social welfare is an urgent requirement of the rapid and sustainable development process. The Government needs to increase resources and play a leading role to improve social welfare and develop a diversified system of basic social services.

In the coming time, ensuring social welfare in association with promoting the development of social services must both help all people to have access to minimum basic social services and meet the diversified and increasing needs of the population for these services. It is necessary to promote the development of social welfare funds at all three levels as follows: centralized funds of the State; funds of enterprises and business units; funds of collectives and communities. The Government should continue to improve mechanisms and policies to expand the participation of all subjects in providing more and better quality public services; effectively develop and implement national programs on development of education, health, culture, information, sports, population, family and children.

Conclusion

After generalizing the economic role of the Government in the mixed economy from the point of view of P.A. Samuelson, the author points out the remaining problems in the process of implementing the economic role of the Government of Vietnam and reason. According to the author, in order to perfect the role of the Vietnamese Government in the socialist-oriented market economy, it is necessary to clear awareness of the role and economic function of the Government in the new period; consistently prioritizing macroeconomic stability, speeding up economic restructuring in the new context economic recovery and development; complete and use the system of macro-regulation tools efficiently; remedies for defects of the market economy; ensuring equity and justice through a variety of public services and improving social welfare.

Abstract

Developmental state is no longer a strange topic to the world in terms of both theory and practice. Vietnam in recent years is also aiming to build a developmental state. The XIII Congress (2021) of the Communist Party of Vietnam has identified three strategic breakthroughs in which the development institution is synchronously completed... Renovation of national governance towards modernity and effective competition result... is the first breakthrough. This article focuses on analyzing the characteristics, opportunities, advantages as well as difficulties, and challenges of the process of building a developmental state in Vietnam today. From there, the article makes some recommendations to improve the efficiency in building a developmental state in Vietnam to meet the requirements of sustainable development of the country, contributing to realizing the aspiration to develop a prosperous and happy country.

Keywords: *developmental states; practical; sustainable development; theoretical; Vietnam.*

1. Introduction

The development state has been widely recognized as the most important factor behind the postwar "miraculous development" in East Asia. It is considered part of helping to shift the economic focus to the Eastern region. The recent rapid transformation of several emerging economies, particularly China and Vietnam, suggests that this model of economic development can remain important even in the age of globalization. Taking Vietnam as a case study, this article argues that despite significant differences in actions, capacities, and ideological orientations between the Vietnamese state and other countries in the region. Vietnam's political leaders have followed the interventionist, state-led development model. Vietnam's goal is sustainable development.

East Asia has earned a reputation for its quick, steady economic growth. It is widely believed that the entire economic center, which is becoming more internationally connected, is moving from Western Europe to North America and then toward East Asia (Berger, 1998; Gilpin, 1995). This is not simply one of the most significant recent advances, but it also

challenges the way many people, particularly in the "West," think about economic development. However, peripheral development persists, and East Asian nations continue to make efforts to influence it. In the case of China, this possibility is corollary and clear (Bagchi, 2000; 2004; 2006; Riskin, 2008).

The central role of the state is one of the most obvious and pervasive aspects of the rapidly spreading development process throughout East Asia. The idea that East Asian development might be negatively impacted by nations' "interference" in economic processes is difficult for many outside observers to accept because it runs counter to much of the liberal economic orthodoxy associated with the so-called "Washington consensus" with a focus on regulations. Responsible and market-focused policymaking (Williamson, 1990; 1994). And it appears that's exactly what happened. Many academics contend that without appreciating the significant role that many nations play in regional planning or efforts to coordinate economic growth, it is hard to comprehend the full East Asian development story (Johnson, 1982; Wade, 1990; Amsden, 1989; Haggard, 2004).

Numerous academics have researched the subject of the developmental state in wealthy nations like the United States as well as in recently industrialized nations like Korea, Taiwan, Singapore, China, India, Finland, Brazil, and Congo. Every country whose state is regarded as being in a developmental stage exhibits the practical outcome of becoming wealthy and powerful, having socioeconomic problems that are successfully resolved, and having their international standing strengthened. This fact may be what motivates Vietnam's current understanding of the developmental state and its efforts to build them.

2. Literature Review and Theoretical Basis

2.1. Literature Review

a. Research on the developmental states

According to C.Johnson (1982), a state that wants to implement the model of the developmental states needs the following four factors: (1) The state civil servants do not need to be large in scale (so that the salary fund is not too large) but need elite and talented management; (2) Political institutions must ensure the civil servants have enough political space to effectively implement them the state policies; (3) The state needs to provide favorable economic intervention in response to the market; (4) There must be a leading organization, oriented to economic development similar to the "navigator organization".

Through theoretical proposals as well as practical experiences in some countries, Quan L.M. (2020) can initially generalize the main characteristics of the constructivist state as follows: (1) The State develops strategies, and creates environments and conditions for social development; (2) The State forecasts, shares and guides in social development; (3) The State saves and brings entrepreneurship in development management; (4) The State is lean, transparent and effective for development; (5) The State develops and employs talents. The characteristics of the developmental constructivist state presented may have their differences, but some of its common characteristics can be stated as having elite leadership

and elites supporting the state; the state has independence, the ability to impose in the face of the pressures of social classes, not to be manipulated; commit to economic growth; economic coordination is carried out by specialized institutions with real power and capacity... (Thu V., 2020).

Developmental states have been "highly selective in their liberalization and export-oriented strategies, often ensuring the development of a competitive region before opening up" (Wade, 2003; Akyuz et al., 1998). They "create winners", not "choose winners" (UNCTAD, 2007). Along with economic causes, the underlying reasons for the success or failure of state interventions are a combination of political and social factors. As Khan and other authors have noted, the difference between successful and failed attempts at state-oriented development does not seem to be primarily related to corruption, which often appears in both respects, but rather to the problem of state takeover (L. Hellman, 2000; O Khan, 2005).

Peter Evans (1995) argues that the construction of a developed state depends on "specific historical assets and characteristics of the surrounding social structure" (Evans, 1995) which are unique characteristics of each country. The construction of the administrative apparatus of the developmental states is also of interest to many researchers. The public bureaucracy has always included the nation's brightest and most talented figures and its appointment is based on merit, rather than politics (Johnson, 1982; Williams, 1985, 1994; Wade, 1990; White, 1988). A special organization in the civil service puts the achievement of the stated development goals and the service of the country above personal and political interests.

Studies have also shown that developmental states need an effective coordination center to manage development. Most successfully developed countries have a central coordination center that promotes economic transformation. This center is not only determined to promote the economy to high growth rates but also works towards eliminating the weaknesses of the economy and making the economy competitive, by diversifying and identifying new niche production products (Woo-Cumings, 1999). From this coordination center, the state directly coordinates industrial investment, actively directs macroeconomic policy according to development goals, and protects and promotes national interests as defined by the government (Schneider, 1999). It sets national objectives, leverages markets, and monitors whether policies are implemented.

Huan D.V. (2015) analyzed and pointed out the differences between the constructivist state and the mining state in several points: (1) The constructivist state is based on a political institution in which power is not concentrated in a part of the state but has relative dispersion and balance; (2) The State shall ensure that all individuals and business organizations can participate in production and business fairly without being affected by policy barriers and monopolies; (3) The State shall ensure the relatively equitable distribution of the fruits of socio-economic development.

Case in point in China. Yasheng Huang (2008) has shown that economic growth in China does not increase due to authoritarianism, but rather because the period of the relative

political opening is 'ahead or accompanied'. In periods of increased relative political repression in China, growth has declined. China's real miracle dates back to the 1980s when Chinese politics was at its freest. Personal income growth exceeds GDP growth; the share of labor in GDP is growing, and income distribution initially improved. China made even more achievements in poverty alleviation in the 1980s without any of the factors (such as foreign direct investment) now considered essential elements of the China model. In 4 short years (1980-84), China lifted more rural people out of poverty than combined in the 15 years from 1990 to 2005 (Huang, 2008).

However, more and more researchers are arguing the case for a democratically developed state. Patrick Heller (1999) rightly points out that there is a precise case for the argument that developed nations can successfully manage the balance between economic growth and social development while building democratic institutions. Of course, Amartya Sen has been making the case for both development and democracy - one indispensable for the other - for some time. Sen (1999) argues eloquently that development 'is a process of expanding the real freedoms that everyone enjoys' and that 'development requires the elimination of the main sources of non-freedom: poverty as well as tyranny, poor economic opportunity as well as social deprivation, abandoned. of public institutions as well as intolerance or excessive activity of repressive states.

b. Research on developmental state in Vietnam

During his 24 years as President of the Democratic Republic of Vietnam, President Ho Chi Minh has had philosophies on government building that are worth the ideological foundation for building a developmental government in our country. In the current context, continuing to study and thoroughly understand the philosophy of building a constructive government according to Ho Chi Minh's thought is a practical job, contributing to raising the awareness of cadres and Party members in building a constructive government in Vietnam (Thang N.T., 2020). The term "constructivist state" has not been mentioned by President Ho Chi Minh at the time of his birth. However, the issue of constructing the development of the country has been mentioned a lot in different aspects of his writings, writings, and speeches. The creation of national development or "nation building", or building a developed nation, building a new and good society, and building and developing the country sustainably are the goals that he has identified and resolved to implement throughout his revolutionary life.

In Vietnam, referring to the state of development creation is referring to the central role of the State in creating an environment and conditions for all individuals and people of all classes in society to promote their capacity and creativity for their benefit and the whole nation. According to President Ho Chi Minh, the development-creating State in Vietnam has the following main characteristics: (1) The State must be a state that "serves the people"; (2) In the state apparatus, the Government must be "integrity", "the whole people are united", "know how to work"; (3) In the State - the country needs to have a Party leader, a contingent of cadres who "know how to lead".

In his inaugural address to the National Assembly in 2016, Prime Minister Nguyen Xuan Phuc affirmed that Vietnam needs to "build a government that creates development, integrity, drastic action, and serves the people." This is fully in line with the practical requirements of the country and receives the concurrence of the whole Party and the whole people. The developmental state refers to the model of the state that makes a reasonable intervention in the economic sphere of social life. This model is applied with different characteristics in many countries but has made the economy have outstanding development. In our country, studies in recent years have clarified many theoretical and practical aspects of the developmental state. And to a certain extent, researchers have also pointed out the possibilities, advantages, limitations, requirements, and conditions when applying it in Vietnam.

Thu V. (2020) outlines the basic contents of the construction and operation of the developmental state in our country expressed on the following points: (1) There is a need for political determination and high unity of senior leaders of the Party and the State on the construction of developmental states, thereby spreading to cadres and civil servants in the Party and State system; (2) Carry out methodical and serious research on developmental states; (3) A developmental state is a state sometimes referred to as an interventionist state to distinguish it from the regulatory state; (4) Developmental states have high demands on vision and capacity for governance and management; (5) Ensuring democracy; (6) The issue of institutionalization of the developmental states.

Building a developmental state is an urgent current issue in our country today. To contribute to the successful construction of the developmental state model, Thuy D.V. (2020) proposes several directions: (1) Closely combining the construction of a developmental state with the process of building and completing a socialist rule-of-law state (2) Building a developmental state must be synchronous across three legislative areas, executive and judicial; (3) Building a developmental state associated with the process of streamlining the state apparatus; (4) improve the efficiency of market-led regulation of the state apparatus; (5) Improve the efficiency and quality of social function performance in the economic field; (6) Building developmental state should selectively inherit the contemporary value of developmental state models in the world (Thuy D.V., 2020).

2.2. Theoretical basis

a. The concept of the developmental state

The term "Developmental State" was first coined by C.Johnson (1982) when he systematically studied the state through a survey of state models of some countries that had succeeded in rapid industrialization such as Japan, South Korea, etc... Initially, the developmental state is a model of state management, in which the state sets development-oriented policies, creates an environment and conditions for economic sectors to realize their full potential in the environment of competition and international integration; strengthens supervision to detect possible imbalances, ensuring macroeconomic stability (Johnson, 1982).

So far, there has been a lot of research on supply chains in many different approaches and there are many different definitions of the term "Development Creation State". Some

views include "market fit" in Japan (Johnson, 1982); "Market-oriented economies" in Taiwan and South Korea (White and Wade, 1985); "Market Strengthening" in Korea (Amsden, 1989); or "managed markets" in Taiwan (Wade, 1990).

Unlike the traditional state - the state mainly adjusts and overcomes market failures, adjusts to ensure social justice, the State creates development more proactively, not only by adjusting and overcoming market failures but also focuses on creating markets according to the vision of the whole country and taking advantage of the advantages on both economically and politically. In particular, focusing on the design of specific guidelines and orientations, and along with that, policies to focus resources, creating priority mechanisms in focus areas (for example, Japan focused on the automotive industry in the 1970s, Malaysia later focused on the electronics industry, India focuses on the software industry, etc.), particularly in its industrial and commercial policies.

According to Marx and Engels, the state has class and social functions. The class function manifests in the protection of the interests and dominant status of the ruling class. Social functions ensure social stability and development, meeting the needs of members of society, and first of all the needs of economic development. Thus, the developmental state is inclined to perform social functions and enhance the efficiency and quality of social functions. The function of the developmental state differs from the "command state" and the "regulatory state" in that it must be effective in leading, promoting, and maintaining economic development at a higher rate (Thuy D.V., 2020).

Fritz and Menocal argue that "while the idea of the "developmental state" emphasizes the efficiency of the state, the conception of "governance" emphasizes the need for state control" (V. Fritz and A. Rocha Menocal, 2006). Amartya Sen writes: "Development is the process of extending real freedom to the people", according to which "the goal of the current developmental state is not only economic growth but also concerned with improving the quality of life and political legitimacy". Vartiainen, J. (1999) notes that the developmental state can be understood as the "welfare state of development" or the "state of the creation of democratic development". UNDP defines: "a developmental state as a state that participates strongly in the national economy to promote development" (UNDP, 2021).

Vinh B.Q (2015) argues that the essence of the state is that it does not manage but serves. The common characteristics of countries, according to him, are: (i) Creating a good political and policy environment to serve businesses and people effectively, without much involvement in the work of enterprises; (ii) Recruitment of civil servants who are competitive, fair, transparent and arbitral; (iii) Close public-private cooperation - cohesion; (iv) The rules of the game in the market are clear and strict.

The idea of "a centralized state interacting with the private sector from a preeminent position to ensure development goals" (Wade, 1990) is often referred to as the "developmental state" theory (Johnson, 1982; White, 1988). Authoritarian and collectivist political regimes around the world have driven markets by "increasing the provision of investable resources, dispersing or "socializing" the risks associated with long-term

investment and directing investment allocation in methods that combine government and entrepreneurial incentives" (Wade, 1990).

According to Dung N.S. (2020), the developmental state is the state that promotes the positive side, overcoming the limitations of the "command state" and "regulatory state" models. This state does not stay out of the market but also does not change the market, but actively intervenes in the market at a reasonable level to promote development and realize the set goals. The term developmental state is substantive and focused on the role of the state's active intervention in the economic sphere. This intervention implies comparing the developmental state with the "regulatory state" in which the state plays a passive role, giving way to the self-regulating mechanism of the market (Thu V., 2020). The developmental state with this characteristic is a development service apparatus instead of a dominant and ruling apparatus; there is a fundamental change in the position and role in the relationship between the state and the development subjects of society, first of all, the economic development subjects (Quan L.M., 2020).

b. The role of the developmental state in the sustainable development strategy

In simple terms, sustainable development means integrating the target economic, social, and environmental factors of society to maximize human well-being in the present without compromising future generations' "ability to meet future generation" needs when possible and making trade-offs when necessary. The pursuit of sustainable development, therefore, requires improving the consistency and complementarity of policies across multiple sectors, in response to the complex development challenges ahead (OECD, 2001). The Rio Declaration explains that "people are at the heart of the concern for sustainable development. They are entitled to a healthy and productive life in harmony with nature" (UNCED 1992).

Sustainable development strategies are socially, economically, and environmentally integrated, taking explanations of their impacts on different socioeconomic groups and for future generations. This, in turn, poses many technical and political difficulties. Countries also need multi-stakeholder forums (including representatives of government, business, labor, and civil society) to examine optional existing policies and translate visibility into specific short- and long-term goals at the national and local levels. The developmental state can promote its characteristics toward sustainable development (OECD, 2001).

Tuan N.V. (2020) assesses the role of the State in sustainable economic development: (1) the State also has a role in setting up a strategic system and building a legal system for sustainable development; (2) The role of organizing and implementing sustainable development: organizing the management apparatus, building a contingent of staff, mobilizing resources; (3) Create social consensus, enhance the social responsibility of individuals to realize sustainable economic development.

Despite many differences in individual economies and economic development approaches, developed East Asian countries have shared some common approaches. The most fundamental element of the development state is that its main concern is to ensure

sustainable growth and development based on high rates of accumulation, industrialization, and structural change (UNCTAD, 2007). These countries are driven by the "urgent need to promote economic growth and industrialization" (Leftwich, 1996) to "catch up" with the West or its industrialized neighbors. This may be to protect oneself from global or regional threats or to gain legitimacy by bringing about a stable improvement in the material and social lives of citizens. The developing state directly and positively influences the direction, pace, and objectives of development, rather than leaving it to uncoordinated market forces or an "invisible hand" that allocates resources in the economy (Johnson, 1982).

Studies on the developmental state show that the developmental state is not opposed to theories or models of the progressive state such as good state governance, developed administration, the role of government in the modern world..., market economy conditions, industrial revolution 4.0... there is a connection between them. These new elements work together toward sustainable development (Khoi D.M., 2017).

Developing countries, where most efforts are made to develop their economies and improve living standards (Beeson, 2006), have tried to find ways to deal with global challenges, toward sustainable development. The fact that some countries operate successfully still appears in some parts of the world suggests that the new emergence of developed nations in catching up with developing economies is still possible and creating sustainability (Hundt, 2009).

Beeson (2006) questioned whether the developmental state has an impact on sustainable development. Even if the developmental state succeeded, the Japanese state always faced the real risk of being captured by the benefits conferred and becoming an obstacle to further necessary reforms. In addition, when the boundaries of technology and knowledge are reached, state planners are not always better than business managers at predicting the future development of technology (Beeson, 2003). As a result, after completing "catch-up" tasks, developmental states either move into the "upgrade" stage on their own or else, can become obstacles to further reforms (Beeson, 2006). This echoes the work of many researchers on the current nature of developmental states in Taiwan and South Korea, such as Cherry (2007), Hundt's (2009), Dent's (2003) Minns's (2001), and in particular a violation of an earlier generalized conclusion by Leftwich (2000) stating that instead of being static, a developmental state is a transitional form of the modern state.

3. Results

3.1. Basic characteristics of the developmental state in Vietnam

Through the theoretical study of a developmental state, it is possible to generalize the basic characteristics of the developmental state in Vietnam as follows:

First, the developmental state in Vietnam puts development goals, synchronously builds institutions to create a driving force for rapid and sustainable development, escapes from the "middle-income trap", and withdraws shortens the development gap with advanced countries.

Second, a strong state with a focus on a strong, wise government, with high political determination, a vision ahead, and proactive and active innovation to meet the high requirements of national development.

Third, the state operates based on the rule of law, effectively combining the rule of law, observing the rules and regulations of the country, and strongly promoting democracy. The State must demonstrate integrity and public service to the people and society as a whole, and promote innovation and creative development of all subjects in all aspects of social life.

Fourth, focus on economic development in the orientation of "inclusive development", sustainable in terms of economy, culture, society, and environment, "leaving no one behind".

Fifth, effectively handle the relationship between the state and the market in the direction of a strong state-efficient market - an active and creative society (people and businesses).

Sixth, shifting from the state of "ruling", commanding - administrative bureaucratic management to the socialist rule of law state, focusing on development management - development administration - serving the state. The law is paramount, the state is both a social management institution and a development partner, an equal and responsible companion for all subjects in society; effectively combining the public and private sectors. The state, especially the government, must act decisively in the management and administration of "speaking and doing".

3.2. Advantages and challenges in constructing developmental state in Vietnam

The goal of building a Vietnam with "rich people, strong country, democracy, justice and civilization" (sustainable development), should be based on three basic pillars: a modern rule of law state, a market economy that develops effectively and a democratic society develops at a high level, in which the rule of law is the main principle governing interactions in society. To realize this goal, it is required to build a developmental state, seize and take advantage of opportunities, overcome difficulties and challenges, create a strong development motivation for our country to develop rapidly, gradually shorten the gap with advanced countries, and realize the goal of sustainable development.

Opportunities and advantages:

The industrial revolution 4.0 with the development trend based on system integration, digital-physical-biological connection with the breakthrough of the internet of things and artificial intelligence is fundamentally changing world production. Accordingly, information will be transparent and public, people can easily access information in society and the world, and at the same time, the leadership and management of the country have to fundamentally innovate.

With industrial revolution 4.0, the State will possess the power of technology to strengthen leadership over the people based on extensive monitoring systems and the ability to control digital infrastructure; The State apparatus and leading agencies are also organized compactly and simply. Previously, due to poor infrastructure and low technology, it was

difficult to get information and timely direction, when there is industrial revolution 4.0, information will certainly be faster, solving jobs more timely.

Improve technology level, improve production capacity and compete in the product chain; creating a big change in the form of service business; create many opportunities for innovative start-ups; significantly reduce transaction and transportation costs; creating attractive and potential investment opportunities in the fields of digital technology and the internet, and also a great opportunity for industrial production with advanced science and technology (Nhut, N.V., 2018).

The goal of building a developmental state has been highly supported by the public. Building a developmental state in the favorable context of the country is that the contingent of cadres and civil servants is fairly basically trained, has appropriate capacity and qualifications, and can adapt to innovation. In particular, the necessary and sufficient conditions for the construction of a tectonic state are being formed and gradually shaped.

Building a tectonic State in the context of the country's deeper international integration, many economic, cultural, scientific, technological, educational, and defense and security activities have been co-operated. Many comprehensive strategic and strategic partnership agreements have been signed with our country. With a flat world and the industrial revolution 4.0, a lot of knowledge and experience of mankind, the knowledge of government administration, corporate governance, and effective social management in the world are having a positive impact on Vietnam.

The 2013 Constitution was promulgated with the overarching goal of building a socialist rule of law state, which is the legal framework for building a developmental state.

The spirit of determination to build a developmental state is widely accepted and supported by all social classes, all of whom have the desire and aspiration for the country to develop quickly and sustainably.

Developing countries like Vietnam will learn many lessons from the successes and failures of previous countries in building a developmental state.

Challenges and difficulties

Firstly, Vietnam's rule of law system is still in the process of being built and has not yet been completed.

The Communist Party of Vietnam has been oriented to build a socialist rule-of-law state since 1991. In particular, from the XI Congress of the Party and the 2013 Constitution, the principle of control between the three legislative, executive, and judicial powers has been mentioned and gradually detailed. The role of Congress is increased. However, the quality of law promulgation is still low due to the small number of full-time National Assembly deputies, most of the laws are prepared and submitted by different Government agencies. The legal system lacks independence, so it is very difficult to prevent abuse of power by state officials. This is reflected in the measurement results of the World Justice Project's Rule of Law Index, according to which Vietnam's index in 2021 will reach a total score of 0.49,

ranking 11th out of 15 countries. in the region, and 88/139 countries around the world. It is noteworthy that of the eight factors used to evaluate the rule of law index, Vietnam has a relatively low score in the factor limiting state power, with a score below the average (0.45), in which The component scores on the restriction of judicial power (0.39) and test of government performance (0.40) are among the lowest in Asia (World Justice Project, 2021).

Moreover, the judicial apparatus lacks relative independence, leading to the inability to control the abuse of power by state agencies. State power control is mainly legislative and judicial control over the executive. However, in Vietnam, the judiciary is still subject to various power relationships, so it is very difficult to prevent abuse of power by state officials. Although the principle of judicial independence has been officially recognized in the Constitution and many other legal documents, it has not been fully respected and followed by Party and State agencies. Interference in judicial activities by courts and judges still occurs at many levels and in many forms, making it impossible for courts and judges in many cases to decide objectively. This is the reason why international independent organizations have assessed that the level of corruption in Vietnam is still quite serious and shows little sign of improvement in the past 10 years (2012 - 2021). According to Transparency International, although the corruption situation in Vietnam has improved somewhat recently, increasing from 30 points to 39 points in the period 2012-2021, overall, this indicator shows that people's concerns about corruption are still very high.

Second, the state administrative apparatus has not been professionalized

Vietnam is in the third stage of administrative reform, each reform period lasts 10 years, starting in 1990. Reform determination was further strengthened after the XII and XIII Party Congress, the government with the determination to build an apparatus of "creating development", creating motivation for individuals and businesses. However, in Vietnam, the use of people is still highly dependent on degrees in a mechanical way. The thinking on staff planning in Vietnam still has some points that are not suitable with the practical environment, the nature of human development goals, it is far from good international practices, and it is easy to encourage interest groups from an early age. , has weakened the sense of commitment to new, breakthrough ideas, and at the same time encouraged prudence, excessive withdrawal, etc., which leads to not fully realizing human potential. There are unclear standards that are basic standards for introducing, nominating, and appointing important positions. This has not encouraged Vietnamese talents domestically as well as internationally in building an administration that gathers elites and talents. In the survey serving the Vietnam Provincial Governance and Public Administration Performance Index (PAPI) 2021, 54% of the interviewees said that they must pay to be employed in the organization. government agencies and nearly 40% say more money is needed for better public services, such as education and health care. It seems that the more you go down to the lower level, the more the enthusiasm for a "development" machine gets colder (Quang N.V., 2019).

Third, the state apparatus intervenes without principles and inconsistently in the activities of the market (both redundant but also lacking).

In Vietnam today, the role of the State cannot be denied in: stabilizing the macro-economy through financial and monetary policy; strengthening national security; providing public goods; fighting against environmental pollution; developing education to increase income and improve social welfare, and creating a social framework governed by law, etc. State management of the economy has fundamentally changed to the main management method. by-laws, mechanisms, policies, strategies, master plans, plans, and economic resources; to maintain macroeconomic stability, create and develop fully and synchronously all elements of the market economy. However, Vietnam's legal system for managing the market economy is still incomplete. The effectiveness and efficiency of state management of the economy are still low, on the one hand, because the intervention of the State is not suitable for the movement of the market. On the other hand, the State lacks tools and mechanisms to monitor and sanction to ensure that actors participating in market relations comply with the set "rules of the game". The planning and planning of the State in many fields are still inadequate and not consistent with reality. In addition, there is confusion between the functions of the state and the market. There are many things that the State needs to do, but it does not or does not do enough. Summing up 35 years of innovation and development in Vietnam, it is clear that the limitations of the relationship between the state and the market are: The role of the State in the market economy has not been clarified because the role has not been clearly defined between the State and the Market. The State still defends many functions that the market performs more effectively (capital allocation, corporate governance, etc.) while not paying enough attention to the functions that the State must complete (building and implementation of the state management framework "administrative-legal framework", provision of public goods and services, development assistance,...).

Fourth, the accountability of state agencies, especially of local authorities, is still weak.

The results of the PAPI survey in 2021 and practical observations show that the accountability of local authorities in some issues in Vietnam is not high at present. Specifically, according to the general survey results on this issue, only 15 provinces achieved the highest index and accounted for 25.4% of the total 63 provinces and cities nationwide. What is ominous is that this index has not increased, even decreased when in 2013 there were 17 provinces achieving this index, accounting for 27%, higher than in 2016. The level of interaction between people and government rights is low. The main forms of accountability of local government today are mainly through newspapers, local radio stations, and websites. At the grassroots level, mainly through loudspeaker systems and message boards. But the efficiency of using these means is low, the content of explanations is not rich and the way of operation is not yet guaranteed to be scientific, does not attract the attention of the people, and is even counterproductive. Many agencies and units apply forms of information explanation through agency websites, intranets, or electronic devices, but the content is extensive and does not go right to the questions of the people. Even many explanatory documents try to complicate them with many technical and scientific terms that are difficult to access to the general public. This has made the activity of formal accountability exist, but it has not brought about the desired effect on society.

In addition, there are some other difficulties such as Creative development thinking in the leadership and management of the country has not kept pace with the development requirements of the country and the rapid and strong development and changes of the country. world. There has not been a strong and synchronous change in awareness in the whole political system about building a developmental state. The heavy influence of the development model - growth in breadth, creating inertia that is not easy to innovate; The inertia towards reforming the political system in general and the reform of the State, in particular, is a major obstacle to the construction of a developmental state; The contingent of cadres and civil servants has not completely met the requirements of the developmental state.

4. Discussion and Conclusion

4.1. Discussion

Some recommendations to improve the efficiency of developmental state construction in the coming time.

4.1.1. Building a professional and capable state administrative management apparatus in the direction of development creation

The administrative apparatus, including administrative institutions and administrative staff, of Vietnam, currently has many outstanding problems, which are a big factor hindering and inhibiting the development of the economy in particular and of the country. To solve the above existing limitations, the administrative reform needs to be implemented more strongly and drastically to achieve some goals such as: creating an equal competitive environment under the market mechanism; strictly controlling and eliminating business monopolies as well as mechanisms and policies that lead to inequality in competition. Laws and mechanisms and policies must create the most favorable conditions for all people and businesses to develop production and business. National resources and resources must be allocated to those who can use them in the most effective way for the country. Build an appropriate institutional framework and create necessary conditions for people to develop their capacities and creativity for their benefit and contribute to society. Fundamentally changing the position of the state towards the people, in the traditional management model, power is concentrated in the hands of the state, the state controls all activities of the society, and the relationship with the people brings about a change in the state of society. more dispensation than service. The new concept of the state apparatus is to decentralize power, focus on output, and consider taxpayers as customers to serve. Building a streamlined, compact but effective administrative apparatus to reduce the burden on the state budget. Regarding the administrative management apparatus, this is an important factor and has a decisive influence on the success of the developmental state model, because in the end, even if it is institutional reform, the strategies to develop the economy or improve political accountability, are also implemented by an administrative apparatus, if this apparatus does not meet the requirements of qualifications and professionalism, the other factors that contribute to the success of the developmental state cannot be realized.

4.1.2. Ensuring consistency between central and local governments in proactively leading and implementing development strategies

In the classical developmental state models, the leading strategies and policies have a "priority focus" on a few specific spearhead industries or a few "leading" localities". In the current period, the developmental strategy needs to change due to the changing context. The state's proactive construction will need to focus on prioritizing investments in research and development of knowledge and innovation. Regardless of which field is focused on, there needs to be an agreement between the central and local governments on the priority sectors and supportive solutions to eliminate the case of lack of consistency, leading to difficulties in the implementation of the economic development strategy.

4.1.3. Correctly identify the role of the state and the market in the socialist-oriented market economy

As the central institution of the political system, the state is not only "engaged", and "participated", but also an equal economic "subject" with political power. Thus, the state, as a special economic entity, is a constitutive content of the market economy. The state ensures public services, which are areas that only the state can solve because it is an area that creates the basis for development in general but is an area of large investment and profitability. low profit. The following areas can be mentioned: 1) Education and training to prepare social capital and human capital; 2) National defense and public security; 3) Organize arbitration and verification agencies; 4) Overcome the gap between rich and poor.

In addition, the state must also ensure economic development associated with the sustainable development of the ecological environment. This is an area of market failure that many countries around the world are unable to address. Environmental security is becoming one of the global issues. Solving environmental problems effectively must involve businesses, civil society, and the state, in which the state has a decisive role.

4.1.4. To build a society that operates based on law, the law must become a decisive means of managing a social life

Establishing a law-based society, making law the most decisive means of managing a social life, will ensure fairness and transparency in social activities. People as well as economic entities rely on the current legal system to live and operate without worrying about being harassed, causing difficulties and troubles because of pressures outside the law caused by individuals above the law. created by law. The reason for establishing a rule of law with the rule of law is because the institutional design in Vietnam has many shortcomings such as cumbersome administrative apparatus, many layers, and many processes, leading to the operation slow action when there is a mistake, it is difficult to find and handle because it involves many ministries and agencies. The quality of the contingent of cadres, civil servants, and public employees has not yet met the requirements of national development.

Thus, to ensure the supremacy of the law, the important thing to do is to reform the institution, because power is always corruptible, so the design of agencies in the state administrative apparatus must ensure the supervision and control of each other's power.

4.1.5. Strengthen the accountability of the state to the people

To ensure the people's right to access information, create conditions for people to participate more in the construction of society. To strengthen the accountability of the state to the people, it is necessary to give more rights to the people so that the people can supervise the activities of the state. To do this you need:

Firstly, raising awareness about the role of citizens in the process of building a state of creation and development, in which it is necessary to focus on increasing awareness for cadres, civil servants, and public employees and strengthening the political activism of the people.

Second, perfect the system of regulations to promote the forms of citizen participation, ensuring the right of citizens to participate. The people's right to participate in state management activities has been recognized in the Constitution and is associated with the State's responsibility to ensure it. These legal provisions are adequate but still need to be improved to ensure people's right to participate.

Third, ensure to provide sufficient information to the people. Citizens' participation in institutional formation and monitoring of state agencies and public officials depends on the quantity and quality of information they obtain. This information needs to be made public and transparent by the state in its activities and accountability.

4.2. Conclusion

Through the analysis of the above theoretical and practical issues, it is shown that building a developmental state in Vietnam is a long-term approach. Since the 6th National Congress of the Party, when recognizing the market economy, Vietnam has abandoned the centrally planned state model and followed closely the model of a developmental state. The process of globalization, strong integration, industrial revolution 4.0, and the recent Covid-19 pandemic create many opportunities but pose many difficulties for this choice. Therefore, Vietnam needs to well implement the strategic breakthrough in completing synchronous development institutions with drastic practical solutions.

BUILDING THE THEORETICAL FRAMEWORK FOR CREATING STAFF'S WORK MOTIVATION IN GENERAL DEPARTMENT OF VIET NAM CUSTOMS

MA. Vy Vu Quynh Nhu

vyvuquynhnhu@gmail.com

Lac Hong University, HCMC, Vietnam

Abstract

In this article, the author built a theoretical framework for the purpose of discovering the key factors affecting the work motivation of officers in General Department of Viet Nam customs. The author used analytical research - synthesized methods to evaluate the valuable findings from previous studies. The theoretical framework proposed by the author is based on the succession of previous studies as Herzberg (1959) but has been adjusted and supplemented to suit the research subjects who are officers in Viet Nam General Department of Viet Nam customs. Research results show that the theoretical model proposed by the author consists of 8 scales and is measured through all 36 component variables.

Keywords: *work motivation, human resource, Vietnam customs.*

1. Introduction

Work motivation is one of the most crucial issues in the field of human resource management because the motivation to work is the desire and willingness to perform the tasks of officers in order to achieve organizations' goals. Once having work motivation, the officers themselves will love the job and always try their best to fulfill their assigned tasks. Therefore, the issues relating to work motivation has received a lot of attention from local and international researchers.

Many different theories trying to explain work motivation as well as related factors have been developed over the years. These include Maslow's Hierarchy of Need (1954), Herzberg's Two-factor Theory (1959), John Stacy Adam's Equity Theory (1863), Victor Vroom's Expectancy Theory (1964), Porter and Lawler's Expectancy Theory (1968) and Alderfer's ERG Theory (1969). On the basis of these theories, researchers proposed factors influencing work motivation based on different subjects and scales.

In Vietnam, there are some studies regarding employee motivation. One of such studies is "Factors affecting the motivation of direct production officers in Vietnam Assembly Corporation (LILAMA)" by Bui Thi Minh Thu and Le Nguyen Doan Khoi (2014). This research analyzed and outlined seven factors that affect the motivation of direct production officers at the company: corporate culture, work, opportunity for training and development, working conditions, wages and welfare regime, relationships with colleagues, relationships with the leaders. In of which, wages and welfare regime with the corporate culture are the most powerful factor. In the research "Employee's Motivation Scale", Tran

Kim Dung and Nguyen Ngoc Lan Vy (2011) developed a framework for researching and testing factors through the survey of full-time officers in Ho Chi Minh city. Based on this research, Nguyen Thi Phuong Dung (2012) also had a paper “Building scales to motivate office workers in Can Tho city”. Besides that, there are some other researches such as “Developing the framework for motivation in public sector in Vietnam” by Hoang Thi Hong Loc and Nguyen Quoc Nghi (2014) and research “Factors affecting motivation of officers in foreign invested enterprises in Dong Nai” by Nguyen Van Hiep and Nguyen Thi Quynh (2014).

In this article, the author built a theoretical framework for the purpose of discovering the key factors affecting the work motivation of officers in General Department of Viet Nam customs.

2. Conceptual Framework and Literature review

2.1. Conceptual Framework

Motivation: It is the subjective purpose in human activities (community, collective, society) that motivates people to work to meet and satisfy the set needs. Motivation is an abstract concept and is difficult to define because firstly, it is often hidden by its true nature and for many different reasons such as: psychological factors, social views, background, and human outlook of each person. Secondly, motivation always changes over time. At each moment, people will have different needs and motivations. Therefore, an HR manager must know exactly the types of motivations and know how to modify them for each specific employee to match the standards and responsiveness of the organization (Anh et al, 2021, 2021a).

Work motivation: The desire and willingness of an individual to increase efforts towards the achievement of a certain result or goal. Personal motivation is the result of many resources operating simultaneously in the environment in which people live and work. Motivation must be associated with the job, the organization and the working environment. In the condition that other factors do not change, motivation will lead to higher productivity and work efficiency. But this also does not mean that being motivated will inevitably lead to high job performance. Overall, job performance depends on the ability, the training and development of each employee (Anh & Tien, 2019, 2019a, 2019b).

Creating work motivation

Motivation is a system and management policies, measures and tips that affect officers in order to make them motivated at work. Thus, motivating officers is the responsibility and goal of the organization as it expects officers to devote their abilities, qualifications and experience to serve the development needs of all. On the contrary, officers expect to receive material and spiritual benefits, helping them find the joy in their work (Dana, 2020).

The purpose of creating work motivation is to contribute to improving work efficiency for officers. Work motivation measures help stimulate officers' working ability, as well as maximize their work productivity towards the mission that is to complete the assigned work in the best way that contributes to the realization of the short-term and long-term goals set by the organization (Dana, 2020a).

Motivation is the key to improving work results. People only work when they want or are motivated to work. Even when trying to excel at work, people only act because they are driven or motivated by themselves or external factors. Motivation is a skill that has and needs to be learned and is indispensable for managers if the business wants to survive and succeed. Job performance can be seen as a function of competence and work motivation. Work capacity depends on factors such as education, experience, and training. Performance improvement usually occurs slowly over a sufficiently long period of time. In contrast, work motivation can improve very quickly.

Because it affects the attitude and behavior of officers helping officers work more enthusiastically, have a greater sense of responsibility for work and of course that will lead to higher work efficiency and making officers more attached to the organization considering as their second family, so officers will have a sense of loyalty to the organization (Grzeszczyk & Tien, 2019; Long, 2019). It is not only at work that people really need motivation, but even in daily life, people need motivation to live. A person without the motivation to live will not be able to survive. Natural selection is the greatest life force for human being. Not only humans but also animals and plants, in order to maintain existence, they must change to easily adapt when the living conditions change (Anh & Tien, 2018). In the economy, the state wants to attract foreign investors by creating an open investment environment. That is also one of the driving forces to attract foreign investment.

In business, managers motivate officers to work harder, devote themselves, and stick with the company for a long time. The existence and development of the company depends greatly on the working efforts of the staff members, their dedication, devotion and contributions for the company. No company can survive and develop with people who are superficial, mentally depressed and bored at work. Therefore, company needs to create motivation for officers (Dinh et al, 2020). Creating labor motivation for officers not only stimulates high efficiency working psychology for officers, but it also increases labor efficiency and business efficiency, builds a professional staff team to increase competition in the market (Minh & Tien, 2019; Tien et al, 2020, 2021).

2.2. Literature review

Motivation is one of the most comprehensively analysed and tested aspects of human life. Between 1950 and now, the phrase “motivation” was used in the titles of over 50,000 texts (Landy, Conte, 2007). In order to recognise the key factors of motivation, it is necessary to understand the ground theories and to critically evaluate and compare the most common findings. It is important to mention that in many General Department of Viet Nam customs the concepts discovered decades ago are still operated without any adjustments (Marciano, 2010).

There are many theories about work motivation due to different approaches to motivation. However, it can be said that all the theories come to a general conclusion that increasing motivation for officers will lead to improved labor performance and achieving organizational goals.

In 1946, the first system of motivational factors published in the Foreman Facts by the Labor Relations Institute of New York with nine motivating components, including: interesting work; achievement recognition; autonomy in work; fine job; high salary; promotion; good working condition; relationship with superiors. After that, this model has been widely disseminated and researched by many researchers and organizations in different industries and fields as Kennett S. Kovach (1987) but he added other elements: discipline

After publishing, motivation model of Kovach (1987) has been recognized by many scientists and widely applied in many different fields, used in many studies such as Simons & Enz (1995) "study factors affecting staff motivation in the hotels"; Siu, Tsang and Wong (1997) "study the factors affecting officers' motivation in the hotel in Hong Kong"; Charles and Marshall (1992) "study the motivation of officers in the hotel in the Caribbean", Hemdi and Nasurdin, (2003); Silverthorne (1992). In Vietnam, there are also authors using Kovach's research model as Le Thi Thuy Uyen (2007); Nguyen Ngoc Lan Vy (2010) carried out the research topic "Researching factors affecting the level of employee encouragement in work at enterprises in HCM city". Besides, according to many researchers such as C. Carolyn Thiedke (2004), James R. Linde (1998), motivation model in Kovach's research (1987) are consistent with some famous motivational theories like Maslow's theory of needs and Herzberg's two-factors theory.

After that, there are many authors who apply Herzberg's theory in their researches. In 2007, Boeve carried out the topic: study motivational factors for faculty at US medical universities based on Herzberg's two-factor theory and job description index (JDJ) of Smith, Kendall and Hulin (1969). Research results show that motivational factors include two groups: internal factors: Nature of work, training and promotion opportunities and external factors including: salary, support of superior and relationship with colleagues.

Shaemi Barzoki et al. (2012) conducted an analysis of the factors affecting the motivation of doctrine based on Herzberg. Seven factors affecting the motivation of the staff proposed by the author include: Safety at work, company's policy, relationships with colleagues and relationships with superiors, working conditions, personal life, salary and bonus. The advantages of the above research models have clearly shown each factor affecting labor dynamics, measuring their impact. This model is also very relevant and is in line with the famous motivational theories, which have been popularized in many countries such as Maslow's theory of needs and Herzberg's two-factor theory. Therefore, the research results are highly reliable. Disadvantages of the above models are not interested in corporate brand elements and corporate culture. These are two important factors in managing and developing the human resources of an organization, especially in multinational and transnational General Department of Viet Nam customs.

Teck-Hong and Waheed (2011) studied the factors affecting work motivation with salers in Malaysia. In this work, the theoretical framework proposed by the author is base on Frederick Herzberg's two-factors theory from 1959. From the data collected from 152 questionnaires, they demonstrated the importance of "working conditions" and "recognition"

that affect officers' work motivation. Besides, they found that the "maintenance" factors are more effective than the "motivating" factors in motivating officers.

Barzoki et al (2012) conducted research on factors affecting officers' work motivation on the basis of the two-factor theory by Herzberg (1959). The study used the stratified random sampling method, surveying 147 out of 640 officers working at organizations. The authors' research model includes 7 factors: (1) Salary, (2) Personal life, (3) Working conditions, (4) Relationship with management, (5) Relationship with colleagues, (6) Organizational policy, and (7) Work safety.

Safiullah conducted research on employee motivation and the most influential factors regarding employee motivation in Bangladesh. The research model is mainly based on the studies by Herzberg et al., Linder, and Hossain et al. Accordingly, the author's research model includes (1) Salary and other financial incentives, (2) Career development opportunities, (3) Relationship with colleagues, (4) Feeling valuable work, (5) Job Security, (6) Good working environment, (7) Flexible working hours and (8) Interesting and challenging work.

Denibutun (2012) has conducted his research "Work motivation: a theoretical framework". According to this research, many different theories have been established all over the world to explain the nature of work motivation. This article is made to explore differences between the theories of such work motivation and consider the motivation as a process of basic human psychology. The theories of motivation help explain the behavior of a certain person at a certain time. Such theories can be divided into 2 groups: (1) the theory of content focuses on the identification of personal needs which affect their behavior in the workplace, (2) the theory of process focusing on the process of human thinking. This thinking process can affect the decisions to perform different actions of humans in their work.

In Vietnam, work motivation is also very interested for researchers. First of all, it is necessary to mention the research of Tran Kim Dung (2011) on employee motivation scale. The study used Confirmatory Factor Analysis (CFA) and based on a survey sample with 445 officers working in Ho Chi Minh City. The results show four factors, namely: 1) Appropriate work; 2) Reasonable remuneration policy (salary, welfare, promotion); 3) Good relationship at work; and 4) Company brand. In particular, the elements of the policy and reasonable remuneration have the strongest impact on officers' motivation. But the study is limited on the workers in Ho Chi Minh City, the results are not representative and accurate for different regions and other types of General Department of Viet Nam customs.

In 2010, Le Dinh Ly published his thesis "Policy to motivate communal Public Servants (An Empirical Study in Nghe An province". With the application of Herzberg's two-factor theory, the author analyzed and evaluated the status of some policies affecting the factors of motivation and maintenance. It is interesting in this study that while Herzberg said that wages were a sustaining factor, this research said that this was a very motivating factor. This is a new result that later studies need to be concerned about. However,

Communal Public Servants have different characteristics compared officers in other General Department of Viet Nam customs and enterprises, especially in multinational and transnational corporations. So, the results maybe are not true for all.

Loc conducted a study that aims to analyze the factors affecting work motivation of cadres, civil servants, and officials in Ninh Kieu District. The author conducted an empirical investigation from the opinions of 250 officials and civil servants and 36 key officials at 13 state management units, 10 administrative units, and 13 wards in the District. the authors proposed a research model based on Maslow demand tower and Nevis (1983) but has been adjusted and supplemented to suit the research subjects of Vietnamese officials. Accordingly, the author's research model includes 4 factors, namely “The interest and recognition of leaders and colleagues”, “Public relationship”, “Nature of work”, “Opportunities for learning and advancement”. They have a positive impact on the employee motivation.

Overall, most previous studies are based on Frederick Herzberg’s two-factors theory (1959) to assess factors affecting officers' work motivation. However, some studies have limitations.

Firstly, although there have been many studies on this issue, researches are different in method, subject and scope. In the study of Buelens & Van Broeck (2007) in Belgium; Nawab (2011) in Pakistan, they have shown the difference in employee motivation between public sector and private sector. It means that, in different types, the application results of motivational models are not the same. In particular, in Vietnam, there has not been any research about work motivation in multi-national and transnational General Department of Viet Nam customs. This is a new point on the author’s research.

Secondly, many models of motivating components over the past 50 years usually focus mainly on job attributes, not much enterprises themselves such as "company brand". In particular, for multi-national and transnational General Department of Viet Nam customs, the company's brand factor is a great strength to attract and motivate for officers. In fact, when officers feel proud of their business, they will stick with the business more.

In the world, there have been studies on this issue. According to Hepburn (2005), Minchington (2006), Barrow and Mosley (2010), brand is a factor that "has a strong impact to attract and maintain good officers". In Asia, Zhou's study (2008) show that in China's labor market, the General Department of Viet Nam customs use brands to attract talented candidates.

According to Stephen Overell (2003), Hay Group's research in 35 large General Department of Viet Nam customs including Oracle, Boots, BMW, found five key elements of encouragement: 1) Internal brand; 2) Organizational values; 3) good leadership; 4) interesting and challenging working environment; 5) Administration of work performance.

Finally, in Multinational General Department of Viet Nam customs, there is different about culture of officers. It also effects to their work motivation. In the world, there have been authors studying this factor but still very limited in quantity. Authors as Nevis (1983), Hofstede (1984), Trompenaars (1993) (in Gambrel & Cianci, 2003) all come to the conclusion that the motivations models come from Europe or the United States - which are countries with individual cultures - need to be adjusted appropriately before applying to countries with collective cultures such as China, Hong Kong, Taiwan or Vietnam.

Mahal (2009) studied the influence of organizational culture and organizational atmosphere on employee motivation levels in Ranbaxy (India) and concluded that: To enhance employee motivation, businesses need to improve their culture and organizational atmosphere. Poornima's study (2009) mentions that human resource management needs to improve the organizational atmosphere to encourage IT staff.

Based on a survey of 312 people at a multinational company with branches in 40 countries, Larsson et al. (2007) concluded that: Culture is positively related to officers' satisfied and the time they stay in the organization.

3. Results

Based on the objective and the study of the literature, the theoretical framework of the study is shown in figure 1. There are seven hypothesis tested as listed below. In this work, the theoretical framework proposed by the author is base on Frederick Herzberg's two-factors theory from 1959 but has been adjusted and supplemented to suit the research subjects who are officers in General Department of Viet Nam customs.

H1: There is a positive relationship between good working condition and officers' motivation in General Department of Viet Nam customs

H2: There is a positive relationship between wages and benefits and officers' motivation in General Department of Viet Nam customs

H3: There is a positive relationship between nature of work and officers' motivation in General Department of Viet Nam customs

H4: There is a positive relationship between training - promotion and officers' motivation in General Department of Viet Nam customs

H5: There is a positive relationship between relationships at work and officers' motivation in General Department of Viet Nam customs

H6: There is a positive relationship between Company brand and officers' motivation in General Department of Viet Nam customs

H7: There is a positive relationship between Company culture and officers' motivation in General Department of Viet Nam customs.

4. Conclusion

Motivation is an integral part of the management in business. It is playing an extremely important role in determining the work efficiency of officers, it will motivate officers to work hard, strive to improve learning, improve work efficiency and product efficiency of business and at the same time increase the income of workers. This is particular in this period, when the human factor is increasingly concerned and appreciated for the development and maintenance of General Department of Viet Nam customs.

No individual is the same, and that needs to take into consideration when talking about motivation to go to work. A manager needs to observe the individual and their

individual needs. It is not possible to give one answer to what motivates officers who work with routine based tasks, as everyone is different and therefore get motivated by a variety of factors. In this article, the author built a theoretical framework for the purpose of discovering the key factors affecting the work motivation of officers in General Department of Viet Nam customs. The author hopes that this article is background for later studies about motivation of officers in General Department of Viet Nam customs.

JOINING ASEAN - IMPORTANT HISTORY TIMELINE OF VIETNAM'S MULTIPLAYER FOREIGN STRATEGY

Nguyen Van Son

phuson389@gmail.com

*Institute of International Relations, Ho Chi Minh
National Academy of Politics, Hanoi, Vietnam*

Abstract

On July 28, 1995, Vietnam officially became the 7th member of ASEAN. Joining ASEAN is considered an important milestone of Vietnam's multilateral foreign policy in the modern era. After joining ASEAN, Vietnam has always been an active and responsible member, making an important contribution to building and enhancing the position and prestige of ASEAN and Vietnam in the international arena. In the context of the Covid-19 pandemic spreading and spreading strongly, Vietnam's multilateral diplomacy has made an important contribution to the task of preventing and combating the Covid-19 pandemic. Thanks to the timely support of international partners and friends, the Covid-19 pandemic in Vietnam has been controlled and established a new normal state to restore and develop the economy.

Keywords: *ASEAN; Multilateral diplomacy; Covid-19 pandemic.*

1. Introduction

ASEAN today has 11 independent countries: Brunei, East Timor, Cambodia, Indonesia, Laos, Malaysia, Philippines, Singapore, Thailand, and Vietnam. Before becoming a member of ASEAN in 1995, the relationship between Vietnam and ASEAN had many ups and downs, sometimes peaceful, sometimes tense depending on fluctuations in international and regional situations. The cause was mutual suspicion among the group of Indochina countries that were helped by the Soviet Union and China in the national liberation revolution and followed the socialist orientation - including Vietnam, Laos, and Vietnam. Cambodia. The remaining group of countries is countries supported by the US and its allies: Thailand, Philippines, Singapore, etc.

After the end of the cold war (December 1989), international relations had many landmark changes. The trend of political-military confrontation has become obsolete, instead, it is a trend of economic cooperation and competition. Increasing economic strength has become the top goal of all countries in the world. This process is driven by liberalism, liberals believe that cooperation between countries will bring peace and prosperity to all nations, with the determination to build ASEAN into a peaceful, neutral region and become a bridge for linkages and cooperation among countries in the Asia-Pacific region. ASEAN has actively developed multilateral cooperation mechanisms such as ASEAN Regional Forum (ARF) - 1994, East Asia Summit (EAS) - 2005; ASEAN Defense Ministers' Meeting

Plus (ADMM+) - 2010. Mechanisms developed by ASEAN have attracted the participation of many countries inside and outside the region, including some important big countries, such as China, the USA, and Russia. ASEAN is making important contributions and roles in the process of structure formation in the Asia-Pacific region.

With a population of nearly 700,000 million people, ASEAN today has become a large market attracting the attention of investment and cooperation from many countries around the world. In that context, as an active and responsible member of ASEAN, Vietnam has conditions to expand links and cooperation with countries around the world on the principle of respecting independence, sovereignty, and equality. and mutually beneficial. Deeply aware of the movement trend of the times, since 1986, Vietnam has had a strategic change in its foreign policy. In its foreign policy and policy, Vietnam affirms that it wants to be friends with all countries in the world based on respect for independence, sovereignty, territorial integrity, and mutual benefits. As a result, the position and prestige of Vietnam are increasingly increasing in the international arena. Vietnam's multilateral diplomacy has made an important contribution to the country's rapid and sustainable development.

2. Method

About the establishment of ASEAN

Since the second half of the twentieth century, the world and region have undergone many complicated and unpredictable changes. In order to protect independence and self-reliance and avoid falling into a spiral of competition among major powers, some countries in Southeast Asia have sought to gather forces and build their own regional organization. After many unsuccessful attempts to establish transnational mechanisms and organizations in Southeast Asia (Association of Southeast Asia - ASA; Group of MAPHILINDO - Malaysia, Philippines, Indonesia). After many efforts, at the end of 1966, Thailand sent a draft on establishing an organization called "Association of Southeast Asian Nations for Regional Cooperation" to Malaysia, the Philippines, Indonesia, and Singapore. After many discussions, on August 8, 1967, the Association of Southeast Asian Nations (ASEAN) was officially established in Bangkok, Thailand with five member countries: Malaysia, Philippines, Indonesia, and Thailand. and Singapore.

Vietnam's process of joining ASEAN

Before Vietnam became a member of the ASEAN common house, the relationship between Vietnam and ASEAN went through ups and downs, due to differences in development paths and the influence of the war. cold. However, after joining ASEAN in 1995, the relationship between Vietnam and ASEAN has developed rapidly and is increasingly warm.

After World War II ended, relations between Vietnam and countries in Southeast Asia were in an atmosphere of peace and friendship. This friendly atmosphere is possible because, during the war for national independence, countries in the region united and helped each other to fight imperialism and colonialism. However, after France's defeat in Vietnam in 1954, the US jumped into the position of France to invade Vietnam, and some Southeast

Asian countries were caught up in the East-West confrontation. Some ASEAN countries even got involved in the Indochina war. Therefore, the relationship between the group of Indochinese countries and ASEAN has had very tense periods.

From 1967 up to now, Vietnam - ASEAN relations have been summarized in 5 stages:

First, the period 1967-1973: The relationship between Vietnam and ASEAN is relatively lackluster. Because Vietnam is conducting a resistance war against the US to save the country. There were times when Vietnam - ASEAN relations were in opposition because Thailand and the Philippines joined the military bloc SEATO, became an ally of the US and directly participated in the Vietnam War.

Second, the period 1973-1978: After the Paris Agreement on Vietnam (1973), our country actively implemented and promoted bilateral relations with ASEAN countries to establish a peaceful and stable international environment in Vietnam. region to restore and develop the economy after the war. However, the victory of the war against the US of the three Indochinese countries opened up opportunities for improvement and establishment of new relations between countries in the region. Both ASEAN countries and the three Indochinese countries expressed their desire to build friendly relations, co-existence, and development. That is reflected in the Laos-Vietnam Joint Declaration (February 1975), the Bali Treaty (1976), and Vietnam's four principles of relations with Southeast Asian countries (1976). That has opened an opportunity for Vietnam - ASEAN to close the past and look towards the future. The determinations of Vietnam as well as the efforts of countries in Southeast Asia during this time have shown the common aspiration of the countries in the region to build a Southeast Asian region into a peaceful region. friendship, solidarity, and cooperation for mutual development. Vietnam joined the signing of the Bali Treaty, then through many mutual visits, Vietnam-ASEAN relations have improved.

Third, the period 1978-1989: The incident in Cambodia at the end of the 70s of the twentieth century pushed the relations between Vietnam and ASEAN countries into a new period of crisis, causing serious consequences for the relationship between Vietnam and ASEAN. development of the Vietnamese Revolution. In December 1978, Vietnam sent volunteer troops to Cambodia to help the people of this country overthrow the genocidal Pol Pot regime. Some major countries have intervened and provoked, making relations between Vietnam and ASEAN more tense, even confrontational. Vietnam's foreign relations during this period were extremely difficult. Vietnam is economically besieged and politically isolated. Relations between Vietnam and ASEAN are frozen. Therefore, peace, cooperation, and friendship in Southeast Asia were once again "forgotten", this period witnessed the tension and radical confrontation between Vietnam and ASEAN countries. It was not until the Cambodia issue was gradually resolved that the relationship between Vietnam and ASEAN changed in a positive direction.

Fourth, period 1989-1995: After Vietnam withdrew its volunteer troops from Cambodia, Vietnam-ASEAN relations changed from a policy of confrontation to dialogue. Vietnam follows the foreign policy of "Wanting to be friends with all countries" and

Cambodia's Peace Agreement signed in 1991 has improved relations between Vietnam and ASEAN. During this period, Vietnam - ASEAN made many efforts in repairing bilateral relations after a period of freezing, especially promoting the process of Vietnam joining ASEAN. The year 1986 was a brilliant milestone in the development history of the Vietnamese nation, as well as the beginning of the process of reconciliation and cooperation between Vietnam and ASEAN countries. At the 6th Congress, the Communist Party of Vietnam affirmed that the task of foreign affairs is: To strive to combine the strength of the nation with the strength of the times, to contribute to maintaining peace in Indochina, and to contribute to the maintenance of peace in Southeast Asia and the world. The objective is to create a favorable international environment to serve the cause of building socialism and defending the Fatherland. On that basis, our Party advocates: "We are willing and ready to negotiate with other countries in the region to solve Southeast Asian problems, establish relations of peaceful coexistence, and build Southeast Asia" into a region of peace, stability, and cooperation"¹. In that spirit, Politburo issued Resolution No. 13/NQ-TW on "the task and foreign policy in the new situation" (1988) so that diplomacy could truly become an important front for the task. building, maintaining, and consolidating the peace that the Vietnamese people have worked so hard to build. At the same time, diplomacy has the task of creating a favorable environment for the country to focus on recovering and developing the economic politics to successfully build socialism.

Along with the Cambodia issue, which was completely resolved in 1991, Vietnam's foreign stance has been positively received by countries in the region and the world, so the relationship between Vietnam and ASEAN has changed positively, developed rapidly with many visits, and high-level contact between the two sides. Thus, with an innovative mindset and principles in line with regional and global realities, Vietnam has gradually restored relations with countries inside and outside the region. With the correct views of the Communist Party of Vietnam on foreign policy since 1986, Vietnam has overcome the difficult period after the dramatic events in the Soviet Union and Eastern Europe in the 90s of the 20th century, gradually breaking down break the isolation situation after Cambodia and gradually integrate with the world.

Facing the rapid progress in the relationship between Vietnam and ASEAN after the Paris Agreement on Cambodia was signed in 1991, on July 22, 1992, Vietnam officially joined the Treaty of Amity and Cooperation in Southeast Asia. Asia (TAC) and become an observer of ASEAN. Since then, Vietnam has always been invited to attend the annual meetings of foreign ministers of ASEAN countries. After a period of active dialogue, based on increasing political trust, on October 17, 1994, Vietnam officially sent a letter to the ASEAN chairman about its wish to join ASEAN.

Fifth, from 1995 to the present: After joining ASEAN (July 28, 1995), the relationship between Vietnam and ASEAN in the fields of economy, culture, science, and technology has been increasingly promoted. Since joining ASEAN up to now, Vietnam has

¹ Communist Party of Vietnam (1987), *Document of the 6th National Congress of Deputies*, Truth Publishing House, Hanoi, p. 108.

always been an active and responsible member, making an important contribution to building ASEAN into a stronger and more united industry organization. From a region, which was known as a hot spot in the cold war, Southeast Asia since the late 20th century has taken on a new face, a region of peace, dynamic development, and important cooperation of many countries and major international organizations. With its achievements over the past 60 years, ASEAN has been recognized by the international community as one of the most successful regional organizations in the world today, making an important contribution to maintaining stability. peace in the Asia-Pacific region. As a result, ASEAN's position and role in the international arena is increasing. From there, created conditions to help Vietnam make the most of the national strength and the strength of the times to serve the cause of building, developing, and defending the socialist Vietnamese Fatherland.

The fact that Vietnam joined ASEAN in 1995 is an important milestone in the history of Vietnam's multilateral diplomacy in modern times. Vietnam, a politically isolated and economically besieged country, has established a favorable international environment to focus on economic recovery and development, and improving the people's material and spiritual life. , making an important contribution to the cause of protecting the Party, State, and the socialist regime in Vietnam. Vietnam's success after nearly 40 years of doi moi is a testament to the correctness of its innovative thinking in general and its foreign policy in particular with the motto of multilateralizing and diversifying international relations. With a new diplomatic strategy in line with the objective development trend of movement in political life, Vietnam has taken advantage of external resources to contribute to the process of industrialization and modernization of the country. As a result, Vietnam has grown from a poor country with a backward economy severely damaged by wars to a developing country with an increasingly modern economic structure. Besides, after many years of opening up for international integration, Vietnam's economy and other economies in the world have become more closely linked. Therefore, promoting cooperation for development and coexistence according to the theory of liberalism is a mandatory requirement for all countries. Because, humanity is facing many global problems such as climate change, epidemics, terrorism, etc. So no country, even a large country with potential, cannot exist in isolation, but it needs to cooperate with other countries at different levels. As Vietnam is a country with limited potential, the requirement of international cooperation and integration is even more important to ensure the goal of rapid and sustainable development of the country.

3. Results

With the motto "multi-lateralization and diversification" in foreign relations, Vietnam's diplomacy has contributed to creating a favorable international environment to gradually restore and develop the economy, creating an important foundation for economic development. building and defending the socialist Vietnamese Fatherland in the current period. A significant highlight in Vietnam's multilateral diplomatic strategy in the modern era is the process of normalizing with China and the United States and joining ASEAN on the principles of respect for independence, territorial integrity, equal cooperation, and mutually beneficial. Thanks to that, Vietnam entered the international political arena with a new look.

In terms of politics - diplomacy: Currently, Vietnam has diplomatic relations with 189 countries, strategic partnerships, and comprehensive partnerships with 30 countries². In particular, Vietnam has established diplomatic relations with major countries that play a role and voice in the international community, especially the five permanent United Nations Security Council countries, namely the US, China, Russia, the UK, and the US. France and some other large and developed countries such as Japan, India, Germany... This shows that Vietnam has an increasing position and role in the international community.

Economically: "If 30 years ago, we had economic-trade relations with nearly 30 countries and territories, now we have economic-trade relations with 230 countries and territories. earth; Total import-export turnover has reached about 600 billion USD so far, about 120 times higher than in the early years of the doi moi period. We have attracted more than \$400 billion in foreign direct investment (FDI)"³. Therefore, the role, position, and international prestige of Vietnam in the region and in the world has increased significantly. With the right strategic thinking on international integration, in the new international context, Vietnam has taken advantage of external resources to serve the task of socio-economic development. The success in the fight against the Covid-19 pandemic is a typical example of the correctness of Vietnam's multilateral diplomacy today.

The Covid-19 pandemic, which appeared in China at the end of 2019, quickly spread and broke out in Vietnam and caused many negative impacts and consequences for the country that it took many years to overcome, including the economic development rate declines (it is 2.9%⁴ in 2020 compared to 7.02%⁵ in 2019); many businesses went bankrupt and had to close (In 2021, there were 119.8 thousand enterprises withdrawing from the market, an increase of 17.8% compared to 2020⁶); unemployment rate increased (In 2019 - 2.1%, In 2020 - 2.6%, In 2021 - 3.2%⁷; thousands of people died (43196 people - As of 06/05/2023⁸). Although, right from the time the Covid-19 Pandemic broke out in China,

Vietnam has taken many drastic measures to prevent the entry of the disease. But due to being a new strain with a high infection rate, along with the subjective psychology of a part of the people, the Covid-19 pandemic in Vietnam has developed very complicatedly.

In that context, Vietnam's multilateral diplomacy has made an important contribution to the task of preventing and combating the Covid-19 pandemic. At the time of the new outbreak, the health systems of all countries fell into a serious crisis due to a shortage of medical supplies such as protective clothing, and medical masks, but Vietnam has fulfilled international obligations to international friends. At the end of December 2019, the first cases of Covid-19 infection appeared in Wuhan City, Hunan Province, China. After that, the disease quickly spread with thousands of new infections every day, Wuhan became the epicenter of the epidemic, falling into a serious health crisis and forcing China to blockade to prevent the spread of infection. with the motto "no internal output, no foreign input". With the view of helping you as helping yourself, on February 9, 2020, Vietnam donated "medical supplies and equipment including ventilators, antiseptic clothes, gloves and medical masks with a total value of 500,000 USD"⁹. On April 16, 2020, amid the complicated developments of the Covid-19 Pandemic in the US, Japan, and Vietnam, Vietnam quickly donated masks and medical supplies to Japan with a total value of 100,000 USD and sent to the US 200,000 antibacterial cloth masks to prevent COVID-19 disease¹⁰.

In addition, after the Covid-19 pandemic spread and broke out in a number of European countries, on April 7, 2020, Vietnam donated "550,000 anti-droplet antibacterial cloth masks to European countries including France, Germany, Italy, Spain and England"¹¹. In particular, after the Covid-19 pandemic complicated developments in the region and the world, to support Laos and Cambodia (two neighboring countries with special relations with Vietnam) in disease prevention and control, on April 3, 2020, Vietnam donated medical equipment to the two friends worth 7 billion VND (VND) for each country¹².

Thus, in the early months of the Covid-19 pandemic broke out in 2020, essential medical supplies such as masks were considered one of the most scarce commodities in the world, Vietnam with limited resources but limited resources. ready, actively share with international friends. Vietnam's actions have demonstrated its current commitment to international integration: Vietnam is a good friend, reliable and responsible partner to all countries with an independent and self-sufficient foreign policy. ownership, multi-

lateralization, and diversification. Therefore, after the Covid-19 pandemic broke out strongly in April 2021, after that, Vietnam emerged as a hot spot for epidemics in the region that received active help from friends, and international partners.

Since April 2020, after the Covid-19 Pandemic broke out and spread strongly globally, to support Vietnam in proactively adapting and responding to the epidemic, the US has supported Vietnam 4 \$0.5 million to “prepare the laboratory system, enable event-based surveillance and case finding, support technical experts for preparedness and response, risk communication, prevention avoidance, infection control, and other activities¹³”. Up to now, after nearly 3 years of the outbreak of the Covid-19 pandemic, “the United States has supported Vietnam with nearly 40 million doses of vaccine, including nearly 39 million doses through the COVAX mechanism”¹⁴. In the condition that the supply of vaccines against Covid-19 is limited, the US vaccines have contributed to helping Vietnam control the disease. The mutual assistance between Vietnam and the US during the Covid-19 Pandemic has shown that the relationship between the two countries is developing better and better. Even according to the US Embassy in Ho Chi Minh City. Ho Chi Minh City affirmed that Vietnam and the US have always been true friends in the fight against the Covid-19 pandemic.

In addition, Vietnam has received active support from China in sharing information and experiences as well as vaccines and medical supplies for the prevention and control of the Covid-19 pandemic. On September 29, 2020, China donated 320,000 medical masks to support Vietnam in the fight against the Covid-19 pandemic and pledged to support Vietnam to fight the disease¹⁵. At the end of 2021, in the context of the rapid outbreak of the Covid-19 pandemic in Vietnam, China quickly provided Vietnam with 3 million doses of vaccines to serve the fight against the epidemic, “increasing the total number of vaccines aided by China. Nation to 5.7 million doses”¹⁶. The timely support from China has contributed to helping Vietnam effectively control the Covid-19 pandemic.

Vietnam also received timely help from international partners and friends such as Germany, Japan, Russia, and Australia... besides the US and China. On the occasion of the visit to Japan by the Prime Minister of Vietnam from 22-25 On November 11, 2021, the

Japanese Government provided a non-refundable aid to Vietnam of 1,540,000 doses of AstraZeneca vaccine for the fight against the epidemic¹⁷. Then, on December 14, 2021, Vietnam received 2,558,000 million doses of Covid-19 vaccine donated by the German government¹⁸. Those help have been an important resource to help Vietnam overcome and win the Covid-19 pandemic. This is a necessary foundation to promote closer relations between Vietnam and its partners with increasing political credibility.

In addition, Vietnam's success in the fight against the Covid-19 pandemic from 2019 to now also stems from the fact that Vietnam has received information and experience in fighting the epidemic from international friends. As the Coronavirus continuously has new variants, making it difficult for disease prevention and control, the information and experience of international partners and friends is an important basis to help Vietnam proactively respond to the pandemic. Covid-19 pandemic. That shows international friends' friendship, solidarity, and mutual support towards Vietnam during the Covid-19 Pandemic.

Looking back, at the world context in 2021, many countries in the region and the world have difficulty accessing the vaccine supply to inject people. But Vietnam has received the attention and aid of vaccines from many countries around the world to serve in the fight against the epidemic. Vietnam received such valuable support from international friends as a result of the correct multilateral diplomacy from 1986 until now. As a result, Vietnam's epidemic prevention and control have gradually achieved positive results. Up to now, the Covid-19 pandemic in Vietnam has been basically controlled, which has created conditions for Vietnam to establish a new normal state and restore production activities.

In short, Vietnam's accession to ASEAN in 1995 is an important milestone of Vietnam's multilateral diplomacy in the modern era. Joining ASEAN is an important first step in Vietnam's process of opening up and integrating into the world after a long period of economic isolation and political isolation. The past years, especially the achievements achieved during the outbreak of the Covid-19 Pandemic, have shown that Vietnam's multilateral diplomacy is correct and represents Vietnamese wisdom.

4. Conclusion

Vietnam's accession to ASEAN has created a trend of peace and cooperation for mutual development in the region and marked a new beginning in Vietnam's diplomatic history in the modern era. As a result, Vietnam has conditions to break the economic siege and political isolation. At the same time, Vietnam's multilateral foreign policy has paved the way for the expansion of foreign relations with all countries in the world without distinction of political regimes, on the basis of respect for established policies, autonomy, territorial

integrity, and non-interference in each other's internal affairs. With tireless efforts since 1986, multilateral diplomacy has contributed to enhancing Vietnam's position, role, and prestige in the international arena. At the same time, Vietnam's multilateral diplomacy is one of the important factors helping Vietnam effectively control the Covid-19 pandemic, creating conditions for economic recovery and development in the post-Covid-19 period.

TOWARDS THE IMPROVEMENT OF THE LAW ON PROTECTION OF INTELLECTUAL PROPERTY RIGHTS IN THE DIGITAL AGE: SOME OPEN-ENDED ISSUES

Nguyen Van My

mynv20610@sdh.uel.edu.vn

MSC Lam Ba Khanh Toan

lbktoan@ctu.edu.vn

Faculty of Law, Can Tho University, Can Tho, Vietnam

Abstract

The 4th scientific and technological revolution creates a premise for the development of a knowledge economy where capital for optimal use and exploitation of resources is an intangible asset - intellectual property rights. It is necessary to recognize the importance of this type of property as soon as possible the importance of this type of property, in which the important issue is the protection of intellectual property rights, which is a concern of all countries, including Vietnam. In that context, building and aiming to perfect the legal framework on protection of intellectual property rights is very necessary and of great significance in the current period. The content of the article will clarify the following issues: (i) problems arising from the legal regulations related to the mechanism of protection of intellectual property rights; (ii) propose some recommendations to improve the legal provisions of Vietnam.

Keywords: *Protection, intellectual property rights, towards perfection, problems, recommendations*

1. Introduction

Intellectual property rights are increasingly being evaluated as an important potential in the economic development of the country in general¹ or creating economic value for rights holders who are individuals and organizations in particular especially in the current digital age². For businesses, it is considered an important factor, creating "leverage" to affirm its position in domestic and foreign markets. The issues raised are the "protection" of this type

of property so as to ensure a balance between the rights and legitimate interests of the rights holders, as well as to create a good mechanism in the use and exploitation of this type of property this is effective. All of this contributes to increasing competitiveness, avoiding the risk of being left behind, and promoting policy making for the stable and sustainable development of Vietnam³. The alarming situation shows that Vietnam's legal framework for "protection" of intellectual property rights is in a "hot"⁴ state because of the increase in the number, nature and extent of infringement acts violate⁵ is always a big concern. On the other hand, the shortcomings in the very legal provisions on "protection" of intellectual property rights are currently causing many questions and inadequacies. It is thought that in the coming period, legislators should have an overall view that can be proposed. Monitoring and perfection is essential. To ensure sustainable economic growth in the "digital age" where the use of scientific and technological knowledge assets to promote the development potential of the state, research and recommendations the aim of completing the legal frameworks on "protection" of intellectual property rights is now extremely important.

protection of intellectual property rights in the period of international integration, such as: i). High construction costs for IP offices; ii). Ineffective enforcement of intellectual property protection; iii). potential when protecting intellectual property rights well and vice versa.

Foreign research projects

Article by Christian Aniwku, Kayode Akindele & Stanley Umezuruike (2023): “*Protecting intellectual property in the digital age - legal strategies for technology companies*”, in Business day, access on 31/3/2023. In the article, the author mentioned the importance of protecting intellectual property rights in the digital age such as: i). Encourage innovation, research and develop solutions for creativity; ii). Protect investments in research and development, create competition, enhance commercialization, etc. As well as pose many important issues in perfecting that country's legal framework for protection. protection of intellectual property rights such as (establishing framework regulations on the exploitation and use of this type of property on the basis of learning from the legislative experience of advanced countries,...).

On the basis of inheritance and development, the authors will generalize and expand on a number of issues such as completing the intellectual property protection mechanism in Vietnam in the "*digital age*", pointing out the inadequacies in the framework. Legislation on protection of intellectual property rights exists in Vietnamese legal documents from which it is recommended to improve Vietnamese law in the coming period.

3. Method

The article is based on qualitative and comparative research methods to assess inadequacies in legal documents related to the protection of intellectual property rights, thereby proposing a number of recommendations to complete the problem. legislation in the future. In addition, other methods such as the writing rule analysis method, the logical method, the synthetic analysis method and the enumeration method are also interwoven in the process of completing this article.

4. Discussion

4.1. Vietnamese law on the protection of intellectual property rights

Intellectual property rights are considered as an intangible property in which all rights holders want to be protected by law to ensure that certain cases are satisfied (*registered or protected protection on the mechanism of self-generated rights*⁶). In particular, the nature of the protected scope is within the territory of Viet Nam and can be protected under the agreement mechanism in bilateral, multilateral treaties or international treaties to which Vietnam is a member. members. And the term of protection is determined by a separate mechanism for each group of rights⁷. Mechanism of protection of intellectual property rights

⁶ Article 6, Article 7 Law on Intellectual Property 2005.

For plant variety rights: Article 169 Law on Intellectual Property 2005.

is set out with the aim of avoiding acts of intentionally infringing on one or several objects of intellectual property rights. In which, Vietnamese law provides for protection through 02 mechanisms: i). Self-protection; ii). Thanks to the authorized subject for protection.

i). Self-protection mechanism for intellectual property rights is put in place when individuals and organizations that are rights holders of intellectual property rights objects believe that they are infringed by acts specified by the intellectual property law as: acts infringing upon the subject matter of rights, such individuals or organizations may apply the following measures to protect rights⁸: *Firstly*, apply technological measures to protect rights, publish rights management information or apply other technological measures to prevent infringement of intellectual property rights⁹; *Secondly*, have the right to request organizations and individuals committing acts of infringing upon intellectual property rights to stop infringing acts, to remove and delete infringing content on the telecommunications network and the Internet., public rectification, compensation¹⁰.

ii). *Mechanism for protection by authorized subjects*¹¹. Depending on the nature and extent of the infringing acts of individuals and organizations, they will be handled according to law through civil, criminal and administrative measures¹². In which, the civil remedy is represented by the right to initiate a lawsuit at court or arbitration against intellectual property rights holders who believe that their legitimate rights and interests have been infringed (claim for damages and other obligations arise)¹³. Administrative measures are sanctions (fines,...) applied by state management agencies to sanction administrative violations when individuals and organizations commit acts of infringing upon intellectual property rights. the basis of the relevant legal provisions¹⁴. And the penal measure is considered the most severe of the state against the subject who commits acts of infringing upon intellectual property rights in the above three mechanisms. It is specified in the applicable penal code (prison and/or fine respectively)¹⁵.

4.2. Problems with the legal framework to protect intellectual property rights in Vietnam

One is, related to the determination of damages in the case of infringement of intellectual property rights.

⁸ Article 198 Law on Intellectual Property 2005 and Clause 10 Article 2 Law on Insurance Business, Amended Intellectual Property Law 2019.

⁹ Point a Clause 76 Article 1 Law on Intellectual Property revision 2022.

¹⁰ Point a Clause 76 Article 1 Law on Intellectual Property revision 2022. This point is said to be the change of intellectual property law compared to previous times of codification Law on Intellectual Property 2005.

¹¹ Point c Clause 1 Article 198 Law on Intellectual Property 2005.

¹² Clause 1 Article 199 Law on Intellectual Property 2005.

¹³ To be applied in accordance with the provisions of Chapter XX of the Civil Code 2015 and general provisions of the Civil Procedure Code 2015; Commercial Arbitration Law 2010

¹⁴ Talk about like: i). Law on sanctioning administrative violations of the 2012; ii). Decree No: 99/2013/NĐ-CP day 16/10/2013 Decree on sanctioning of administrative violations in the field of industrial property; iii). Decree No: 131/2013/NĐ-CP day 16/10/2013 Decree on sanctioning administrative violations of copyright and related rights; iv). Decree No: 31/2016/NĐ-CP day 06/5/2016 Decree on sanctioning of administrative violations on plant varieties.

¹⁵ The crimes are specified in the Article 225; Article 226 Current Penal Code.

Firstly, where the amount is considered a “reasonable” cost to hire an attorney, the extent of reasonableness here is in practice difficult to determine. Because it may be “reasonable” for the plaintiff - plaintiff but “unreasonable” for the defendant (defendant). In addition, the issue of legal service contract (lawyer-client service fee) is determined on many different bases (experience, popularity, nature of the case, etc.¹⁶....). And moreover, the consideration of the cost of hiring a lawyer that is considered "reasonable" belongs to the jurisdiction of the trial panel in the case.

Secondly, ignore the subject who has the right to force the payment of reasonable costs to hire a lawyer. Regarding the resolution of a dispute over individual intellectual property rights, the organization believes that the settlement of a civil case has the right to initiate a lawsuit to court or arbitration for settlement¹⁷, but the law only requires demand of one party to the court to compel the other party to pay the cost of hiring a lawyer.

The problem here is the lack of transparency and clarity in the understanding as well as the application of regulations in practice, which is currently the situation in the "digital age", the protection issue is facing many difficulties of both countries. management and rights holders, when one party loses the balance of its legitimate rights and interests, it will lead to many other legal consequences.

Two is, there is a lack of specific regulations for the application of the mechanism to protect intellectual property rights. In the digital age, where infringements take place in cyberspace, in addition to legal sanctions, preventing and stopping violations is also very important. Specifically, the current regulations have defined self-protection measures by: “Forcing the removal of electronic copies of infringing works, performances, phonograms, video recordings, broadcasts, in cyber and digital space¹⁸” but so far there is no mechanism and method to coerce violators to do so.

There is, criminal sanctions are still "willing", omitting the subject of adjustment.

Firstly, the willful application of the Trial Panel. For the crimes of infringing upon intellectual property rights, specified in Article 225; 226 The current Penal Code, the legislator stipulates that the criminal responsibility of the individual who commits the crime may also be subject to the additional application of Point c, Clause 3 in Article 225 and Point c, Clause 4, Article 226 of the Penal Code. “The offenders may also be subject to a fine of between VND 20,000,000 and 200,000,000, a ban from holding certain posts, practicing certain professions or doing certain jobs from 1 year to Five years.” In which cases will the above-mentioned "still possible" apply and considering that up to now, there has been no specific record to serve as a basis for the Trial Panel to apply to settle the case.

¹⁶ Article 55 Law on Lawyers.

¹⁷ Point d Clause1 Article 198 Law On Intellectual Property 2005

¹⁸ Clause 3 Article 3 Decree no: 131/2013/NĐ-CP day16 month 10 year 2013 regulations on sanctioning administrative violations of copyright and related rights (amended and supplemented by Decree no 28/2017/NĐ-CP day 20 month 3 year 2017).

Secondly, there is a lack of regulation on the case of infringement of the right object being a plant variety. In principle, when they are all objects of intellectual property rights protected by Vietnamese law (plant variety rights), the problem here is only two groups of rights: copyright, related rights and rights. Industrial property is protected by the criminal law, which loses the uniformity and comprehensiveness of the law for groups of objects of protected rights.

5. Discussion and Conclusion

5.1. Some recommendations to improve the protection of intellectual property rights

5.1.1. As for the regulation on "reasonable" compensation to hire a lawyer

In the next period, legislators should have a look towards amending and supplementing a number of issues in the following direction:

Firstly, the judicial council of the supreme people's court should issue detailed guidelines on "*reasonable costs of hiring a lawyer*" in the following directions: "*reasonable cost of hiring a lawyer*" is determined on the basis of compliance with the general provisions of the Law on Lawyers. In case there is disagreement about the cost of hiring a lawyer during the complaint and/or appeal process related to this content, it will be determined in the following way:

- Compensation for attorney fees will be decided according to the agreement of the parties in the process of settling the case and/or settling the complaint.

- Compensation for attorney's fees will be compulsory under the plaintiff's legal service contract if the court or arbitrator determines that there is an infringement of rights and vice versa (with proofs). In case there are grounds to determine that the legal service contract is fake or there is a change in the cost of lawyer's remuneration (higher) during the settlement process, it shall be determined according to the average price of 03 Law Offices. or a law firm in the same area to evaluate and determine the cost of attorney's fees. The applicable jurisdiction in this selection is consulted with experts and/or competent regulatory authorities.

Secondly, in clause 10, Article 2 of the Law on Insurance Business, the Law on Intellectual Property 2019 is amended and supplemented in the following directions:

"4. Organizations or individuals that are defendants in an intellectual property right infringement lawsuit, if concluded by a court or arbitrator that they have not committed an infringing act, have the right to request a court or arbitrator to force the plaintiff to pay reasonable expenses for hiring a lawyer or other expenses as prescribed by law."

5.1.2. For the protection mechanism of intellectual property rights in intellectual property law

Consolidate and absorb the methods of building intellectual property rights protection mechanisms of countries around the world on intellectual property rights protection. In particular, the promulgation of legal documents detailing the central mechanism of protection of intellectual property rights by applying self-protection measures must be flexible of the competent subject when handling. Infringement of intellectual property rights includes, but is not limited to:

i). Order and procedures for forced removal of copies of infringing works, performances, phonograms, video recordings and broadcasts in electronic, cyber and digital forms).

ii). Develop more framework regulations on handling intentional acts of individuals and organizations that do not comply or do not comply with regulations (administrative, civil, criminal).

5.1.3. *Regarding the mechanism of protection of intellectual property rights in the criminal law*

Early promulgate documents detailing how to apply in which cases the offender "*can still*" be subject to additional penalties at point c, clause 3, Article 225 and point c, clause 4, Article 226 of the Penal Code current.

This "*possible*" nature will apply: when the subjects commit criminal acts, including but not limited to: acts of "*recidivism*", "*using high technology*", to infringe intellectual property rights.

Early promulgate documents amending and supplementing the current Penal Code in the direction of recognizing the protection of rights to plant varieties under Chapter XVIII, Section 3 with the way the law should be developed and the description orientation according to the right object.

5.2. *Conclusion*

Based on the analysis and comparison of Vietnamese legal documents governing the protection of intellectual property rights, the authors have pointed out some outstanding problems in the current law. Since then, some solutions have been proposed to help Vietnamese law improve the provisions and regulations related to the regulation of intellectual property rights protection in the new period where the "*digital age*" will this is an important stepping stone for Vietnam to more easily integrate into the international economy. Moreover, this job also shows the cross-cutting view of our party and state in developing rapidly and sustainably mainly based on science and technology¹⁹, where in the context of the knowledge economy most of the use of intangible asset resources to create development motivation, if well done with the protection mechanism, will contribute to helping Vietnam rise to new heights on the world map.

**SESSION 7:
SOCIAL AND HUMANITIES ISSUES**

FACTORS AFFECTING THE NATIONAL HIGH SCHOOL GRADE EXPERIENCE IN VIETNAM

Dr. Pham Minh Hoan

hoanpm@neu.edu.vn

School of Information Technology and Digital Economics

National Economics University, Hanoi, Vietnam

Abstract

Education is always one of the top priorities in the country. Reality shows that accompanying the development of the country is the development of education. One of the most concerning issues is the annual high school graduation exam score because it reflects the learning process of students and the quality of training as well as the experience and knowledge of the teachers. Therefore, in our research, we focus on the factors that affect the national high school exam scores. There are many elements that can affect the learning ability of high school pupils such as family economic conditions, religion, gender, region, IQ, qualifications, and communication ability of teachers, ... In this research, we focus on studying the factors affecting the average score of the national high school exam in the provinces of Vietnam. Economic conditions are always one of the essential factors affecting students' learning ability. Students with a good economic background can study at private schools with modern facilities and small scale. Since then, they get more close attention and access to knowledge in a more interesting way, so the learning results are often more outstanding. Our results are no exception. GDP per capita of a province reflects the economic conditions and average living standards of that province and it has a positive effect on the average score of the province's national high school exam. The higher the province's GDP per capita, the higher the average score of that province's national high school exam. However, our research also shows that the group of high-income provinces does not mean that the average high school exam score will also be high. This may be related to the overcrowded number of students in these provinces and the uneven quality of students, thus reducing the average score.

Keywords: *high school grade, OLS, Fixed Effects Model (FEM), Random Effects Model (REM).*

1. Introduction

Academic achievement is one of the measures reflecting the learning and research capacity of high school students, as well as the teaching capacity of teachers in high schools. This is also an important criterion to evaluate the output quality of high school students, who will become excellent leaders and human resources responsible for the economic and social

development of the country. According to Jayanthi et al. (2014), students' academic success affects their self-esteem, motivation and perseverance; conversely, an outcome of academic failure can lead to a reduced opportunity for a student to seek a higher degree and increase the cost of education. This means that academic achievement is not only a top important goal of learners but also a topic that attracts special attention of teachers and educational and training institutions. However, the reality shows that achieving a high result or student's academic success is not easy to do, because academic achievement is a quantity that depends on many internal and external factors of the learner. As a result, educators and academics have long sought to discover elements that contribute to learners' success. Government policies, school-related factors, socioeconomic position, and individual and household characteristics will all have an influence on kids' learning outcomes (Dayioglu and Türüt-Asik, 2004; Farooq et al., 2011). According to Khan and Ahmad (2012), parents' socioeconomic status (SES) has a greater influence on their children's academic success. The majority of study findings identify parents' educational level and employment position as important predictors of student accomplishment (Saifi and Mehmood, 2011; Al-Matalka, 2014). Another research in 2014, conducted by Singh and Singh, discovered that parental SES did not substantially affect pupils' educational attainment, but that the parents' education level and the child's health condition did. in affecting children's academic success and social development. By the end of the trial, there were no significant variations in SES across students from various homes. Akhtar (2012) discovered that pupils who came from middle-class families outperformed those from upper and lower grades. Hijazi and Naqvi (2006) discovered that family income had no substantial influence on student success. That suggests that pupils from affluent homes are less concerned with their schoolwork. For their part, Ogunshola and Adewale (2012) revealed that parental SES has no significant effect on student academic performance rather than student health status being identified as having a statistically significant effect, regarding student learning outcomes.

Two significant structures are the school sector (private or public) and class size. Private schools are often better funded than public schools and have smaller class sizes. Private school financing increases academic achievements and get into resources such as computers, which have been found to improve academic ability (Crosnoe, Johnson, Elder, 2004; and Eamon, 2005). Lower class sizes provide more personal situations and, as a result, can build connections between instructors, which has also been found to improve student achievement. Kids from lower socioeconomic backgrounds who attend underfunded schools perform worse than those from better socioeconomic ones (Crosnoe et al., 2004, Eamon, 2005). Some of the characteristics that can impact students' academic success have been recognized as geographical location, number of training institutions, number of students and teachers arranged in a class, and socioeconomic level. Past research on the impact of these characteristics on academic success has been inconclusive. But some of the research' findings revealed that these characteristics had a considerable effect on students' academic success. According to some research, these characteristics have no substantial impact on kids' academic ability. Furthermore, not much empirical evidence was found in Vietnam on factors that affect the academic achievements of high school pupils.

The target of the research is examining how the geographical location, the number of students and teachers organized in a class and household socio-economic status affects the national high school exam scores. The official data source used by this study is the dataset from Kaggle, the General Statistics Office of Vietnam and the Ministry of Education and Training of Vietnam. All 63 provinces and cities of Vietnam are included in the research sample in the period from 2018 to 2021. 2018 was considered for selection because after 2015, Vietnam began to apply the form of university admission based on high school graduation exam scores, combining the two previous exams: high school graduation exam and university entrance exams. Purpose of using this exam results to consider and recognize high school graduation; thereby, providing information to assess the quality of general education; provides data as a basis for higher education and vocational education enrolment. At the same time, in order to reduce the situation of exam preparation, study cabinets, study deviations and reduce costs for families and society. Moreover, the official data source used by this study is the data set of the General Statistics Office of Vietnam to measure one of the main variables of the study, which is per capita income per month at current prices. The local disaggregation has so far only had complete data from 2018.

This study was conducted to answer the following questions:

Question 1: The higher GDP per capita each province, the higher the average high school graduation exam score of the province?

Question 2: The smaller the number of high school students/the number of high schools, the higher the average high school graduation exam score?

Question 3: The smaller the number of high school students/the number of high school teachers, the higher the average high school graduation exam score?

Question 4: The average high school graduation exam scores of the delta provinces are higher the average high school graduation exam scores of the mountainous provinces?

Question 5: The higher income rating, the higher the average high school graduation exam score?

2. Literature review

This article delves into the global importance and impact of education on society. It points out that education is seen as the lifeblood for the efficient and appropriate stable growth of the human community, and it links this importance to the development of human capital. The article goes on to say that education is the starting point for all human activity and the development of a country overall.

School sector and class size are two significant structural components of schools that are determined by the economic position of the parents. Private schools are often better funded and have smaller class sizes than public schools. More funding for private schools improves academic achievement and increases access to technologies such as computers, which have been shown to boost academic aptitude (Crosnoe, Johnson, Elder, 2004; and Eamon, 2005). Lower class sizes enable more intimate situations, which can increase

teacher-student connection and, as a result, student development. Students from low-income households who attend under-resourced schools perform worse than pupils from higher-income families (Crossnoe et al., 2004, Eamon, 2005).

Low academic achievement among students is a cause for worry for educators and anxiety for parents. It has been established that the quality of a student's parents and home background goes a long way toward forecasting the level and uniformity of a child's functioning survival and academic needs fulfilment and provision. Inadequate parental care paired with severe deprivation of a child's social and economic needs leads to low academic attainment.

Many studies have discovered that student and teacher attitudes, study habits, instructors' credentials, teaching methodologies, school atmosphere, government policy, school location, and family types all have an influence on students' academic achievement (Edwards, 2000; Aremu & Sokan, 2003; Asikhia, 2010; Akomolufe & Olorumfemi-Olabisi, 2011).

Previous study has shown that the impact of gender, geography, and socioeconomic position on pupils' academic success is not consistent. This needs regular verification of the effect of socio-economic position, location and gender on pupils' academic ability in mathematics anywhere and through time.

3. Method

Quantitative research techniques involve tasks such as data collection and processing, data synthesis, and data presentation to aid in the analysis and explanation process. Secondary data acquired from Kaggle, the General Statistical Office of Vietnam, and the Ministry of Education and Training of Vietnam were used in the study.

3.1. Pooled OLS model (POLS)

POLS is a model that assumes that the y-axis and slope coefficients do not change over time and in units (country). The estimation method for POLS is classical least squares. The POLS model assumes that there is no c_i factor (the factor of the characteristic difference between units but not measurable) in the model.

3.2. Fixed effects model (FEM)

a. Model

In economic relations, with the dependent variable, Y , and two observable explanatory variables, X_{11} and X_{22} , and one or more unobservable variables. We have table data for Y , X_{11} , and X_{22} . The table data consists of N - object and T - moment, and so we have $N \times T$ observations. The classical linear regression model without a shear coefficient is determined by:

$$Y_{it} = \beta_1 * X_{it1} + \beta_2 * X_{it2} + \mu_{it} \text{ with } i = 1, 2, \dots, N \text{ and } t = 1, 2, \dots, T$$

where Y_{it} is the value of Y for object i at time t ; X_{it1} is the value of X_1 for object i at time t , X_{it2} is the value of X_2 for object i at time t , and μ_{it} is the error of object i at time t .

The fixed effects model, which is an extension of the classical linear regression model, is given by:

$$Y_{it} = \beta_1 * X_{it1} + \beta_2 * X_{it2} + v_{it} + \varepsilon_{it}$$

Where $\mu_{it} = v_{it} + \varepsilon_{it}$. The error of the classical linear regression model is separated into two components. The v_{it} component represents unobservable elements that vary between objects but do not change over time. The composition ε_{it} represents unobservable elements that vary from object to object and change over time.

b. Estimated method

Two methods are commonly used to estimate the parameters of the effect model, namely:

- The LSDV minimum false variable regression estimation for each false variable is representative of each observed object of the sample.
- Fixed effects estimator

However, when the sample is too large, using the LSDV method will be very cumbersome. So, it makes more sense to use fixed effects estimates.

Fixed effects estimation principle: To assess the causal effects of independent variables X_{11} and X_{22} with dependent variables Y , estimate the fixed effects model using changes in X_{11} , X_{22} , and Y over time. Calling the variable Z_i denotes the unobservable variable that varies between objects but remains constant over time and so includes the error part in it. Since Z_i remains constant over time, it does not cause any change in Y_{it} .

3.3. Random effect model (REM)

a. Model

Considering an economic relationship consists of a dependent variable, Y , and two observable explanatory variables, X_1 and X_2 . Consider a table data for variables Y , X_1 , and X_2 . The table data consists of N objects and T times, so we have $N \times T$ observations.

The random effects model is written as:

$$Y_{it} = \beta_1 * X_{it1} + \beta_2 * X_{it2} + v_{it} + \varepsilon_{it} \text{ with } i = 1, 2, \dots, N \text{ and } t = 1, 2, \dots, T$$

In it, the standard error is divided into 2 components. The composition v_{it} represents unobservable elements that change between objects but do not change over time. The component ε_{it} represents all unobservable elements that change between objects and time. Suppose that v_{it} is given by:

$$v_{it} = \alpha_0 + \omega_i \text{ with } i = 1, 2, \dots, N$$

In particular, v_{it} is divided into two components: First, the uncertainty component α_0 . The second is the random component ω_i .

Suppose, ω_{it} for each object is derived from an independent probability distribution with an average value of 0 and constant variance, that is, $E(\omega_{it}) = 0$, $\text{Var}(\omega_{it}) = s_\omega^2$, $\text{cov}(\omega_{it}, \omega_{st}) = 0$.

n random variable ω_i are called random effects.

The random effect model can be rewritten:

$$Y_{it} = \alpha_0 * X_{it1} + \beta_2 * X_{it2} + \mu_{it}$$

Where $\mu_{it} = \omega_{it} + \varepsilon_{it}$. An important assumption in the random effects model is that the error component μ_{it} does not correlate with any explanatory variable in the model.

b. Estimated method

OLS estimation for the random effects model will give non-deviant but inefficient estimation parameters. Moreover, the estimates of the standard error and therefore the t-statistic will no longer be accurate. This is because OLS estimation ignores self-correlation in the error component μ_{it} . In order for the estimation results to not deviate and be effective, we can use feasible GLS estimation (FGLS) to overcome the phenomenon of self-correlation error.

In addition to the two methods of fixed and randomized impact, in some cases researchers still use Pooled OLS (POLS) estimates for this type of collected data. According to Gujaranti (2004), a POLS estimate is an OLS estimate on a data set obtained by objects over time, so it considers all coefficients unchanged between different objects and unchanged over time.

3.4. Model selection

The fixed effects estimate is verified by the F-test with the null hypothesis that all micro-coefficients are zero (i.e., there is no difference between different objects or times). Rejecting the null hypothesis at a given significance level (e.g., a significance level of 5%) would show that a fixed effects estimate is appropriate. According to Baltagi (2008), for random effects estimation, using the Lagrange Multiplier (LM) with the Breusch-Pagan test verifies the conformity of the estimate. Accordingly, the null hypothesis holds that the error of the raw estimate does not include deviations between objects $\text{var}(v_i) = 0$ (or the variance between objects or times is constant). Refuted the null hypothesis, showing that the error in the estimate includes deviations between groups, and is consistent with the estimate of random effects.

According to Baltagi (2008) and Gujarati (2004), the Hausman test will be used to select the appropriate estimation method between fixed and random effects estimation methods. Null hypothesis assumes that there is no correlation between the characteristic errors among objects (v_i) and the variables that explain X_{it} in the model. Estimation RE is reasonable under null hypothesis but inconsistent in the alternative hypothesis. However, in cases where the null hypothesis is rejected, a fixed effects estimate is more appropriate than a random effects estimate. Conversely, there is not enough evidence to refute null hypothesis, which means that without refuting the correlation between error and explanatory variables, the fixed effects model is no longer relevant and therefore a random effect model will be chosen.

3.5. Data processing method

Firstly, the research team eliminated the ineligible students who did not participate in the 3 compulsory subjects Math, Literature, and English.

Secondly, the team then totalled the top three subjects for each student and divided the data by test year.

Thirdly, for each year we use winsor method to handle outliers in variables. Winsorization is a method used to reduce the impact of external variables in data by returning

foreign values to a specified value at a percentile of data. The winsor method usually turns extraneous values (observations) outside the percentile between 95% and 5% into values at these two percentiles.

Finally, we statistics the number of students participating in the provinces and the total score of all students in each province by year. We then divide the total score by the number of students in provinces by year to get the average score of the provinces for each year.

3.6. The errors encountered in the model estimation

a. Cross-sectional dependence

Traditional panel data regression models such as FE, RE, all assume that the parameters (coefficients) of the variables are identical across cross-sectional units. However, according to Pesaran and Smith (1995), ignoring the heterogeneity of the coefficients can lead to discrepancies in the results. Thus, only when the assumption of homogeneity of the coefficients is maintained can the validity of the analytical results be guaranteed.

b. Serial correlation

Serial correlation is the correlation of a signal with a delayed copy of itself as a function of delay. This is typically measured in terms of the correlation coefficient, which is a measure of the similarity between observations of a random variable as a function of the time lag between them. The analysis of autocorrelation is a mathematical tool for finding repeating patterns, such as the presence of a periodic signal obscured by noise or identifying the missing fundamental frequency in a signal implied by its harmonic frequencies. It is often used in signal processing for analyzing functions or series of values, such as time domain signals. The consequence is that the OLS normal estimators are not the least-varient estimators among the unbiased estimators although they are unbiased.

c. Unit roots

A unit root is a feature of some stochastic processes (such as random walks) that can cause problems in statistical inference involving time series models. A linear stochastic process has a unit root if 1 is a root of the process's characteristic equation. Such a process is non-stationary but does not always have a trend.

d. Heteroskedasticity

Heteroskedasticity is a common but undesired phenomenon in Predicting statistical variables. When heteroskedasticity is present, it can distort the normal distribution of the error. Visual inspection of the residual errors will often show them to fan out over time.

Heteroskedasticity is a case of violating the assumptions of the linear regression model. Therefore, it can affect the results when analyzing econometrics or financial modelling such as CAPM.

Although, variable variance does not affect the consistency of regression parameter estimation, it can lead to error in conclusion. When variable variance error occurs, the F-test (F-test) is unreliable. The consequences in practice can be severe if we use regression analysis in developing investment strategies.

4. Results

4.1. The result of selecting model

• Choosing between POLS and REM

H0: POLS is preferred.

H1: REM is preferred.

Table 1. The results of selecting between POLS and REM

	P-value	Hypothesis
Model	$2.95 * 10^{-5}$	H1

Source: Summarized by the research team from model results - R software

The result shows that random effects model is preferred.

• Choosing between REM and FEM

H0: REM is preferred.

H1: FEM is preferred.

Table 2. The results of selecting between REM and FEM

	P-value	Hypothesis
Model	$1.113 * 10^{-11}$	H1

Source: Summarized by the research team from model results - R software

The result shows that fixed effects model is preferred.

4.2. Testing for cross-sectional dependence

H0: There is no cross-sectional dependence in the model.

H1: There is cross-sectional dependence in the model.

Table 3. Testing for cross-sectional dependence

	P-value	Hypothesis
Model	$< 2.2 * 10^{-16}$	H1

Source: Summarized by the research team from model results - R software

The result shows that there is cross-sectional dependence in model.

4.3. Testing for serial correlation

H0: Serial correlation doesn't present in the model.

H1: Serial correlation present in the model.

Table 4. Testing for serial correlation

	P-value	Hypothesis
Model	$< 2.2 * 10^{-16}$	H1

Source: Summarized by the research team from model results - R software

The result shows that serial correlation presents in model.

4.4. Testing for unit roots

H0: Unit roots present in data

H1: No unit roots present in data

Table 5. Testing for unit roots

	P-value	Hypothesis
Model	0.01	H1

Source: Summarized by the research team from model results - R software

The result shows that no unit roots present in data.

4.5. Testing for heteroskedasticity

H0: Heteroskedasticity doesn't present in model.

H1: Heteroskedasticity presents in model.

Table 6. Testing for heteroskedasticity

	P-value	Hypothesis
Model	0.2093	H0

Source: Summarized by the research team from model results - R software

The result shows that heteroskedasticity doesn't present in model.

4.6. The result of the model's estimated coefficients

Overall, model has 2 errors: cross-sectional dependence and serial correlation. According to Baltagi, cross-sectional dependence is a problem in macro panels with long time series. This is not much of a problem in micro panels (few years and large number of cases). Therefore, in this case we decide to not do anything to correct this error. For serial correlation, we control this error by using robust covariance matrix estimation (Sandwich estimator). Then the result of model's estimated coefficients is in below table.

Table 7. The result of the model's estimated coefficients

Coefficients	Estimated value
log(GDPP)	0.7386 ****
log(svtrg)	0.3630 ****
log(svgv)	-0.2458 ***
xhtn	-0.0577 *

Source: Summarized by the research team from model results - R software

*Levels of significant: '****' 0.1%; '***' 1%; '**' 5%; '*' 10%*

4.7. Research result explanation

Hypothesis 1: GDP per capita each province has positive impact on the average high school graduation exam score of the province?

GDP per capita each province has positive impact on the average high school graduation exam score of the province. Specifically, when GDP per capita per month increases 1%, the average high school graduation exam score increases 0.7386%. This result

is consistent with Crosnoe, Johnson, Elder, 2004; and Eamon, 2005 pointed out that additional financing for private school leads to improve academic performance and provide greater access to tools such as computers, which have been proved to improve academic ability. Crossnoe et al., 2004, Eamon, 2005 also show that pupils from low-income families who attend underfunded schools do not do as well as students from higher-income families. In addition, Saifi and Mehmood, 2011; Osonwa et al., 2013 pointed out that the rationale for low academic performance of students from low-income households is that the parent has so many employment and family duties that need time, attention, and money that less attention is given to their children's education. The results of Eshetu's (2015) study also revealed many pupils whose parents had higher socio-economic status did better than those whose parents had lower socio-economic status. Besides that, according to the findings of Osonwa et al. (2013), there is a substantial association between economic status and academic success of students, with children from lower income homes doing significantly worse than children from higher income households.

Hypothesis 2: The number of high school students/the number of high schools has positive impact on the average high school graduation exam score?

The number of students/the number of high schools has positive impact on the average high school graduation exam score. Specifically, when the number of students/the number of high schools increases 1%, the average high school graduation exam score increases 0.3630%. This result may refer to more investment in facilities, increase in the number of classrooms, the number of teachers to be able to attract more students, increase the number of students receiving intermediate training.

Hypothesis 3: The number of high school students/the number of high school teachers has positive impact on the average high school graduation exam score?

The number of high school student/the number of high school teacher has negative impact on the average high school graduation exam score. Specifically, when the number of students/the number of high school teachers increases 1%, the average high school graduation exam score decreases 0.2458%. This is completely reasonable, because when this ratio increases, the teachers in charge of training will be able to pay more attention to each student, the teachers working in the office will be able to handle the workload more effective. This directly increases the quality of training, and at the same time accelerates the progress of administrative tasks such as disbursing scholarships, disbursing funds to support students to some extent as a source of spiritual motivation for students. students learn better.

Hypothesis 4: The average high school graduation exam scores of the delta provinces are higher the average high school graduation exam scores of the mountainous provinces?

Because the geographic locations of the regions are time-invariant, the FEM has been converted to a component in the standard error. Because the geographic location of the regions is time-invariant, the FEM has been transformed into a component in the standard error. Therefore, we cannot conclude the impact of the geographical location of the provinces on the average high school graduation exam score.

Hypothesis 5: Income rating has positive impact on the average high school graduation exam score?

Income rating has negative impact on the average high school graduation exam score. Specifically, when income ranking of province increases 1 unit, the average high school graduation exam score decreases 0.0577 unit.

5. Discussion and Conclusion

To summarize, it is imperative that provinces increase their GDP in order to improve the living standard of their citizens and help them to contribute more to the national economy. Many provinces lack the funds necessary to restore and promote production and business, boost exports, disburse public investment capital and mobilize public-private cooperation resources for strategic infrastructure Development and improve their GDP per capita. In addition, schools in these provinces often do not have the necessary facilities and resources to accommodate growing student populations and improve student learning outcomes. In order to address these issues, provinces need to increase their GDP and restore production and business, boost exports, disburse public investment capital and mobilize public-private cooperation resources for strategic infrastructure development. One policy to increase GDP and improve the quality of education is to provide more funding for education. Increasing funding for education can improve the quality of education by providing more money for teachers, schools, and other educational institutions. Funding can also help to improve classroom conditions and improve teacher retention.

In addition, they should also maintain a moderate number of students in order to boost student learning outcomes. When there are more students, the teacher has to cater to each individual student more, which can be time-consuming and annoying. When there are fewer students, the teacher can focus more on one individual and his or her education. When teachers are engaged in their work, they are more likely to be able to provide students with the necessary tools and resources they need to be successful. In contrast, when teachers are disengaged or unengaged, they are more likely to provide subpar instruction which can have a negative impact on student performance.

Lastly, schools in these provinces should strengthen their facilities and expand their area in order to attract more students and accommodate the growing number of students in the province. Many of the factors that impact academic performance in the world also have an impact on the availability and quality of instructional materials. When resources are limited, schools are often forced to make difficult decisions about which materials to provide to students. This can have a significant impact on the ability of students to learn and perform at the level they are capable of. In some cases, schools with poor quality instruction are unable to provide the students with the necessary tools and resources they need to be successful in school. In other cases, schools with lower quality instruction may simply be unable to teach the subject material in an efficient and effective manner.

The study tested the effect of GDP per capita, geographical location, the number of students/the number of high schools, high school student to teacher ratio and income rating

to the national high school exam scores. In particular, GDP per capita and the number of students/the number of high schools has positive impact on the average high school graduation exam score. On the other hand, high school student to teacher ratio and income rating has negative impact on the average high school graduation exam score.

Based on the results of research, provinces need to focus on increasing their GDP by restoring and promoting production and business; boosting exports, disbursing public investment capital and mobilizing public-private cooperation resources to develop infrastructure, especially strategic infrastructure, thereby increasing GDP per capita, helping families to spend more on their children's education. Besides that, schools need to strengthen their facilities, expand the area to be able to attract more students and accommodate the growing number of students along with the population.

FACTORS INFLUENCING STUDENT SUCCESS

Truong Doan The
doantheu@gmail.com

Cao Thuy Xiem
ctxiem@gmail.com

National Economics University, Hanoi, Vietnam

Abstract

The purpose of this research is to examine factors influencing student performance. Two research questions are what student performance is, and what factors influence student performance in public universities in Hanoi. The research model was tested on survey data using SmartPLS software version 4.0.8.9. Five verified factors influencing student success include student self-motivation, student self-efficacy, engagement in a university environment, student satisfaction with the university, and luck. In addition, one controlled variable that negatively affects student success is club membership. Based on the findings several managerial implications were proposed, and this research contributes information on student performance to the literature.

Keywords: *Student performance, engagement in university life, student self-efficacy*

1. Introduction

Human resource quality is one of the most important factors determining the prosperity of a nation. The development of high-quality human resources is impossible without education. In recent years, the perspective of education systems has changed from “How should we teach students” to “How should we help students learn”, the purpose of this article is to answer two questions, what is student achievement or performance, and what factors affect student performance. The article's main parts are a literature review, and an empirical analysis of factors influencing undergraduate student performance in public universities in Hanoi, based on which management implications were drawn in order to help students improve their performance.

2. Literature review and the research model

2.1. Literature review

Student performance is a complex concept that is hard to find a uniform definition (Mills, Heyworth, Rosenwax & Carr, 2009; Toutkoushian & Smart, 2001). Various definitions of undergraduate student performance can be found in the literature. Kim, Newton, Downey, and Benton (2010) define college success as “acceptable grade averages, retention toward a degree and attainment of productive life skills” (p. 112). Hunter (2006) considers college success as the whole student development and having many dimensions beyond cognitive and academic factors. Finn and Rock (1997) argue that the academic

achievement of students is to graduate on time with good grades. The definitions mentioned above refer to college student success as not grades, but emotional, social, cognitive, and academic development. The factors influencing student success have been interpreted by various theories or models. The *expectancy-value theory* holds that motivation is an important factor for student success. Motivation is the direct source of expectations for success (Wigfield, 1994). According to Tinto's model of academic and social integration, engaging in a new environment, the university environment affects student success. The more engaged students are in university, the higher their achievement is (Tinto & Pusser, 2006). Another theory of student success is the achievement goal theory, which emphasizes setting goals, high goal sett leads to high achievement (Canfield & Zastavker, 2010).

According to Goken Aydin (2017), personal factors affecting student success include own self-efficacy, learning organization and learning attention, time use, communication in the classroom, and engagement in college life. Pritchard and Wilson (2003) argue that due to the fact that students have to adjust to the university environment, emotional and social factors are crucial to student success, and so do psychological factors. According to Pike and Kuh (2005), factors affecting student success are student behavior, attitudes, expectations, and engagement in university life. Wafa (2021) found that student achievement is mainly influenced by external support from family, friends, and society, followed by decision-making and determination, ambition, hard work, and perseverance. The main factors hindering student success are discouragement followed by irresponsibility, sloppiness, laziness, poor time management, failure, and frustration.

Changing the perspective of education systems from “How should we teach students” to “How should we help students learn” so that they develop and maintain their achievements shows that student achievement is relevant to the responsibility of the faculty and the school as a whole (Hunter, 2006). Direct interaction between faculty and students results in an increase in student achievements (Crisp, Baker, Griffin, Lunsford & Pifer, 2017).

According to Kuh (2006), student success is created by pre-university experience (background and college readiness); student engagement (learning skills, engagement in social life and the university environment); and graduate outcomes (grades and work-related issues). Kim, Newton, Downey & Benton (2010) clarify factors affecting the success of students into three groups, the first group of variables is the learning outcome at high school, the second group of variables is demographical, the third group of variables is student individual characteristics or “psychosocial factors”. According to Newton, Kim, Wilcox and Beemer (2008), psychological factors are attitudes, motivations, use of campus resources, learning methods, etc. In addition, student learning outcomes also depend on the level of student satisfaction with the university - satisfaction with faculty, quality of programs, activities, and university environment, and overall satisfaction with life (Klein, Kuh, Chun, Hamilton & Shavelson, 2005; Pascarella & Terenzini, 2005). Cao and Truong (2022), confirm four factors affecting the student's perceived learning outcomes, which are assessment of learning outcomes, facilities, student interactions in the classroom, and student self-motivation. Nguyen Thuy Dung, Hoang Thi Kim Oanh, Le Dinh Hai (2017), found that

the level of study (which year student), gender, study time, grades, library, and internet use for learning were factors affecting student success. Dang Thu Ha (2017) pointed out that student self-efficacy has a direct and positive influence on learning outcomes, class participation, and interaction with lecturers on the subjects, and problems outside the subject (career, job...) do not directly affect student achievement, however, has an indirect impact through the student self-efficacy; The interaction with lecturers on subject-related issues (subject contents, assignments, grades, tests...) has an insignificant effect on student learning outcomes and student self-efficacy. Le Dinh Hai (2016), confirmed that factors affecting students' learning outcomes were learning methods, learning persistence, competition in learning, school impressions, school resources, and learning motivation. A recent study by García y García (2021), of attribution, found that college students attribute intelligence as the most important factor influencing their success. Gender differences, through two expressions, calmness, and effort, also have an impact on student achievement. The student success of male students is also influenced by efforts and good teachers, while female students are also affected by liking the teacher, luck, and attention.

The *attribution theory* was developed by Heider (1944; 1958). The essential of this theory is that people tend to find causality to explain their own behavior, that of others, and surrounding events. According to Kelley (1967), in order to interpret surrounding events and make inferences, people create causal schemes taking into account three conditions, the individual himself (internal attributes), influences (external attributes), and surrounding circumstances.

The attribution theory does not necessarily find the actual cause of events but rather a subjective causality. Attribution is a hedonic process, it depends on gender, age, and culture, and depends on whether the attribution is made for one's own behavior or that of others (Digia and Zdravkovi, 2019; Weiner, 2010b). In education, on both sides student or teacher, the reasons for student success or failure are student self-efficacy, skills, intelligence, the difficulty of homework, and characteristics of teachers and luck (Weiner, 1985). The attribution is conscious or unconscious, it affects students' achievement and therefore their motivation, feelings, behavior, and school decisions. To understand the attribution made by students it is necessary to consider at least three variables involved in the causality scheming process. The first variable is the recognition that attribution is subjective, showing bias, and according to Weiner (2010b), it is a hedonic process that tends to find internal factors for the behavior of others and external factors for one's own behavior. Regularly, success is said to be the result of efforts, and internal causes, while failure is attributed to external causes such as luck. The second variable is relevant to students using communications received from teachers to make comments and use them to explain their success (Matteucci and Gosling, 2004). The third variable is the management of impressions that students make to influence others' beliefs about the cause and to seek justification, especially if academic goals are not achieved. According to Weiner (2010a), attribution has at least four characteristics: locus or location, controllability, stability, and globality. Locus or location is a fact that can be attributed to internal or external factors. People who depend

on the environment and others make external attributions to things that happened to them. In contrast, those who trust their own resources and can transform their environments consider what happens to them as a result of their own actions. Controllability, there are causes that the actors can manage at will, while others are beyond their control. If school failure is attributed to a lack of effort, students will control their academic success, whereas if it is attributed to the teacher's characteristics, students will hardly control their success or failure. Stability, the cause may be stable or unstable over time. Things that are stable over time we can't change, that is, we can't change the cause to change the result. Globality, causes can be generalized to situations. If students use luck to blame their failures in school, they may use it to explain their failures in other circumstances.

2.2 Research model

Inheriting previous studies, we propose the research model, as shown in Figure 1.

Student self-motivation

Motivation is the direct source of expectations. Students who have high expectations will aim to achieve scholarships, satisfy their parents' expectations, improve themselves, have good jobs in the future, and be able to achieve high academic results. Therefore, the hypothesis is:

H1: Student self-motivation is positively related to student success.

Student self-efficacy

Self-efficacy is considered an internal factor, that students can control on their own at will, affecting their success. Students who have good intelligence and learning methods, attention, can manage their time and actively exploit campus resources such as libraries, lecture halls, and Wi-Fi to connect to the internet for learning, do not have cheating intentions on exams, learn hard, stay calm on tests and exams over the course will have good success. However, it should be noted that there are components of learning ability that can be changed, such as effort, proactive behavior, and self-discipline, and things that are hard to change, such as intelligence. Good self-efficacy will lead to good achievement. The hypothesis is

H2: Student self-efficacy is positively related to student success.

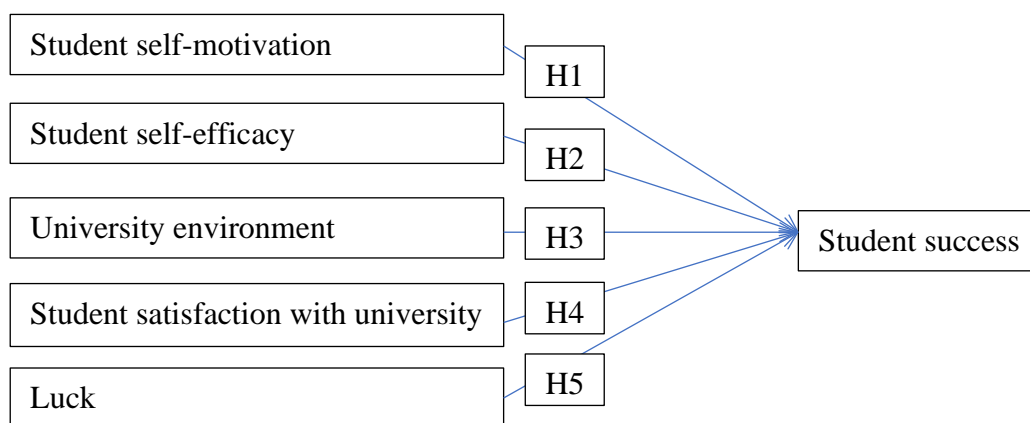

Figure 1. Research model

University environment

The university environment is an external factor, beyond the control of students. The environment can have a positive or negative impact on a student's success depending on the specific circumstances. The university environment has an impact on student's learning attention, the implementation of time plans for learning and other activities may be hindered, peer pressure on learning or trends in student life also affect student success, participating in clubs can take time away from learning, while it has a positive impact on engaging into social life, tough family situations that force students to take part-time jobs also affect students' grades. It is hypothesized

H3: The university environment is positively or naively related to student success.

Student satisfaction with university

The level of student satisfaction with the university is an external factor affecting student achievement, beyond the control of students. With good teachers, good programs, good activities for students and a good university environment, and a good life in general, students' success will likely be high. Therefore, we hypothesize

H4: The student satisfaction with university is positively related to student success.

Luck

Luck is one of the factors influencing student success. In terms of scores, for students who are fortunate to learn with good teachers, their exam questions often fall into sections they thoroughly learned, have few health problems, and those related to personal feelings during exam time will get high grades. Therefore, the hypothesis is

H5: The Luck is positively related to student success.

3. Method

Five hypotheses were tested by a quantitative survey on the factors influencing student success, employing structural equation modeling. The research design is provided in the following sections. First, the description of the development of the survey instrument is reported. Second, the test of the measurement model is represented, which includes an estimation of internal consistency and the convergent and discriminant validity of the instrument items, and the report of scale reliability and validity data. This is followed by the structural modeling results.

Survey instrument

Based on the extensive literature review, we conducted the preliminary survey with which students were asked to write down attributions to their achievements. 38 responses received are useful references for designing a questionnaire. The first part of the questionnaire includes questions about a participant's information and the second consists of five multivariate/item scales measuring factors that affect student success, using a 5-point Likert scale with increasing agreement from "Not agree at all" to "Completely agree".

The main survey was conducted virtually using the Google Form application. The online address (URL) of the survey is sent to the participants (students who studying in public

universities in Hanoi) via student email and uploaded to groups on social networks (Facebook, Zalo, MS Teams, LMS...). Participants are informed that this survey is anonymous and information they provide will always remain anonymous. Data for this research are collected from a non-probability convenience sample. The survey was carried out from January to March 2023. 480 valid responses have been collected, fulfilling the conditions of sample size (Hair et. al., 2014). The sample's characteristics are provided in Table 1.

Table 1. Characteristics of the sample

		Respondents	Percentage
Sex	Male	336	70%
	Female	144	30%
Study level	First-year students	271	56%
	Sophomores,	189	39.4%
	Third year	17	3.5%
	Fourth-year students	3	0.6%
Education program	Traditional	331	69%
	Advanced and oriented	145	30,2%
	Other	3	0,6%
Student residence	Campus	427	89%
	Non-campus	53	11%
Part-time job	Yes	257	53,5%
	No	223	46,5%
Club membership	Yes	285	59,4%
	No	195	40,6%
Student's family residence	Urban	220	45,8%
	Rural	260	54,2%
Who finance student's studying	Parents	344	71,7%
	Student him/herself	8	1,7%
	Parents and the student	122	25,4%
	Other	6	1,2%

Source: authors

Research methods

Structural equation model-based PLS methodology was applied to test the research model represented in Figure 1, using SmartPLS software version 4.0.8.9.

Measurement model estimation

The data analysis started with model estimation. The measurement model was tested by estimating the internal consistency and the convergent and discriminant validity of the

instrument items. If reliability measures were above the level recommended of .70 internal consistency is verified (Fornell & Bookstein, 1982; Nunnally & Bernstein, 1994). If individual reflective measures correlate more than .70 with the construct they intend to measure then they are considered to be reliable. Table 2 represents reliability measures above .70 ensuring adequate internal consistency and reliable individual reflective measures.

If the item loads highly (loading is greater than .50) on their associated factors, convergent validity is demonstrated. The AVE ranging from 0.562 to 0.92 (Table 2) were above the threshold of .05 (Chin, 1998; Fornell & Larcker, 1981).

Table 2. Convergent and discriminant validity of the model constructs

Variable	Outer loading
Motivation	
IC = 0.866	
AVE = 0.686	
Mot1	0.669
Mot3	0.906
Mot4	0.890
Self-efficacy

Suc3	0.822
Suc4	0.854
Suc5	0.803

IC = internal consistency (Composite reliability (ρ_a); AVE = average variance extracted

Source: authors extracted from the processed data

Discriminant validity assessment was conducted by comparing the square root of the AVE for each construct with the correlation between the construct with other constructs in the model (Chin, 1998; Fornell & Larcker, 1981). Constructs in the estimated model that satisfied the condition of discriminant validity were represented in Table 3.

Table 3. Correlation among construct scores (Discriminant validity - Fornell-Larcker criterion)

	Self- efficacy	University environment	Student motivation	Luck	Student satisfaction	Student success
Self-efficacy	0.838					
University environment	0.388	0.882				
Student motivation	0.331	0.41	0.829			
Luck	0.346	0.34	0.26	0.749		
Student satisfaction	0.274	0.487	0.486	0.378	0.861	
Student success	0.459	0.507	0.546	0.405	0.531	0.81

Note: The boldface figures in the diagonal represent the square root of the AVE figures. They should be higher than the correlation figures.

4. Structural model results

R² for dependent construct

The estimated structural model $R^2 = 0.492$ (Figure 2) indicates that 49.2% of the variance in student success is explained by independent variables. According to Falk & Miller (1992), the percentage of variance explained for the dependent variable was greater than 10 percent, indicating the satisfactory value of the PLS model.

Structural coefficients

The results of the estimated model indicated that five constructs hypothesized to affect student success were significant (Table 5).

Table 5. Structure (inner) model results

	Path coefficients	T statistics (O/STDEV)	Sig. level
Effects on the student success (adjusted $R^2 = 0.487$)			
Self-efficacy	0.2	4.571	****
University environment	0.171	3.158	***
Student motivation	0.274	5.788	****
Luck	0.126	2.967	***
Student satisfaction	0.213	3.992	****

**** $p < .001$, *** $p < .010$, ns = not significant

Source: authors extracted from the processed data

Figure 2. Estimated model

To test whether student sex, level of study, education program, campus residence, club membership, part-time job, student's family residence, and who finances student studying influence student success, these factors were included in the model. The results indicate that only club membership is significantly negatively related to student success (Table 6).

Table 6. Structure (inner) model results

	Path coefficients	T statistics (O/STDEV)	Sig. level
Effi -> Suc	0.19	4.37	****
Env -> Suc	0.18	3.315	***
Mot -> Suc	0.279	5.809	****
Luc -> Suc	0.122	2.862	***
Sex -> Suc	-0.086	1.071	ns
Lev -> Suc	0.012	0.372	ns
Pro -> Suc	-0.025	0.653	ns
Cam -> Suc	0.1	0.931	ns
Job -> Suc	-0.049	0.708	ns
Clu -> Suc	-0.175	2.732	***
Fam -> Suc	-0.089	1.223	ns
Fin -> Suc	-0.003	0.083	ns

**** $p < .001$, *** $p < .010$

Source: authors extracted from the processed data

Effect size (f square)

f square represents the effect size of independent variables on dependent variables. According to Cohen (1988), *f* square < 0.02 indicates an extremely small effect, $0.02 \leq f$ square < 0.15 : shows a small effect; $0.15 \leq f$ square < 0.35 implies a medium effect and *f* square ≥ 0.35 : represents a large effect. $0.15 \leq$ all path coefficients < 0.35 (Table 5) demonstrate that *student self-motivation*, *self-efficacy*, *university environment*, *student satisfaction*, and *luck* have a medium effect on student success.

5. Discussion and conclusion

This research explored factors influencing student success. The model was tested on survey data by applying SmartPLS technology. All five hypotheses were supported by the data. Our research verified five factors affecting student success including (i) student self-efficacy, similar to the findings of Goken Aydin (2017), and Dang Thu Ha (2017); (ii) university environment, similar to the findings of Pritchard and Wilson (2003), and Pike and Kuh (2005), Hunter (2006); (iii) student satisfaction with university, similar to findings of Crisp, Baker, Griffin, Lunsford & Pifer (2017), Klein, Kuh, Chun, Hamilton & Shavelson (2005), Pascarella & Terenzini (2005); (iv) student self-motivation, similarity to the findings of Cao and Truong (2022); and (v) luck, similar to the findings of García y García (2021).

In contrast with the findings of Nguyen Thuy Dung, Hoang Thi Kim Oanh, Le Dinh Hai (2017), and Le Dinh Hai (2016), we found that student sex, level of study, education program, campus residence, part-time job, student's family residence, and who finances student studying not significantly influence student success, while club membership has a negative relationship with student achievements.

Practical implications

This research found three internal and two external factors affecting student achievements. Internal factors include student self-motivation (for a scholarship, self-improvement, good job in the future), *student self-efficacy* (*good study methods, time management, and attention*), and *student engagement in university life* (easier attention, proactively time arrangement for studying and other activities). External factors, which are out of student control, include *student satisfaction* with the university (highly qualified instructors, high-quality education programs, good student activities, and university environment), and *luck* (engaging in courses with good instructors, exam questions often fall into the well-learned sections), less likely to have problems related to health, personal and family feelings at the of midterm and final exams). Therefore, in order to improve student's learning outcomes, it is necessary to organize activities that affect students' behavior so that they maintain their self-motivation, such as organizing talk shows whose guest speakers are successful alumni. *Student self-efficacy* and *engagement in university life* are difficult things to change because it belongs to the gifted, but the school can support them through soft skills training courses, facilitating good students' campus life, both physical facilities and service quality. *Student satisfaction with the university* is under the university's control, respondents revealed that somewhere are staff undertaking their job unprofessionally (instructors abuse students' presentations, lack of enthusiasm, dormitory staff is not friendly), and too long class-section time reduces learning effectiveness, this implies the need of improving and ensuring the quality of teachers, training programs, student activities, and physical facilities. *Luck* is beyond the student's control; however, the university can reduce some of the risks by ensuring the quality of teachers. In addition, this research found that participating in any club negatively affects students' academic performance. Therefore, measures guiding activities of clubs so that alleviate the effect on students' learning time are needed.

Limitations and directions for further research

This research was unfunded, so the survey was conducted in a convenient way, which may cause the results to be biased. Further research in the future would use better samples to avoid bias.

APPENDIX

Survey questions

Student success

Suc1 = I get high scores.

Suc2 = I understand the content of subjects and can apply it to explain related problems in practice.

Suc3 = I feel confident and satisfied by acquiring knowledge.

Suc4 = I feel I am more mature socially.

Suc5 = I gained more living skills.

Self-motivation

Mot1 = I study hard to get a scholarship.

Mot2 = I study hard to satisfy my parents' expectations.

Mot4 = I study hard to get a good job in the future.

Self-efficacy

Effi1 = I have good intelligence.

Effi2 = I have a good study method.

Effi3 = I manage my time well.

Effi4 = I work very hard.

Effi5 = I can make attention when learning.

Effi6 = I often exploit resources on campus such as libraries, lecture halls, Wi-Fi to connect to the internet for learning objectives.

Effi7 = I don't rely on photocopiers' (cheating) test stuff.

Effi8 = I am calm when taking midterm and final exams.

University environment

Env1 = In the university environment, it is easier for paying attention when learning.

Env2 = Being independent helps me proactively arrange learning and other activities.

Env3 = Peer pressure has a positive effect on my academic performance.

Env4 = I actively take part in clubs so my socialization improved.

Env5 = I don't have a part-time job so my grades are higher.

Student satisfaction with university

Sat1 = I am satisfied with instructors.

Sat2 = I am satisfied with the quality of the education program.

Sat3 = I am satisfied with the student activities and the university environment.

Sat4 = I am generally satisfied with university life.

Luck

Luc1 = I usually engage in courses with good instructors.

Luc2 = Exam questions often fall into the well-learned sections.

Luc3 = I less likely have problems related to health at the time of midterm and final exams.

Luc4 = I less likely have problems related to personal and family feeling at the time of midterm and final exams.

THE INTENTION AND BEHAVIOUR OF GEN Z IN HANOI CITY TO PURCHASE SUSTAINABLE FASHION PRODUCTS

Abstract

The purpose of this study is to examine the factors affecting the intention and behaviour of Gen Z to buy sustainable fashion products in Hanoi City. The research method is a combination of qualitative and quantitative research methods. Research data was collected through surveys on 433 Gen Z consumers in Hanoi. The results of this study show that the level of impact of factors on fashion shopping intention in descending order is as follows: Support, Affordability, Attitude, Accessibility, and Subjective Norms. On the contrary, the results also show that there is one factor that has no impact on the intention to purchase, which is the Knowledge factor. Besides, the results also show that Intention has a positive influence on sustainable fashion product purchase behaviour. From there, the author proposes some solutions to help businesses take measures to promote the intention and behaviour of consumers to buy sustainable fashion products in Hanoi city.

Keywords: *Sustainable Fashion, Consumer Intention, Consumer Behaviour, Gen Z, Hanoi City.*

1. Introduction

The apparel and fashion industry is one of the largest global polluters contributing to various social and ecological problems (McNeill and Venter, 2019). The United Nations Conference on Trade and Development (UNCTAD) in 2019 pointed out that garment manufacturing is the second most polluting industry in the world due to the large amount of wastewater and emissions generated. In addition to the positive values that this industry brings, a notable aspect of fashion sustainability needs to be seriously considered.

Vietnam is an emerging Asian economy. It is considered a fast-growing and promising consumer market with a population of nearly one hundred million individuals, in which young consumers account for a large proportion (Nguyen and Nguyen, 2017). Vietnamese consumers spend significant amounts of money on fashion each year, in which clothing is the third priority, after food and savings. The domestic market for apparel products is worth \$4,5 billion and has an annual growth rate of 20%. Because of population growth and consumption increase, Vietnam faces the great challenge of environmental pollution and unsustainable development.

Fashion businesses are becoming more aware of the need to create environmentally friendly and socially conscious products (Brown, 2010). Manufacturers in major Asian markets such as China, Bangladesh, India, South Korea and Vietnam are focusing on using natural or organic fabrics in green and low-toxic production processes (Le, 2017). The authorities also play an essential role on this issue. On the consumer side, although Vietnamese consumers are considered to be the most socially conscious in the Asia-Pacific region (Nielsen, 2015), studies on sustainable consumption in general and for fashion in particular are still limited (Hung et al., 2018; Tri and Linh, 2018; Nguyen et al., 2020).

In metropolitans like Hanoi or Ho Chi Minh City, the demand for shopping, especially for fashion products is especially high and the level of interest in sustainable lifestyles is higher than in other geographical regions as well (Tran Thi Tu Uyen et al., 2021). In addition, young people between the ages of 18 and 34 are the group that spends the most on fashion. This is understandable because young people always pay attention to how they look and invest the most in their appearance.

Therefore, the study of Gen Z's intention and behaviour to purchase sustainable fashion products in Hanoi, is a meaningful topic in terms of theory and practice in the current context of Vietnam.

2. Literature review and theoretical framework

2.1. Literature review

Relationship between attitude and intention to purchase sustainable fashion products

Consumers' brand purchase intention is a result of their attitude toward the brand (Chang et al., 2019). However, a positive attitude toward a product does not automatically translate into purchase intention (Chen, 2007). Research results by Minsun Lee and Hyun-Hwa Lee, (2021) demonstrate that consumers have significantly different attitudes and intentions depending on the type of fashion product recycling.

Relationship between knowledge and intention to purchase sustainable fashion products

Paulins and Hillery (2009) show that knowledge about eco-fashion helps individuals to be responsible and contribute to society. Consumers' knowledge of products and their relative ethical implications are also major contributors to ethical consumerism (Shim, 1995). Despite the high level of environmental awareness, some customers are still hesitant to buy sustainable apparel due to scepticism about its quality and aesthetic value.

Relationship between subjective norms and intention to purchase sustainable fashion products

An Indonesian study led by Yann Truong and Rod McColl (2011) revealed that subjective norms and social attitudes influence the purchase of sustainable fashion products. Supporting this assumption, Ham et al. (2015) suggest that subjective norm is an important factor for consumer purchase intention. In addition, other scholars (Chen, 2007) indicate a positive relationship between subjective norms and intention to buy organic and sustainable food.

In contrast, other researchers (De Lenne & Vandenbosch, 2017; Tri & Linh, 2018) assert that subjective norm is not a significant predictor of purchase intention.

Relationship between affordability, accessibility and intention to purchase sustainable fashion products

The accessibility and affordability of sustainable clothing are one of the main obstacles that consumers face when attempting to shop for sustainable fashion products due to the insufficient number of stores and limited choice of styles and sizes (Connell, 2010).

In terms of accessibility, according to Hiller Connell (2010), the main barrier that consumers face in their efforts to purchase in an environmentally conscious manner is the limited choice of attractive sustainable clothing options available as well as the limited number of stores offering these products.

In terms of affordability, the price of a good must be attractive to customers to positively influence purchase intention (Büyükdag et al., 2020). This claim has been reinforced by a previous study (Legere & Kang, 2020) which stated that the customer's intention to pay more for the product is as essential as the purchase intention. Another study conducted research on this topic and found that people are willing to pay high prices for sustainable products (Prakash & Pathak, 2017).

Relationship between support and intention to purchase sustainable fashion products

In the past, although consumers often claimed that they supported sustainable values, this was not reflected in their sustainable consumption behaviour (Bray et al., 2011). However, recent studies show that the trend has changed, with consumers becoming more and more interested in sustainable consumption and willing to buy eco-friendly items such as second-hand clothes, reducing purchases of clothes and recycling them compared to the past (Borusiak et al., 2020).

2.2. Theoretical framework

2.2.1. Sustainable fashion

According to research by Kumar et al., (2012), sustainability implies bringing positive impacts and minimising negative impacts related to the whole production process in 3 aspects: environmental, economic and social.

According to Shen et al. (2013), the definition of sustainable fashion spans several dimensions; however, they all include the same factors - the impact of the fashion industry

on the environment and stakeholders through many different aspects, including society at large, 8 aspects in Sustainable fashion structure:

- 1) Recycle - Recycled garments are made from used recycled materials
- 2) Organic - Organic products are made from natural sources without any pesticides or harmful substances
- 3) Vintage - Refers to any old and cyclical clothing that has been given a new life
- 4) Vegan - Products that do not contain products from skin or animal tissue.
- 5) Locally made - Includes products that require little transportation and contribute to the local economy.
- 6) Artisan - Products that continue the skills of ancestral traditions.
- 7) Custom made - The goal of this personalised design is to encourage quality fashion design and slow down mass-produced disposable fashion.
- 8) Fair Trade Certified - Includes products made by companies that show respect for employees and their human rights.

2.2.2. Consumers

According to Deming (1986), consumers are all objects directly related to the quality requirements of products and services that businesses need to meet. The Law on Consumer Protection of the National Assembly of Vietnam (2010) has defined a consumer as a person who buys and uses goods and services for consumption and the daily life of individuals, families, and organisations.

Thus, it can be understood that consumers are those who purchase products/services to satisfy their own needs and desires.

2.2.3. Gen Z

Although the specific birth year of Gen Z varies among scholars, the term generally refers to people born between the mid-1990s and mid-2010s (Iorgulescu, 2016; Park, 2016). In this study, to be consistent with the context of 2023 (the time of conducting the research) and the current situation of fashion use in Vietnam, the authors chose to study the Gen Z customers who are born between 1995 and 2006. In other words, they are people aged 17 - 28 when compared to 2023 (the time period the study was carried out).

2.2.4. Theories of consumer behaviour

Theory of Reasoned Action - TRA

Theory of Reasoned Action (TRA) is a theory developed to effectively exploit the relationship between attitudes, subjective norms for behavioural intention and behaviour (Ajzen and Fishbein, 1980). Based on the TRA model, “Behavioural Intention” plays a decisive role in the process of performing the actual behaviour. According to Ajzen (1980), “Behavioural Intention” is directly influenced by “Attitude toward Behaviour” and “Subjective Norms”.

Theory of Planned Behaviour - TPB

The theory of planned behaviour first appeared in Ajzen's research in 1991, which is the successor and development of the theory of reasoned action (TRA). From the TRA theory (Ajzen and Fishbein, 1980), the behavioural intention theory has been improved to overcome the limitations in explaining the behaviours that are not within the scope.

In this new model, Ajzen retains the mediating role of the central factor “Behavioural Intention” including motivational factors to influence actual behaviour. In the “Theory of planned behaviour”, Ajzen still supports the role of two factors, “Attitude” and “Subjective Norms”, while adding the factor “Perceived Behavioural Control”.

2.2.5. Factors affecting the intention and behaviour of Gen Z to purchase sustainable fashion products and research hypotheses

➤ Attitude

In this study, attitude is considered as an individual's feelings towards sustainable fashion. “Attitude” is a variable that has been mentioned many times as a factor that influences sustainable purchase intentions (Saricam & Okur, 2018; Nam et al., 2017). Similarly, studies from Chen & Tung (2014); Nguyen et al., (2019) also show that a positive attitude often leads to a positive purchase intention. From there, the author proposes the hypothesis:

H1: Consumers’ attitude toward sustainable fashion has a positive influence on the intention to purchase sustainable fashion products.

➤ Knowledge

Knowledge is the information stored in memory in addition to the consumer's level of product awareness (Brucks, 1986). A finding by Hong (2019) indicates that the emergence of sustainable apparel in the Korean market is replicated by the increase in environmental knowledge towards organic and dyed natural textile products. Customers will not feel reluctant to engage with sustainable fashion in the future (Han, 2017).

In this study, knowledge of a product is understood as a person's understanding of product-related factors (the advantages of sustainable fashion over conventional fashion; whether sustainable fashion has contributed to the environment; labour situation; sustainable brands, designs, physical and chemical characteristics,...). From there, the author proposes the hypothesis:

H2: Consumers’ knowledge of sustainable fashion has a positive influence on the intention to purchase sustainable fashion products.

➤ Subjective Norms

In this study, the subjective norms is understood as the individual's perception of the reference group's expectations with the intention to use sustainable fashion products. In Finlay's study (1997), argues that subjective norms only appears when an individual's perception or intention is influenced by other individuals or groups of people in a particular situation. In Vietnam, the “herd behaviour” is a psychological type that is easily grasped by

lack of information or incomplete information capture (Vu Huy Thong, 2010). Therefore, an individual before performing a certain behaviour often consults around. Therefore, the author proposes the hypothesis:

H3: Subjective norms has a positive influence on the intention to purchase sustainable fashion products.

➤ ***Accessibility***

In this study, accessibility refers to people's overall ability to achieve desired services and activities with sustainable fashion, collectively referred to as opportunity. According to Hiller Connell (2010), the main barriers consumers face in their attempt to purchase in an environmentally conscious manner are the limited choice of attractive sustainable clothing options available as well as the limited number of stores offering these products. Therefore, the author proposes the hypothesis:

H4: Consumers' accessibility to sustainable fashion has a positive influence on the intention to purchase sustainable fashion products.

➤ ***Affordability***

In this study, the authors define affordability as the price of the product, relative to the income of the (potential) consumer. Price plays an important role in purchasing behaviour. As reported by Hustvedt and Dickson (2009), price is one of the main external barriers faced by consumers, who want to adopt more sustainable methods of purchasing clothing. However, some consumers can afford high prices but are not willing to pay high prices (Joergens, 2006). Therefore, the author proposes the hypothesis:

H5: Consumers' affordability to sustainable fashion has a positive influence on the intention to purchase sustainable fashion products.

➤ ***Support***

In this study, support can be understood as consumers helping or encouraging the use of sustainable fashion products by saying or showing that they agree with the values that sustainable fashion brings.

Previous research has clearly shown that the ethical and pro-environmental motivations that people espouse are significantly related to their pro-environmental intentions and behaviour (Gkargkavouzi, 2019; Kang, 2020). From there, the author proposes the hypothesis:

H6: Support for sustainable fashion has a positive influence on the intention to purchase sustainable fashion products.

Consumers are more and more interested in and supportive of sustainable consumption and are willing to buy eco-friendly items such as second-hand clothes, reducing buying clothes and recycling them compared to before (Borasiak et al., 2020). Therefore, our attitude about our moral obligation to protect the environment affects our support for sustainable fashion. From there, the author proposes the hypothesis:

H7: Consumers' attitudes towards sustainable fashion have a positive influence on their support for sustainable fashion.

An earlier study by Kim & Damhorst (1998) found that knowledge of clothing has a limited relationship with a person's support for fashion consumption. However, after the sustainable fashion movement took place, the more consumers understood the ethical aspects of products, the more likely they were to purchase those products (Dickson, 2001). From there, the author proposes the hypothesis:

H8: Consumers' knowledge of sustainable fashion has a positive influence on their support for sustainable fashion.

➤ ***Purchasing intention of consumers***

In this study, purchase intention is how consumers choose to buy a sustainable fashion product because they feel it meets their needs and matches their overall outlook. Research results of Vu Huy Thong (2010) suggest that shopping intention is one of the two decisive factors affecting the purchasing behaviour of consumers. The intention is a factor used to assess the ability to perform a behaviour in the future (Blackwell et al., 2001). According to Ajzen (1991), the intention is a motivating factor, it motivates an individual to willingly perform the behaviour (Ajzen, 1991). From there, the author proposes the hypothesis:

H9: Intention to purchase sustainable fashion products has a positive influence on actual product purchase behaviour.

Based on the theories and hypotheses mentioned above, the authors propose the following research model:

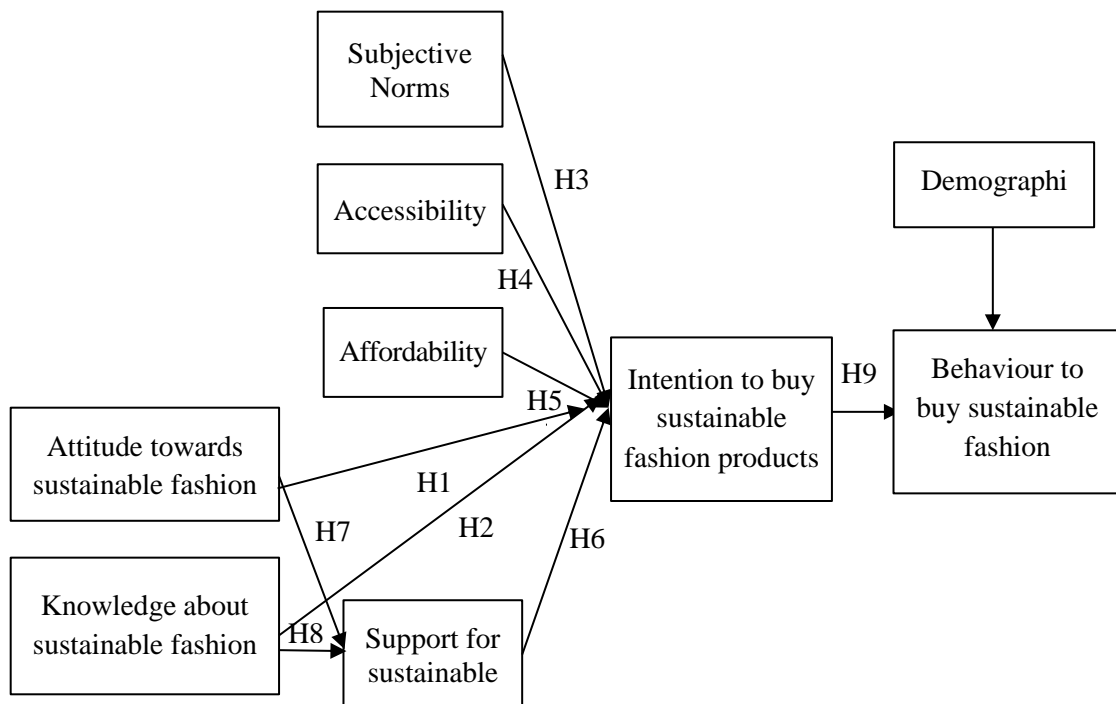

Figure 1. Proposed research model

Source: Synthesised by research team

3. Method

3.1. Qualitative research method

The research team actively approached and conducted in-depth interviews with some customers of sustainable fashion products to study the factors that influence their purchasing behaviour. The selected customers are interviewed based on their knowledge and experience related to sustainable fashion.

From the research on the theoretical basis along with the customer's answers, the research team has proposed 8 concepts, namely: Attitude, Knowledge, Subjective Norm, Accessibility, Affordability, Support, and Purchase Intention.

3.2. Quantitative research method

a. Questionnaire design

The group set up a questionnaire based on the preliminary components of the scale and adjusted it according to the real situation. The official questionnaire, with 03 parts, was distributed to respondents in Hanoi to collect data for analysis.

Part 1: The research team will introduce the purpose and meaning of the questionnaire and survey questions about the demographics of the respondents (age, gender, marital status, education level, household income, and living area).

Part 2: Questions about the factors likely to influence the consumption behaviour of sustainable fashion products. Questionnaire on a Likert scale from 1 to 5.

Part 3: Questions about sustainable fashion product consumption behaviour on a Likert scale from 1 to 5.

b. Data analysis

Secondary data analysis: The research team implements methods of comparing, synthesizing and analyzing collected data based on domestic and foreign research papers in the same area from reliable sources.

Primary data analysis: After collecting the answered questionnaires, the author conducts filtering and cleaning of data, information encryption, entering data and analyzing data using SPSS 25.0 and AMOS 24.0 software followed by these steps:

First step: Descriptive statistics of the research sample

To ensure the high reliability of the research results, the group investigated 458 observations. After data cleaning, the number of votes retained for analysis was 433 votes (reaching 94.54%). Thus, when 39 variables were included in the analysis, the research sample with 433 questionnaires was appropriate.

- Sample: Gen Z consumers living and working in Hanoi.

- Sampling method: The questionnaire is designed on Google Forms and distributed on social networking platforms.

- Sampling duration: 02/01/2023 - 01/30/2023

- Collecting Method: The author team collects information through answered surveys on Google Forms.

The number of votes (after data cleaning) will be statistically based on the following characteristics: gender, age, education level, marital status, and income.

Table 1. Sample description table

Characteristics		Frequency	Percentage (%)
Gender	Male	158	36,5
	Female	275	63,5
	Others	0	0
Age	Under 18	24	5,6
	From 18 - 22	278	64,2
	From 23 - 28	131	30,3
Marital status	Unmarried	414	95,6
	Married with no children	13	3,0
	Married with children	6	1,4
	Divorced	0	0
Educational level	High school undergraduate	21	4,8
	High school graduate	74	17,1
	Undergraduate	195	45,0
	Bachelor's Degree	127	29,4
	Postgraduate	16	3,7
Income	Under VND 1.000.000	84	19,4
	From VND 1.000.000 - VND 4.499.999	173	40,0
	From VND 4.500.000 - VND 7.499.999	63	14,5
	From VND 7.500.000 - VND 14.999.999	58	13,4
	From VND 15.000.000 - VND 30.000.000	32	7,4
	Over VND 30.000.000	23	5,3

Source: Synthesised from analysis results on SPSS 25.0 by research team

Second step: Check the reliability of the scale

The reliability of the scale is assessed through Cronbach's Alpha coefficient. Cronbach's Alpha reliability coefficient is used to remove inappropriate variables before analyzing exploratory factor analysis (EFA) because these observed variables can generate dummy factors.

Third step: Verify the value of the scale by exploratory factor analysis (EFA) and confirmatory factor analysis (CFA).

Exploratory factor analysis (EFA) is a quantitative analysis method belonging to the group of interdependent multivariate analyses. Confirmatory factor analysis (CFA) is the next step of the exploratory factor analysis (EFA), which includes designing to independently identify, test, and adjust measurement models. The purpose of CFA is to establish well-fit measurement models that can be used to test structural models.

4. Results

4.1. Evaluation of the scale by Cronbach's Alpha reliability coefficient

The results of Cronbach's Alpha test of the scales show that all scales meet the requirements of reliability ($\geq 0,6$). The correlation coefficients of the total variables (Corrected Item - Total Correlation) of the scales are all larger than the allowed level ($\geq 0,3$). Therefore, all observed variables were used in exploratory factor analysis (EFA) in the next step.

Table 2. Cronbach's Alpha analysis results of the scales

No.	Factor	Symbol	Number of observed variables	Minimum Corrected Item - Total Correlation	Cronbach's Alpha
1	Attitude	TD	6	0,676	0,896
2	Knowledge	KT	5	0,616	0,835
3	Support	SUH	5	0,684	0,879
4	Subjective Norms	CCQ	5	0,592	0,832
5	Accessibility	KNTC	4	0,636	0,829
6	Affordability	KNCT	5	0,437	0,826
7	Intention	YD	5	0,751	0,906
8	Behaviour	HV	4	0,592	0,817

Source: Synthesised from analysis results on SPSS 25.0 by research team

4.2. Exploratory Factor Analysis results (EFA)

The results of factor analysis are accepted when the total variance extracted is $> 50\%$ (Gerbing and Anderson, 1998). The exploratory factor analysis obtained the following results:

Table 3. Pattern Matrix

	Factor						
	1	2	3	4	5	6	7
TD1	0,705						
TD2	0,797						
TD3	0,663

Source: Synthesised from analysis results on SPSS 25.0 by research team

The results of the rotation matrix of Table 3 show that the observed variables of each factor group have convergent values, showing high levels of significance (load coefficient greater than 0,5). Specifically, the following observed variables: TD5, SUH2, CCQ2, KT2, KNCT4, KNCT5, YD2 respectively have the most practical significance in the respective group of factors.

Summarising the results of EFA exploratory factor analysis, it shows that the observed variables all satisfy the conditions with the given criteria, the scales selected for the factors in the model are satisfactory. All variables are convergent and suitable for analysis in the following sections.

4.3. Test results of scales of measurement by Confirmatory Factor Analysis (CFA)

Firstly, because $\text{Chi-square/df} = 1,572 < 2$, $\text{TLI} = 0,911 > 0,90$, $\text{CFI} = 0,919 > 0,90$ and $\text{RMSEA} = 0,051 < 0,08$, it can be said that the model fits the market data.

Table 4. Model fit results

CMIN/DF	CFI	TLI	RMSEA
1,572	0,919	0,911	0,051

Source: Synthesised from analysis results on AMOS 24.0 by research team

Secondly, the standardized regression weights are all greater than 0,5. Which ranges from 0,665 to 0,864 and all have $P < 0,05$, so the scales reach convergence values.

Thirdly, because the model fits the market data and the observed variables are not correlated with each other, the scale is unidirectional based on the $\text{AVE} > 0,5$ and $\text{CR} > 0,7$ indexes.

Finally, The AVE coefficients of the above 8 groups are all larger than MSV, so the scale is discriminatory. Thus, model one is suitable for market data, the concepts have convergent validity, unidirectionality, discriminant validity, and scale reliability.

Figure 2. Evaluation of scales of measurement

Source: Synthesised from analysis results on AMOS 24.0 by research team

4.4. Test results of models and research hypotheses

Theoretically, three indexes GFI, TLI, CFI all above 0,9 are good. However, in practice, it is difficult to achieve all three indicators. Models with TLI, CFI $\geq 0,9$, CMIN/df ≤ 3 , and MRSEA $\leq 0,08$ are acceptable. Compare this criterion with the actual results of acceptable data sets that fit the model.

1.892 chisquare/df
 .870 cfi
 .774 gfi
 .745 agfi
 .063 rmsea
 .000 pclose
 .861 tli

Figure 3. SEM model

Source: Synthesised from analysis results on AMOS 24.0 by research team

The SEM analysis results show that the research model is consistent with market data: Chisquare; CMIN/df = 1,892; GFI = 0,774; TLI = 0,861; CFI = 0,870; RMSEA = 0,063.

Table 5. SEM model estimation results

Relationship			Unstandardized	Standardized	S.E.	P-Value	
SUH	<---	TD	0,086	0,111	0,051	0,094	Not Supported
SUH	<---	KT	0,595	0,551	0,090	***	Supported
YD	<---	TD	0,178	0,263	0,040	***	Supported
YD	<---	KNTC	0,136	0,217	0,037	***	Supported
YD	<---	CCQ	0,124	0,144	0,051	0,014	Supported
YD	<---	KNCT	0,261	0,297	0,055	***	Supported
YD	<---	SUH	0,456	0,522	0,073	***	Supported

HV	<---	YD	0,265	0,188	0,110	0,016	Supported
R2 (SUH): 31,5%							
R2 (YD): 59,8%							
R2 (HV): 3,5%							

Source: Synthesised from analysis results on AMOS 24.0 by research team

Based on the data in the table, the research team found that there are 5 factors, except Knowledge (KT) that have no impact on the intention to purchase sustainable fashion products and the level of impact (by standardized regression weights) of the factors in descending order are: (1) Support (SUH) (0,522), (2) Affordability (KNCT) (0,297), (3) Attitude (TD) (0,263), (4) Accessibility (0,217) and (5) Subjective Norms (CCQ) (0,144).

Besides, considering the influence on the Support (SUH), the results show that the Attitude (TD) does not affect the Support (SUH), while the Knowledge (KT) has a positive effect with a standardized coefficient of 0,090.

Factor Intention (YD) has a positive influence on sustainable fashion purchasing Behaviour (HV) with a normalised coefficient of 0,188.

Table 6. Test results of research hypotheses

Hypotheses	Content	Results
H1	Consumers' attitude toward sustainable fashion has a positive influence on the intention to purchase sustainable fashion products.	Supported
H2	Consumers' knowledge of sustainable fashion has a positive influence on the intention to purchase sustainable fashion products.	Rejected
H3	Subjective norms has a positive influence on the intention to purchase sustainable fashion products.	Supported
H4	Consumers' accessibility to sustainable fashion has a positive influence on the intention to purchase sustainable fashion products.	Supported
H5	Consumers' affordability to sustainable fashion has a positive influence on the intention to purchase sustainable fashion products.	Supported
H6	Support for sustainable fashion has a positive influence on the intention to purchase sustainable fashion products.	Supported
H7	Consumers' attitudes towards sustainable fashion have a positive influence on their support for sustainable fashion.	Rejected
H8	Consumers' knowledge of sustainable fashion has a positive influence on their support for sustainable fashion.	Supported
H9	Intention to purchase sustainable fashion products has a positive influence on actual product purchase behaviour.	Supported

5. Discussion and Conclusion

5.1. Discussion

5.1.1. Relationship between Attitude, Knowledge, and Support for sustainable fashion

The research team tested the impact of Attitudes and Knowledge on Support for sustainable fashion consumption. The Attitude variable (TD) has a standardized regression weights of 0,111 and the Knowledge variable (KT) has a standardized regression weights of 0,551. This result has shown that knowledge of sustainable fashion has an impact on the support in the variables (with a standardized regression weights up to 0,551) for sustainable fashion while the hypothesis of attitudes that led to support for sustainable fashion fell out of favour after completing linear structural modelling (SEM) analysis.

5.1.2. Relationship between Attitude, Knowledge, and Intention to purchase sustainable fashion products

Attitude (TD) has the third largest impact on the intention to purchase sustainable fashion products and with a standardized regression weights of 0,263. The results of this study are consistent with those of Tsogas (1999); Rise et al. (2010).

In contrast, Knowledge about sustainable fashion with a standardized regression weights of 0,104 has no impact on the intention to purchase sustainable fashion products with a p-value of 0,162 ($> 0,05$) causing this hypothesis to be rejected. This is contrary to the research results of Ho Thuy Thi Hai et al. (2020) who say that both attitude and knowledge factors have a positive influence on intention.

5.1.3. Relationship between Subjective Norms and Intention to purchase sustainable fashion products

With high reliability at $\alpha = 0,832$ and standardized regression weights of 0,144 and p-value result of 0,014, the Subjective Norms (CCQ) has a positive influence on the intention to consume sustainable fashion products. This is the least positive factor among the factors affecting Intention (YD).

This conclusion is completely consistent with the TPB model studied and proven by Ajzen and also by K. Peattie's (2010) consensus.

5.1.4. Relationship between Support and Intention to purchase sustainable fashion products

Support (SUH) and Intention (YD) to purchase sustainable fashion products are positive with a standardized regression weights of 0,522 and a P-value of 0,000. This result has led to the conclusion that the factor of Support (SUH) has the strongest positive impact on the intention to purchase sustainable fashion products.

5.1.5. Relationship between Accessibility and Intention to purchase sustainable fashion products

With the exploratory factor analysis method EFA with a standardized regression weights of 0,217, the Accessibility (KNTC) is the fourth strongest positive factor of Intention (YD). This result is also similar to the results in the study of Hiller Connell (2010).

5.1.6. Relationship between Affordability and Intention to purchase sustainable fashion products

The factor Affordability (KNCT) is considered to have the second strongest positive effect after the factor of Support (SUH) on Intention (YD). Through the actual survey of Gen Z consumers in Hanoi, in a survey 433 people, 143 people or 37,6%, chose the main barrier to purchasing sustainable fashion products is due to price, which accounts for the highest proportion of the reasons that consumers do not choose sustainable fashion products. Also as reported by Hustvedt and Dickson (2009), price is one of the main external barriers faced by consumers, who want to adopt more sustainable methods of purchasing clothing.

5.1.7. Relationship between Intention and Behaviour to purchase sustainable fashion products

The purchasing intention (YD) has a positive influence on the Consumer Behaviour (HV) variable with a standardized regression coefficient of 0,188 and a P-value of 0,016 with a 95% confidence interval. This result gives the confidence that the Intention factor has a positive influence on the consumer's buying behaviour of sustainable fashion products. This result is similar to the Theory of Reasoned Action (TRA) as well as The Theory of Planned Behaviour (TPB), intention will indicate the individual's effort in performing the behaviour and the willingness to try to do it.

5.1.8. Demographic analysis and sustainable fashion consumer behaviour

With the results of data analysis obtained from SPSS, the research team concludes that the demographic independent variable is associated with the behaviour of using sustainable fashion.

Regarding gender, the research team found that women have more important attributes for acquiring full knowledge of sustainable fashion consumption intentions than men. Specifically, considering age groups, the group has found that especially in the 18 - 22 year-old-age group, with dynamic characteristics, there is a high awareness of sustainable fashion and quickness in updating new things and receptive to new things, both sexes often pay attention to the environmental aspects of products, especially this rate is higher in women.

Regarding Income variance, the results show that the income group from VND 1.000.000 to VND 4.499.499 accounted for the largest proportion with 40,0%. In second place is the group Under VND 1.000.000 with 19,4%. One of the factors leading to this result is the convenient income sample, the majority of the sample element is students - This is the sample group that the research team can easily access due to the similarity in terms of age.

In correlation with the frequency of use, the research team found that the frequency of buying sustainable fashion products of Gen Z Hanoi does not completely depend on personal income. Most of the majority selection of income groups fall in the frequency of buying medium (range 3-6 months) and regular (from more than 1 month to 3 months). It can be concluded that at all income levels, the demand for fashion is relatively similar because clothing plays an important role at events in life.

When it comes to the education level factor, the data results show that College/University and College/University Graduation are the two groups that have heard of sustainable fashion products with the highest, 31,1% and 18,6% respectively. From here, the research team makes a judgement about the group of people who are interested in the intention to consume sustainable fashion, who have a fairly high level of education in society and have the ability to learn and grasp information about new products quickly.

In the process of surveying the barriers between demographics and sustainable fashion behaviour, the research team asked the question "If I don't choose to buy sustainable fashion products, what is the main reason?" and get the result:

Figure 4. Barriers to the intention to consume sustainable fashion products

Source: Synthesised by research team

As can be seen, most consumers perceive the barrier to using sustainable fashion largely due to the price of the products (33,0%) and lack of interest (27,3%).

5.2. Recommendations

The research results show that the factors affecting the intention and behaviour of Gen Z to purchase sustainable fashion products in Hanoi are the following: Attitude, Subjective Norms, Support, Accessibility, Affordability. It is necessary to have solutions coming from the policymakers, businesses and even consumers:

For Consumers

Firstly, consumers should actively seek information about sustainable fashion on credible websites or related sources.

Secondly, consumers should spread the positive aspects of sustainable fashion by encouraging friends, colleagues, and family members to use sustainable fashion products, providing information about this type of fashion, and thereby promoting sustainable values to the whole society.

Finally, consumers should spread the positive aspects of sustainable fashion by encouraging friends, colleagues, and family members to use sustainable fashion products, providing information about this type of fashion, and thereby promoting sustainable values to the whole society.

For Businesses

Firstly, businesses should actively invest in media and communication activities to improve customers' knowledge and attitudes.

Secondly, businesses can build their brand with a more sustainable-leading lifestyle image with more ethical values for the environment and society.

Thirdly, businesses should expand distribution channels, use multiple platforms to improve accessibility for customers.

Fourthly, business managers also need to improve product quality and image by investing in aspects such as material, utility, durability, and design of the product. In addition, it is important for the brand and the product to obtain certificates of sustainability standards as a commitment to the core values of sustainability and as well as to gain trust from customers.

Finally, the price factor can hinder customers from purchasing sustainable fashion products.

For policymakers

Firstly, government and policymakers need to complete the environmental protection legal system. Vietnam needs policies to promote sustainable consumption, actively participate in global trends, ensure sustainable development, manage and use natural resources more effectively.

Secondly, the government should strengthen support for businesses to develop sustainable product lines, conduct more research and gradually apply models in promoting sustainable consumption in general and sustainable fashion in particular by supporting the investment in factory equipment, developing advanced technology to produce fashion products with these special technical requirements.

Thirdly, state management agencies should promote communication of the ethical aspect of sustainable fashion consumption through the mass media, raise consciousness and provide knowledge to consumers about sustainable products.

Finally, the government needs to strengthen the management of consumer protection with effective policies such as forcing manufacturing enterprises to publicise their production processes, requiring businesses to provide full and clear commitment policies on product quality and ensuring warranty policies for consumers.

Abstract

The study aims to explore the factors affecting buyer purchase intention in Vietnam towards vegan cosmetic products, which are Reference Group, Consumer Perception, Salesperson Attitude, Product Quality, Price, Place, Promotion, and Brand. The data were collected using an online questionnaire, which was distributed on different social media platforms and consisted of 480 customers in Vietnam. SPSS 22 was used to confirm the validity concerns and analyze the collected data. The findings discovered that all the independent variables had a significant positive effect on the dependent variables; further, product quality had the highest mean. Findings from this research could eventually give recommendations to vegan cosmetic businesses to enhance their performance and boost sales in the future.

Keywords: *consumer behavior, factor, recommendations, vegan cosmetics.*

1. Introduction

Vietnam's cosmetics market was rather young, yet was one of the most dynamic in the region. As living standards in Vietnam grew, Vietnamese consumers were becoming more aware of personal care and beauty products besides satisfying basic needs. It can be seen that Vietnam's cosmetic import turnover has more than doubled, from about 355 million USD in 2010 to more than 790 million USD in 2018 by GMP (2020). With the revenue of the cosmetics market continuously increasing over the past two decades, Vietnam has become an attractive destination for many foreign cosmetic brands.

A trend toward adopting safer substances in cosmetics has emerged as a result of growing consumer awareness of health and wellness. The need for skin and hair care products devoid of chemicals and tested on animals is growing, and consumer views toward natural personal care are changing, which has fuelled the development of vegan cosmetics. With the tough competition from other types of cosmetics, vegan cosmetics still do not have a footing in the Vietnamese cosmetics market despite great effort. In order to develop innovative and effective marketing strategies, businesses in the vegan cosmetics sector must pay attention to the factors influencing Vietnamese consumers' decisions to buy vegan cosmetics.

Several international research has been found to investigate the determinants or elements affecting customers' choices of vegan cosmetics. Kotler (2009) identified four major categories of influences, including cultural, social, personal, and psychological components. Lakshmi & Babu (2019) also performed research on the same subject in India, however, the findings showed that in addition to the previously mentioned components, psychological issues also significantly affect cosmetics purchasing behaviors. The factors influencing Vietnamese consumers' decisions to buy vegan cosmetics are currently the subject of scant research in Vietnam. As a result, Pham Nhat Vi (2020) performed research in eight provinces in the Vietnamese region of Ba Ria-Vung Tau and established that product pricing was the most significant factor in determining customers' decision to purchase vegan cosmetics. In addition, a survey was carried out in Ho Chi Minh City by Nguyen Hoai Tu Nguyen and Nguyen Thi Bich Ngoc (2021) to find out what influences female Gen Z customers' inclination to buy cosmetics. There were some similarities between this study and that of Pham Nhat Vi (2020). Pham Nhat Vi (2020), however, proposed a unique element—salesperson attitude—which was also a distinct feature in studies of consumer behavior. Therefore, this article is one of the few to research factors impacting customers' decision to buy vegan cosmetics in the context of Vietnam.

Recognizing the noteworthy and urgency of the aforementioned problem, the authors chose the topic "Factors affecting Consumer Behavior to Buy Vegan Cosmetics in Vietnam" as the focus of their study. The objectives of this study were to (i) investigate the factors that influence Vietnamese consumers' decisions to buy vegan cosmetics, (ii) determine the degree to which these factors have an impact on Vietnamese consumers' decisions to buy vegan cosmetics, and (iii) propose recommendations for vegan cosmetic businesses.

2. Method

Based on earlier research from both domestic and international sources, the authors chose eight factors that affect Vietnamese buyers' choices to buy vegan cosmetics and created a research model with the following variables:

Independent variables: Reference Group, Consumer Perception, Salesperson Attitude, Product Quality, Price, Place, Promotion, and Brand.

Dependent variables: Consumer behavior to purchase Vegan cosmetics in Vietnam.

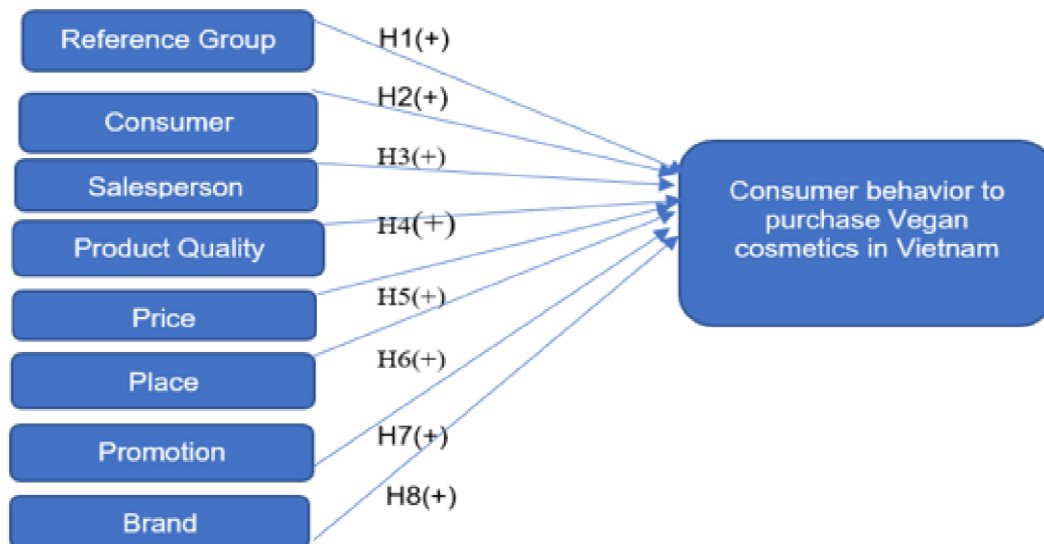

Figure 1. Research Model

The research was conducted to test the following hypothesis:

H1: Reference group is positively correlated with consumer behavior to purchase vegan cosmetics. H2: Consumer perception is positively correlated with consumer behavior to purchase vegan cosmetics.

H3: Salesperson attitude is positively correlated with consumer behavior to purchase vegan cosmetics.

H4: Product quality is positively correlated with consumer behavior to purchase vegan cosmetics.

H5: Price is positively correlated with consumer behavior to purchase vegan cosmetics.

H6: Place is positively correlated with consumer behavior to purchase vegan cosmetics.

H7: Promotion is positively correlated with consumer behavior to purchase vegan cosmetics.

H8: Brand is positively correlated with consumer behavior to purchase vegan cosmetics.

2.1. Qualitative research methods: Expert opinion method

After adjusting the questionnaire, the author consulted 05 experts who are lecturers from different universities in Hanoi for a more comprehensive evaluation. The experts' opinions, assessments, and recommendations are solid to help the researchers finalize the questionnaire before the official survey.

2.2. Quantitative research methods: Questionnaire

Questionnaire development

The author created a questionnaire with three main sections to test the proposed hypotheses from the literature review: (i) demographic information of the sample, (ii) questions measuring the independent variables, and (iii) questions measuring consumer behavior to purchase vegan cosmetics in Vietnam.

Data collection

Data was collected in February 2023 with questionnaires distributed to customers in three regions (the North, Central, and South) of Vietnam via Facebook pages, emails, and messages. A total of 480 questionnaires were administered, and 388 completed questionnaires were processed for analysis.

Data analysis procedure

In this study, consumer behavior to purchase vegan cosmetics in Vietnam is the independent variable and 08 dependent variables include reference group, perception, attitude, product quality, price, place, promotion, and brand. Data were analyzed using SPSS22 to gain demographic information about the sample and test the scales of the research concepts through Cronbach's Alpha reliability assessment, exploratory factor analysis (EFA), and Linear regression equation.

3. Results

Demographic information

Samples were collected by convenient methods in the form of survey questionnaires. The demographic information is summarized in the following table.

Table 1. Consumers' demographic information

Gender	Male	31%
	Female	67%
	Prefer not to say	2%
Age	18 - 30	64%
	31 - 40	17%
	41 -50	17%
	>50	1.9%
Living place	North	36.2%
	Central	19.9%
	South	43.9%
Monthly income	<\$200	22.1%
	\$200 – \$400	53.8%
	\$400 - \$600	11.4%
	>\$600	12.8%

Evaluating of scale reliability by Cronbach's Alpha

Table 2. Summary of the results of the scale reliability analysis

Factors	Cronbach Alpha
Reference group	.836
Perception	.822
Salesperson Attitude	.757
Product quality	.882
Price	.859
Place	.867
Promotion	.824
Brand	.772

Overall, the research uses 09 conceptual scales of which 08 scales are for factors affecting consumer behavior to purchase Vegan cosmetics in Vietnam and 01 is for consumer behavior. The analysis results show that the corrected item-total correlation coefficients all are greater than 0.3 and the Cronbach's alpha of the scales is all greater than 0.6. The scales all passed the tests of reliability and would be included in the exploratory factor analysis (EFA).

Analysis of the scale validity

EFA analysis with observable variables of the scales of determinants of customers' behavior to purchase Vegan cosmetics in Vietnam.

Table 3. KMO and Bartlett's Test

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.874
Bartlett's Test of Sphericity	Approx. Chi-Square	5933.742
	df	378
	Sig.	.000

From the research results, it can be seen that to check whether the study is large enough and eligible for factor analysis, the author has conducted Kaiser Meyer - Olkin test and Bartlett's Test. With the test result $KMO = 0.874$ greater than 0.5 (satisfying $0.5 \leq KMO \leq 1$) and Sig value. = 0.000, so it can be assured that the data is suitable for factor analysis and that the observed variables have a correlation relationship in the population.

EFA analysis for Consumer behavior

Table 4. KMO and Bartlett's Test

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.739
Bartlett's Test of Sphericity	Approx. Chi-Square	572.900
	df	3
	Sig.	.000

The research results reveal that to check whether the study is large enough and eligible for factor analysis, the authors conducted the Kaiser-Meyer-Olkin test and Bartlett's Test. With the test result $KMO = 0.739$ greater than 0.5 (satisfying $0.5 \leq KMO \leq 1$) and Sig value. = 0.000, therefore it can be assured that the data is suitable for factor analysis and that the observed variables have a correlation relationship in the population.

Linear regression equation

After performing exploratory factor analysis and grouping variables by each factor, the study continued to run regression analysis. For its regression analysis, the study employs

a multivariate regression model (multiple regression model). The study measures the impact of factors on customer behavior using regression analysis based on measuring the influence of extracted factors.

The factors that emerged from the observed variables in the EFA factor analysis serve as the independent variables in the regression analysis model, and the dependent variable in the model is "Behavior". The regression model is as follows:

$$CB = \beta_0 + \beta_1RG + \beta_2CP + \beta_3SA + \beta_4PQ + \beta_5PM + \beta_6BR + \beta_7PR + \beta_8PL$$

The model summary demonstrates that the initial model reported an R-square value of 0.683 and an adjusted R Square value of 0.676. The adjusted R-square shows how well a model fits the data; in this case, it indicates that the 08 independent variables explained 67.6% of the variance in "customer behavior".

The model summary table below shows the outcomes of creating a multivariate regression model using SPSS software:

Table 5. Multivariate regression analysis results

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	95.0% Confidence Interval for B		Collinearity Statistics	
	B	Std. Error	Beta			Lower Bound	Higher Bound	Tolerance	VIF
1 (Constant)	-661	.194		-3.414	.001	-1.042	-.280		
RG	.171	.034	.188	5.030	.000	.104	.238	.601	1.665
CP	.079	.039	.067	2.033	.043	.003	.155	.765	1.307
SA	.183	.038	.159	4.859	.000	.109	.258	.786	1.272
PQ	.235	.030	.293	7.891	.000	.177	.294	.607	1.647
PM	.113	.039	.115	2.900	.004	.036	.190	.529	1.890
BM	.068	.031	.068	2.178	.030	.007	.130	.861	1.161
PR	.135	.037	.149	3.610	.000	.062	.209	.491	2.039
PL	.161	.045	.151	3.614	.000	.073	.249	.480	2.085

All independent variables in the regression analysis utilizing the t-test had Sig values below 0.05. Each of these components is important to the model and influences buyer decisions to buy vegan cosmetics. $B > 0$ denotes a positive association between the independent variables and the dependent variable, which is buyer behavior toward vegan cosmetics.

As can be seen from the table, Product quality is the factor that has the strongest influence on customers' purchasing behavior ($\beta = 0.293$), followed by Reference group ($\beta = 0.188$), Salesman attitude ($\beta = 0.159$), Place ($\beta = 0.151$), Price ($\beta = 0.149$), Promotion ($\beta = 0.115$), and Brand ($\beta = 0.068$). Consumer perception is the factor that has the most negligible impact on consumers' behavior to buy vegan cosmetics ($\beta = 0.067$).

4. Discussion and Conclusion

Discussion

The study sought to identify the determinants of consumer behavior to purchase vegan cosmetics in Vietnam. Overall, the results show that vegan cosmetics purchasing behavior was positively influenced by the reference group, consumer perception, salesperson attitude, product quality, price, place, promotion, and brand.

Firstly, product quality is the most significant driver of customer behavior to purchase vegan cosmetics in Vietnam, which is in line with the earlier work of Dickieson and Arkus (2009) in the context of vegan food. According to Kuo & Wu (2018), the quality of the product is important to consumers because if the organization can meet the consumer standard in the future, they will repurchase even though the prices increase.

Secondly, the reference group is validated to have substantial effects on the purchasing decision of vegan cosmetics. The findings match with the studies of Lorek and Fuchs (2013); Ritter et al., (2015). Today, marketers must understand consumers' social environment which influences their final product or brand choice. The social environment includes the influence of reference groups such as friends, family, and work associates, among others, that affect consumer behavior.

Thirdly, the findings of our study reveal the significant direct effect of salesman attitude on buyers' purchasing behavior, which is on par with the previous research by Pham Nhat Vi (2020) and the research on Female Buying Behavior Related to Facial Skin Care Products by Kokoi (2011).

Besides, the place factor is found to have a slight effect on the decision to buy vegan cosmetics, which is similar to some previous research by Nguyen Ngoc Dan Thuy (2014). Place influences buying behavior in many ways. Increasing the likelihood of getting a product means increasing the chances that a buyer can find it and buy it. Products that are sold exclusively in separate places can also attract consumers and motivate them to buy the product.

Moreover, the results also show that the purchasing decision is strongly affected by the price factor. According to Patel (2019), most consumers use price as an indicator of quality in decision-making and as one of the factors influencing the purchase of cosmetic products. This finding is consistent with the previous studies of Muhammad et al. (2019), Patel (2019), and Nguyen Hoai Tu Nguyen and Nguyen Thi Bich Ngoc (2021), which confirmed that price is one of the strongest influencing factors on consumers' purchase intention.

Price and Place are considered two important factors in the marketing mix strategy of businesses in general and furniture businesses. According to Philip Kotler (2007), the marketing mix helps businesses to influence the purchase intention of customers. In this study, the author also found a relationship between price, place, and consumer behavior to buy vegan cosmetics. This implies that consumers are still interested in the price of vegan cosmetics, and these are decisive factors affecting consumer behavior to purchase vegan cosmetics.

In addition, the promotion factor is believed to have significant effects on the buying behavior of vegan cosmetics, which is in parallel with previous findings of Patel (2019). Patel (2019) emphasized that promotion is one of the factors affecting the decision to buy cosmetics. Promotions offer customers ideas about new things to buy, promotions create interest in the product, give them information on how to use the product, generate interest in the product, and help customers make purchasing decisions faster.

Additionally, the findings regarding the brand factor were supported by some previous studies with the same results (Nguyen Hoai Tu Nguyen & Nguyen Thi Bich Ngoc, 2021; Nguyen Ngoc Dan Thuy, 2014; Showrav, 2018; Mohammadzadeh, 2015) shows that brand-related factors increase customers' intention to buy cosmetics. According to Anjana (2018), the brand is one of the factors that strongly influence customers' decision to buy cosmetics. This factor is also considered consistent with the characteristics of consumer behavior of Generation Z.

Last but not least, consumer perception is confirmed to be a significant factor affecting the way consumers decided to buy vegan cosmetics, which is in line with the earlier work by Showrav, and Dewan Golam Yazdani (2018). However, the study of Showrav showed a slight difference from our research in terms of the level of influence of consumer perception. In Showrav and Dewan Golam Yazdani's research, consumer perception is found to be the strongest influential factor in Dhaka City; however, our research revealed that consumer perception only has little effect on the purchasing decision of vegan cosmetics. This can be explained by the difference in target research location and audience.

Recommendations for businesses

The authors propose recommendations for businesses.

4.1. Strengthening the role and credibility of the reference group

The results show that the "Reference group" is the second most influential factor in the decision to buy vegan cosmetics for consumers in Vietnam in the group of 08 influencing factors within the scope of the study. The reference group can have an indirect role in guiding consumers to the decision to buy vegan cosmetics. Nowadays, the trend of group consumption or trend-following is becoming significantly popular, once again confirming the crucial role of reference groups in promoting purchasing decisions, specifically for vegan cosmetics. The study proposes suggestions to increase the credibility of reference groups, thereby promoting consumers' decision to buy vegan cosmetics.

Businesses need to actively promote communication activities through the media such as newspapers, radio, magazines, social networks, etc. with campaigns associated with successful celebrities with high prestige in certain fields such as entrepreneurs, artists, athletes, etc., using their influence and prestige to help consumers realize the connection between the use of vegan cosmetics and the health protection, environmental protection, humanitarian value, or quality of vegan cosmetics compared to other conventional cosmetics.

Moreover, businesses can also combine with other organizations and associations working in the environmental field to introduce their products through the forms of

coordination, becoming sponsors, patrons, and support activities of these organizations and associations. Through press conferences and events, businesses can organize the distribution of trial products or coupons and directly promote communication activities on social networking sites to create viral effects to attract more customers.

Last but not least, it is of great importance to strengthen the word-of-mouth marketing strategy: update new and interesting information to hold consumers' intention, bring psychological emotions about the story, and love sweet feelings to create a more favorable effect. In addition, it is also possible to use the trust of the loyal customer group to increase the trust in customers by storing the experiences and feedback of this loyal customer group, which will become convincing evidence of trust with a new group of customers.

4.2. Enhancing consumer perception of vegan cosmetics

From the findings, the “Consumer Perception” factor has positive impacts on consumers who may be more likely to conduct business with vegan cosmetic businesses they trust. Developing a positive relationship with customers can generate more leads and sales, contributing to company success and longevity. Customer perception can also impact whether consumers are loyal to vegan cosmetic brands or switch to their competitors. To enhance consumer perception of vegan cosmetics, the authors propose that:

Firstly, it is crucial to research to learn what the public thinks of the businesses' vegan cosmetics brands, products, or services, for example, sending out surveys to current customers, posting a link on social media accounts to an anonymous survey, searching online for comments and reviews about the vegan cosmetic businesses, ...

Secondly, businesses should apply research to product development. Once vegan cosmetic businesses have an idea of how the public feels about them, they can create products and services that better meet customers' needs. Businesses may consider upgrading existing products to include more features or enhancing their usability and launching new products as a response to an unmet need among consumers.

Last but not the least, vegan cosmetic businesses should improve the customer experience. Businesses need to consider every facet of consumers' experience, from reading the website to visiting the store. Each of these points can positively or negatively affect how clients and customers feel about the business.

4.3. Improving salesperson attitudes

Research results indicate that “Salesperson Attitude” is the third influencing factor in Vietnamese consumers' behavior to buy vegan cosmetics in the group of 08 influencing factors within the scope of the study. Sales staff are considered the face of the company when directly interacting with customers, consulting, introducing goods, and promoting buying decisions. To increase the behavior to buy vegan cosmetics, the authors suggest that:

Businesses should organize many training sessions for sales staff so that they have professional knowledge and a deep understanding of vegan cosmetics. Salespeople should understand the characteristics and effectiveness of vegan cosmetics compared to other

cosmetics to promptly answer questions and advise customers with a confident, professional attitude, which brings trust to customers. The professional knowledge of salespeople must always be periodically checked by the company, updating new knowledge about the market and products if needed.

In addition to product expertise, businesses should also organize training for sellers on sales expertise. Sales staff should have considerate attitudes, gestures, and respect for customers, know how to listen to customer feedback and to overcome, and behave skillfully, flexibly and satisfy customers. Sales staff must have confident gestures and actions, be both agile and polite, have a positive attitude, and be excited when talking about products, showing professionalism in sales skills to customers. At the same time, keep a warm, cheerful, enthusiastic, hospitable, and thoughtful attitude when communicating with consumers.

4.4. Promoting product development strategies

The results show that "Product quality" is the factor that has the greatest influence on Vietnamese consumers' decision to buy vegan cosmetics in the group of 08 influencing factors within the scope of the study. With the development of the economy, the sales process becomes more and more difficult because the products on the market are increasingly diversified in terms of models and types and customers are increasingly demanding higher quality products. To increase the behavior to buy vegan cosmetics, the author proposes the following:

Businesses should constantly improve products by testing new formulas with new technology. Developing the scale of cultivation and production, and improving technology; therefore, the final product meets vegan standards because this is predicted to be a consumer trend for cosmetics and natural ingredients, the advantage of a tropical country like Vietnam. Businesses should diversify products with quality assurance, invest in product packages, and constantly improve vegan products.

Additionally, it is crucial to build a prestigious business image of vegan cosmetics. When deciding to launch a product, businesses should always ensure that the vegan product is of the highest quality when it reaches the consumers. Each product needs a certificate to ensure safety for users.

Moreover, businesses need a clear and specific direction. Periodic product improvement plans are necessary to implement seriously and fully, ensuring long-term development.

It is of great importance to focus on market research, studying factors affecting product quality from the micro-economy, and macro-economy, and studying the needs of consumers, and product suppliers... Businesses should conduct surveys, listen to consumers' opinions to have strategies for product upgrading as well as develop reasonable pricing policies, aiming to catch up with customers' consumption trends.

4.5. Promoting pricing strategies

According to the research results, "Price" is a factor that significantly influences the decision to buy vegan cosmetics of Vietnamese consumers in the group of 08 influencing factors within the scope of the study. Vegan cosmetics are new to consumers. Although the

income of the consumers participating in the survey is mostly in the middle, the majority of the consumers still think that the current price of vegan cosmetics is higher than that of conventional cosmetics. Thus, for low-income people, this is an obstacle and forces them to choose other cosmetic lines that are more affordable. To increase the decision to buy vegan cosmetics, the research group proposes the following suggestions regarding prices:

Businesses should have pricing policies to improve the competitiveness of their products. Subsidy policies come from minimizing intermediary costs such as costs for distribution channels, costs related to law, and costs related to product promotion, ... If possibly minimizing intermediary costs, firms can offer more attractive product prices for consumers, thereby reaching more audiences.

Businesses should also diversify product lines with different price ranges depending on the target customers. Customers can be divided by income: high, middle, and low income, or price packages for agents, distributors, business units, and individual customers (retail).

Finally, businesses must diversify product designs and sizes, trial product samples, and compact product samples that are convenient for transportation and travel to bring products closer to lower-income consumers.

4.6. Promoting promotion strategies

The results show that "Promotion" is the fifth most influential factor in Vietnamese consumers' decision to buy vegan cosmetics in Vietnam. The cosmetic market is growing, which means that the competition is getting fiercer, to survive and develop, businesses must find an advantage over their competitors, one of which is the promotion programs. To increase consumer behavior to buy vegan cosmetics through this factor, the author proposes the following:

Businesses should ensure that they have a professional team to build promotion programs to maintain relationships with consumers and create credibility and trust for the business. This team needs to conduct market research, and research customer insight to be able to implement discount programs to attract customers to purchase vegan cosmetics while at the same time ensuring revenue for the company.

In addition, businesses need to diversify, ensure the quality of promotions to meet the requirements and expectations of consumers, and ensure support for consumers in gradually switching to using vegan cosmetics, thereby creating the habit of using vegan cosmetics. It is possible to apply cumulative promotions, loyal customers promotions, and promotions for the whole consumer family, ...

Moreover, it is crucial to organize advertising/promotional programs and activities to stimulate demand and attract vegan cosmetics consumers' attention. Vietnam is a price-sensitive country, so price or product promotions will be an effective channel to pull consumers to vegan cosmetics stores.

It is also possible to associate with companies operating in other fields such as F&B, education, and healthcare,... to organize promotions on a large scale, attracting a large number of potential customers from other sectors.

Inspiring and spreading positive messages through programs aimed at the environment: tree planting campaigns, recycling old plastic bottles, programs to exchange old bottles, receive new products...are highly recommended.

Last but not the least, participating in sponsorship of lifestyle shows, contests, or exhibitions vegan, green lifestyle for the environment and animals to have ways to reach potential consumers.

4.7. Promoting branding strategies

One of the elements influencing consumers' choices to purchase vegan cosmetics in Vietnam is the "Branding" element. Kotler and Keller (2009) claim that each day, consumers discuss hundreds of different brands. Even while media and entertainment products like movies and TV series are frequently mentioned, other product categories are as frequently brought up. Therefore, businesses must implement successful branding tactics to increase customer demand for vegan cosmetics. Several strategies to promote the branding component have been proposed:

Firstly, businesses should emphasize the products. Nowadays, there is an increasing demand for beauty, and beauty concerns go beyond just looks to encompass safety and health. This necessitates that companies alter their brand development tactics by coming up with opportunity-creating image-building techniques. While developing a brand image, businesses should emphasize the advantages of vegan cosmetics, such as their use of harmless ingredients, adherence to humanitarian principles, and protection of human health.

Secondly, it is of great importance to focus on the message: Consumers today frequently select product categories based on special considerations for ethical responsibility as well as environmental friendliness. As a result, businesses can establish their brand as an inspiration for a vegetarian lifestyle, a radical way of living towards ethical values, and common values for the environment and society. This will help them establish an ethical corporate image with good ethics and social responsibility.

Thirdly, digital marketing on social networking sites is the most popular and successful marketing tactic nowadays. Statistics from 2018 indicated that 64 million people in Vietnam now utilize the Internet, or 67% of the country's entire population, including Facebook. This demonstrates that the Internet marketing trend including social media platforms will intensify and take the lead. Marketing initiatives will be carried out via social media, email, blogs, vlogs, online, etc. Businesses may develop the trends like "living green" and "using vegan cosmetics" by fusing a variety of marketing techniques with distinct messages and objectives. By generating trends and fevers, making the most of digital marketing can assist companies in lowering operational expenses and expanding their consumer base.

4.8. Promoting place (distribution) strategies

The place element refers to how consumers get products or services to consumers at the right time, at the right place, and in the right quantity. It includes distribution channels (for example, via a shopfront, online, or a distributor), location, logistics, service levels, and market coverage.

Firstly, vegan cosmetic businesses should increase the number of distribution channels they have to boost their profits because having more channels means getting more vegan cosmetics to consumers which translates to more money.

Secondly, a vegan cosmetic business can increase the efficiency of a distribution channel by maximizing the benefit of channel intermediaries or increasing the number of intermediaries they have. Intermediaries are additional businesses that take a manufacturer's product and sell it on the open market, such as a distributor or a retailer. Vegan cosmetic businesses need to choose intermediaries that fall in line with their business models and goals.

Conclusion

The study was conducted to investigate determinants of consumer behavior to purchase vegan cosmetics in Vietnam. The research results have broad significance and have achieved the research objectives. The finding revealed that 08 determinants have positive effects on consumer behavior to purchase vegan cosmetics.

Like many previous studies, the research is subjected to potential limitations due to a lack of time and experience. To begin with, the results of this research are limited to consumers in three regions in Vietnam. Besides, the sample size of the research is just 388, which indicates that the findings of this research cannot be generalized to all regions in Vietnam. If the research is continued to be carried out with a more representative sampling method, the higher the generalizability, the more accurate the results.

Through this research, several practical implications can be drawn. Being one of the few researchers studying determinants of consumer behavior to purchase vegan cosmetics in Vietnam, the findings from the research have provided numerous value information for vegan cosmetics companies. The results of this study will help vegan cosmetics companies better understand the buying behavior of consumers and this will be the basis for businesses to build marketing strategies in the future.

Abstract

With the pharmaceutical business growing and with some experience in a pharmaceutical working environment, the authors have chosen to explore this field further through research. This current study aims to find out the determinants of consumers' purchasing decisions and behavior of medicine regarding over the counter (OTC) pharmaceutical market. The convenient sampling method is used for the selection of the sample. The study applied statistical tools for factor analysis and descriptive statistics to achieve the objectives. The results of factor analysis revealed seven factors named as: brand experience, drug availability, brand package, subjective norms, habit, culture and admin manager. All independent variables are connected with the dependent variable. Admin management affects the OTC's buying behavior the least, habit has the most influence over medicine buying behavior of consumers.

Keywords: *Consumer behavior, Buying, Intention, OTC.*

1. Introduction

In fact, drug demand is rapidly expanding, and individuals are tending to focus on self-care. This is one of the key reasons why people want to purchase medications without a prescription. As a result, management agencies and drug-selling units must be held accountable for people's self-purchase and usage of pharmaceuticals to treat ailments. Understanding that consumer psychology is critical for regulating and managing the behavior of buying medications without a prescription. In conclusion, research on purchase intentions are more important than ever for countries and enterprises to monitor the continual change of customers in each individual scenario.

2. Literature Reviews and Theoretical Basis

Theory of Reasoned Action (TRA)

The Theory of Reasoned Action (TRA) model was developed in 1975 by Fishbein and Ajzen to understand the relationship between behavior, attitudes, intentions and beliefs. This model assumes that a person's behavioral intentions are influenced by their own subjective norms and attitudes. Study the application of the TRA model in the study of intention to buy over-the-counter drugs. This model is considered to be very useful in predicting individual behavior and can be adapted to different research contexts.

Theory of Planned Behavior (TPB)

The Theory of Planned Behavior (TPB) is a development and improvement from Fishbein and Ajzen's Theory of Rational Behavior (TRA). TPB was created to address TRA's limitations on the assumption that human behavior is entirely controlled by reason. TPB consists of 3 main elements: attitude, subjective norm and perceived behavioral control. Perceived behavioral control reflects how easy or difficult it is to perform a behavior and whether performing the behavior is controlled or restricted.

Over-the-counter (OTC)

Information on over-the-counter drugs is released from important health organizations such as the World Health Organization and the US Food and Drug Administration. Over-the-counter drugs are pharmaceutical products, drugs or medicinal products that can be used and distributed without the permission of a medical professional. Consumers can use them to prevent, alleviate, or treat mild symptoms or illnesses, and their use in the form, condition, and dosage allowed is safe for the consumer. At present, OTC behavior is growing because of flexibility as it requires a lot of time, effort, energy, and money to have prescriptions from doctors and purchase medications accordingly. Therefore, people do not want to invest those efforts when they think that they are suffering from some common illnesses. It provides a much more convenient means for patients to self-treat their minor afflictions. Thus, Over-the-counter (OTC) medicines are among the products that consumers regularly purchase for avoiding more formalities, and it gives consumers a sense of control when making decisions about their health, which is not the case with prescription drugs.

Brand experience

Brand experience, according to Brakus et al. (2009), is "subjective, consumer internal responses (feelings, affective, cognitive, and behavioral responses) evoked by Brand-related stimuli that are part of a brand's design and identity, packaging, communication, and environment". Furthermore, informational experience leads to learning (Kotler and Keller, 2016, p. 191) and is widely regarded as the primary source of inside information (Paddison and Olsen, 2008). Brand experience is one of the most researched experiences that influence purchase intent, with some studies indicating that it is superior to others (Abraham et al., 2015; Al-Motassem et al., 2008; Kevrekidis et al., 2018) while other studies indicate that it is secondary to other factors (Lodorfos et al., 2006).

Drug availability

One of the primary determinants of drug access is drug availability (WHO, 2003). According to Srivasta and Wash (2017), drug accessibility and availability are important factors influencing over-the-counter drug purchase, particularly in suburban and remote areas. Steinhart et al. (2013) show that both product availability and non-availability can trigger purchase intention. They define participation as “the importance of the audience to which the assessment is being made”, while the perceived feasibility is with respect to the “easiness of obtaining the product”.

Brand Package

A product's packaging determines its look, including the design, branding, form, color, and materials utilized (Oladele et al., 2015). According to Olawepo and Ibojo (2015), packaging components, specifically color, image quality, and labeling (i.e. type of information and typeface), have a considerable influence on consumers' purchase intention. In contrast, Kevrekidis et al. (2018) discovered that OTC drug packaging had a comparatively lesser impact on purchase intention when compared to other drug variables. Although this finding agrees with the findings of Kohli and Buller (2013), it contradicts the findings of Srivastava and Wagh (2017), given that brand packaging increases drug intention significantly.

Subjective Norms

According to Ajzen (1991), the subjective norm is an individual's perception of societal pressures, related to performing or not performing a behavior. Subjective norms aim to measure social influences on one's behavior, i.e. the expectations of family members (Ha, 1998). Mintel et al. report that the opinions of friends, family, and medical professionals can influence some people's decisions to purchase OTC products. Research by George N. Lodorfos et al. (2006) on OTC also suggests that “the more positive an individual feels about the attitudes of friends, family, and medical professionals towards the OTC brand, the higher the perception of OTC brands. the greater the intention to buy their product”.

Habits

Habits are activities that are repeated many times from the past to the present. Habits are also the result of cumulative learning or adaptation (Limayem et al. 2007), while Kim et al. (2005) argues that habit is automatic. When consumers have good experiences with purchasing OTC medicines without a prescription, they tend to continue buying that same brand in the future, especially when experiencing similar symptoms. This habit of buying OTC medicines without a prescription can have a positive effect on their intentions and lead to repeated purchases in the future.

Culture

According to Hofstede (1980, 1991), culture is a system of programming in the human subconscious to distinguish members of one group of people from members of another. From the study of Sudaryanto, et al (2021) also showed that culture has a significant influence on purchasing decisions. Thus, culture in a society will tend to convey the results

of a behavior performed, through the process each individual will receive and build intentions for the behavior.

Admin management

According to the Ministry of Home Affairs, management is an activity aimed at an organized and oriented influence of the subject of management on a managed object to regulate social processes and human behavior, in order to maintain the stability and development of the managed object according to the set goals. State management related to the sale and purchase of over-the-counter drugs is the law enforcement of the State. This includes the regulation and organization of the sale of over-the-counter drugs by drug dealers and retailers to consumers through a system of legal documents regulating the sale of drugs.

Purchase intention

Purchase intention is one of the determinants of consumer's perceived behavior towards an individual's intention to purchase a particular brand or product. When purchasing and using OTC drugs, consumers are asked to rely more on their own judgment (Wieringa, Reber and Leeflang, 2015).

After reviewing different researches concerning buying behavior of medicine consumers, the own creation of the theoretical framework has been formed. It is believed that the frame consists of the main attributes that have an impact on purchase intention of OTC medicine.

According to the conceptual framework designed for the study, consumers' buying decision toward medicine is examined through five of its factors including brand experience, drug availability, brand package, subjective norm, habit, culture, admin management, purchase intention. Understanding these variables is essential for this study since they have a significant influence on buying behavior. The dependent variable indicates the organizational effectiveness. The aspects as mentioned above supporting this study are illustrated in the following figure:

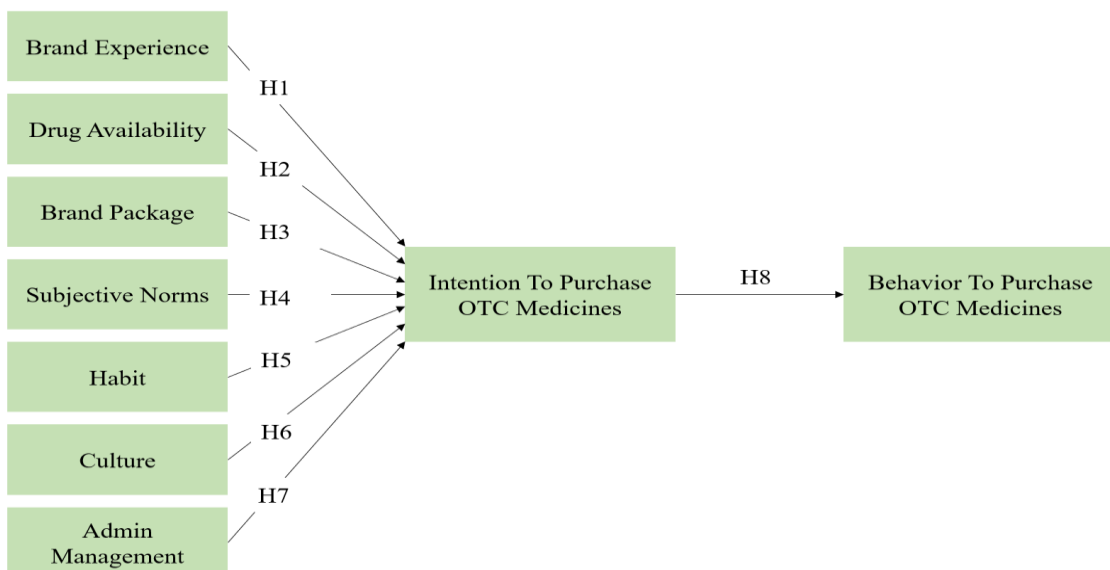

Figure 1. Conceptual Framework Model (Source: Authors Constructed)

From the conceptual framework model the following hypotheses are formulated to conclude as:

H1: “Brand experience” has a positive effect on “Intent to purchase over-the-counter drugs”

H2: “Drug Availability” has a positive effect on “Intent to purchase over-the-counter drugs”

H3: “Brand Package” has a positive effect on “Intent to purchase over-the-counter drugs”

H4: “Subjective Norms” has a positive effect on “Intent to purchase over-the-counter drugs”

H5: “Habit” has a positive effect on “Intent to purchase over-the-counter drugs”

H6: “Culture” has a positive effect on “Intent to purchase over-the-counter drugs”

H7: “Admin Management” has a negative effect on “Intent to purchase over-the-counter drugs”

H8: “Intent to purchase over-the-counter drugs” has a positive effect on “Behavior to purchase over-the-counter drugs”

3. Method

The study was conducted in Vietnam, using quantitative research methods and a relevant questionnaire was created based on earlier research, using incorporated theories in consumer behavior, relevant to OTC. To effectively measure the research constructs, information from the theoretical and empirical research studies in both consumer behavior and OTCs were used.

Questionnaire Design

This study has collected data through developing a close-ended questionnaire administered to the consumers who purchase OTC (over the counter) medicine. The Questionnaire includes a 5point likert scale and multiple-choice questions. The survey questionnaire is structured with two parts. The first part is involved with issues related to socio-demographic information of the respondents such as age, gender, family size, education level, career, marital status, family size and personal income. The second part of the questionnaire is related to consumers' purchase behavior in terms of essential factors in purchasing medicine.

Sources of data

For completing this study in a more organized way, the information and data have been collected from both the primary and secondary sources. Primary data is obtained through a self-administrated questionnaire. Secondary data sources include previously conducted research papers on different issues pharmaceuticals, different journals, and articles on pharmaceuticals industry of Vietnam, various books and newspapers articles.

Data collection and Data analysis

The study's target attendant was people who bought over-the-counter (OTC) medications. The survey was distributed online and in person, and 440 votes were entered into data processing using SPSS 25 software after invalid votes were removed. Descriptive statistics, test scale determination, exploratory component analysis, correlation analysis, and regression analysis are some of the approaches used in data analysis. The findings of the investigation are compared and reviewed to identify the contributing elements, including any new ones. The study aims are matched with appropriate methodologies that are very applicable in practice.

After analyzing the data, the research results were screened according to the above-mentioned criteria and compared and contrasted by the research team. The team recognizes the influencing factors found in previous studies and adds new factors, as well as definitions and new characteristics of these factors. From there, appropriate approaches are selected for research with high practical application. The research results that were screened according to the above criteria were compared and contrasted by the research team. The team recognizes the influencing factors found in previous studies and adds new factors, as well as new definitions, definitions, characteristics, or manifestations of the mentioned factors. . Thereby, select the approaches to suit the research objectives and have high practical applicability.

Regression Model:

The functional relationship between the variable can be expressed as

$$\text{Model (1): } PI = \beta_0 + \beta_1(\text{BE}) + \beta_2(\text{DA}) + \beta_3(\text{BRP}) + \beta_4(\text{SN}) + \beta_5(\text{H}) + \beta_6(\text{C}) + \beta_7(\text{AM})$$

$$\text{Model (2): } BP = \alpha_0 + \alpha_1(PI)$$

4. Results

Several statistical analyzes and tests were performed, including factor analysis and regression analysis. The main purpose of using factor analysis techniques is to simplify the data (Hair et al., 2002, p. 601) and to reduce a large number of variables (Pallant, 2007, p. 179). It is also considered an appropriate method to overcome the potential problems of multicollinearity among the variables that pertain to each category. A pre-analysis was conducted to examine the appropriateness of the data for factor analysis and then the results of the factor analysis were examined using multiple criteria, including eigenvalues, interpretability and internal consistency, as recommended by Haque et al. (2015). Items determined to have eigenvalues > 1 and factor loadings < 0.3 had little or no relationship with one another, hence, they were discarded (Hair et al., 2002). Besides, the reliability of the scale is evaluated by Cronbach's Alpha coefficient. The results of Cronbach's Alpha test is shown in the following table:

Variable code	Variable name	Number of observed variables		Cronbach's Alpha	Minimum total variable correlation coefficient
		Before	After		
BE	Brand Experience	4	4	0.803	0.593
DA	Drugs Availability	4	4	0.818	0.612
BRP	Brand Package	3	3	0.778	0.553
SN	Subjective Norms	5	5	0.84	0.633
H	Habits	4	4	0.833	0.630
C	Subjective Norms	3	3	0.776	0.576
AM	Admin management	3	3	0.796	0.584
PI	Purchasing Intention	5	5	0.855	0.650
BP	Behavior to Purchase	3	3	0.756	0.549

Source: Authors own survey

The findings of the reliability test reveal that the measured Cronbach's Alpha coefficients are all 0.7 or higher (a good level). So the scales are considered to be internally consistent and have good reliability, as they are closely related to each other and their underlying factors. Items of Purchasing Intention and Behavior to Purchase got 0.855 and 0.756 Cronbach's alpha values respectively. Its value indicates the internal consistency of data is acceptable and reflects a good reliability measure. This promotes the goodness of data and using it in further statistical analysis. In summary, based on the preliminary analysis, evaluating the data by factor analysis and reliability estimates indicated that all 34 items were appropriate and valid for further statistical analysis.

The authors test the validity of factors based on KMO, Eigenvalue and loading factors. The results of Barlett's KMO test show that the KMO coefficient is 0.889, which satisfies the allowed KMO value and the Sig.=0.000 < 0.05 coefficient shows that the observed variables are correlated with each other in the population and in the multivariate analysis. The EFA discovery factor was suitable for use in this study. Eigenvalue criterion is greater than 1, then 7 factors are drawn. Here instead of the initial 7 latent variables in the hypothetical model, the research team identified 7 main factors or 7 independent variables: Brand Experience (BE), Drug Availability (DA), Brand Package (BRP), Subjective Norms (SN), Habits (H), Culture (C) and Admin Management (AM).

Table 1. KMO and Bartlett's Test

KMO and Bartlett's Test		
Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		0.889
Bartlett's Test of Sphericity	Approx. Chi-Square	6301.798
	Df	561
	Sig.	0.000

Source: Questionnaire Survey

With a coefficient of determination (R^2) value of PI of 70.9% indicating that 7 independent variables H, SN, DA, BE, BRP, C and AM can predict 70.9% of PI fluctuations, R^2 value of BP is 13.6% for PI. Knowing PI can predict 13.6% of BP variables based on PI. Based on the P value, these relationships in the model all exist and are statistically significant. Each of these hypotheses is correlated with the intention to buy OTC medicines at 95% confidence level. The result empirically proves that all 7 factors have a positive and a moderate impact on the intention to buy OTC medicines. The state management of drug trading in Vietnam tends to have a positive impact on consumers' buying behavior of OTC drugs, especially in Hanoi city. This is contrary to the hypothesis that the group has proposed that the state management factor has a negative impact on the Intent and Behavior to buy OTC drugs. This can be explained by the third observation variable in the scale of this factor, which is "I think that the management of drug sales is still loose, so I can comfortably buy prescription drugs without any problems. A doctor's prescription is required." It can be seen that the regulations are still loose, the enforcement is not serious, the sanctions are not

enough of a deterrent, so it is easier for businesses and pharmacies to violate, which makes consumers more inclined to buy OTC drugs. *Regression Analysis*

Model 1: $PI = 0.133*(BE) + 0.199*(DA) + 0.170*(BRP) + 0.147*(SN) + 0.266*(H) + 0.201*(C) + 0.109*(AM)$

Model 2: $BP = 0.269*PI$

The regression analysis model results in the table above show the level of influence of the independent variables on the dependent variable. Culture has significant impact ($B = 0.268$, $\beta = 0.266$) and $Sig. = 0.000$, $\alpha=95\%$. Habits can have a positive effect of 0.266 standard deviations on the Purchasing Intention. Then, these factors are Culture, Drugs Availability, Brand Package, Subjective Norms, respectively, with a standardized impact coefficient of 0.201; 0.199; 0.170; and 0.147. Finally, the group of factors that have the least influence on OTC drug behavior to purchase is Brand Experience and Admin Management. Purchase intention has a positive effect on OTC drug buying behavior $\beta = 0.269$ (regression model) and $\beta = 0.369$ (SEM model). Or more than 75% of respondents said that they have no intention of buying OTC drugs within the next 6 months. In addition, about 74% of consumers intend to discontinue purchasing OTC drugs. Accordingly, it is concluded that Vietnamese's OTC buying behavior (typically in Hanoi) affected mostly by their culture when they think that is it useful and necessary for them to buy OTC medicines. This is suitable for the increasing trend of self-medication and OTC medicine demand.

5. Discussion and Conclusion

The study's findings indicate that the seven factors examined have a positive influence on the buying intention of over-the-counter drugs. In which, Brand Experience, Drugs Availability, Brand Package, Subjective Norms, Habits, and Culture have a positive correlation with Buying Intention and Behavior to Purchase regardless of the effects having different outcomes. Additionally, Habits and Culture are the two factors that have the most positive and powerful influence on people's buying intention of over-the-counter drugs in Ha Hoi. Following that are the effects of Availability, Brand Package, Subjective Norms, and Brand Experience. The impact of Admin management, on the other hand, was initially suggested by the research team to have a negative effect on the buying intention of drugs (over-the-counter); however, data analysis revealed that this factor has the smallest positive impact.

5.1. Discussions

Through the analysis results, the study found that all 7 factors have a positive influence on the intention to buy OTC. Both the overview analysis and the case study concluded that Brand Experience, Drug Availability, Brand Package, Subjective Norms, Habits, and Culture are positively correlated with Purchase Intent and Buying Behavior OTC although the effects are not quite the same. Habit and Culture are the two factors that have the most positive and strong influence on the intention to buy over-the-counter drugs of people in Ha Noi. Next is the influence of Availability, Packaging, Subjective Standards, and Brand Experience. However, the impact of Admin management was initially suggested by the research team to have a negative effect on the intention to buy OTC, according to the results of data analysis, this factor has a positive smallest impact.

Brand Experience

In conclusion, the brand experience has a positive influence on the intention and behavior of purchasing OTC drugs. This result is similar to Liu and Wang's (2016) study, which suggests that brand experience has a minor effect on purchase intention, while factors such as price and product quality have a greater impact

Drug Availability

Drugs Availability has been confirmed in both regression and SEM models and has a positive influence on the intention to purchase OTC drugs with a reliability of $\alpha = 0.818$ and correlation coefficient $\beta = 0.199$ (regression model) and $\beta = 0.24$ (SEM model). This conclusion is consistent with Habash and Al-Dmour's (2020) study, which investigated the combination of internal and external factors leading to the greatest impact on OTC drug purchases compared to individual factor groups.

Brand Package

The results show that Brand Package has a positive influence on the intention to impact OTC drug purchases with $\beta = 0.170$ (regression model) and $\beta = 0.134$ (SEM model). Specifically, Srivastava and Wagh (2017) developed a model to analyze the relationship between packaging factors and consumer shopping behavior in India, and the results indicated that packaging has a significant impact on consumer shopping behavior, particularly in the context of fierce competition in the market.

Subjective Norms

Subjective norm reflects the influence of the surrounding environment on users' intentions and behavior. These results contribute to demonstrating the availability of the Theory of Reasoned Action (TRA) (Ajzen, 1991). The results are also similar to the study by George N. Lodorfos (2006), which showed that individuals who perceive positive attitudes from friends, family, and expert analysts are more likely to purchase non-prescription drugs

Habits

Habit has been verified in the regression model and has a positive influence on OTC purchasing behavior with a confidence level at $\alpha = 0.833$ and correlation coefficient $\beta = 0.266$. This conclusion is consistent with George N. Lodorfos' research (2006) on the role of habit in OTC purchasing behavior. Moreover, according to this author group, Habit is a key factor determining OTC drug purchasing behavior.

Culture

This factor has been confirmed in both regression and SEM models to have a significant positive influence on the intention to purchase OTC drugs with $\alpha = 0.776$ and correlation coefficients of $\beta = 0.201$ (regression model) and $\beta = 0.214$ (SEM model). Sudaryanto and colleagues' (2021) study also showed that culture has a significant influence on purchasing decisions. In other words, if consumers in Vietnam, particularly in Hanoi, maintain a culture of buying OTC drugs, this will further enhance their OTC drug purchasing behavior.

Admin management

The Admin management of drug sales in Vietnam tends to have a positive impact on OTC drug purchasing behavior of consumers, specifically in Hanoi. This contradicts the hypothesis that the Admin management factor has a negative effect on the intention and behavior of buying OTC drugs. Regulations are still loosely defined, enforcement is not strict enough, and sanctions are not sufficiently deterrent, allowing businesses and pharmacies to more easily violate the rules, leading to an increasing tendency for consumers to buy OTC drugs.

Based on the research results, the research team has proposed specific solutions for 4 main target groups, including: For the state, to build a clear and appropriate legal system and implement new policies if necessary. For the OTC market, to provide accurate information about over-the-counter drug products to meet consumer expectations and ensure the safety of OTC businesses as well as consumers. For OTC business units, to strictly follow the regulations of the Ministry of Health and the State on OTC. For consumers, to find out carefully about information of over-the-counter drugs before buying and pay attention to health during OTC using to have timely interventions whenever having uncommon symptoms

This study was done with the sample size of 440; it can be done on the large sample size which can give furthermore deep insights. The proposed study was carried out in Ha Noi, and it can be carried out in a few more cities nationwide to understand more on factors considered by people while selecting OTC products. Religion is not considered in the proposed paper; it can be considered as one of the demographic variables based on which preferences and factors considered while purchasing OTC products can be studied.

5.2. Conclusion

The above conducted empirical study gave insight into factors that affect behavior to purchase OTC of consumers. Admin management affects the OTC's buying behavior the least, habit has the most influence over medicine buying behavior of consumers. Based on this result, this research can help in adjusting legal system and making consumers buy OTC in effective way.

Abstract

This study was carried out to analyze and evaluate the influence of the enrollment method on students' learning results in Hanoi city. On the research overview, theoretical basis and primary data sources, this study has applied the method of multivariate linear regression function analysis to estimate the level and direction of impact of each enrollment method on learning outcomes. Research results show that, for each different method of enrollment, there is a different impact on learning outcomes. In particular, students using the ability assessment enrollment method have higher GPAs than students using the high school graduation test enrollment method; students using the combined enrollment method have higher GPAs than students using the high school graduation test enrollment method; students using the transcript enrollment method have lower GPAs than students using the high school graduation test enrollment method. Research also shows that, in addition to the method of admission, there are 6 other factors that affect students' learning outcomes: learning methods, study consistency, learning motivation, school facilities, faculty capacity, family factors.

Keywords: *learning outcomes, enrollment methods, students*

1. Introduction

In the national education system, higher education is one of the higher education platforms with the most important role in economic development and socio-political stability. In order to improve the quality of higher education, it is necessary to synchronously implement solutions from enrollment, training process, assessment methods... In which, admission is the most important aspect. Quality input will facilitate the training process. To get a good entry, the prerequisite is to have a suitable admission method. In recent times, the

renovation of the enrollment method is one of the directions that higher education institutions in Vietnam have chosen. Especially after the impact of the Covid - 19 pandemic, universities have introduced many different enrollment methods. The use of many different admissions methods makes it possible for the school to attract many candidates, so there are more favorable conditions to choose the most elite candidates.

However, the use of many different admissions methods also leads to not the same criteria for selection of candidates and may lead to the quality of candidates selected in different modes, which will affect the learning outcomes of these candidates after admission and affect the outputs in the training activities of higher education institutions. Meanwhile, there is currently not much research on the influence of enrollment methods on students' learning outcomes, thereby helping to consider the reasonableness of enrollment methods with training industries. Because of the importance of admission methods in improving learning outcomes, the study of the influence of each mode of admission on student learning outcomes is an urgent requirement in the current period.

The study was carried out to determine the impact of each method of enrollment on students' learning outcomes in Hanoi city, thereby making some recommendations on the selection of an appropriate method of enrollment for higher education institutions. Specifically, the research paper solves two main problems: *First*, it helps to identify factors affecting students' learning outcomes in Hanoi. The authors have added more differences in students' learning outcomes using different admissions methods when applying to universities. In addition, the topic uses a competency framework to measure the skills of students after graduation from high school, before entering the university door. *Second*, the research project has built a model and quantified the influence of factors affecting students' learning outcomes, and clarified the difference in GPA for students applying different methods when applying to the school. This can help universities have a basis in building the number of quotas when enrolling.

2. Literature review and Theoretical framework

2.1. Literature review

Research by Nguyen Thi Anh Duong (2013) has shown that the method of enrollment is understood as a way for educational and training institutions to recruit students in accordance with their educational and training goals. When it comes to the method of admission, it refers to a lot of different aspects related to admissions, which are the standards applied in admissions, with each different educational institution, there is a difference between the different admissions standards.

David Wilkinson and colleagues (2008) conducted a study of enrollment methods in the medical industry and predicted learning outcomes at the University of Queensland, Australia. The results showed that the average grade point average (GPA) of previous levels was most closely related to students' academic performance, followed by interview scores and scores on specific admissions tests. With the results obtained from the above study, David Wilkinson et al. (2011) separately studied the predictions of the entrance exam for

academic results at the university. The results suggest that entrance tests have a weak correlation with grade point average (GPA), furthermore this weak correlation does not exist after the first year of college. At the medical school of Chang Gung University in Taiwan, Ji-Tseng Fang et al. (2011) studied through two methods: the proposal of the school and the university entrance exam. Overall, the students' academic performance through the school's proposal is slightly better than the entrance exam method.

In addition to the mode of admission that affects learning outcomes, there are other influencing factors such as learning methods, learning motivation, school impression, consistency in learning, school resources, learning competition according to the research of Le Dinh Hai (2016). In the same view, Dinh Thi Hoa et al. (2018) conducted a study with factors affecting learning outcomes but another new factor is the influence of friends and suggested that the above factors affect learning outcomes for students in economics. Phan Thi Hong et al. (2020) pointed out that teaching methods, learning methods and facilities are factors affecting learning outcomes. Research by Ngo My Tran et al. (2021) concluded that two factors affecting learning outcomes are critical thinking and problem-solving skills for students in economics.

There are many studies on students' learning outcomes that have shown factors that affect students' learning outcomes such as: study consistency, learning methods, academic competition, facilities, family factors, extracurricular activities,... In this study, the authors inherited factors that affect learning outcomes and resolved gaps from the following studies: (i) Most of the studies were conducted in countries such as the US, Malaysia, Indonesia,... there were differences in customs, culture, living conditions, attitudes and activities compared to Vietnamese students, (ii) In Vietnam, there are also some studies that are interested in students' learning outcomes but only done within one university and not yet spread across different disciplines, (iii) The studies all give different definitions and ways to evaluate learning outcomes, the research of the group adds a new measurement for learning outcomes built on a competency framework scale, (iv) In Vietnam, there are very few lessons research on the impact of the admission method on learning outcomes. New research papers were conducted on the scope of medical schools. Moreover, the research papers focus mainly on high school graduation exam scores while in recent years, many universities are diversifying forms of enrollment. Therefore, in this study, the authors uses quantitative research methods to understand and measure factors affecting learning outcomes as well as the impact of each enrollment method on specific sectors. From there, offer suggestions and solutions to universities to make appropriate policies in admissions to ensure the quality of outputs.

2.2. Theoretical framework

Based on the models that have done research on the factors that affect previous learning outcomes, the authors inherits the factors that affect learning outcomes and adds a new factor that is the method of admission. In this study, the authors proposed a model of 9 factors affecting learning outcomes, including: (1) Learning motivation, (2) Learning methods, (3) Academic competition, (4) Academic consistency, (5) School facilities, (6) Faculty capacity, (7) Extracurricular activities, (8) Family factors and (9) Admission methods.

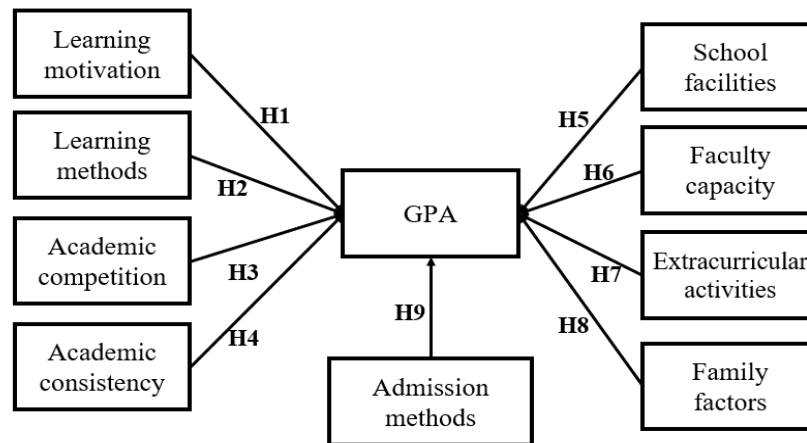

Figure 1. Research model

Hypothesis

H1: Learning motivation has a positive impact on students' learning outcomes

H2: Learning methods have a positive impact on students' learning outcomes

H3: Competitive learning has a positive impact on students' learning outcomes

H4: Consistency in learning has a positive impact on students' learning outcomes

H5: The school's facilities have a positive impact on students' learning outcomes

H6: Lecturer capacity positively affects students' learning outcomes

H7: Extracurricular activities have a positive impact on students' learning outcomes

H8: Family factors positively affect students' learning outcomes

H9: There is a correlation between the enrollment method and students' learning outcomes

H9a: The method of reviewing high school transcripts has the opposite impact on students' learning results using the method of reviewing high school graduation exam scores

H9b: The assessment method has a positive impact on students' learning results using the method of reviewing high school graduation exam scores

H9c: The combination of high school graduation exam scores + international certificates has a positive impact on students' learning results using the method of reviewing high school graduation exam scores.

3. Methods

Research data

The study used primary data collected by the survey method of online questionnaire distribution by Google Forms through Facebook and Zalo platforms (student groups in 4 divisions) in Hanoi city. The surveyed subjects are students in four majors: Division III, Division IV, Division V and Division VII. The sampling method used is targeted sampling, the obtained sample size is valid with the post requirement of 540 for studies using exploratory factor analysis (EFA).

Data collection and processing

The study uses quantitative methods with the aim of checking the suitability of the factors. Quantitative analysis is performed in the following order: (i) Descriptive statistics of the observed variables of the scale, (ii) Evaluation of the reliability of the scale by Cronbach's Alpha coefficient, (iii) Testing the value of the scale by EFA exploratory factor analysis method, (iv) Correlation analysis (Pearson correlation coefficient), (v) Multivariate regression (OLS least squares regression method) and (vi) Testing the difference using T-test and ANOVA.

4. Results

4.1. Current learning outcomes of students

The authors classified weak, average, good, very good, excellent based on the GPA classification on a 4-point scale of the Ministry of Education and Training. Among 540 students, 0.7% achieved weak academic results; 2.04% achieved average academic results; 47.78% achieved good academic results; 37.96% achieved good academic results and 11.48% students achieved excellent academic results. Details of the representation in the circular graph are shown below.

Figure 2. Student learning results

4.2. Influence of factors on learning outcomes

The initial proposed research model includes 9 factors affecting students' learning outcomes: learning motivation, learning methods, academic competition, academic consistency, school facilities, faculty capacity, extracurricular activities, family factors and mode of enrollment. In particular, there are 8 factors in the model measured by 32 observed variables and 1 factor is the enrollment method using dummy variables.

Performing exploratory factor analysis (EFA) for the observed variables, the results after rotating the factors affecting students' learning results are from 32 observed variables, while 30 variables are retained in the group analysis into 8 factors and the factor load factor of each observed variable is greater than 0.5; Thus, there are 2 inappropriate observed variables due to the difference in load factor < 0.3 , namely: PPHT7, PPHT8.

Table 1. Rotated Component Matrix

NO.	Variable	Factor							
		1	2	3	4	5	6	7	8
1	PPHT3	0.795

	Kethop	0.18	0.026	0.193	6.971	0	0.88	1.137

Regression model

$$\text{GPA} = 1.105 + 0.063 * \text{DCHT} + 0.167 * \text{PPHT} + 0.116 * \text{KDHT} + 0.046 * \text{CSVC} + 0.056 * \text{NLGV} + 0.084 * \text{YTGD} - 0.073 * \text{HOCBA} + 0.194 * \text{DGNL} + 0.18 * \text{KETHOP}$$

When performing OLS linear regression analysis, the factors: learning motivation, learning methods, learning consistency, faculty capacity, school facilities, family factors and 3 false variables in the category of admission methods are: Academic transcripts, Assessment of competencies that affect learning outcomes. The above factors affect the learning outcomes in the same direction with high to low impact levels being the learning method that has the strongest impact on learning outcomes ($\beta = 0.167$). This is followed by academic consistency ($\beta = 0.116$) and family factors ($\beta = 0.084$). The motivational factors of learning, faculty capacity and school facilities have a negligible impact on learning outcomes.

4.3. Effect of enrollment method on learning outcomes

For the admission method results, students using the competency assessment method had higher average scores than students using the high school graduation exam results ($\beta = 0.194$). This can be understood that the knowledge in the university is often general, approaching from the width and gradually down to the depth and nature of the competency test is a general view. For those of you who enroll in the high school entrance exam, the time in high school you only focus on the right subjects in your admissions field. Therefore, students who are considered by the enrollment method will have higher academic results than students who are considered by the high school graduation exam score.

For students who use school admission transcripts, the average GPA is lower than that of the high school graduation exam group ($\beta = -0.073$) because most students' transcripts do not reflect the essence of their academic ability. This is due to the inadequacies of our country's education system, causing parents, students, teachers and schools to have a "circumvention" policy. The difference depends on the school the student is studying, the way the teacher's score is calculated.

For students who use the combined admission method of international certificate and high school graduation exam score ($\beta = 0.181$), the average GPA is higher than the high school graduation exam group because these students have access to international certificates, the thinking will be open and creative as well as new perspectives on problems. Therefore, the combination of high school graduation exam scores with international certificates helps you have higher academic results than the group that only considers high school graduation exam scores.

5. Discussion and Conclusion

Currently, the trend of innovating the method of enrollment at universities in Vietnam is growing. Especially after the impact of the Covid - 19 pandemic, in order to adapt to the context at that time, many schools changed the admission scheme as well as the criteria for the entrance methods. However, the quality of student input due to the use of different methods can significantly affect the quality of students later in the school. Therefore, it can be seen that studying the impact of the admission method on learning outcomes is essential to help universities have a basis for admission, thereby improving the quality of the school's training. Through the research, the authors hope the topic will have both theoretical and practical implications for the school and students.

- On the basis of the research results, the authors made the following recommendations:
- Students' learning outcomes play an important role in the learning process of students. Therefore, the school needs to devise appropriate strategies to stimulate students to create effective and consistent learning methods in learning.
- Universities should increase the percentage of admission by the method of admission, which is the assessment of capacity and the combination of international certificates with high school graduation exam scores to bring higher academic results than high school graduation exam scores; reduce the % of admission by the method of transcripts.
- For the Division III - Business and management, law should increase the percentage of admission by combining international certificates with high school graduation exam scores; reduce the percentage of admission by high school graduation exam scores and proceed to no admission by transcripts.
- For the remaining 3 majors: Division IV , Division V, Division VII, the increase in % of admission by the method of capacity assessment, decrease in % of admission by high school graduation exam scores and proceed to not admission by the transcript method.

Abstract

Impulse buying behaviour has been observed as one of the important studies conducted by marketers and researchers, as impulse buying has become a prevalent phenomenon in every retail format. The study was conducted to assess the relationship between influential factors and impulsive purchasing behaviour in Circle K convenience stores in Hanoi, Vietnam. After reviewing previous studies, the authors indicated 05 factors that affected impulsive purchasing behaviour including impulsiveness, instant gratification, visual appeal, promotions and money availability. Moreover, the research team had also distributed the questionnaire and received 310 responses. The findings showed that 04 factors (impulsiveness, instant gratification, visual appeal and money availability positively affected consumers' impulsive behaviour while impulsiveness had the strongest influence on the impulsive purchasing behaviour of Circle K's consumers in Hanoi. After scrutinising the findings, the research group proposed suggestions to boost sales and enhance profits for Circle K managers and product providers in Hanoi, Vietnam.

Keywords: *Circle K convenience stores, factors, impulsive purchasing behaviour, influence*

1. Introduction

Consumer behaviour was considered as the most complex issue of marketing theory and practice due to its striking heterogeneity and many factors exerting a combined impact on it, in diverse ways, depending on the situation. Technologic developments and changes in lifestyles revealed impulsive purchasing habits which were an important phenomenon for consumer behaviour after 1950s (Sheth, 1985).

“Impulsive purchasing” or “impulsive buying” was described as any purchase that a shopper makes but had not planned (Baumeister, 2002). Adelaar et al. (2003) shared the same view about impulsive buying which was considered an unplanned purchase made by a spontaneous decision and a subjective bias in favor of immediate possession.

In recent years, convenience stores have been booming in popularity due to their approachability, stable price, and quality assurance. There were dozens of convenience store brands in Vietnam such as Circle K or GS25, Family Mart, and 7-Eleven. In this research, Circle K was chosen to be the brand to elucidate the phenomenon of impulsive purchasing of consumers in Hanoi.

Being commissioned in 1915 in Texas, United States, Circle K was then widespread all over the world with more than 16,000 associates, and in Vietnam, there were over 400 stores. Its vision was to be the most preferred convenience stores in Vietnam to complete its mission which was to create a shopping environment with excitement, enjoyment, and safety with a wide selection of quality products, services, and food service items with fast and friendly service for consumers.

There have been numerous international and domestic studies conducted to investigate factors that affected the impulsive buying behaviour of customers; however, little research was concerned with the impulsive purchasing behaviour in Circle K Hanoi. To fill the research gaps, it is vital to conduct research on factors affecting impulsive purchasing behaviour of customers in Circle K convenience stores in Hanoi. The study aims to clarify the effect of these factors on impulsive purchasing behaviour of customers of Circle K convenience stores. Thus, the group of authors offer recommendations for Circle K managers and product suppliers to stimulate sales and enhance profit.

There have been a lot of researchers studying the factors influencing impulsive purchasing behaviour in international studies and domestic studies. Verhagen & van Dolen (2011) researched majorly about the impact of online store beliefs on impulsive purchasing that were Merchandise effectiveness, Ease of use, Enjoyment, Website communication style, Positive effect, and Negative effect. Asrinta (2018) analyzed the impact of sales promotion and store atmosphere on consumers’ shopping emotions. Besides, sales promotion, store atmosphere, and shopping emotions were considered as factors influencing impulsive buying. Investigating the online market in Ho Chi Minh City, Pham Quoc Trung & Nguyen Ngoc Hai Ha (2017) recognized six factors that encouraged impulsive purchasing behaviour: Visual appeal, Website ease of use, Trust, Impulsiveness, Instant gratification, and Normative evaluation.

Previous studies presented many factors affecting consumers' impulsive purchasing behaviour. However, after scrutinizing those studies, the authors discovered some research gaps. Firstly, in terms of the factors, many studies focused on external factors while others only centralized internal ones. Secondly, it was found that most of the prior research seemed to pay attention to impulsive buying behaviour in online marketplaces. For the above-mentioned reasons, the authors decided to conduct research on “Factors affecting consumers' impulsive purchasing behaviour in Circle K convenience stores in Hanoi”.

According to Kotler (2001), consumer purchasing behaviour was defined as the study of how individuals selected, buy, or used products, services, and how different experiences or ideas meet consumer needs and wants. Solomon (2006) also shared the view that consumer behaviour referred to the process involved in selecting, and purchasing products, ideas or experiences by individuals, groups, and organizations to meet their needs and desires.

Overall, impulsive purchasing behaviour was an increasingly significant trend (Dittmar, 2005). It was reported as a chronic, repetitive, and uncontrollable purchasing impulsive, primarily triggered by negative events or feelings with dire psychological, social, and financial consequences Joireman et al. (2010). Additionally, Pandya (2021) added that consumers' impulsive purchasing was the potential to grow further with modern technologies such as internet and television shopping channels and marketing innovations.

Based on previous studies, the study discussed the five prominent factors influencing impulsive purchasing behaviour:

Impulsiveness: Impulsiveness in purchasing was an automatic response to novel stimuli that occurred at a preconscious level due to biological tendencies (Gąsiorowska, 2011).

Instant gratification: Instant gratification was the state of satisfaction of a consumer when they were going to perform impulsive purchasing behaviour (Youn and Faber, 2000).

Visual appeal: Visual merchandising, which included it, was the visual presentation to communicate a store/company's fashion value and quality image to prospective consumers (Kim, 2003).

Promotions: Promotions might include promotional gifts (such as free gifts, product maquette, free samples, etc) that attracted to buyers. (Youn and Faber, 2000).

Money availability: A higher income level was one of several elements that contribute to impulsive purchasing at an advanced stage (Vishnu & Raheem, 2013).

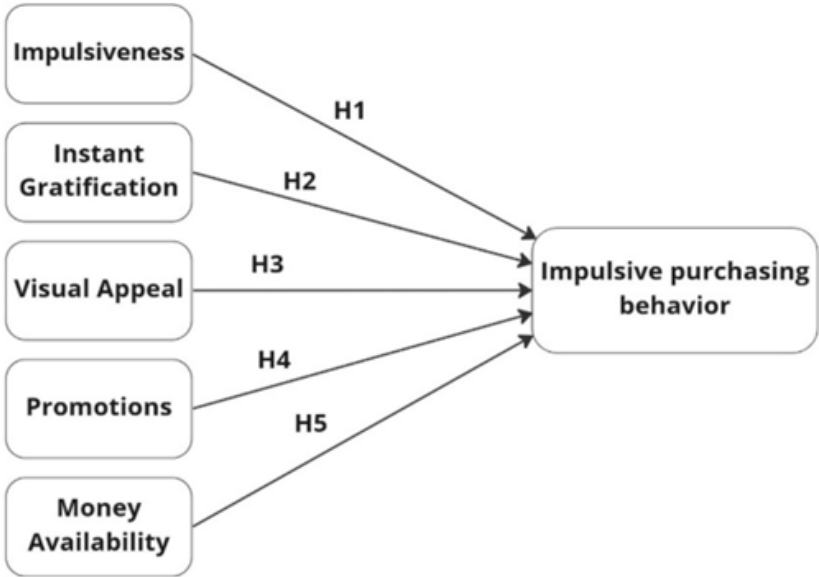

Figure 1. Research model

H1: Impulsiveness has a positive effect on consumers' impulsive purchasing behaviour in Circle K convenience stores in Hanoi.

H2: Instant gratification has a positive effect on consumers' impulsive purchasing behaviour in Circle K convenience stores in Hanoi.

H3: Visual appeal has a positive effect on consumers' impulsive purchasing behaviour in Circle K convenience stores in Hanoi.

H4: Promotions have a positive effect on consumers' impulsive purchasing behaviour in Circle K convenience stores in Hanoi.

H5: Money availability has a positive effect on consumers' impulsive purchasing behaviour in Circle K convenience stores in Hanoi.

2. Method

2.1. Qualitative method

The expert interview approach was the qualitative research technique used to consult experts about the scale of the study. Professional recommendations would provide the researchers with a stronger foundation to develop and optimize the scale for the official survey. The study opted to conduct the interview in compliance with the following procedures to maximize the efficiency of the qualitative expert survey method. Firstly, researchers developed primary research questions, scale, and hypotheses. Secondly, the study selected 05 experts in the field of economics to conduct the expert interviews. Thirdly, the researchers proceeded to interview the chosen experts as several questions were posed to the experts during the interview. Finally, opinions from expert were organized and interpreted. Thus, the researchers would subsequently provide conclusions and adjust the research scale before delivering official surveys.

2.2. Quantitative method

2.2.1. Data collection

The research team has used primary data which were collected from impulsive purchasing behaviour surveys. The collection process was carried out as follows: (i) delivering the questionnaire; (ii) collecting and processing data.

2.2.2. Data analysis

Descriptive Statistics: The research team used Statistical Packages for Social Sciences (SPSS) software to analyze the frequency distribution of factors impacting impulsive buying behaviour among consumers in Circle K convenience stores in Hanoi.

Exploratory Analysis: To test and purify the reliability of the scale surveys, the research team has utilized Cronbach's Alpha, or coefficient alpha. A statistical technique called Exploratory Factor Analysis (EFA) was used after Cronbach's Alpha to discover the fundamental pattern of a sizable collection of variables.

Regression: In this research, the team would implement regression analysis to identify the correlation between factors affecting the impulsive buying behaviour of consumers at Circle K convenience store.

Regression (Dummy variables): Specifically, in this study, the researchers used dummy variables to abolish the disadvantages of linear regression when using categorical variables as predictors for connections between elements.

2.3. Research procedure

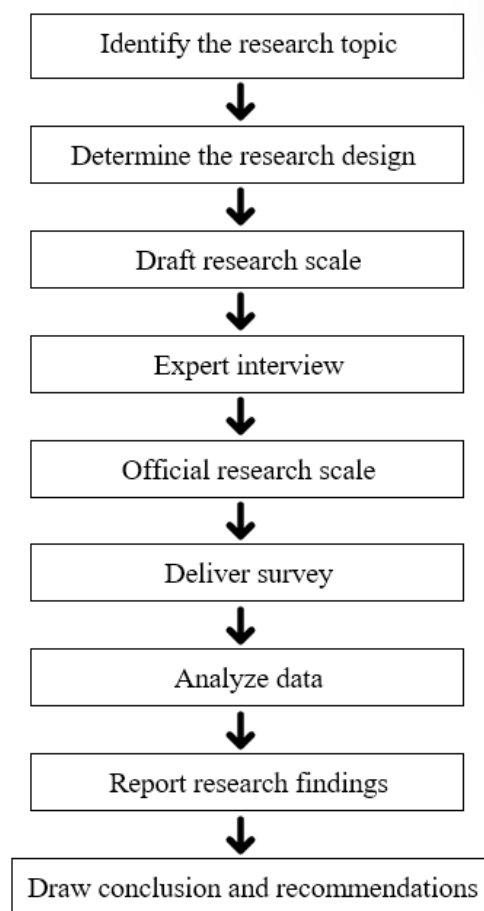

Figure 2. Research procedure

3. Results

The adjusted item-total correlation is more than 0.3, and the Cronbach's alpha for the five scales is greater than 0.6, according to the analysis results of evaluating scale reliability. It guarantees enough reliability to be used in the exploratory factor analysis.

Table 1. Reliability Test

Factors	Cronbach's Alpha
IP (Impulsiveness)	0.764
IG (Instant Gratification)	0.795
VA (Visual Appeal)	0.742
PM (Promotions)	0.824
MA (Money Availability)	0.767

The validity of the scales was then examined by the researchers to make sure they accurately reflected the element they were trying to evaluate. Analyzing indicators such as KMO, P-value of Bartlett's test, Total Variance Explained which showed that the scales of factors and impulsive purchasing behaviour scales are valid allowed the researchers to compute the effect of factors on impulsive purchasing behaviour.

Table 2. KMO and Bartlett's Test

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		0.827
Approx. Chi-Square		2830.062
Barlett's Test of Sphericity	df	253
	Sig.	0.000

KMO is $0.827 > 0.5$; P-value of Bartlett's test is 0.000, very small (< 0.05); therefore, the EFA method is suitable

Table 3. Total Variance Explained

Component	Initial Eigenvalues			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings		
	Total	& of Variance	Cummulative %	Total	& of Variance	Cummulative %	Total	& of Variance	Cummulative %
1	6.310	27.433	27.433	6.310	27.433	27.433	3.303	14.363	14.363
2	2.516	10.940	38.374	2.516	10.940	38.374	2.980	12.956	27.319
3	1.837	7.988	46.361	1.837	7.988	46.361	2.722	11.837	39.156
4	1.767	7.684	54.045	1.767	7.684	54.045	2.670	11.607	50.763
5	1.381	6.003	60.048	1.381	6.003	60.048	2.136	9.285	60.048

With the main component extraction method and Varimax rotation, there were 5 factors extracted from 23 independent variables of 5 scales. The extracted variance index was 60,048%, indicating that the 5 factors drawn explain most of the change of the dependent variable in the overall observation.

Table 4. Rotated Component Matrix

	1	2	3	4	5
PM4	0.614				
IG3		0.784			
IG8		0.778			
IG2		0.746			
IG1		0.626		0.384	
IG4		0.574			
MA3			0.816		
MA1			0.700		
MA2			0.680		
MA5			0.625		
IP2				0.792	
IP1				0.773	
IP3		0.372		0.632	
IP5				0.522	
IP4				0.468	
VA3					0.859
VA1					0.810
VA5					0.730

The rotation component matrix showed that 23 independent variables had been properly grouped into 5 separate groups corresponding to 5 factors in the research model: Impulsiveness, Instant Gratification, Visual Appeal, Promotions, and Money Availability.

Table 5. Descriptive Statistics of Variables in the Regression model

	N	Minimum	Maximum	Mean	Std. Deviation
B (Impulsive purchasing behaviour)	310	1	5	3.24	0.745
IP	310	1	5	3.27	0.820
IG	310	1	4	3.18	0.551
VA	310	1	5	3.59	0.731
PM	310	2	5	3.88	0.645
MA	310	1	5	3.84	0.718

Table 6. Coefficients

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
(Constant)	-0.376	0.248		-1.516	0.130
IP	0.476	0.041	0.524	11.644	0.000
IG	0.285	0.057	0.211	5.002	0.000
VA	0.155	0.041	0.152	3.785	0.000
PM	0.021	0.053	0.018	0.396	0.692
MA	0.134	0.045	0.129	2.953	0.003

All factors had positive regression coefficients ($\text{Beta} > 0$). However, the factor PM was not significant in the regression model ($\text{sig value} > 0.05$), from the five factors calculated above, there were statistically significant positive impacts of four factors IP, IG, VA, and MA on the dependent variable B. In terms of impact level, factors were reflected by the Standardized Coefficients. Specifically, this coefficient was highest in the first-factor variable (IP) and the smallest in the variable PM.

Table 7. Coefficients (Age factor)

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
(Constant)	-0.185	0.258		-0.718	0.473
IP	0.472	0.040	0.520	11.783	0.000
IG	0.281	0.057	0.207	4.929	0.000
VA	0.148	0.040	0.146	3.670	0.000
PM	0.015	0.052	0.013	0.294	0.769
MA	0.160	0.045	0.155	3.551	0.000
isAge1	0.187	0.156	0.056	1.195	0.233
isAge2	-0.277	0.101	-0.163	-2.745	0.006
isAge3	-0.203	0.133	-0.078	-1.523	0.129
isAge4	-0.152	0.199	-0.032	-0.764	0.446

To examine the impact of age on impulsive buying behaviour, the author created a dummy variable for the Age factor. This variable had 5 values, so the 4 dummy variables created were Below 18 (isAge1), From 18 to below 22 (isAge2), From 22 to below 25 (isAge3), and from 25 to below 30 (isAge4), respectively and group above 30 as the reference group.

The regression coefficient of the variable *isAge1* was positive, compared with the reference group, the group of people under 18 tended to make more impulsive purchases than those over 30. The remaining age groups (*isAge2*, *isAge3*, *isAge4*) had negative regression coefficients, indicating that people in these age groups tended to make fewer impulsive purchases than people over 30 years old.

4. Discussion and Conclusion

4.1. Discussion

The main objective of the study was to identify the elements affecting customers' impulsive purchasing behaviour at Hanoi-area Circle K Convenience chain stores. Except for the effects of promotions, the data showed that every hypothesis that had been put forth was supported. In terms of factors affecting purchasing behaviour, impulsiveness and instant gratification were positively related to impulsive purchasing in the context of Circle K convenience chain stores in Hanoi. Moreover, visual appeal was validated to have substantial effects on the impulsive purchasing behaviour of consumers in Circle K convenience stores in Hanoi. Consumers appeared to be influenced to make impulsive purchases due to the visuals of the stores, both inside and outside. In addition, the research findings also demonstrated the efficacious impact of promotions on stimulating the impulsive purchasing behaviour of consumers in Circle K convenience chain stores in Hanoi. Fifthly, the findings proved that money availability was a driver of impulsive purchasing in Circle K convenience chain stores in Hanoi. Lastly, this study empirically tested the influence of gender on impulsive purchasing behaviour of consumers and which groups of age could tend to buy most in Circle K Hanoi. Regarding the age aspect, it was discovered that consumers under the age of 18 tended to make the most impulsive purchases because they were still mostly dependent on their parents' incomes and rarely had a saving mindset.

4.2. Recommendations

4.2.1. Recommendations for Circle K managers

Customers frequently choose convenience stores that offer quick and easy services, thus Circle K Leaderboard may think about making some changes to the system to boost sales and improve customer satisfaction. First, the periodic personnel training programs for all store employees organized by the recruitment department seems to be the essential activity due to its urgency. Second, opening more outdoor space for consumers to sit back for chatting or working, which was now a popular habit of the youngsters in Hanoi, should be considered by Circle K. Third, to create a sense of urgency and excitement among customers, Circle K retailers can stock up on seasonal or limited edition goods that they would consider a once-in-a-lifetime opportunity to purchase. Fourth, Circle K managers can use data analytics to learn more about client preferences and behaviour. Finally, managers could think about putting a loyalty program in place to reward loyal customers.

4.2.2. Recommendations for product providers

Regarding the research findings, there are several recommendations for Circle K product providers. First, implementing more promotional initiatives that have successfully

influenced consumers' impulsive purchasing behaviour. Second, Circle K product providers should focus on the influence of visual appeal on consumers' impulsive purchasing behaviour. Third, during the research, Circle K convenience stores sold products with effective visual merchandising. Fourth, product suppliers can also collaborate with Circle K to create limited-edition or unique goods that are exclusively sold at Circle K locations. Fifth, it is critical to guarantee that the given goods are of a high caliber and offered at reasonable prices. Last but not least, Circle K can work with product suppliers to create eco-friendly sustainable practices.

4.3. Conclusion

This study aims to gain insight into consumers' impulsive shopping behaviour in Circle K convenience stores and the relationship between those factors and impulsive purchasing behaviour. The results revealed that four of the five variables (impulsiveness, instant gratification, visual appeal, and money availability) affect consumers' propensity to make impulsive purchasing behaviour of Circle K's consumers in Hanoi. It also pointed out that promotional factors did not significantly influence impulsive buying behaviour. The gender factor was proved to have no effect on impulsive buying behaviour while different age groups had different impact on impulsive purchasing behaviour. Based on the study's findings, the team offered advices to Circle managers and product suppliers. The recommendations are suggested with a view to satisfy the buyers with their impulsive buying by making a certain extent and adjusting marketing strategies and activities.

Abstract

The study presented the background theories and research models of domestic and foreign authors from which to draw a research model for the topic. Accordingly, 6 factors were applied by the research team to build a research model, including the factor of nature of work; Salary and benefits; Train; Advancement; Immediate superiority; Business image. With the appropriate method and sample size to ensure the research objectives, the topic tested the reliability of the scales, and exploratory factor analysis to assess the influence of factors affecting motivation working for insurance agent employees of Baoviet Life Corporation. The results of multivariate regression and ANOVA test show that all 6 components above affect the working motivation of insurance agent employees of Baoviet Life Corporation. Through the analysis results, the research team has also identified the factors that have a positive impact on the working motivation of insurance agent employees of Baoviet Life Corporation.

Keywords: *Insurance agent; Life insurance, Staff; Work motivation*

1. Introduction

According to statistics from the Department of Insurance Management and Supervision, the revenue of new life insurance exploitation through agency channels accounts for over 80% [10]. However, there is a reality of the life insurance market in the world and in Vietnam, where life insurance agent staff lack the motivation to work, and the quit rate is high. Motivating and retaining insurance agents is a difficult problem, but in Vietnam, research on this content is still limited and has not been studied specifically at

Baoviet Life Corporation. The research contents mainly focus on assessing the working situation or the current state of human resources of the insurance company without going into the assessment of the factors affecting the employee's work motivation. Conduct research at Bao Viet life insurance enterprise to identify and specify factors, and specific levels of impact of each factor on the working motivation of life insurance agents and propose solutions, necessary measures and recommendations to increase the working motivation of agents under Baoviet Life Corporation.

2. Literature Review

2.1. Theoretical foundations

Motivation

According to Vroom (1964), motivation is the state formed when employees expect that they will receive the desired results and rewards if they make efforts to perform the job [21].

Motivation to work

Robbins (2001) cho rằng: “Động lực làm việc là sự sẵn lòng thể hiện mức độ cao của nỗ lực để hướng tới các mục tiêu của tổ chức trên cơ sở thỏa mãn những nhu cầu cá nhân [15]”. This means that when goals are clearly defined, employees can rely on them to determine the necessary tasks or specific behaviors to promote efficiency and performance; Conversely, if the goal is not focused and unclear, employees can quickly lose their motivation to work.

Insurance agent

According to the Law on Insurance Business, “An insurance agent is a person who is paid to work for a business that sells the company's products to buyers. [13]” Insurance agents are individuals or organizations that act as intermediaries. between the business and the insurance buyer, representing the business and acting in the interests of the business.

The role of work motivation

For employees: Work motivation plays an important role in determining employee behavior.

For organizations: In an enterprise, human resources are an important and indispensable part, so the motivation of employees plays a decisive role in determining the strength of the organization.

For society: Creating motivation to express the increasing satisfaction of people's needs, ensuring their happiness and comprehensive development, thereby promoting the society to go up, contributing to the development of the economy country economy.

Measures to promote work motivation

Create a sense of meaningful work;

Praise and praise your efforts;

Salary increases policy;

- Listen and respect the opinions of employees;
- Notification of feedback on work results;
- Believe in the ability of employees;
- Create a dynamic and creative working environment.

2.2. Research models

Based on Maslow's Theory of Needs (1943) [12], Herzberg, F. (1968) [9], Victor Vroom's Expectation Theory (1964) [21] and domestic and international studies: Kovach (1987) [11]; Lee, C.C., et al (2012) [6]. Dung, T.K (2015) [8] and Thi, C.H., & Hung, V.Q. (2010) [16] to come up with a proposed research model and adjust the factors accordingly. The research model is as follows:

Figure 1. Conceptual framework

Source: Processing of the research team's investigation results

2.3. Scale development

These variables were measured using a 5-point Likert scale (from 1 strongly disagree to 5 strongly agree).

Table 1. The scale

Symbol	Observed variables
NW	Nature of work
NW1	My work is interesting
NW2	I have the right to the responsibility
NW3	I am proactive in my work and recognized for my work
SAB	Salary and benefits
SAB1	The company has a policy of paying salary commensurate with
SAB2	individual work results
SAB3	The company has a commensurate reward policy
SAB4	The company has a reasonable salary increase policy

Symbol	Observed variables
SAB5	I feel satisfied with the company's commission policy
TRAIN	Train
TRAIN1	The company's training helped me understand the human nature of life insurance
TRAIN2	Company training makes me proud to be a life insurance agent
TRAIN3	The company's training made me realize that the life insurance agent career is challenging and requires a long-term commitment.
AD	Advancement
AD1	The company has a clear promotion policy
AD2	The company gives me promotion opportunities
AD3	The company's work processes are applied consistently and unbiased, in compliance with ethical standards
IMS	Immediate superior
IMS1	Respected and trusted by superiors
IMS2	Superiors treat fairly, without discrimination
IMS3	The superiors wholeheartedly guide in the work
BUI	Business image
BUI1	I am proud of the company brand
BUI2	I believe in the future development of the company
BUI3	I am satisfied with the company culture
BUI4	The company's regulations and procedures are convenient for me to do my job
BUI5	The company always complies with the laws and regulations of the State
MIAS	Work motivation of insurance agent staff
MIAS1	I enjoy working and am proud of the company's insurance agent job
MIAS2	I feel motivated at work
MIAS3	I usually work in the best mood

Source: The research team

3. Method

Primary data is collected by mainly survey methods, specifically:

The survey method using questionnaires is the main tool for the research team to collect primary data about the research contents of the topic.

Design of the questionnaire: The questionnaire was prepared by the research team based on the principle of questionnaire making and consists of 3 pages with 29 questions, in

which the first part is personal information that will be kept confidential during the process. The process of synthesis and processing, the following part is the evaluation and scoring questions, the last part is the open-ended question for agents participating in the survey, which is to make recommendations to the business. The questions have been edited to fit the research content.

From the revised and supplemented questionnaire, the research team conducted a field survey at the agents of Baoviet Life Corporation. The survey results were analyzed using SPSS 22 software for the research criteria. The steps are as follows:

Formal research: The topic uses quantitative research methods for this part.

Testing the reliability of the scales: Based on the Cronbach Alpha coefficient to detect incorrect indicators in the research process.

EFA exploratory factor analysis aims to: Extract, arrange indicators to measure concepts and latent variables.

Check the correlation between the factors to limit the phenomenon of multicollinearity between the component factors. Confirm the correlation between the observed variable and the dependent variable.

Multivariate regression analysis and ANOVA test, evaluate the role of each component in the model.

4. Results

The period from 2019 to 2021 is a challenging year for Vietnam in the context of the global outbreak of COVID-19. The economy closed, millions of businesses went bankrupt and closed temporarily, and workers lost their jobs and lost income in the long term. Those unfavorable factors together with the pressure within the economy have strongly affected the production and business activities of enterprises in general and Baoviet Life Corporation in particular. However, with the determination and best efforts of all staff, employees, and consultants, Baoviet Life Corporation still achieved remarkable results and successes in business activities.

Table 2. Preliminary data on revenue, number of insurance agents and insurance agency expenses in the period of 2019-2021

Unit: Million VND

Targets	2019	2020	2021
Total revenue	32,149,614	36,169,047	37,848,122
Revenue from insurance activities	25,451,556	28,046,303	30,561,996
Insurance agents present at the beginning of the year (person)	219,791	251,335	164,702
Insurance agents present at the end of the year (person)	251,335	164,702	187,782

Targets	2019	2020	2021
New recruitment insurance agent (person)	41,421	44,278	44,931
Insurance agent leaves, dismisses (person)	9,877	130,911	21,851
Ratio of agents firing leaving / number of new recruiting agents (%)	23.8	29.6	48.6
Agent commissions	1,819,043	1,925,698	1,887,725
Recruitment cost	3,171	4,809	2,723
Agent training expenses	45,064	48,311	40,376

IMS	3	0.624	0.466	0.616	3
BUI	5	0.901	0.734	0.883	5
MIAS	3	0.882	0.764	0.839	3

Source: Processing of the research team's investigation results

The minimum total variable correlation of the components of the scales ensures that the level >0.3 [20] is suitable for the research purpose and novelty in the research. Therefore, it can be concluded that: the scale used in the study is appropriate and reliable and can be used to conduct factor analysis and further research steps.

Exploratory factor analysis

The combined results of EFA exploratory factor analysis for each scale showed that the KMO coefficient (Kaiser-Meyer-Olkin) >0.5 for all scales [20]. This satisfies the first condition for EFA analysis. Next, we see that the value $\text{Sig} < 0.05$ is the standard guarantee for all scales of independent variable components, the total variance extracted is greater than 50% as prescribed and all converge to only 1. common factor, with all factor weights as large as 0.5.

Table 4. Synthesized results of exploratory factor analysis (EFA) for each scale

Scale	KMO coefficient	Sig	Total variance explained	Number of factors eliminated	Number of converging factors
NW	0.667	0.000	76.002	0	1
SAB	0.857	0.000	77.596	0	1
TRAIN	0.749	0.000	86.755	0	1
AD	0.731	0.000	80.724	0	1
IMS	0.583	0.000	57.208	0	1
BUI	0.852	0.000	71.857	0	1
MIAS	0.745	0.000	80.912	0	1

Table 5. Extracted from Table of Exploratory Factor Analysis EFA common to all scales of independent variables

	KMO = 0.813			Sig= 0.000					
	Initial Eigenvalues			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	5.920	26.911	26.911	5.920	26.911	26.911	3.960	18.000	18.000
2	3.473	15.788	42.699	3.473	15.788	42.699	3.675	16.706	34.706
3	2.791	12.684	55.383	2.791	12.684	55.383	2.611	11.868	46.575
4	1.935	8,796	64.179	1.935	8.796	64.179	2.388	10.855	57.430
5	1.475	6.707	70.886	1.475	6.707	70.886	2.262	10.281	67.711
6	1.168	5.311	76.197	1.168	5.311	76.197	1.867	8.486	76.197
7	0.849	3.857	80.054						
8	0.565	2.568	82.622						

Source: Processing of the research team's investigation results

From the table of exploratory factor analysis results for all components of the scale of independent variables, we see that the total variance extracted is 76.197% > 50%. KMO index of 0.813 ensures the requirements, in addition, sig also gives results of 0.000 < 0.05 following the requirements for our analysis. The results shown on the factor rotation matrix table show us that 22 observed variables converge on 6 factors including the group of factors on the nature of work, salary and benefits, training, promotion, direct superiors, etc. Next, the corporate image with all factor weights is 0.5. Because no new factors were formed, all 22 observed variables remained as they were.

Correlation and regression analysis

Correlation

Pearson correlation analysis is one of the steps the research team performed in the study using SPSS quantitative analysis. The purpose of running the Pearson correlation is to test the close linear relationship between the dependent variable which is the working motivation of insurance agent employees in terms of the nature of work, salary and benefits, training, promotion, and level of education. directly, the image of the business because the condition for regression is first to be correlated. In addition, it is necessary to identify the problem of multicollinearity when the independent variables are also strongly correlated with each other. The sign of doubt is based on the correlation sig value between the independent variables less than 0.05 and the Pearson correlation value greater than 0.3 [19].

Regression analysis

The multivariable regression equation showing the relationship between the work motivation of insurance agent employees for the components of the scale has the following form:

$$Y = a_0 + a_1X_1 + a_2X_2 + a_3X_3 + a_4X_4 + a_5X_5 + a_6X_6$$

In there:

Y: The dependent variable represents the predictive value of the work motivation of insurance agent employees.

a₀, a₁, a₂, a₃, a₄, a₅, a₆: are regression coefficients

X₁, X₂, X₃, X₄, X₅, X₆: Are the independent variables in order: composition of work nature, salary and benefits, training, promotion, immediate superiors, corporate image.

The results of the linear regression analysis are as follows:

Table 7. Linear regression results

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	0.756 ^a	0.572	0.558	0.60214

Source: Processing of the research team's investigation results

We see that adjusted R = 0.558 > 0.5 indicates 6 components that affect the working motivation of insurance agent employees of Baoviet Life Corporation. Looking at the results of the regression analysis, we see that the preconditions for the regression analysis are satisfied. Thus, we can consider the results of the regression analysis to be reliable. However, this fit is only true for the sample data. To test whether the model can be inferred for the real population, we must test the model's goodness of fit:

Hypothesize:

H₀: The factors of nature of work, salary and benefits, training, promotion, immediate superiors, corporate image, and work motivation have no relationship with each other.

H₁: The factors of the nature of work, salary and benefits, training, promotion, immediate superiors, corporate image, and working motivation are related to each other.

Choose significance level = 0.05 corresponding to 95% confidence level.

Table 8. ANOVA testing

Model	Sum of Squares	df	Mean Square	F	Sig.
Regression	89.167	6	14.861	40.988	.000 ^b
Residual	66.714	184	0.363		
Total	155.881	190			

Source: Processing of the research team's investigation results

The results of the ANOVA test show that the F-test value reaches the value of 40,988 at the significance level sig = 0.000 < α = 0.1. Thus, we reject hypothesis H₀, and accept hypothesis

H1, that is, the factors of work nature, salary and benefits, training, promotion, immediate superiors, corporate image, and work motivation having a relationship with each other. Therefore, the model fits the data set and can be generalized to the population. In addition, we can consider the problem of multicollinearity that occurs when the independent variables (factors) are strongly linearly correlated with each other. In other words, multicollinearity occurs when a linear correlation exists between ≥ 2 independent variables in the model.

Table 9. Results of multivariate regression model

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	VIF
	B	Std. Error	Beta			B	
Constant	-1.342	.388		-3.462	.001	.764	1.310
NW	.277	.064	.237	4.299	.000	.782	1.279
IMS	.169	.077	.120	2.207	.029	.870	1.150
SAB	.101	.044	.117	2.272	.024	.813	1.230
TRAIN	.177	.046	.208	3.885	.000	.738	1.355
AD	.179	.050	.201	3.576	.000	.786	1.272
BUI	.442	.058	.413	7.593	.000	.764	1.310

Source: Processing of the research team's investigation results

5. Discussion and Conclusion

So, the regression equation for the standardized coefficients Beta is as follows:

$$\text{MIAS} = 0.413\text{BUI} + 0.237\text{NW} + 0.208\text{TRAIN} + 0.201\text{AD} + 0.120\text{IMS} + 0.117\text{SAB}$$

The results of the regression results in Table 7 allow us to test the regression coefficients in the model. Components with a statistical significance of less than 5% are kept, and components with a statistical significance greater than 5% are discarded. The larger the beta coefficient of any component, the more important it is, showing the degree of influence on the dependent variable from the table of regression analysis results above, we can see that the constant is not statistically significant, so the constant has no effect in the regression equation. The remaining 6 factors: The nature of work, Salary and benefits, Training, Promotion, Direct superiors, and Corporate image are all relevant and have a positive influence on work motivation. Specifically, the Business Image component has the strongest influence first with a Beta coefficient of 0.413 ($t=7.593$ and $\text{Sig} < 0.05$), followed by the Nature of Work component with a Beta coefficient of 0.237 ($t= 4.299$ and $\text{Sig} < 0.05$) had a second largest influence. Third is the Training component with a Beta coefficient of 0.208 ($t= 3.8885$ and $\text{Sig} < 0.05$). The Promotion component has the fourth largest influence on motivation with a Beta coefficient of 0.201 ($t= 3.576$ and $\text{Sig} < 0.05$). The fifth is the direct superior component with a Beta coefficient of 0.120 ($t= 2.207$ and $\text{Sig} < 0.05$). Finally, the salary and benefits component with a Beta coefficient of 0.117 ($t=2.272$ and $\text{Sig} < 0.05$) is also the component that has the lowest influence on the agent's motivation.

Abstract

This study is to examine the impacts of the factors of talent management on employee retention in the banking sector of Ha Noi, Vietnam. Employee's retention is a major and essential issue for performance of any organisation. Therefore, a long-term talent strategy is needed to address potential issues in this area. The research has surveyed 319 bank officers working at 25 Vietnamese commercial banks in Ha Noi with the application of Convenience and Snowball sampling methods. The results reveal that five factors of talent management: the right fit position, remuneration, employee empowerment, training and development, and work-life balance have a positive influence on employee retention, in which the right fit position made strongest impact, and the work - life balance made the weakest impact.

Keywords: *Employee retention, talent management, Vietnamese commercial banks.*

1. Introduction

Vietnam is currently experiencing a significant period of international integration, and to achieve sustainable economic growth, it is crucial to develop high-quality human resources. The banking industry, with the high-quality workforce considered as the backbone of the national economy, plays a vital role in this regard. However, in the era of Industry 4.0, where information technology is at the forefront, the industry is facing many challenges related to its workforce. There is a shortage of personnel with the necessary skills for data analysis, digital technology proficiency, and professional competence. To adapt to the changing banking landscape, besides taking advantage of the opportunities presented and invest in human resource training and development, the better talent management is also taken into consideration in many financial institutions to make their talented employees stay and contribute longer. Together with digital transformation, human capital is also one of factors that help maintaining competitive advantages within these institutions.

Due to the market's lack of talents, rival companies are competing in talent recruitment and acquisition through a variety of various strategies, and organizations must have a "fairly costly" strategy to retain their talents. Today, when a talent is unhappy with his bank or current work, he can easily move to other financial institutions because he is always welcomed. The effects and patterns of turnover will be different amongst industries. Therefore, turnover should be minimized or kept under control since it has a detrimental effect on production and performance.

Employee retention has been not only a problem for companies in the modern age, but also a significant financial risk. Managing this issue, keeping talented employees stay with their company are of vital importance to all forms of organisations. It is particularly critical in the service sector like the commercial banks due to the direct connection between their staff and the clients.

A lot of factors in talent management have been studied in different areas, includes banking sector. However, this is limited in Vietnam context. Thuy Vo and Mai Nguyen (2021) showed that amongst job satisfaction, motivation, commitment and loyalty, the greatest impacts on intention to stay of staff are respectively job satisfaction, commitment, loyalty and working motivation.

Talent management has become a strategic imperative for organisations because of the differential value generated by skilled workers and their contribution to companies in the hypercompetitive and dynamic global economy. However, it is also the challenge for HR to manage talent globally. Talent management is supposed to be the key to retain employees for organisations. Furthermore, Tower Watson (2011) pointed out that 30% of companies have problems with the retention of high skilled workers. Hence, talent management plays a crucial role to keep organisations moving ever closer to their goals. McKinsey Global survey (2018) confirmed that talent management impacts positively on organisational performance.

Banking industry is supposed to pay great attention to achieve competitive advantages through talented employees (Anwar, Nisar, Khan & Sana, 2014). They are showing the different innovative tactics to improve the capabilities of employees. Besides, Srivastava and Nidhi (2013) figured out that the banking sectors are becoming increasingly competitive and customer oriented, identifying and applying talent management are the biggest challenges. As a result, it is critical to understand the interactions between the elements that determine talent development, as this provides management with a foundation for developing proactive and effective HR initiatives.

This research aims at contributing to the current literature on talent management and employee retention and exploring the relationship between factors of talent management and employee retention in the context of Vietnamese commercial banks.

2. Literature review

Talent management

Talent refers to a person's abilities, including their skills, knowledge, experience, intelligence, judgement, attitude, and character. These abilities can be enhanced through

learning and growing. According to Cheese et al. (2008), valuable resources such as talented employees help create a firm's sustained competitive advantage. Many authors have argued that the resources and capabilities that contribute to a firm's sustained competitive advantage are strongly affected by the capabilities of high-quality staff.

Talent management (TM) is commonly defined as a methodical approach to attracting, identifying, nurturing, retaining, and utilizing talented individuals (Scullion et al., 2010). The definition of the term talent management has evolved to encompass multiple meanings that reflect important developments in human resources within modern societies. Initially, there was a strong emphasis on recruiting top-level managers and the significance of securing the most skilled and capable individuals, as well as assessing characteristics that indicate potential managerial success. Nevertheless, as the field of human resources has progressed, more precise terms of talent management have emerged. Generally, the literature on TM offers a rational and instrumental interpretation of the TM process, whereby talents are recruited and developed using various TM practices to guide their behaviours in alignment with organizational requirements. This, in turn, results in individual happiness and motivation, as well as enhanced individual and organizational performance. The term "the war for talent" was coined by a group of McKinsey consultants in the late 1990s to emphasize the crucial role of employees in the success of top-performing companies, which helped to spur the mainstream acceptance of talent management. This emphasizes the importance of talent management for businesses to win their competitors.

Modern talent management literature mainly highlights organizational goals. The "hard" approach is rooted in McGregor's theory X, and represents a functional and practical view of people, where employees are viewed as objects (resources) that require effective control and management to achieve organizational goals (Greenwood, 2002; Legge, 2005). In general, talent management is intended to fulfil the quantitative and qualitative requirements for human resources and contribute to the overall performance of the firm, which encompasses factors such as profit, competitive advantage, and sustainability, which prioritizes high performance (in the exclusive approach) and organizational objectives.

In contrast, the "soft" approach to HRM is rooted in McGregor's theory Y, which acknowledges that employees are human beings with their own feelings and desires that guide their actions. The well-being and rights of employees are taken into consideration, along with the interests of the organization (Greenwood, 2002). Instead of using punishment and coercion to control employees, advocates of the "soft" approach believe that managers should trust in the employees' own sense of responsibility and support and encourage their growth, using methods that foster commitment and personal and professional development.

Talent management practices may include employee attraction and retention policies, talent audits, employee resource planning, role development, career management, learning and development, and performance management, among others. These practices may vary depending on the organization's needs and objectives.

Employee retention

The HR perspective views employees as the primary asset of an organization (Lins et al., 2017). Considering that employees not only participate in the direct processes of the organization but also influence the setting of organizational objectives and the process of their achievement, the sustainable management of talent becomes crucial. In pursuit of gaining a competitive edge, several companies have adopted sustainability management systems.

Retention of employees has a close relationship with the internal marketing theory uses the term "employee loyalty" to describe the loyalty of employees towards their organization (Foreman & Money, 1995). Employees are considered "internal customers", and the more loyal they are, the better they perform, the less likely they are to leave, and the more they are seen as an asset to the organization (Welch, 2011, Whelan and Fink, 2016). Retention decides both the attitude of behavioural intention and the retention behaviour of the stakeholders towards the organization (Blanco-Gonzalez et al., 2020). These are both crucial aspects of a long-term relationship between the employee and the organization. Retaining skilled employees is crucial for maintaining competitiveness and creating a desirable workplace. However, retaining employees has become a challenge for many companies in the competitive global labour market (Lalitha, 2012). The movement of employees in and out of enterprises can have direct financial impacts such as replacement and training costs that increase operating expenses, negatively impacting the growth and profitability of firms. Therefore, employee retention is essential for the long-term success of an organization.

From the perspective of Isfahani & Boustani (2014), employee retention is defined as the ability to maintain a stable human resource in organizations as a common consideration. They also showed that employee retention can be measured by the rate of employee retaining per year or organizational trust. Meanwhile, Chikumbi (2011) supposed that there are two ways to measure employee retention including: employee engagement and organizational culture. The personal premises of loyalty, belief, commitment, identification, attachment with the company influence directly on employee retention. Hence, these are important indicators to reflect employee retention in an organization.

Talent management versus retention of employees

Employee turnover generally leads in three sorts of losses for organizations: (1) monetary loss from recruiting and replacing the employee, (2) loss of the previous employee's talent and experience, and (3) loss of the customers' relationship network as well as their soft information.

The literature has established three theories on the three types of losses caused by employee turnover. First, according to the cost-based hypothesis (Dalton & Todor, 1979), staff turnover leads a business to pay additional expenditures for recruiting and training new personnel. Second, human capital theory (Becker, 2009) contends that each employee possesses distinct attributes or traits, abilities, knowledge, and experience that have a direct influence on their organization's success. Third, according to social capital theory (Leana & Van Buren,

1999), each employee has a system or plan for developing long-term relationships with consumers. When these employees leave the organization, their clients may lose interest in the organization, which is common in financial institutions such as banks.

Talent management can affect many aspects in organisation, especially the retention of employees. However, few companies can be aware and concentrated on talent management to enhance employee's performance. Talent management is considered as an effective retention strategy for talent performers by practitioners (Hughes & Rog, 2008; Lockwood, 2006). Narayanan, Rajithakumar and Menon (2018) also pointed out the same idea that talent management has a positive relationship with employee retention and intention to stay could be seen as employee attitude toward the company which practices talent management.

Talent retention is a critical component of the talent life cycle. According to Schiemann, the talent life cycle is the path involving the talent's interaction with the organization regarding HR and, above all, human capital, and its scope has been defined in terms of the serial steps of "attracting, acquiring, onboarding, training, managing performance, developing and succession, retaining and recovering." While an organization is trying to optimize the benefits of talent investments to gain financial and/or non-financial benefits such as better quality, more productivity, and deeper employee retention, and this may assist the organization control the talent life cycle in addition to its competitive advantage.

Research model and hypothesis development

This study constructs a research model to discover the relationships between talent management and employee retention as presented in the figure 1. The five factors of talent management are taken into consideration: the right fit position, remuneration, employee empowerment, work-life balance, training and development. Besides, the demographics are also used as control variables for this analysis.

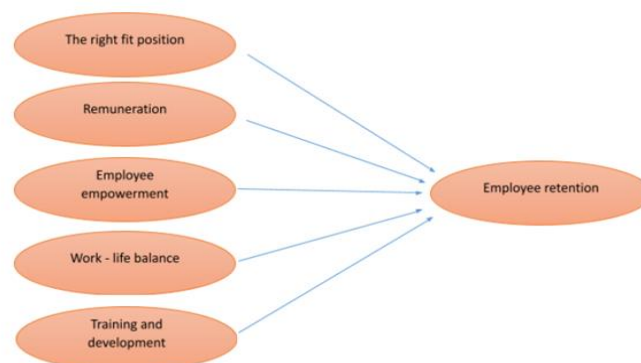

Figure 1. Research model

The right fit position is crucial in an organisation because when employees find that they do not fit their working position, they will tend to leave the organisation. The right-fit position ensuring that human resources can effectively contribute to organizational

performance involves two crucial considerations. The first is evaluating whether there is a fit between the values of the individual and those of the organization, which is known as person-organization fit. The second is assessing whether the values of the individual align with the job they will be performing, which is referred to as person-job fit. These two factors are important in determining the level of success an individual will have in their role and how they will contribute to the organization's overall performance.

Person-organization fit is a specific aspect of the broader concept of person-environment fit, as outlined by Darnold in 2008. It is concerned with the compatibility between an individual and the organization they work for and has been linked to various factors such as job satisfaction, organizational commitment, turnover, and psychological well-being. Person-organization fit is generally defined as the extent to which an organization's values align with an individual's values.

Person-job fit refers to the level of compatibility between an individual's abilities and the characteristics of the tasks they are expected to perform. When there is a good fit between an employee's skills and the demands of the job, it can increase their commitment to the role, as per the research conducted by Meyer & Allen in 1997. Additionally, Poisat (2006) deduced that the right fit between employee and job position would utilize employee talent to improve performance and employee retention. The aim of person - job match is aligning characteristics of individuals and jobs in ways that will result in desired HR outcomes. To the extent that the individual is a good fit for the job, it will most likely have a positive effect on HR outcomes such as attraction, success, retention, participation, satisfaction, etc.

The investigation of Onyeizugbe and Asiegbu (2017) at commercial banks in Nigeria identified that 94% variation in employee satisfaction was explained by changes in job fit. This concluded that the job fit increases the employee satisfaction as well as performance of individuals. Furthermore, Siti and Khulida (2016) also investigated the relationship between person - job fit, work engagement and employee retention. It revealed that P - J fit has positive inclination toward employee retention and work engagement. Accordingly, person - job match is an important factor to analyse and evaluate its impacts on employee retention. Therefore, the hypothesis is proposed as:

Hypothesis 1: *The right fit position is positively related to employee retention in Vietnam commercial banks.*

The remuneration: The study of Barkhuizen (2014) identified that remuneration practice is one of the most preferred of Generation Y employees, who were born from 1981 to 1995. Besides, remuneration was also asserted as a main dimension to manage talent successfully (Hoek & Schultz, 2013).

An attractive remuneration is one of top factors related to employee retention because workers can fulfil their financial, material needs and ensure recognition from society through remuneration. It is not only money but also non - cash settlements. Besides, compensation is considered as a tactic that organisations use to commit their employees to the company (Cappelli, 2001; Mitchell et al., 2001). Bogdanowicz and Bailey (2002) outlined the similar change of companies which try to bring benefits and holistic motive for their employees.

Outstanding workers may leave an organisation because they are disgruntled, underpaid, or unmotivated, and when attempting to maintain employees within the organization, they may present other challenges as well (Coff, 2010). The study of Shropshire and Kadlec (2012) pointed out that the actual causes for retention in various industries include job security and salary in Bangladesh. Furthermore, the study which was researched in British American insurance companies by Gachanja (2015) emphasized the key findings that lack of financial support and dissatisfaction with remuneration methods were found as the key reason for the leaving of employees. In the service sector, many companies are attempting to improve their productivity in order to increase professional satisfaction and employee promise. Thus, pay satisfaction has a direct effect on turnover, and high employee turnover rates will reduce the organization's service quality. This therefore demonstrates the importance of remuneration in the service sector to retain employees.

Hypothesis 2: *The remuneration has a positive relationship with employee retention in Vietnam commercial banks.*

Employee empowerment has been recently mentioned to be an essential element for organization to make initial changes in employee management strategies. Empowerment can be understood as when managers tend to share his information, or powerfulness for his employees to enhance their capability while making decisions (Karim & Rehman, 2012), which encourages the sharing of power within top management and the lower staff. Employee empowerment, furthermore, enhances the capabilities and responsibilities of employees when performing their tasks (Saifullah et al, 2015). The major objective of empowerment is to fill the gap amongst management and employees, giving employees permission to make appropriate necessary decisions, from that raising the responsibility and organizational commitment inside them.

According to DuBrin (2010), employee empowerment is the transition of decision - making power or responsibility from manager to member. Employees can build on their existing strengths and gain self-confidence through empowerment activities. Allowing workers to think, make decisions, perform projects, and handle their responsibilities independently exemplifies this. This is then illustrated by increased loyalty and increased commitment from staff. Employees should have total autonomy in their work, according to Block (1987), and their participation in decision-making should be strong. Besides, employee empowerment is highlighted in many researchs because of its importance in the workplace that can raise the performance of individuals. Employee empowerment is not only a challenge but also inspiration for employees to do their job better.

Hypothesis 3: *Employee empowerment has a positive relationship with employee empowerment in Vietnam commercial banks.*

Training and development: Because of increasing competitiveness and rapid change in technology, banks require new training and development methodologies for their healthy survival (Muhammad, 2021). Therefore, banks put a lot of training on their employees to guarantee employee performance as well as increase the retaining ability. With the rapid

advancement of technologies, the need for training is continuous, and this is the case with any organisation. Rather than depending on professions, companies must constantly improve workers' expertise to perform better and compete in the future since it is an age of quality and efficiency.

Training is offered to various HRM administrative techniques for retention and development of staff, such as on-the-job training, vocational training, and general training, as well as a supplement to the company's training programs. Meanwhile, development is the process of developing for future jobs. Deckop et al. (2006) stated training and advancement significantly lowers the employee turnover rate. Employee development is beneficial for minimizing absenteeism, but also for making employees more consistent and satisfied with their work, thus lowering turnover rate. Also, this researcher found out that development opportunities motivate employees to face and solve the difficulties of their current job and increase the probability to stay in their organization. Many studies have shown the directly positive correlation between organizational training and career development and staffs' retention. Findings by Cardy (2011) and Kroon (2013) indicated that career growth results in a rise in employees' desire to remain in their current jobs.

A study Huang and Su (2016) was conducted on 150 employees working in a variety of firms in Taiwan, concluded that organizational training and development provision was considered as a platform to create a sense of success and progress to staff as well as a powerful instrument to form the motivation and attitude of staff towards work, thus enhancing their engagement degree. Further, Afroz (2018) by interviewing 150 bankers from 14 banks, revealed that trained staff were more committed and satisfied to their current banks.

Hypothesis 4: *Training and development is positively related to the retention of employees in the financial institutions in Vietnam.*

Work-life balance in the modern professional environment is one of supreme concerns due to the development of today's advanced labour force, marked by a greater rate of women's participation in the labour and characterized by long working-time jobs, new technologies, a worldwide competitive market, and a growing interest in private life (Subhasree Kar, 2013). Especially the younger labor force of generation Y, who are different from the older generation. They are demanding flexible and meaningful jobs, career independence, maximum benefits, and a far more improved work-life balance. Work-life balance strategies are implemented in both organizational and functional frameworks as well as formal and casual partners to support people to navigate the overlapping domains of work and family care efficiently. Work-life balance policies can consist of providing flexible work arrangements, for example, adjustable time, which allows employers to modify their start and end times, given that a minimum amount of working hour; or permitting them to flexibly go out of office or working from home while still ensuring their performance: or providing family - friendly policies such as leave policies in lieu of family responsibilities. Work life balancing policies is stated to provide a win - win position for both organizations and workers (Lockwood, 2003). It was the aim of Kumari's (2012) investigation to find out how workers perceived their work-life management strategies in the Indian banking sector.

Quantitative analysis was conducted with a sample size of 350 bank workers. Research has shown that any aspect based on work - life balance is a strong advocate of employee satisfaction between males and females in the workplace, which is linked to work-life balance initiatives. A positive relationship reveals that workplace fulfilment is a very large concern for workers' work-life balance and vice versa.

Using quantitative data collection techniques, Rizvi (2013) revealed that Pakistan bankers were suffering through intense work life imbalance. She concluded that intervention in the employee's personal life negatively affects his or her work, Vikas Shrotriya (2009) studied that a work-life balance means achieving a balance between professional work and other tasks so as to minimize tension between professional and family involvement and thereby enhances the effectiveness and performance of workers by increasing dedication and satisfaction. Ioanlazar and Codruta (2010) stated in their research that work-life management activities are particularly advantageous when accompanied by supervisor and organizational support. These results are mostly correlated with employees' sentiments such as improved work satisfaction, reduced turnover, improved efficiency, interpersonal commitment, and dedication to greater levels of corporates' success.

Hypothesis 5: *Work-life balance increases the intention to stay by employees.*

3. Method

By the end of 2022, there is a statistic of 273,364 employees working in 28 Vietnam listed bank (Vietnamnet, 2023). In this study, the authors aimed to investigate the influences of talent management on employee retention with focus on the credit staff, who are considered as key workforce in implementation of banking service, in comparison to employees at other departments of commercial banks. The Convenience and Snowball sampling methods were applied. The survey was conducted at 25 Vietnamese commercial banks based in Hanoi, which divided into two groups: (1) *Group 1*: top 10 reputable commercial banks (according to the ranking of Vietnam Report and Vietnamnet newspaper in 2020 (H.Kim, 2020)), including Vietcombank, Techcombank, Vietinbank, Agribank, BIDV, HDBank, MB, TP bank, VPbank, and ACB and (2) *Group 2*: MSB, ABbank, Eximbank, LienVietpostbank, and other 11 commercial banks. There is a total of 319 respondents, in which 265 employees working at group 1 (accounting for 83.1%), other 54 respondents (16.9%) belong to group 2. The data was collected through both online survey and offline questionnaires.

Respondents working at credit department accounts 74.6%, respondents working at other units accounts for 25.4%. Most respondents (51.4%) have 1 to 3 years of experience, 28.8% of respondents have working experience of 4 to 5 years, 9.4% for 6 to 8 years, 7.8% for 10 to 15 years, and only 2.5% for 15 to 20 years. Non - managerial staff is 275 respondents (86.2%), while group of managerial staff (manager, vice manager, director, and vice director of branch) account for 13.4%.

The measurements were developed based on previous researches: *The right fit position* is measured by items built by Lauver & Kristof-Brown (2001); Silverthorne (2004);

The remuneration and measurements were from Chikumbi (2011); *Employee empowerment* were based on Chikumbi (2011), Hayes (1994); *Training and development* was from Siddiqui & Sahar (2019); *Work - life balance* was from Jill et al. (2014); *Employee retention* was from (Kyndt et al., 2009), (Yamamoto, 2011).

In this study, SPSS 26.0 was applied in the data processing and analysis: Cronbach Alpha's measurement research applied to evaluate the reliability of the scales, Exploratory Factor Analysis (EFA) to find the convergent validity and discriminant validity between the dimensions of the scale, then, Linear Regression Model was used to test and perform data analysis the hypotheses.

4. Results

In descriptive results: most items have the value of mean higher than 3, hence, the Likert scale can be concluded having tendency to be positive and mostly agreed by respondents.

The result of scale reliability evaluation with values of Cronbach's alpha: The right fit position (alpha = 0.887), Remuneration (alpha = 0.887), Employee empowerment (alpha = 0.882), Work life balance (alpha = 0.858), Training and development (alpha = 0.875), Employee retention (alpha = 0.817). The Cronbach's alpha of factors ranges nearly upper 0.8. For the scope and sample of this study, these indexes demonstrate the high reliability of items. Hence, the scale is considered as valid and reliable, and it can reflect accurately the opinions of respondents.

Following the use of EFA and the removal of inconsistent items, the conceptual model's five groups of factors remain intact. In addition, factor loading serves as a criterion to ensure the practical significance of EFA. In this study, all factor loadings exceeded 0.5, demonstrating the practical significance of the Likert scale in explaining the factors.

Table 1. Regression results

Independent variable	M1	M2
Gender	-0.043	-0.033
Age	0.181*	0.043
Education level	-0.033	-0.016
Position	0.119	0.055
Experience	-0.044	0.048
Bank	-0.060	-0.053
Working department	-0.114	-0.005
The right fit position		0.300*
Remuneration		0.122*
Employee empowerment		0.181*

Independent variable	M1	M2
Work life balance		-0.112*
Training and development		0.245*
R Square	0.081	0.526
Change to R square	0.081	0.445
Adjusted R square	0.060	0.508
Note: confidence interval a * being 95%		
M1: model with demographic		
M2: model with demographic and independent variables.		

Regression results show that R square for model 2 (with control and independent variables) is 0.526. This means that control and independent variables will clarify 52.6 percent of the employee retention variable. Moreover, there are five factors (the right fit position, remuneration, employee empowerment, work life balance, training, and development) that have an impact on employee retention.

Even though the beta index is negative, the relationship between work-life balance and employee retention is positive because the questions about work-life balance have a negative sense. As a result, five factors have a positive impact on employee retention.

Consider to the control variables, the age of the employee has an impact on employee retention in model 1 (with beta = 0.181). However, it is insignificant when combining with independent variables in model 2.

5. Discussion and Conclusion

5.1. Discussion

In the table of regression, all five factors of independent variables have an impact on employee retention, meanwhile control variables (demographic) have no impact on employee retention. Moreover, R square is 52.6% so the model is meaningful and significant to explain the relationship between independent variables and the dependent variable. The result also shows that there is no difference in employee retention between top 10 reputable commercial banks and other banks. Similarly, the credit department and other departments have no difference in employee retention.

As mentioned before, the meaning of work-life balance questions is negative so even though the beta is negative, the relationship between work life balance and employee retention is positive. Therefore, five factors including the right fit position, remuneration, employee empowerment, work life balance, training and development impact positively on employee retention. These are the elements that concern employees while making judgments about whether to stay or to leave the bank. This outcome is also consistent with the

hypothesis proposed in the literature. The impact levels of each aspect differ, for example, the appropriate fit position has the most impact on employee retention, while work-life balance has the least impact.

The right fit position is the most concern for HR to improve employee retention in the bank. The more fitting a job, the more employees tend to stay to work for the bank. Because they can adapt to the job requirements that fit them. Besides, the more satisfied remuneration, the higher employee retention within the bank. Additionally, the impact of employee empowerment on employee retention also points out that the more empowerment within the workplace will lead to more employees wanting to stay. For example, if staff have more power in decision making in their job, they will stay and keep working. This is similar for work life balance, training and development. If the work - home conflicts are reduced, they tend to stay. Furthermore, if employees receive the most up-to-date training program to help them do their jobs better, they will be more likely to stay.

It proves that Vietnam commercial banks have not applied effective policies to balance the work - life of employees. It can be understood as employees of banks work tirelessly to meet the diverse needs of their clients (Goyal & Babel, 2015). They must also meet several deadlines in order to compact and load their materials while also producing high-quality results. Accordingly, banking workers find it difficult to combine work and family life due to the demands of the job. Hence, HR and bank leaders should consider these factors to have policies to satisfy employees as well as retain employees. Especially, they should create policies to enhance work - life balance for employees because this factor still impacts on employee retention as the result revealed. Increasing work - life balance supports to improve employee satisfaction, employee retention as well as productivity. There are some benefits indicated for employers if they have strategies to manage work - life balance well: reducing absenteeism rates, increasing employee morale and commitment and productivity, decreasing stress and turnover rate, attracting skilled employees, minimizing recruitment and training cost (Goyal & Babel, 2015). Accordingly, it is important for employers to focus on balancing work - life of employees to gain these benefits.

5.2. Managerial implication

The current situation of human resources in the Vietnamese banking industry is facing complicated problems. The emergence of new banks threatens commercial banks because it risks disrupting human resources. Talent and skilled employees are especially sought due to the lack of high-quality employees in the market. Banks are having a difficult time filling immediate vacant positions, and their recruiting costs are that daily. To recommend the policy of increasing employee retention, factors figured out in this study are helpful. It means that managers should base on the impact level of factors to plan effective strategies to retain human resources. Specifically, they should be concerned with the right fit position mostly, and then training and development, employee empowerment, remuneration and work life balance.

According to Herbert et al. (2019), in terms of the right fit position, the organisation should decide which types of applicants are most likely to possess the requisite KSAOs (Knowledge - Skills - Attitude - Other attributes), as found through the job analysis process. Hence, banks can apply KSAOs for strategies in the recruiting process to find the right person with right competencies for each position and avoid lack of talent or skilled employees as well as reduce cost for recruitment and training. Besides, banks should focus on training and development to support employees in their current job and opportunities for their future career. Moreover, they should have strategies to increase the power of making decisions for employees, provide good remuneration compared to other competitors, enhance work-life balance to increase employee retention.

This study identified factors that positively affect employee retention in Vietnam commercial banks, including the right fit position, remuneration, employee empowerment, work - life balance, training and development. The right fit position has the highest impact on employee retention, while work - life balance has the lowest impact. This is the addition to the findings of new factors influencing employee retention in Vietnamese commercial banks. Furthermore, it also denotes a well-suited role, decent remuneration and employee empowerment, training and development, and strong employee retention. Nonetheless, it also emphasizes the poor work-life balance in the banking workplace. Hence, this research supports HR departments in banks considering factors to have appropriate policies to address the potential problems in their existing talent management strategies to improve employee retention.

Abstract

This paper aims to examine the factors influencing the intention to use home medical examination and treatment services among people in northern Vietnam. A qualitative method from 396 respondents was used to test the proposed model. All data were assessed reliability and validity on SPSS version 26 before conducting into CFA and CB-SEM in AMOS software. The findings indicate that all the hypotheses are accepted. Specifically, Benefit Perception has the strongest impact on consumers' attitudes, while the subjective Norm is the least impact factor. In addition, Risk Perception is the only variable that has a negative impact on both consumer attitudes and intentions. To increase positive attitudes and intentions of people towards using home healthcare services and to relieve pressure on public healthcare services, management agencies need to increase propaganda about this new form of healthcare services through public channels. Besides, home-visiting doctors have a responsibility to enhance their professional capabilities and be aware of the attitudes of respect, attentiveness, and friendliness towards patients.

Keywords: *home healthcare services, intention, Northern Vietnam*

1. Introduction

Currently, the overload of healthcare services is a common issue in most public hospitals in Vietnam, especially in central and provincial level hospitals. The utilization rate of inpatient beds often exceeds 100%. It ranges from 120% to 150% in some large hospitals, such as Bach Mai Hospital, Ho Chi Minh City Tumor Hospital, and Children's Hospital 1 (Ho Chi Minh City). The demand for healthcare services is increasing while the infrastructure development of healthcare facilities is still low and insufficient to meet the increasing demand.

Moreover, the healthcare system still needs to meet the healthcare needs of the people entirely, and the efficiency of healthcare services is low. In addition, primary healthcare at the local level could be more effective, leading to many people neglecting preventive care and not raising awareness of their health until they get sick and start seeking treatment. Besides, most current medical stations cannot manage chronic diseases, and the quantity and quality of services at first-line healthcare facilities still need to be improved. According to decentralization, communal health stations can only provide 50% to 70% of technical services and around 40% of the drug list.

To address these issues, one of the solutions proposed is home healthcare services (HHCS) - a type of family healthcare service that has been available for a long time in many countries worldwide but has only recently developed in Vietnam. HHCS provides many benefits for patients and their families, but due to the lack of information and psychological hesitation, many people need to pay more attention to this service.

Around the world, the family doctor-HHCS model has been widely developed and applied in many countries. In 1995, 56 countries had developed and implemented family medicine training programs. The World Organization of Family Doctors (WONCA) was established in 1972 and now has nearly 100 member countries. Nowadays, the family doctor model has been developed extensively not only in developed countries such as France, the U.S., the UK, Canada, and Australia, but also in developing countries such as Malaysia, the Philippines, and especially Cuba, which is considered a model country in developing the family doctor model in the group of developing countries.

Despite its many benefits, this service has yet to be supported by many development policies in Vietnam, and its usage has only increased during the Covid outbreak. In order to maintain public participation in the use of home medical examination and treatment services after the pandemic, the government and healthcare businesses need to have programs to educate and guide people on using this alternative healthcare model.

This study examined the factors influencing the intention to use home medical examination and treatment services among people in northern Vietnam. The research team believes that the study's findings will guide government management agencies, hospitals, home healthcare service providers, and the public to gain an overall understanding of this activity, thereby strengthening the intention to use this service in Vietnam.

2. Literature review

2.1. Theory planned behavior

The Theory of Planned Behavior (TPB) was developed from the Theory of Reasoned Action (Ajzen and Fishbein, 1975), which was created to overcome the limitations of previous theories that assumed human behavior is solely controlled by rational thinking.

According to the Theory of Reasoned Action, if a person has a positive attitude towards behavior and essential others expect them to perform the behavior (i.e., subjective norm), then this will lead to a higher intention to perform the behavior (i.e., greater motivation) and a greater likelihood of actually acting (i.e., implementing the intention). This finding has been demonstrated in many previous studies, affirming the link between attitude and subjective norm on intention and subsequent behavior.

However, there is still much controversy and opposition regarding the correlation between intention and actual behavior. Some studies have shown that intention only sometimes leads to actual behavior due to limitations in the situation. Specifically, if an individual lacks behavioral control, intention is not the decisive factor in performing that behavior. Additionally, Ajzen proposed the Theory of Planned Behavior by adding a new factor, perceived behavioral control, to extend the Theory of Reasoned Action and include non-rational factors to increase the accuracy of predicting human behavior.

Furthermore, the strong correlation between attitude and intention in this theory has also been tested in the health field, such as in the study "Theory of Planned Behavior: A case study with Health-related Behaviors" by G. Godin and G. Kok. Therefore, the authors applied the Theory of Planned Behavior to construct their research model in this study.

2.2. Health Consciousness

In the study "Habits of Using Health Services on Mobile Devices under the Influence of Health Consciousness," health consciousness is a motivational factor that predicts many health attitudes and behaviors in previous studies. Jayanti and Burns (1998) demonstrated that health consciousness refers to "the extent to which health concerns are integrated into a person's daily activities," Individuals with high health consciousness are more likely to engage in preventative healthcare behaviors than health-related actions.

In the study "Impact of health consciousness, concerns for food safety, and Ethics on Attitudes and Intentions to consume organic food," health consciousness measures the willingness to perform health-related actions. Health-conscious consumers always care about their health and have the spirit of improving or maintaining their health and quality of life, as well as preventing diseases by taking good health-related actions and being aware of their health.

In the study "Health Consciousness and its Impact on Awareness, beliefs, and Intentions to consume dairy products: A consumer perspective in emerging markets," health consciousness is understood as an individual's tendency to engage in actions that positively impact their health. Gould divides health consciousness into four main parts: concern for

health, increased attention to health, frequent searching for health information, and the ability to evaluate health status.

In the study "Influence of quality perception and health consciousness on Attitudes and Intentions to use home healthcare services," health consciousness is understood as the degree of consumer concerns about health-related issues, as demonstrated by their tendency to act or use products and services that benefit their health.

2.3. Benefit perception

The structure of perceived benefits is defined as the belief in positive outcomes associated with a specific behavior to cope with a real threat or perception. The structure of perceived benefits is most applied to health-related behaviors, specifically an individual's perception of the benefits that will accrue by engaging in a specific health action (Victory Champion, 2020).

Perceived benefits refer to the awareness of positive consequences of a specific action. In behavioral medicine, the term perceived benefits is often used to explain an individual's motivation to engage in a behavior and apply interventions or treatments. Researchers and theorists attempt to measure positive perceptions because they believe that behavior is driven by an individual's perception of acceptance, motivation, and attitude toward that behavior, especially if it is positive (Leung, 2013).

2.4. Risk perception

The perception of risk refers to "the subjective evaluation of the likelihood of a specific accident occurring and the degree of concern we have about its consequences" (Sjöberg, Moen, & Rundmo, 2004). Pidgeon, Hood, Jones, Turner, and Gibson (1992) defined *risk perception* as "people's beliefs, attitudes, evaluations, and emotions, as well as the cultural or broader societal values and orientations they accept, regarding the dangers and benefits of such hazards, and thus emphasize that risk perception is not just an individual process but must be understood on a cultural and social basis, a conclusion consistent with the perspective of Kasperson, Kasperson, Pidgeon, & Slovic (2003).

According to Simon Grima and colleagues (2021), risk perception is the subjective judgment that people form about the characteristics, severity, and coping strategies of risks. One of the critical factors is the feeling of outrage and indignation that a risk elicits, which will exponentially amplify worry and quickly spread throughout society. Meanwhile, A. M. Adams and colleagues (2001) state that risk perception is like the perception of noise, heat, or health; there are objective measures for at least some aspects of these entities, but these measures themselves are not sufficient, as subjective perception is also important. It is recognized that individuals tend to evaluate risks not only based on statistical data but also on many other subjective qualitative aspects. Risk assessment and perception are unconscious, subjective, and personality-dependent, and do not follow rational patterns or methods. Three aspects influence how an individual perceives risk. The first is the psychological tendency of the individual towards risk. Individuals may seek risk, dislike

risk, or be neutral toward it. Some will accept relatively significant risks for relatively small benefits, while others are the opposite. However, if the probability of an individual being affected is 0 or 1, the importance of adverse outcomes for the individual must be considered. Some may have greater significance than others. The second aspect of risk perception is the characteristics of the risk itself.

According to Rebecca Ferrer and colleagues (2015), risk perception - or an individual's perception of threat sensitivity - is a central component of many health behavior change theories, such as the Health Belief Model, Protection Motivation Theory, and Extended Parallel Process Model. These theories emphasize that the perceived risk of a health threat is a critical factor in the decision to adopt protective behavior. Additional consequences and the importance of providing accurate and comprehensible information about risks, highlighting the severity of the potential consequences, and enhancing the perceived efficacy of the recommended behavior. Overall, risk perception is a complex and dynamic process influenced by various personal, social, and cultural factors, and it is essential to consider these factors when assessing and managing risks.

2.5. Attitude

According to A.Ph. Lagiurxki (1874-1917), psychological life is divided into external and internal fields. External psychology is "the system of personality attitudes towards the surrounding environment." According to him, attitudes towards the environment include attitudes towards nature, labor products, other individuals, and social groups, and he particularly values attitudes towards labor, profession, ownership, others, and society.

Author V.N. Miaxisev (1892-1973) began studying the issue of attitude and mainly relied on the perspective of the psychology of personality theory. It is a combination of theoretical concepts that hold that "the psychological nucleus of personality is a complete system of selective, conscious attitudes with subjective value towards objective reality." The attitude system is formed through the mechanism of "from outside to inside" transformation through activities and communication with others in the social conditions that the subject is living and operating in. It determines the emotional characteristics, cognitive perception of objective reality, and behavioral reactions of individuals. All psychological organizations are related to attitudes. V.N. Miaxisev identified two types of attitudes: positive and negative, and the relationship between them and the people around them is the basis for forming the personality attitude system.

V.A. Iadov studied mood's role in the individual's social behavior. He believed that "humans have a complex system of different positionings (positioning including social mood, basic tendencies of interest, and value orientation system) and these organizations control human behavior. These positions are organized into four levels with different degrees, and in a positioning system, the higher-level positioning can dominate the lower-level positioning."

Another approach is the theory of subjective attitude by author B.Ph. Lomov in the late twentieth century. He believed that "the nature and dynamics of subjective attitude are

formed in each individual depending on their position in the system of social relations and its development in that system." Based on these proposals and the research perspective on personality, which includes subjective attitudes of individuals, B.Ph. Lomov outlined the scientific basis and methodology for studying attitudes.

2.6. Home Healthcare Service Intention

According to the Theory of Planned Behavior by Ajzen (1991), the critical factor in the theory of behavior with a plan is an individual's intention to carry out a specific behavior. The intention is postulated to capture the factors that motivate and influence behavior, and it reflects and drives the individual's effort and determination to perform the desired behavior. Generally, the stronger the intention to engage in a behavior, the higher the likelihood of performing that behavior. However, it should be noted that an intention can only be expressed in behavior if the behavior is subject to the control of willpower, meaning that the person can decide whether to perform the behavior or not.

Overall, these factors reflect an individual's ability to control their behavior. When individuals have the necessary opportunities, resources, and intention to perform a behavior, they are more likely to succeed in carrying out that behavior.

Therefore, in this study, the intention is understood as the desire to use home healthcare services in the future when the necessary resources and appropriate circumstances are present.

2.7. Hypothesis development

H1: Health consciousness has a positive influence on attitude

Since 1991, Dr. Stephen J. Gould has done the topic "Health awareness and health behavior: Applying a new health cognitive scale" and has argued about the hypotheses that individuals have any individuals. Personal consciousness is higher than others who are more likely to focus on psychological signs and SOMA inside related to stress factors in life and then act concretely to reduce them. On this basis, researchers in preventive medicine and relevant related fields are reasonable when considering whether this self-conscious characteristic measure may arise. The branch is a sense of health or the level of awareness of your health. In addition, positive results with the expansion of the sense of self - consciousness for the awareness of specific areas.

By 2008, Nina Michaelidou and Louise M. Hassan studied the role of health awareness, food safety, and morality in attitude and intention toward organic food consumption. These hypotheses are all standard and accepted.

H2: Subjective norm has a positive influence on attitude

Attitude towards acts plays an essential role in explaining the intention to buy. In the theory of planning behavior (TPB), the attitude toward customers is based on evaluating the desired effect on behavior. The higher this assessment, the more positive customers' attitudes will lead to solid intentions to commit this behavior.

Subjective standard is a social decision factor for reflecting social pressure on behavior. These subjective effects may differ between cultures and social factors about a person's belief about the opinion of others who agree to buy beer.

According to Hofstede, assessing Vietnamese culture is considered a collective, different from the unique culture in some Western countries such as England. A collective culture is a place where individual freedom may be limited. Moreover, individuals must integrate into the vast community (Hofstede, 2012). The "herd effect" also quickly affects Vietnamese consumers' psychology. The reason is that the information needs to be fully grasped accurately (Vu Huy Thong, 2010). Often through observation, people of everyone around learn and becomes more secure when someone has used it, so the trend of using beer will be affected by others.

H3: Perceive Behavioral control has a positive influence on attitude

An individual's perception of ease or difficulty in giving specific attitudes depends on the available resources and opportunities to perform behaviors. Ajzen suggested that cognitive factors that control behavior directly affect attitude trends. If the person is aware of his accurate level of control, the behavior control also predicts behavior. The concept of awareness of behavior control is conceptuality with autonomy.

H4: Benefit perception has a positive influence on attitude

The perception of benefit is related to performance expectations in attitude. Based on Davis's original definition, perception of benefit in this study refers to "the extent to which participants believe that using home healthcare service for self-management will enhance their abilities and improve efficiency." External and consumer health studies have consistently found that perceived benefits and attitudes are related to the acceptance of home healthcare services. This suggests that patients are more likely to accept home healthcare services if they believe the method is helpful because it can communicate health benefits or facilitate self-management conditions.

Improving customer benefits by improving service quality, such as diversifying current services, offering flexible testing packages, and customizing testing packages to customer requirements, can increase perceived benefits. In addition, increasing the number of guidance staff at hospitals can quickly support customers to save time and effort by the home healthcare service criteria.

H5: Risk perception has a negative influence on attitude

Risk perception and risk attitude are clearly described as determining factors of risk behavior, but they are rarely combined in a comprehensive approach to studying risk behavior (Frank Win van Winsen et al., 2011). Different scientific fields apply various approaches to study these two issues. The concepts of risk can be grouped according to epistemological foundations (Zinn, 2009). Furthermore, individuals have different perceptions of reality due to their different explanations of reality.

A.E. Lobb, M. Mazzocchi, and W.B. Trail (2007) proposed a statistical strategy to explain how the intention to purchase food is affected by different levels of risk perception

and trust in food safety information. The modeling process is based on Ajzen's Theory of Planned Behavior and includes trust and risk perception as additional explanatory factors. This study only presents a reverse impact of risk perception on attitude towards using safe food. Although there are many differences in the service industry, this impact direction is like studies in other service industries (Hsi-Peng Lu, Chin-Lung Hsu, Hsiu-Ying Hsu, 2005; N. Arora, M. Rahul, 2018). Applied to home healthcare services, it is assumed that risk perception has a reverse impact on attitude towards home healthcare services.

H6: Risk perception has a positive influence on attitude

The relationship between health awareness and the intention to use the service is also considered to be a direct and positive impact, mentioned in topics such as "the habit of using mobile services." Regarding health under the influence of health awareness "by Fanbo Menga, Xitong Guob, Zeyu Peng, Xiaofei Zhangd, and Doug Vogelb (2019), or in the study" The influence of debate, trust and health awareness about satisfaction, the intention of use and loyalty to the use of mobile applications related to health" by Putu Wuri Handayani, Nabilah Badriyah Gelshani, Fatimah Azzahro, Ave Adriana Pinkem, Achmad Nizar Hidayanto (2020)

H7: Benefit perception has a positive influence on home healthcare service intention

The concept of perceived benefits originates from social exchange theory, using costs and benefits as a starting point to examine social interaction behavior among individuals (Ward & Berno, 2011). Perceived benefits refer to the degree to which an individual believes that using a service or technology or performing a specific action can bring a certain level of interest (Reyes, Li & Visich, 2016).

Perceived benefits are the most important factor in explaining a significant proportion of the variance in behavioral intention. Patients are more likely to intend to use home healthcare services if they believe that using this service will enhance the ability and effectiveness of their healthcare treatment. This study also found that perceived usefulness significantly affects self-report use, consistent with previous research. Patients who feel that home healthcare services are beneficial to their health reported higher usage of these services.

H8: Risk perception has a negative influence on home healthcare service intention

Risk Perception refers to various types of financial risks, product performance, social, psychological, physical, or time risks when an individual uses mobile health services (Yang Zhao et al., 2018) and has been shown to influence the intention to use electronic health check-up services (mHealth). Based on 35 previous studies on the application of mobile health services, this study conducted a meta-analysis to examine eight factors influencing individual attitudes and behavioral intentions.

The meta-analysis results showed that risk and perceived attitudes significantly impact behavioral intentions, indicating that multiple factors influence user acceptance. In addition, traditional reception and health behavior theory variables need to be comprehensively considered and analyzed in mobile health application research. As an

individual's risk perception of using mobile health services increases, their intention to use decreases. Many other studies also note this counteractive impact (Clarissa Nuralifa Mangkunegara, Fatunah Azzahro, P. W. Handayani, 2018).

H9: Attitude has a positive influence on home healthcare service intention

According to Ajzen (1991), attitude toward a behavior is an individual's evaluation of the outcome of performing a behavior. Attitude towards behavior is the extent to which the individual perceives the expression of that behavior as positive or negative. The consumer's attitude influences their intention (Ajzen & Fishbein, 1985). Building on this concept, Chaniotakis, Lymperopoulos, and Soureli (2010) have indicated that attitude towards behavior is the individual's evaluation that performing the behavior is worth the amount spent. Before this, Giner-Sorolla (1999) developed a scale for the attitude towards behavior factor that includes the individual's intention to perform a behavior aimed at the product/service beforehand and the belief that performing the behavior will be very good for themselves. De Matos, Ituassu, and Rossi (2007) also mentioned that the attitude towards the behavior of consumers is based on the belief that using the product will bring many benefits and is the best choice for them. These studies all show that there is always a relationship between attitude and intention to behave. The more positive the attitude, the more likely the customer is to develop an intention.

Figure 1. Conceptual framework

3. Method

3.1. Samples and Data collection

After having the final conceptual framework, this study uses a quantitative method, in which questionnaires were used as instruments to collect data from online users. The data collection was implemented from March to May 2023. A purposive sampling technique was applied due to the special feature of the research context. Researchers collected

questionnaires from respondents that are people over the age of 30 who can afford medical examination and treatment services for themselves and their relatives. Under Comrey's (1973) formula, the research sample size was required to be at least five times the number of observed variables. With 35 observed variables, this research must collect at least $5 \times 35 = 175$ respondents.

Therefore, there are 396 valid questionnaires, excluding the non-standard questionnaires, and the effective rate is 79.2%. The research sample showed that most survey subjects were between 18-25 and 35-60. The age group of 18-25 may not be the direct users of curative care services or have little need, but the research team believes that they are the ones who have the role of influencers in the decision-making process to use the service. At the same time, they are young people, so they can easily access new products and incredibly convenient services such as medical treatment. In addition, in the remaining age groups from 35 to 60, the number of respondents is adjusted because this is the group with a high probability of using the service or influencing the decision to use the service of relatives because they are potential customers of medical care services. The remaining two age groups under 18 and over 60 will be those who may need home healthcare services, but our service users need more time to decide which medical services to use. Hence, the survey focuses on the remaining objects will be more reasonable.

In addition, the respondents generally have a relatively high level of education and income. However, the number of people with an income of less than 10 million/month is the majority; it is appropriate because the number of respondents is 18-25 is quite a lot; this is the age at the beginning of his career, so that the income may be low. Based on this education and income level, the research team may know and be potential customers of home healthcare services.

3.2. Data analysis

The impact of independent variables and home healthcare services intention were examined under covariance-based structural equation modelling (CB-SEM). CB-SEM assesses the relationships between the model's constructs systematically and holistically (Hair et al., 2006). It takes an affirmative rather than an exploratory approach to data analysis. Finally, CB-SEM considers model fit while it considers explicit estimates of measurement error. Before the data was put into SEM, Cronbach's alpha assessment, exploratory factor analysis (EFA) and confirmatory factor analysis (CFA) were conducted to guarantee the reliability, validity and the goodness of fit criteria. The testing standard is Cronbach Alpha ≥ 0.7 and the Corrected item-total Correlation ≥ 0.3 (Hair et al., 2006). The result showed that HC5 was also eliminated with the Corrected Item-Total Correlation lower than 0.3. Hence, the adjusted model finally only has 34 observed and seven latent variables, then put into CFA and CB-SEM.

4. Results

After preliminary testing of measurement scales, we continued to use AMOS software version 20.0 to conduct CFA (Confirmatory Factor Analysis) for measurement

scales, testing the suitability of the research model and research hypotheses. Testing criteria used include CMIN/df; Goodness of Fit Index; Tucker & Lewis Index; Comparative Fit Index; Root Mean Square Error Approximation. The confirmatory factor analysis (CFA) of our measures indicates that the overall model fit of the measurement model was satisfactory: CMIN/df=1.301<3; CFI=0.975; GFI=0.913; TLI=0.973; RMSEA=0.028; PCLOSE=1.00. Furthermore, all factor loadings were statistically significant within an acceptable range.

From the above results, the research model is delighted and suitable with market data.

Attitude and Home healthcare services intention were affected by Health consciousness ($\beta=0.209$, $p<.001$; $\beta=0.331$, $p<.001$), so H1 and H6 were supported. With the development of the economy and higher living standards, people are becoming more concerned about their physical and mental health. They are increasingly seeking solutions to protect their health from an early age rather than waiting until they become ill and need to visit a hospital for treatment. This heightened health awareness has led to a more positive attitude towards various preventive and treatment methods, not just going directly to a hospital but also utilizing home healthcare services.

These results indicate that if individuals have a positive subjective perception of home healthcare services, their attitude towards it becomes more positive. This subjective perception is influenced by advice and opinions from family members such as spouses and relatives and healthcare professionals such as doctors and nurses, who positively impact the process of using home healthcare services in Vietnam. In other words, those around the user influence their perception of healthcare services, especially those from their family members and healthcare professionals. The perceived behavioral control also positively impacts users' attitudes toward home healthcare services in Northern Vietnam. Users generally know and

can use home healthcare services, contributing to a more positive attitude. They believe they have sufficient knowledge about relevant information, are financially capable of paying fees, and have the ability to support and promote the process of using home healthcare services. Additionally, they assert that they have enough understanding about this service and trust that their intention to use home healthcare services is accurate.

Attitude and Home healthcare services intention were affected by Benefit Perception ($\beta=0.314$, $p<.001$; $\beta=0.280$, $p<.001$), so H4 and H7 were supported. This is the strongest factor influencing consumer attitude. Before using a product/service, consumers consider the benefits it brings compared to its cost. In Vietnam, as awareness of health among the population is increasing, the benefits of using home healthcare services are unprecedented, reducing some of consumers' hesitation in using the service. Therefore, a higher perceived benefit leads to a more positive attitude and intention of consumers toward the service.

On the other hand, Risk perception also affects the attitude and intention of consumers with $\beta = -0.111$, $p = .001$, and $\beta = -0.170$, $p <.001$. Despite the undeniable benefits of home healthcare services for consumers, they still have concerns about the risks that this service may bring, such as the expertise of doctors and the quality of infrastructure. This is a significant obstacle to the widespread adoption of home healthcare services in Northern Vietnam. They need to ensure they do not encounter health issues from receiving medical care at home instead of going to hospitals or healthcare facilities.

Prior research has extensively employed the theory of planned behavior to investigate the link between attitude and purchase intention (Ajzen, 1991), which accounts for why the intention to use home healthcare services was influenced by the attitude with $\beta=0.182$, $p<.001$. The more positive the attitude, the greater the consumers' intention to utilize home healthcare services.

5. Discussion and Conclusion

The study on the intention to use home healthcare services has reconfirmed the TPB model of Ajzen and Fishbein (1975) in the healthcare field, specifically in the northern region of Vietnam. The study also showed that perceived health and perceived benefits significantly impacted attitudes and intentions to use home healthcare services among people in the northern region of Vietnam. This needs further research in the medical field for future topics. Scholars can consider comparing different forms of healthcare services under the influence of perceived health and perceived benefits. Further research will clarify the role of these two factors in the medical field.

Furthermore, perceived risk has been demonstrated to impact attitude and intention to use home healthcare services negatively. This shows that economic and resource risks create barriers for patients to agree to use home healthcare services. To clarify this relationship, future scholars need to study each factor in perceived risk, such as economic risk, psycho-social risk, social support risk, time risk, process risk, and treatment risk, in their roles in affecting attitude and intention to use healthcare services.

To increase positive attitudes and intentions of people towards using home healthcare services and to relieve pressure on public healthcare services, management agencies need to increase propaganda about this new form of healthcare services through public channels so that people can have complete information and gradually become familiar with this new form of healthcare services. Avoid fears that high medical costs accompany home healthcare services. Through this propaganda, subjective standards from payers for home healthcare services will increase thanks to the social impacts and influence of others.

Complete information must also be provided and analyzed for people to understand the health benefits of home healthcare services. Training doctors for home healthcare services needs to be emphasized, along with updating modern equipment suitable for healthcare conditions to increase awareness of benefits and reduce perceived risks from patients. Moreover, registering for home healthcare services and the payment process must be simple and transparent.

To increase awareness of the benefits for users of the service, home-visiting doctors have a responsibility to enhance their professional capabilities and be aware of the attitudes of respect, attentiveness, and friendliness towards patients. Doctors need to consult on appropriate treatment protocols to support patients to recover from illness as quickly as possible. This helps patients feel empathy from the doctor while reducing risk perceptions regarding the skill level of home-visiting doctors.

When doctors support patients in recovery from illness with professionalism and a caring attitude, patients will positively spread word-of-mouth about the home visiting medical service, which increases subjective standards in promoting attitudes and intentions to use home medical examination and treatment services for everyone.

Abstract

In the current era of technology 4.0, modern education with the intelligent school model requires students to have factors such as positive thinking, independence, creativity, proactive grasping, effective teamwork, and problem-solving skills to master scientific knowledge. The study was conducted to investigate the impact of some soft skills and thinking on the learning outcomes of students at universities in Hanoi, namely: Critical thinking, Teamwork skills, Creative thinking, and Problem-solving skills. The study first reviewed previous research and developed hypotheses related to the research's objectives. Structural equation modeling (SEM) was conducted to test the hypotheses with the survey data of 623 students from several universities in Hanoi. Results of the study reveal that the factors affecting students' Learning outcomes include: Creative thinking; Teamwork skills; four factors of Problem-Solving Skills are Problem-solving confidence, Approach style, Avoidance style, and Personal control; two tendencies of Critical thinking are Cynical disposition and Analytical disposition. Finally, the results of the multi-group structural analysis show that there is a difference in the impact of variables in the model between students of different majors and no difference between male and female students.

Keywords: *Learning outcomes, Critical thinking, Problem-solving skills, Teamwork skills, Creative thinking*

1. Introduction

According to the World Economic Forum's predictions, by 2025, humans will only account for 48% of the workforce, with the remaining 52% consisting of machines and related algorithms. The traditional educational approach of solely transmitting knowledge is no longer appropriate. As reported by Bao Thanh Nien in 2019, the new core of modern

education is focused on teaching thinking and soft skills, which are human traits that machines cannot replace. Additionally, Iper's 2022 study on education trends reveals that advanced education systems around the world, such as those in the US and Finland, are currently emphasizing the training of 21st-century skills, including teamwork, communication, critical thinking, and creativity. According to Thoi Bao Ngan Hang (2013), teaching methods at Vietnamese universities still rely on the instructor-centered approach, which emphasizes understanding concepts, following predetermined discussion methods, and finding the true answer. This teaching approach, known as the "teacher lectures and students take notes," is still widespread, resulting in passive learning, lack of critical thinking, and creativity. In the study conducted by the National Capacity Research and Development Center under the Ministry of Education and Training (2021), which surveyed the soft skills of university students in Vietnam in the context of the 4th Industrial Revolution, the results showed that only about 15% of students having sufficient soft skills to work effectively in the 4.0 era. Therefore, it is necessary for universities and students to develop solutions that promote students' thinking and skills during the learning process, which will help students actively grasp and enhance their learning outcomes.

Currently, in Vietnam, there is only one study on the impact of critical thinking and problem-solving skills on students' academic achievement, but the sample size is not representative (Ngo My Tran et al., 2021). Moreover, there are not many studies that have examined the differences between students from different majors in terms of the impact of factors on academic achievement/learning outcomes. This indicates that there is still a significant gap in research on the influence of skills and critical thinking on students' academic achievement in Vietnam.

The research was conducted with four main objectives to provide proposals for universities and students: (1) Clarify the theoretical foundation and related concepts of students' knowledge acquisition at universities; (2) Build a model with factors that influence students' learning outcomes; (3) Examine the differences in the impact of these factors on students' learning outcomes among different gender and academic majors; (4) Suggest some solutions for universities and students to improve student's learning outcomes through their critical thinking skills and soft skills.

2. Literature Review

2.1. Learning outcomes

According to Young et al. (2003), the students' Learning outcomes are measured based on students' overall assessment of the knowledge and skills they acquired while taking the course. This concept also is used in the study "Factors affecting the learning outcomes of economics students" quoted in the book "Scientific Research in Business Administration" by Nguyen Dinh Tho & Nguyen Thi Mai Trang (2007).

Learning outcomes are written statements of what the successful student/learner is expected to be able to achieve at the end of the program module/course unit or qualification (Adam, 2004). Learning outcomes are statements of what a learner is expected to know,

understand, and/or be able to demonstrate after the completion of a process of learning (ECTS Users' Guide, 2005). Mrunal Mahajan & Manvinder Kaur Sarjit Singh (2017) suggested that learning outcomes should be based on the following factors: Knowledge, Cognitive, Practical, and Generic Skills.

2.2. Critical thinking

John Dewey (1909), an American philosopher, psychologist, and educator introduced the first concept of critical thinking, which is called "reflective thinking": "Active, persistent, and careful consideration of a belief or supposed form of knowledge in the light of the grounds which support it and the further conclusions to which it tends".

According to Irani et al. (2007), critical thinking includes three tendencies: Engagement (the ability to find and predict situations based on reasoning skills and self-confidence), Cognitive maturity (considering objective factors before making decisions, looking at problems from many directions) and Innovativeness (desire to seek new knowledge and seek truth, intellectual curiosity). Meanwhile, according to Chanut Poob Dej et al. (2014), critical thinking includes four tendencies: Cynical disposition (being distrustful or critical of others' opinions), Analytical disposition (being logical and objective towards others' opinions), Empathic disposition (mentally identifying with other people), Pluralistic disposition (accepting a diversity of opinions, values, theories). Through the research results of Chanut Poob Dej et al. (2014) and suggestions from experts, the authors propose the following hypotheses:

H1a. Cynical disposition of Critical thinking negatively affects students' Learning outcomes

H1b. Analytical disposition of Critical thinking positively affects students' Learning outcomes

H1c. Empathic disposition of Critical thinking positively affects students' Learning outcomes

H1d. Pluralistic disposition of Critical thinking positively affects students' Learning outcomes

2.3. Problem-solving skills

Problem-solving skills were defined as a behavioral process that makes available a variety of response alternatives for dealing with a problematic situation and increases the probability of selecting the most effective response from among these alternatives. Five stages of problem-solving skills were identified: general orientation or "set," problem definition and formulation, generation of alternatives, decision-making, and verification (D'Zurilla & Goldfried, 1971). Heppner and Petersen (1982) conducted research to develop the Problem-Solving Inventory (PSI), a scale designed to measure an individual's perception of their problem-solving abilities, as well as their behavior and attitudes related to problem-solving style. While the PSI does not directly measure problem-solving skills, it assesses an individual's beliefs, attitudes, and problem-solving styles. The scale includes 35 observed variables divided into three groups: Problem-solving confidence (with 11 observed variables), Personal control (with 5 observed variables), and Approach-Avoidance style (with 16 important variables). Heppner and Petersen (1982) define these factors as follows:

Problem-solving confidence (PSC) represents an individual's positive thinking and trust in their ability to solve problems. According to the studies of Elliott et al. (1990) and Heppner et al. (1995), PSC has a positive impact on improving students' knowledge acquisition. Based on the theoretical foundation and supporting evidence, the author formulates the hypothesis:

H2a. Problem-solving confidence positively affects students' learning outcomes

Approach-Avoidance style (AAS) is an individual's general tendency to approach or avoid social problem-solving. Studies by Heppner et al. (1995) and Baker (2003) have demonstrated that students who have a positive tendency towards approaching problem-solving are more likely to achieve better learning outcomes and knowledge acquisition. Based on the theoretical foundation and expert suggestions, the authors propose two hypotheses:

H2b. Avoidance style when solving problems negatively affects students' learning outcomes

H2c. Approach style when solving problems positively affects students' learning outcomes

Personal control (PC) represents an individual's level of trust in controlling their own emotions and behavior when addressing real-world problems. Similarly, to the Approach-Avoidance style or Problem-solving confidence, the positive impact of Personal control on knowledge acquisition has been confirmed in studies by Heppner et al. (1995) and Salami & Aremu (2006). Therefore, the authors propose the following hypotheses:

H2d. Personal control when solving problems positively affects students' learning outcomes

2.4. Teamwork skills

Teamwork is a generic and transversal skill that is characterized by its relational dimension. It is defined as the capacity to integrate into and interact with work groups, striving toward achieving common goals (Anderson-Butcher et al., 2014; Atxurra & Villardón-Gallego, 2015; BarraycoaMartínez & Lasaga-Millet, 2010; González & Wagenaar, 2003). According to Lower et al. (2017), from an individual perspective rather than a group perspective, team working skills include individual attitudes and behaviors. In 1997, Cannon-Bowers and Salas also concluded that there are three essential competencies for teamwork: Knowledge, skills, and attitudes (KSA).

In the academic sector, teamwork skills are often studied along with team-based learning (Park et al., 2015) and pedagogy for teamwork (Earnest et al., 2017), without much emphasis on the relationship between teamwork skills and knowledge acquisition. This often leads to a low assessment of the importance of teamwork skills among students, despite the fact that these are skills that students are expected to develop (Allen & O'Neill, 2015).

Gui Lohmann's study (2019) has shown that there is an important relationship between teamwork skills and knowledge acquisition. In addition, the positive impact of teamwork skills on knowledge acquisition has also been confirmed in the study by Tenzin Doleck et al. (2017). Therefore, the authors propose the following hypotheses:

H3. Teamwork skills positively affect students' learning outcomes

2.5. Creative thinking

According to Theo Davut (2008), creative thinking is the ability to discover previously undefined relationships and create new and unique experiences as a new template. Tenzin Doleck et al. (2017) suggest that there is a difference between creativity and creative thinking. While creativity is "the production of novel ideas that are useful or influential" (Sawyer, 2012), creative thinking is "a cognitive activity that includes many components of thinking skills, mediated by more aesthetic components of traditional creativity" (De Schryver & Yadav, 2015). Creative thinking has important impacts on various fields such as science, technology, economics, and education (OECD, 2019). In education, Tan (2000) and Greenstein (2012) have pointed out that creative thinking is one of the important higher-order thinking skills that help individuals succeed in school and in their future careers (Torrance, 1972). Akpur (2020), Anwar (2012), Gralewski and Karwowski (2012), Gregory and colleagues (2013), Huang and colleagues (2017), and Sebastian and Huang (2016) all argue that developing and enhancing students' creative thinking is important for their academic achievement.

According to Fernando Lourenco and Dilani Jayawarna (2010), there is a specific relationship between creative thinking and academic outcomes, including learning potential and intentions to use learning in the future. From the above theoretical bases and evidence, the authors hypothesize:

H4. Creative thinking positively affects students' learning outcomes

With the hypotheses stated above, the author group identifies the research model as follows:

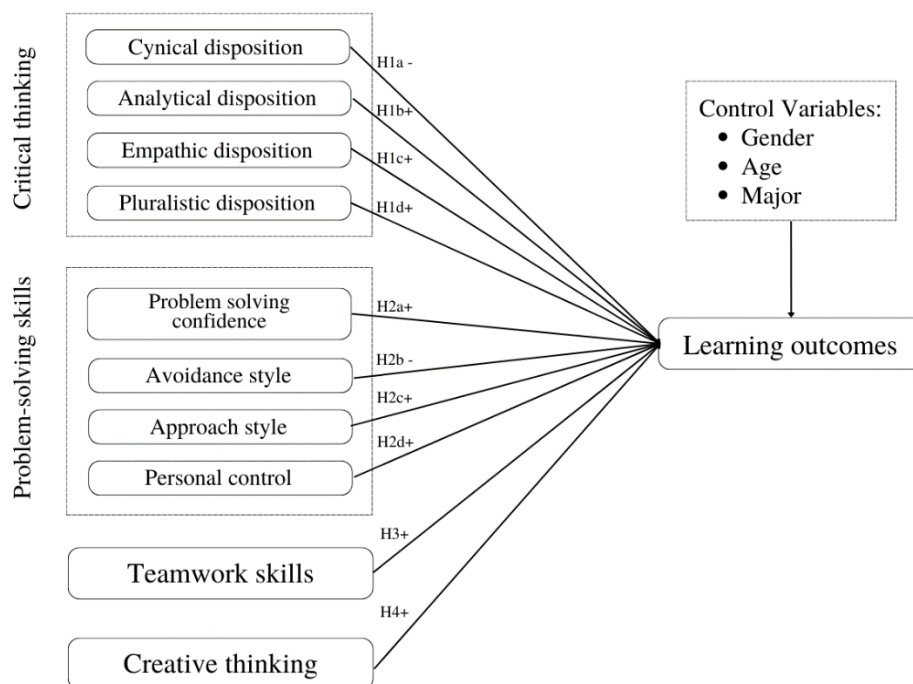

Figure 1. Proposed research model

Source: Self-synthesized research team, 2023

3. Method

3.1. Research process

The research process was carried out in three main stages:

In stage 1, the authors employed a qualitative research method. Through studying secondary data, the team constructed a theoretical framework to systematize concepts, measurement scales, and relationships among variables. From there, they identified gaps in previous research to propose testable hypotheses and model proposals. Subsequently, the authors used in-depth interviewing techniques to interview 18 students and 03 experts in the field of education, and university lecturers, following the prepared content. The aim was to identify the cognitive factors and soft skills that influence students' knowledge acquisition, screen and determine the relationships between variables in the initial theoretical model, while also testing the statements used in the quantitative research measurement scale previously constructed, thus refining the draft measurement scale before proceeding with quantitative research.

Prior to conducting a large-scale survey, the researchers performed a preliminary quantitative study through an online survey with 176 respondents. After collecting the questionnaire responses, the authors revised and shortened the questionnaire, adjusted the scale, and used simple, appropriate, and understandable language for the respondents. The data were then processed using SPSS 26.0 software with reliability coefficient Cronbach's Alpha and exploratory factor analysis (EFA).

Finally, the formal quantitative study was conducted in stage 3. Due to limited resources and time, the research team chose a convenient sampling method as it was appropriate for its ease of access, convenience in approaching respondents, and shorter data collection time. Following the recommendation of Hair, Anderson, Tatham, and Black (1998) for reference on the expected sample size, the research team needed a minimum of $N = 5 * 66 = 330$ research samples. However, to ensure objectivity and reliability for the study, the research team collected 623 survey questionnaires. The data collection process was carried out in both survey methods, face-to-face interviews, and online surveys. The total number of collected questionnaires from both survey methods was 641. After screening and checking the quality of the responses, the research team eliminated 18 questionnaires that did not meet the requirements. The remaining 623 survey data were classified and processed using SPSS 26.0 and SPSS AMOS 26.0 software to draw conclusions and provide recommendations for solutions.

3.2. Research Instruments

In order to determine the impact of critical thinking, problem-solving skills, teamwork skills, and creative thinking on the knowledge acquisition of university students in Hanoi, the authors used a Likert scale for the independent variables in the model, with a rating scale ranging from 1 to 5 (1 = Strongly Disagree; 2 = Disagree; 3 = Neutral; 4 = Agree; 5 = Strongly Agree).

Specifically, the Critical thinking scale was adapted from the study by Poondej, C., Koul, R., & Sujivorakul, C. (2013); the Problem-solving skills scale was adapted and modified from the study by P. Paul Heppner & Chris H. Petersen (1982); the Teamwork skills scale was adapted from the study by Lower et al (2017); the Creative thinking scale was adapted and modified from the study by Hu et al (2009); the Learning outcomes scale was adapted and modified from the study by Nguyen Dinh Tho & Nguyen Thi Mai Trang (2009).

3.3. Research Sample

According to the statistical results from the data of 623 survey samples, there were 325 female students and 298 male students participating in the survey, accounting for 52,5% and 47,8% respectively. Fourth-year students accounted for the majority of respondents (28,4%), followed by 24,2% of first-year students, 22,5% of second-year students, 17,2% of third-year students, and the rest were students from the fifth year and above. In terms of majors, students majoring in social sciences and humanities accounted for 36,9%, while students majoring in science, engineering, and technology accounted for 32,9%. The remaining 30,2% of students belonged to natural science majors.

4. Results

4.1. Results of the scale evaluation

4.1.1. Results of evaluating the reliability of the scale with Cronbach's Alpha coefficient

Table 1. Results of Cronbach's Alpha test for each variable

Constant	Factor	N of items	Cronbach's Alpha	Conclusion
HN	Cynical disposition	6	0,850	Accepted
PT	Analytical disposition	5	0,828	Accepted
DC	Empathic disposition	5	0,815	Accepted
DN	Pluralistic disposition	4	0,788	Accepted
TT	Problem-solving confidence	8	0,908	Accepted
NT	Avoidance style	5	0,900	Accepted
TC	Approach style	8	0,902	Accepted
KS	Personal control	5	0,847	Accepted
TW	Teamwork skills	10	0,912	Accepted
ST	Creative thinking	6	0,899	Accepted
KT	Learning outcomes	4	0,878	Accepted

Source: Self-synthesized research team, 2023

The data analysis results indicate that all variables used in the model have a Cronbach's Alpha coefficient > 0,6. At the same time, the correlation coefficient of the total

variables of each factor in the scale is greater than the significant condition of 0,3. The Cronbach's Alpha coefficient for each specific factor: The highest is the Teamwork skills factor with a coefficient of 0,912 and the lowest is the Pluralistic disposition factor with a coefficient of 0,788. No factor in the scale is below 0,6, meaning that all scales are valid, appropriate, meaningful, and ensure reliability.

4.1.2. Exploratory factor analysis

Table 2. KMO and Bartlett's Test results for independent variables

KMO		0,960
Bartlett's Test of Sphericity	Approx. Chi-Square	25017,158
	df	1891
	Sig.	0,000
Variance Extracted		62,531%
Eigenvalue		1,177

Source: Self-synthesized research team, 2023

The above test results show that the KMO coefficient satisfies $0,5 < \text{KMO} = 0,909 < 1$, so the EFA analysis method is appropriate for the data. In addition, Bartlett's test indicates that the observed variables are correlated with each other within the population ($\text{sig} = 0,000 < 0,05$). The authors obtained an approximate extracted variance of $62,531\% > 50\%$, indicating that the factor groups extracted from the rotated matrix explain 62,531% of the variance in the data, and the Eigenvalue index $= 1,177 > 1$. Therefore, the collected data is entirely suitable for conducting exploratory factor analysis (EFA).

The researchers want to select high-quality observed variables, so we will use a factor loading threshold of 0,5 instead of selecting factor loadings based on sample size. We then used the one-time elimination method for bad variables during the EFA analysis. 61 remaining observed variables were divided into 10 factors, however, some observed variables did not converge according to the previously proposed model. Specifically, two observed variables from the Pluralistic disposition scale converged with five observed variables from the Empathic disposition scale to form a group, referred to as the Empathic disposition scale.

4.1.3. Test the scale by confirmatory factor analysis

Table 3. Model Fit rating index in CFA analysis

Index	Value	Evaluation
CMIN/DF	2,412	Very good model (< 3)
CFI	0,897	Acceptable model ($> 0,8$)
GFI	0,815	Acceptable model ($> 0,8$)
RMSEA	0,048	Very good model ($< 0,06$)
PCLOSE	0,982	Very good model ($> 0,05$)

Source: Self-synthesized research team, 2023

The above results indicate that all indicators meet the requirements, meaning that the model can be suitable for the research data. Thus, after determining the relationship between variables in the model, and checking the suitability of the model with market data, the scale has reached the standard to test the model and hypotheses set forth by the research.

4.2. Test model and research hypothesis

4.2.1. Structural Equation Modeling Analysis

The analysis of the model results shows that the theoretical model has a significant Chi-square value (623) = 4126,770; Chi-square/df= 2,394; P-value= 0,000. Other indicators such as RMR = 0,043; GFI=0,802; TLI= 0,859; CFI= 0,867; RMSEA= 0,049 also meet the requirements and have been accepted (Schumacker & Lomax, 2004).

Figure 3. Results of testing Structural Equation Modeling

Source: Self-synthesized research team, 2023

4.2.2. Test the research hypotheses

Table 4. Results of unstandardized regression weights

			Estimate	S.E.	C.R.	P	Conclusion
KT	<---	HN	-0,058	0,029	-2,030	0,042	H1a: Accepted
KT	<---	PT	0,100	0,033	3,011	0,003	H1b: Accepted
KT	<---	DC	0,062	0,036	1,727	0,084	H1c: Rejected
KT	<---	TT	0,123	0,030	4,126	***	H2a: Accepted
KT	<---	NT	-0,064	0,022	-2,941	0,003	H2b: Accepted
KT	<---	TC	0,268	0,033	8,157	***	H2c: Accepted
KT	<---	KS	0,183	0,031	5,894	***	H2d: Accepted
KT	<---	TW	0,302	0,037	8,223	***	H3: Accepted
KT	<---	ST	0,114	0,032	3,507	***	H4: Accepted

Source: Self-synthesized research team, 2023

The unstandardized regression weights table shows that the p-value of the variable Empathic disposition is $0,084 > 0,05$; therefore, the variable Empathic disposition does not have a significant influence on the dependent variable Learning outcomes. Other independent variables such as Cynical disposition, Analytical disposition, Problem-solving confidence, Avoidance style, Approach style, Personal control, Teamwork skills, and Creative thinking all have p-values less than 0,05, indicating a significant influence on the dependent variable Learning outcomes. Thus, the authors reject hypothesis H1c and accept hypotheses H1a, H1b, H2a, H2b, H2c, H2d, H3, H4.

Table 5. Results of standardized regression weights

			Estimate
KT	<---	HN	-0,082
KT	<---	PT	0,125
KT	<---	TT	0,163
KT	<---	NT	-0,115
KT	<---	TC	0,342
KT	<---	KS	0,248
KT	<---	TW	0,347
KT	<---	ST	0,140

Source: Self-synthesized research team, 2023

The table of standardized regression weights shows that the impact level of Teamwork skills on Learning outcomes is 0.347, the largest among all factors. The factors

of Analytical disposition, Problem-solving confidence, Approach style, Personal control, Teamwork skills, and Creativity Thinking all have positive coefficients, indicating a positive impact on the dependent variable Learning outcomes. The two factors of Cynical disposition and Avoidance style have coefficients of -0.082 and -0.115, respectively, both smaller than 0, indicating that these two factors have a negative impact on the dependent variable Learning outcomes.

4.3. Evaluate the difference between groups in the control variable

4.3.1. Multigroup Analysis for the variable "Gender"

Table 6. Results of Multigroup Analysis for the variable "Gender"

	Chi-square	df
Invariant model	8870,772	2746
Variant model	8857,387	2738
Difference	13,385	8
P-value	0,09927169	

Source: Self-synthesized research team, 2023

The result of analyzing the two invariant and variant models for the variable "Gender" showed a p-value of $0,099 > 0,05$ (95% confidence level), indicating no Chi-square difference between the invariant and variant models.

Conclusion: There is no difference in the effect of variables in the model between students of different genders.

4.3.2. Multigroup Analysis for the variable "Major"

Table 7. Results of Multigroup Analysis for the variable "Major"

	Chi-square	df
Invariant model	12688.858	4123
Variant model	12647.108	4107
Difference	41.750	16
P-value	0.00042992	

Source: Self-synthesized research team, 2023

According to the results of the analysis of the two invariant and variant models of the variable "Major", the p-value is $0,0004 < 0,05$ (95% confidence level), indicating a Chi-square difference between the variant and invariant models. The authors chose the variant model to interpret the results.

Table 8. Result of variant model for the variable "Major"

	Social Sciences and Humanities		Engineering and Technology Sciences		Natural Sciences	
	Standardized regression weights	P	Standardized regression weights	P	Standardized regression weights	P
KT <--- HN	-0,097	0,124	-0,078	0,191	0,049	0,500
KT <--- PT	0,089	0,170	-0,027	0,657	0,381	***
KT <--- TT	0,046	0,450	0,185	0,002	0,305	***
KT <--- NT	-0,068	0,268	-0,222	***	-0,029	0,673
KT <--- TC	0,210	***	0,565	***	0,211	0,003
KT <--- KS	0,400	***	0,292	***	-0,002	0,980
KT <--- TW	0,523	***	0,090	0,119	0,365	***
KT <--- ST	0,132	0,033	0,250	***	-0,004	0,949
Squared Multiple Correlation	0,518		0,565		0,419	

Source: Self-synthesized research team, 2023

In the impact of the problem-solving approach on learning outcomes among students in different fields, the largest effect was found for students in the Engineering and Technology Sciences major (0,565 > 0,211 > 0,210), indicating that for these students, the problem-solving approach has a significant influence on their learning outcomes. The impact of teamwork skills on learning outcomes among students in the Social Sciences and Humanities was found to be the strongest (0,523 > 0,365 > 0,090), suggesting that for students in these fields, teamwork skills are crucial and have a positive impact on their learning outcomes in the university more than in the other two fields. On the other hand, the impact of problem-solving confidence had the strongest effect on knowledge acquisition among students in the Natural Sciences (0,305 > 0,185 > 0,046), indicating that students in this field are confident in their ability to solve problems. There was no significant difference in the correlation coefficients of the variables on knowledge acquisition among students in the three different fields. The highest correlation coefficient was found for the science and technology field at 0,565, while the lowest was found for the natural science field at 0,419. This suggests that overall, cognitive and soft skills have a significant impact on knowledge acquisition among students in the science and technology field.

Conclusion: There is a difference in the impact of variables on the model among students in different fields of study.

5. Conclusion

5.1. Conclusion

Through the process of validation and analysis of the data, the authors found that there are 8 factors that affect students' knowledge acquisition, including 2 factors with opposite effects: Cynical disposition (belonging to Critical thinking) and Avoidance style (belonging to Problem-solving skills); and 6 factors with positive effects: Analytical disposition (belonging to Critical thinking); Problem-solving confidence, Approach style, and Personal control (belonging to Problem-solving skills); Creative thinking and Teamwork skills.

In addition, analyzing the multigroup structure also helps to identify differences between different groups of students in terms of the impact of skills and thinking on learning outcomes. Specifically, there was no difference in the impact of variables in the model between students of different genders. However, there were differences in the impact of variables in the model between groups of students belonging to different majors, including Social Sciences and Humanities, Natural Sciences, Engineering and Technology Sciences.

Based on the conclusions drawn from the study, the authors provide some implications and recommendations for students and universities to enhance student's learning outcomes during and after the learning process. For students, not only is it important to improve their specialized knowledge and learn from textbooks, but also to develop and hone skills and critical thinking, especially those that students in the 21st century require, including critical thinking, problem-solving skills, teamwork skills, and creative thinking. Developing these skills will help students have a multidimensional perspective and better solve problems that arise during the learning process, stimulate comprehensive logical and creative thinking, increase cooperation with those around them, increase efficiency, and improve work results, leading to better learning outcomes. Universities, it is not the only place to equip students with knowledge, but also a supportive environment to help students develop other soft skills. Investing in soft skills education for students, including improving teaching methods and practical activities, is essential. This will enhance students' ability to apply knowledge and achieve success in their future careers.

5.2. Limitations and future research

During the research process, there are still some limitations that remain. Firstly, there are limitations regarding the scope of the research. Data were only collected from universities in Hanoi. Future studies could expand the scope of research to other provinces, cities, or regions across the country. Secondly, the sample selection structure of the group is not diverse enough. The survey sample mostly consists of public university students. Future studies could investigate the impact of skills and thinking on learning outcomes for various other groups such as high school students, students from different types of universities such as vocational schools, junior colleges, international linked universities, etc. Thirdly, there

are limitations regarding the measurement scale. The current study uses a measurement scale consisting of 66 questions. The long measurement scale may waste the survey respondents' time, and the author's time in collecting data, or result in some dishonest or poor-quality answers. A shorter measurement scale will help future researchers optimize data collection time while still obtaining more data.

National Economics University, Hanoi, Vietnam

Abstract

This paper uses qualitative and quantitative research to identify and evaluate factors affecting healthcare workers' intention to leave their job after the COVID-19 pandemic. Research data was collected from 183 healthcare workers in both public and private medical institutions in Hanoi from September to December 2022. Using SPSS 25 for data analysis, the study shows that the increase of Salary/Compensation, Interpersonal relationships, Recognition, Advancement and Working conditions would lower intention to leave job among Hanoi healthcare workers. Fear of infection and contagion, meanwhile, would heighten the intention to leave job. This result is used to propose some suggestions to improve this medical situation.

Keywords: *Intention to leave, healthcare workers, COVID-19 pandemic.*

1. Introduction

The COVID-19 pandemic first entered Vietnam in January 2020, and by December 2022, it has resulted in over 11 million infected cases, with casualties being 43186, accounting for 0.4% cases.

Over the course of the pandemic, lacking medical staff occurs occasionally due to an overload of patients, with many workers even having strong urges to leave their occupation. The Ministry of Health reported that many medical workers are compelled to move from public institutions to private ones after two years of battling with COVID-19. Official reports reveal, over 9680 workers have left their job from January 2021 to June 2022. This figure proves to be a great setback, especially in times of low workforce.

Existing studies have pointed out factors that have the most impact on medical staff's intention to leave include Work Stress, Salary and Fear of infection. Abdulrhman Saad

Albougami (2020) study pointed out nurses in Saudi Arabia experience moderate levels of stress in their job. Similarly, Jison Ki (2020) pointed out the relationship between health and intention to leave, with most participants reporting more than two health issues, mostly chest pain, leg pain, exhaustion and sleep disorders, directly influencing their intention to leave. In Vietnam, studies in this field are particularly limited. Phung Thanh Hung (2019) study discovered 60% of surveyed nurses have high job motivation and job satisfaction, but this study has a small sample size with low representability.

Existing literature in Vietnam has not been able to fully examine the impact of this pandemic on the medical staff, plus having smaller sample sizes. Therefore, inheriting the research suggestion from Randa M. Said (2021), this study is carried out to analyze the factors impacting intention to leave among Hanoi medical staff, with emphasis on their fear of infection and contagion during the pandemic.

Herzberg's Two-Factor theory considers two kinds of factors that have influence on job satisfaction: Hygiene factors and Motivation factors. He listed Hygiene factors including (1) interpersonal relations, (2) salary, (3) company policies and administration, (4) supervision, (5) working conditions which contributes to avoiding unpleasantness at work (Herzberg, 1966). On the other hand, Motivation factors have a direct impact on job satisfaction, as it involves (1) room for advancement, (2) the work itself, (3) possibility for growth, (4) responsibility, (5) recognition and (6) achievement. In this study, the research group focuses on examining interpersonal relations, salary, working conditions, room for advancement and recognition.

Hobfoll's Conservation of Resources theory suggest how stress occurred in particular situations involving personal resource, which could offer an understanding of the motivation of people to either maintain or seek a resource. This study apply this theory to figure out stress levels of medical workers during the pandemic in relation to the fear of infection and contagion.

This research was conducted to analyze factors affecting healthcare workers' intention to leave during the post-COVID-19 period by using theoretical basis and research results. Through finding most influential factors on the intention to leave of medical staff in a certain pandemic circumstance, the research group would suggest a series of solutions which help medical institutions adjust their policy to assist medical workers properly, improving retention rates in those organizations.

2. Methods

Study design

This study used qualitative and quantitative research to explore and evaluate factors affecting healthcare workers' intention to leave after the COVID-19 pandemic in Vietnam. Based on the theoretical basis, the paper's model was designed as follows:

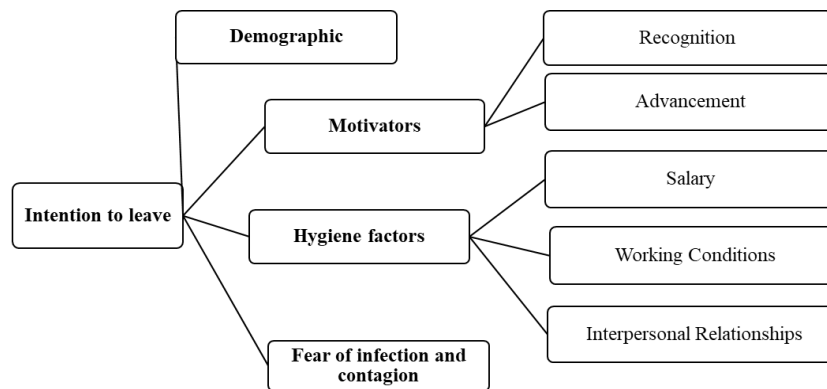

Figure 1. Research model of factors affecting healthcare worker's intention to leave

Source: Summary of the team's research results, 2022

Data collection and processing

The interviews

The authors conducted interviews with two doctors working at public hospitals in Hanoi and applied the preliminary data collection in a clinic with 20 staff in order to modify the final questionnaire.

After selecting samples, the authors interviewed two doctors working at public hospitals in Hanoi to justify COVID-19 relevant factors. When asked about difficulties during the COVID-19 pandemic, the first interviewee admitted that they were extremely nervous and stressed by the rising numbers of patients as well as the lack of medical equipment. Meanwhile, the second interviewee claimed it was a period of fear and exhaustion by the workload and the skepticism from others, worrying they were the spreading source of COVID-19. When asked about their intention to leave their current job, the first interviewee did not want to leave their job. However, the second interviewee confessed that they had thought about quitting their job due to unbearable pressure.

The survey

The author used a cluster sampling technique to select qualified samples with two standards of “directly involved in diagnosis and treatment of COVID-19 in Hanoi and agree to participate in this study from October to December 2022”. A total of 200 healthcare workers from 05 medical institutions participated, including public and private hospitals and clinics. However, there were 17 incomplete surveys. Therefore, 183 respondents were included in the final analysis.

The questionnaire had three sections, described as follows:

Demographic: This section asked respondents about their demographic and work-related information, including gender, marital status, cohabitation status, academic level, workplace, work experience, working position.

Factors affecting healthcare workers' intention to leave: A Likert Scale 5-point questionnaire was used in this section for respondents to rank their satisfaction with Recognition, Advancement, Salary, Working conditions, Interpersonal Relationships, and

Fear of Covid (including the fear of infection and contagion, and the fear of discrimination from the community).

Intention to leave their current jobs: The questionnaire used a Likert Scale 5-point from (1) Strongly disagree to (5) Strongly agree.

Data analysis

The authors used SPSS 25 software to analyze collected data. A standard logistic regression was performed to ascertain the relationship between factors. Besides, this study also utilized research techniques such as Cronbach's Alpha and EFA, the Exploratory factor analysis, to measure the data's consistency and reliability. The ANOVA test was applied to determine the differences in the respondents' intention to leave caused by demographic factors, including work experience, academic level, workplace, working position, and salary; meanwhile, the T-test was used to compare the intention to leave due to gender, marital status and cohabitation status.

Linear regression was also performed in this study to accredit the proposed hypotheses, examining the effects of independent variables on the dependent variable, which was the intention to leave.

$$Y = \beta_0 + \beta_1X_1 + \beta_2X_2 + \beta_3X_3 + \beta_4X_4 + \beta_5X_5 + \beta_6X_6 + \varepsilon$$

- Y: Intention to leave
- X1: Recognition
- X2: Promotion opportunities
- X3: Salary/ Compensation
- X4: Working environment
- X5: Interpersonal life
- X6: Fear

β is the Effect size, showing the effects of independent variables on dependent variable Y.

Table 1. Hypotheses proposed from the research model of factors affecting healthcare worker's intention to leave

No	Hypothesis
H1. Motivators reduce the intention to leave of healthcare workers.	
H1.1	"Recognition" reduces the intention to leave of healthcare workers.
H1.2	"Advancement" reduces the intention to leave of healthcare workers.
H2. Hygiene factors reduce the intention to leave of healthcare workers.	
H2.1	"Salary" reduces the intention to leave of healthcare workers.
H2.2	"Working conditions" reduces the intention to leave of healthcare workers.
H2.3	"Interpersonal relationships" reduces the intention to leave of healthcare workers.
H3. Fear of Covid increases the intention to leave of healthcare workers.	

Source: Summary of the team's research results, 2022

3. Results

Cronbach's Alpha analysis

The following analysis results show that the Cronbach's Alpha coefficient values are all over 0.7 and the variables have a sufficient total correlation coefficient greater than 0.3 after performing the Cronbach's Alpha analysis of the observed variables. As a result, every variable complies with the reliability standards.

Table 2. Scale analysis results

Number	Scale	Item	Cronbach's Alpha
1	Recognition	CN	0.737
2	Advancement	CHTT	0.747
3	Salary	LT	0.771
4	Working Conditions	MTLV	0.779
5	Interpersonal Relationships	QH	0.804
6	Fear of infection and contagion	NSLN	0.843
7	Fear of discrimination from the community	NSKT	0.802

Source: Summary of the team's research results, 2022

Exploratory Factor Analysis

Six factors were extracted from the EFA results under the assumption that the Eigenvalue was greater than 1, and these six factors condensed the data from the 21 observed variables. In addition, the total variance extracted for the six factors is 67.880% > 50%, indicating that the six factors and the 21 observed variables together account for 67.880% of the variance in the data. The load factor is greater than 0.5 for all elements.

Multivariate regression analysis

The adjusted R² (Adjusted R-squared) value after performing the regression is 0.633, which means that the model accounts for 63.3% of the variation in the dependent variable "Intention to leave." Other factors contributed to the remaining 36.7% intention to quit. According to the Durbin-Watson d statistic value of 1.855 (dU = 1,800 d = 1,855 4-dU = 2,145), there is no correlation between the first order series in the model. If the independent variable and other variables have a good correlation and the VIF value is less than 1.4, there is no danger of multicollinearity. Regression results of the factors show that, all 6 factors in the model have a certain degree of influence on Intention to quit due to Sig value. < 0.05. The magnification coefficient of variance is less than 2.2, indicating that there is little possibility of multicollinearity. Thus, we draw a regression model of the impact of factors on the intention to leave health workers in Hanoi city as below:

$$Y_{DNV} = 5,546 - 0,195*CN - 0,194*CHTT - 0,245*LT - 0,112*MTLV - 0,228*QH + 0,300*NS$$

Table 3. Results of Regression Analysis

	B	Standard error	Beta	T	Sig.	VIF
Constant	5.546	.448		12.393	.000	
CN	-.195	.054	-.187	-3.613	.000	1.330
CHTT	-.194	.051	-.186	-3.788	.000	1.200
LT	-.245	.051	-.247	-4.810	.000	1.302
MTLV	-.122	.054	-.119	-2.255	.025	1.372
QH	-.228	.052	-.219	-4.382	.000	1.234

	R squared					.645
	Adjusted R Square					.633
	Standard error					.42853
	Durbin Watson					1.855

4. Discussion and Recommendations

4.1. Discussion

The results of this study are consistent with earlier findings, including the papers of Lakshman Sangeetha (2016), showing that Motivation factors, including Advancement, Recognition, partly has an impact on medical staff's intention to leave. Hygiene factors, including Interpersonal Relationships and Salary is proved to have the largest negative impact towards staff's intention to leave, which proves similar to Abdulrhman Saad Albougami (2020). Workers believe that Salary is one of the most accurate means to prove their necessity to the organization and the value of the job. Fear of infection proved to have the greatest influence over the intention to leave, consistent with Saeideh Varasteh's findings (2022). The beginning of the pandemic came with many risks that remained unknown, with a speedy spread of the virus, resulting in medical staff's fear of contamination and the discrimination from the general public.

Vietnam, similarly to other countries, faced great challenges as the medical workforce fell insufficient during the pandemic. Apart from attracting new-hires, the need to retain former employees proved to be irreplaceable. The research group's suggestions include relieving tension between workers, improving communications between managers and staff to encourage better cooperation; considering changing policies to improve salaries, compensation and advancement opportunities for the workforce. Regarding fear, it is suggested that new information about the pandemic is regularly updated, especially in the rise of new variants of COVID (May 2023), and supplementing protecting equipment.

COVID-19 has greatly impacted medical staff's work and life. Managers have suggested a few solutions to retain employees, deduced from the findings above. In Vietnam, suggested solutions have been implemented, but have yet to show any significant results.

4.2. Recommendations

Vietnam and many other countries have been facing many patients with COVID-19 and a shortage of healthcare workers. Recommendations for hospital directors to improve job satisfaction include that managers can treat all healthcare workers fairly, listen to staff concerns, pay attention to their work and life problems at an early stage, maintain a good working relationship with employees, especially those with experience and regarding future welfare and benefits and even their state of health. Managers should create a system of consultation and open communication between doctors, nurses, and others to improve work interaction so that the team works together and trust can be strengthened.

At the same time, medical facilities need to establish a reward and recognition system for healthcare workers' contributions. This helps to improve morale and job satisfaction. Finally, having the opportunity to be promoted in the workplace is one way to help improve the expertise, pay, and self-determination of healthcare workers in the workplace. Managers should encourage healthcare professionals to specialize in a particular area of clinical practice, allowing them to acquire new skills, take on greater responsibility with greater autonomy, and grant promotion potential to increase their job satisfaction and stability.

The most common reason for quitting jobs during the beginning of the epidemic was that employees were afraid because they did not understand the disease, lacked personal protective equipment, and was fearful of spreading the disease to family members, so they needed to find a way to provide adequate personal protection equipment, ensuring the safety of healthcare workers and their families. Prioritizing healthcare workers' families when doing COVID testing and getting vaccinated are both effective ways to prevent work-family conflict. These measures also help families to support healthcare workers to some extent mentally and reduce the loss of human resources. Increasing workers' knowledge of the illness will reduce their fears over time and allow them to return to work after a period of absence. Therefore, health organizations should organize regular training sessions to keep healthcare workers updated with the latest and most accurate information about coronavirus to reduce the fear and negative feelings associated with this disease.

In conclusion, all these measures can help improve the quality of patient care.

Abstract

During the historical development of mankind, democracy is a social value that appeared quite early. The content of democracy can basically be understood as power belonging to the people. Power belongs to the people, always associated with the right to life and freedom of the people, with the task of liberating people from oppression, exploitation, injustice and bringing a life of freedom, equality and happiness. In terms of social regime, democracy is a form of state, which is born and develops in association with the state and also disappears when the state is lost. Democracy can also be considered as an organizational method and a tool for social management, a historical category, a cultural category, a political category, showing a profound humanity and era.

Keywords: *Democracy, civil rights, organizational method, social value.*

1. Introduction

Democracy is an objective need, a common aspiration of people in the process of man conquering the natural world and reforming society. Democracy is always associated with the development of the times and social progress. As humanity advances, the issues related to democracy and human rights become more urgent. Today, in the context of globalization, international integration, the development of the knowledge economy and the scientific-technological revolution, the issue of democracy is no longer a matter of individuals, of nations, nation, but of all mankind. Democracy has put people at the center of development, democracy contributes to solving economic, cultural, ethnic, religious and especially political issues. Without democracy, there would be no justice, freedom, civilization; Democracy must be associated with the socio-political regime. In fact, any democracy shows its democratic character through the state regime. Of course, not every state regime is accompanied by democracy, but whether the relationship between democracy and the state or democracy and politics is appropriate or inappropriate. Therefore, in the current context, democracy has an increasingly important position and role.

2. Method

The article is made based on the worldview and methodology of Marxism - Leninism. It is a combination of dialectical materialism and historical materialism to explain the process of formation and development of the democratic category. On the basis of that general methodology, the article uses a combination of history and logic to summarize the democracies that have existed in history and from that to draw the logic of the concept of democracy from many angles. When analyzing the history of socio-economic forms, the author finds that in each certain historical period there are different approaches to democracy. Comparative methods are also used in the article, to shed light on the extent to which democracy is used by countries around the world. In addition, the author also uses other interdisciplinary methods such as enumeration, analysis, synthesis, data synthesis... to clarify the angles of the current concept of democracy.

3. Results

3.1. The concept of democracy

The idea of democracy appeared very early, right in the primitive commune period, around the VII-VI century BC. The early form of democracy was expressed through the inherent rights of all citizens in the gentile society, but later Ph. Engels called it primitive democracy. In primitive society, categories such as freedom, democracy, justice... have not yet appeared, all members of a clan or tribe exercise the right to elect and remove the head of the clan or tribe. The work "Origin of the family, private property and the state" by Ph. Engels pointed out: "For all its innocence and simplicity, what a fine institution that gentile system is. There were no armies, gendarmes and police, no nobles, kings, governors, magistrates and magistrates, no prisons, no trials - and yet everything went smoothly. All frictions and all disputes are resolved collectively by the people involved - i.e. clans or tribes, or between clans... It's all up to the people involved, solve it on its own, and in most cases an old custom has already solved everything" (Marx, C & Engels, Ph, 1984, p.151-152). In the rule of primitive democracy, humanity between people is the main thing, it is a rule of behavior between people according to conventions and customs, not legal ones. The growing society, especially the development of productive forces and the division of labor, leads to excess wealth, private property and class division appearing. Democracy begins to take on a class character, democracy is associated with the nature of the state. Especially when there is language, writing and the development of abstract thinking, of the ability to generalize in human perception, people express that idea with the term Demoskratos that the Greek thinker antiquity speaks of democracy. In the language of the ancient Greeks, the term was compounded by Demos, the people, and Kratos, the ruler. Accordingly, the original meaning of democracy (Demoskratos) is also the basic meaning of the concept understood as the people's power or the people's power. The development of democracy has experienced the ups and downs of history, of the level of socio-economic development, of human cognitive capacity... But basically, until today, the term democracy is the power belonging to the people, which has been inherited and developed by theorists through the ages.

Democracy has been given different views by many theorists, but in general, democracy is the power that belongs to the people. According to the classics of Marxism-Leninism, democracy is just a political category; it was born, formed, developed and died along with the birth, formation, development and death of politics, in which, the most important is the state. Democracy is a form of state. Therefore, democracy is also a form of state and democracy will also have to be lost when that state no longer exists, of course it will only happen when communism is completely victorious. According to V.I Lenin, “Democracy is freedom, equality, the decision of the majority; there is nothing higher than freedom, equality, the decision of the majority” (Lenin, V.I, 1995, p.414). V.I Lenin repeatedly asserted that “democracy” is a form of state, one of forms of state. On the basis of Marxism-Leninism, President Ho Chi Minh conceived “Democracy is that people are democracy. Democracy is a treasure because it is not something that is naturally available but it is the result of the revolution, which our people had to struggle and sacrifice hard to win. Democracy is a treasure because it is the ideal and aspiration of all our people for a good society in the future. Democracy is a treasure because it gives people the right to control their own destiny, creating conditions and premise for the whole society, as well as each individual in the society, to develop and perfect. Thanks to democracy and through democracy, people have active, proactive and creative activities towards history” (Ho Chi Minh, 1996, p.279). He emphasized that because the people are the masters, the highest position belongs to the people, all power belongs to the people, all benefits are for the people, all work is done by the people. “The people are the masters” and “the people are the masters” show the originality and creativity in Ho Chi Minh's concept of democracy. The person who has put the people's position on the position, acts as the subject of society through the role of the people as the owner of the state.

In fact, there are many different views about democracy, according to the Vietnam Encyclopedia, democracy is understood as: “organizational form of socio-political institutions based on the recognition of the people as the source of power and the recognition of the principles of equality and freedom. Democracy is also applied to the organization and operation of certain political organizations and institutions” (Vietnam Encyclopedia, 1995, p.113). In the dictionary of philosophy, democracy is “one of those forms of government characterized by the formal proclamation of the principle that the minority is subject to the majority and the recognition of the freedom and equality of the citizens” (Dictionary of Philosophy, 1986, p.118).

International IDEA, International IDEA Strategy 2012-2017 (Stockholm: International IDEA, 2012), “Democracy is a universal human aspiration and an experience that is pursued and lived in different ways around the world. Democracy is also a system of governance in which government is controlled by the people and in which citizens are considered equals in the exercise of that control. Beyond the basic tenets of citizens’ choice and political equality, the critical choices are best made, and the quality of democracy best gauged, by those directly concerned: the citizens themselves. Therefore, the key leaders in

democratic change are a country's citizens, and the starting point for reform is at the national and local level" (Brechtje Kemp & Melida Jimenez, 2013, tr.13).

Amartya Sen said that "What exactly is democracy? We must not identify democracy with majority rule. Democracy has complex demands, which certainly include voting and respect for election results, but it also requires the protection of liberties and freedoms, respect for legal entitlements, and the guaranteeing of free discussion and uncensored distribution of news and fair comment. Even elections can be deeply defective if they occur without the different sides getting an adequate opportunity to present their respective cases, or without the electorate enjoying the freedom to obtain news and to consider the views of the competing protagonists. Democracy is a demanding system, and not just a mechanical condition (like majority rule) taken in isolation" (Amartya Sen, 1999, tr.5).

From the above viewpoints on democracy, we can understand that democracy is a product of human social history, a natural need with human nature in the process of fighting for natural and social reform. At present, when society is developing more and more, people's awareness level is increasing, the democracy category is also increasingly perfected. Democracy is perfected when the state is established by the people, the entire power of the state originates from the people. The people authorize the state to implement the will and aspirations of the people. serve the interests of the people.

3.2. Angles of approaching the concept of democracy today

First, democracy is approached as a democracy, which is the approach of popular interest. On the basis of inheriting the ideology of democracy of C. Marx and Ph. Engels, V.I. Lenin repeatedly affirmed that "democracy" is a form of state, one of the forms of the state. Democracy is also a state, so if the state is lost, democracy will also be lost. That is reflected in the thesis: "Democracy is a form of state, one of forms of the state. Therefore, like all existence of the state, democracy is an organized and systematic exercise of coercion against people" (Lenin, V.I, 1995, p.123). As can be seen, according to V.I. Democratic Leninism is just a political category, it is born, exists, and dies along with the birth, existence and death of politics, in which, the most important is the state. Democracy is a form of state.

Democracy is a democracy - That is, an organized form of the State, which is the coercion of a group of people with a group of others in society; official recognition of equal rights among citizens in participating in State management, defining the State structure. Everyone has the right to participate and contribute in decision making. In the history of human development, primitive democracy, existing in primitive communal society, is not a democracy because the state has not yet appeared and is not political. The birth of democracy is associated with the State, with the society with class division, bearing the profound class nature that it represents. Slavery democracy has the essence of the slave-owner class, reflects economic interests and is a tool to protect the political power of the ruling class, implement democracy with slave owners and deprive slaves of their democratic rights and social classes are ruled, implement a dictatorship, and suppress all opposition to that state. Democracy for

slaves is just a wish, a longing; and for slave owners, democracy was power and dictatorship over slaves and immigrants. The inner hiddenness of the slaves was manifested on the outside by strong struggles that caused slavery to disintegrate, slave democracy to collapse and replaced by feudalism. However, C. Marx denounced the monarchy as an autocracy - Tram is a state, a bad state regime. This is considered the most stagnant period in human history in terms of democracy for the people. The bourgeois revolution broke out, bringing with it many people's expectations for a more progressive, more humane democracy. In modern capitalist society, bourgeois democracy has also brought many progressive values to mankind, but in the end, this democracy only serves the rich. Therefore, bourgeois democracy cannot hide the exploitative, pressured, and unfair nature of the bourgeoisie. Bourgeois democracy is a tool and method to serve the economic interests and political power of the bourgeois minority in society. The economic basis of the bourgeois democracy is the capitalist private appropriation regime. The bourgeois democracy cannot create social justice and equality and cannot eliminate human exploitation. The aspirations, desires and expectations of the people have been suppressed to the extreme, leading to the struggle movements of the working people in history to constantly arise, they fight for the rights of freedom and democracy, human right. The great victory of the Russian October Revolution in 1917 was the first time in the history of the establishment of a proletarian state that exercised the power of the vast majority of the working people. As C. Marx once wrote: "...until there is democratic government, communists and democrats will fight side by side, and the interests of the people are also the interests of the communists" (Marx, C & Engels, Ph, 1995, p.391). In that process of movement, socialist democracy did not appear spontaneously but was the result of human development: "Any other kind of democracy can only exist in the minds of theorists, disregarding factual facts and arguing that it was not the man in the situation that developed the principles, but the principles themselves that developed into democracy became the principles of the ruling class, the principle of the masses" (Marx, C & Engels, Ph, 1995, p.791).

Thus, as a democracy is a democracy, there have been three democratic regimes in human history. It is slavery with slave democracy; capitalism with bourgeois democracy and socialism with socialist democracy.

Second, democracy is approached as an organizational method, management tool and operation of social organizations. Democracy is a form and method of social management, is the basic principle guiding the construction and operation of all organizations in the political system, in the content and mode of operation of the political system, value and each of its elements; in solving social relationships; carrying out democratic activities, ensuring the freedom and equality of all members; the principle of submission to the majority, respect for the minority; exercise the right to referendum, citizen's initiative and discussion before the competent authority decides.

Thus, we can see that social management methods to increase democracy have been implemented in almost all countries in the world, although the development level of countries is different. Countries use these methods more often and materialize into political life. In today's world, the use of social management tools and methods strengthens democratic institutions and

democratic processes worldwide. The spread of the extent to which tools are used to practice democracy such as referendums (allowing people to vote on issues related to politics, the constitution, laws, etc.); initiative agendas (the principle of submission to the majority, respect for the minority for the council to negotiate effective decision-making); Citizen initiative (proposing provisions on the Constitution, laws, etc.) and recall (resignation) further shows that democracy is a preeminent and effective form of management.

In the socialist regime in Vietnam, democracy as a method of organizing and managing society. Democracy follows the principle of collective leadership, assigning individuals to be in charge; the principle that the minority is subject to the majority; the consultation and discussion of the people before promulgating the guidelines and policies of the Communist Party and the Socialist State, the exercise of the rights to complain, denounce, supervise and criticize the society, debate, explanation, publicity, transparency, responsibility of individuals and organizations for issues related to the collective, to the community. President Ho Chi Minh also affirmed: “The government belongs to the people, is owned by the people... The people are the masters of the government. The people elect representatives to act on their behalf. That's democracy. The authorities are unified, centralized. From the People's Council and the Communal Administrative Resistance Committee to the National Assembly and the Central Government, the few must submit to the plural, the subordinates must submit to their superiors, the localities must submit to the central government, so that both the people and the people must obey, while concentrating” (Ho Chi Minh, 2011, p.263). Democracy is a method of collective decision-making in which all members have equal rights to participate in decision-making.

Third, democracy is approached as the most important feature in the system of human and civil rights. Democracy is first and foremost a human right; moreover, it places special emphasis on political rights. Because, political emancipation is a prerequisite for all other human liberation, political equality is the premise of all equality, all freedom. In other words, political rights are, on the one hand, a precondition for the realization of other rights, and on the other hand, a reflection of each individual's degree of emancipation of the “human capacity”. Democratic rights are expressed in the system of human rights, which is understood as freedom, equality, and the right to pursue happiness, as President Ho Chi Minh affirmed: “all nations in the world are born equal, every nation has the right to live, to be happy and to be free” (Ho Chi Minh, 2011, p.1). With a noble human spirit, always wishing for the Vietnamese people to enjoy democratic freedoms, Ho Chi Minh advocated to democratize effectively by legalizing those rights. Referring to the amendment of the Constitution, he emphasized: “It must be a Constitution that guarantees democratic freedoms for all classes of people” and in the report on the draft amendment to the 1959 Constitution, Ho Chi Minh affirmed the right to democracy with the following basic rights:

“Citizens of the Democratic Republic of Vietnam have the right to work. Right to rest,
Have the right to study,
Having physical freedom,
Have the right to freedom of speech, press, assembly, association, demonstration,

Have the right to freedom of religion, to follow or not to follow a religion,

The right to vote, to stand for election...

All citizens are equal before the law.

Women have equal rights with men in politics, economy, culture, society and family”
(Ho Chi Minh, 1996, p.593).

Marxist-Leninist classics have especially emphasized political rights as the essence of democratic rights. Therefore, the first task for the working class to influence the affairs of the state is to achieve political freedom, that is, all citizens have the right to participate in deciding important issues of the state, including discussing and monitoring government activities; the right to vote in elections, the right to freedom of speech, the right to freedom of religion, the right to freedom of the press, the right to freedom of assembly, the right to request public documents and information, and other rights... Democracy is also a social value of people that has been institutionalized into the legal system of a certain state, associated with a certain political system based on a certain level of economic development. Therefore, democratic rights, on the one hand, are a reflection of man's progress towards freedom, equality, and the comprehensive liberation of each individual's human nature, and on the other hand, the development of the law, cultural and social progress of that country. Democracy is recognized as a universal value. Democracy makes people's lives richer and better. Indeed, political freedom is part of human freedom in general, and the exercise of civil and political rights is an important part of the good life of individuals as society. Participation in politics and society has intrinsic value for human life and happiness. Being prevented from participating in the political life of the community is a great deprivation. Democracy as an inevitable human need, the need to be openly discussed, to give personal views, to be constructive. Therefore, it can be said that democratic rights are basic human freedoms in a democratic social system or the legitimate requirements and needs of people for political equality and social equality. This is the environment and conditions for the existence, development and perfection of the personality and freedom of each individual.

Fourth, democracy is approached as a cultural value - democratic culture. Democratic culture is an integral part of social life. Democratic culture reflects the good, the beautiful, the true - the good - the beautiful, the human nature. Democracy from a cultural perspective, democracy is the sum total of human creative activities. In democratic culture, both material culture and spiritual culture converge. Material culture includes institutions, apparatus, customary laws...; Spiritual culture includes ideas, consciousness, needs, communication, behavior, democratic lifestyle... The process of implementing democracy is also the process of cultural activities including creation, inheritance, protect, develop, promote, exchange... The democratic cultural level of individuals and communities is one of the criteria and measures to assess the cultural level, the intellectual level, the personality level, and the cultural level, civilization level of people and society. The core nucleus of democratic culture in terms of subjectivity, in operation and communication and behavior is mutual respect between people and social community in the process of participating in social relations; implement democracy in a cultured manner, respecting the rights, interests, democracy,

freedom, equality, institutions, institutions and mechanisms of social democracy. At the same time, on his side, it is a worthy demonstration of his right to mastery and democracy in an active, self-conscious, and high self-esteem. On the contrary, democratic countercultures are attitudes and behaviors as well as their products, consequences and consequences that infringe upon the democratic, free and equal rights of others; trampled on recognized democratic values; bureaucratic behavior, authoritarianism, autocracy, extremism, anarchy, political indifference, habit of contentment, resignation, avoidance, weakness, cowardice, not daring to stand up for people's values the owner and the people, defending the right and the truth.

The process of practicing democracy requires democratic acts such as debate, criticism, and struggle. It can be understood that the content of democratic culture is the totality of democratic values created by people and communities, including systems of democratic ideas, theories, organizations, institutions, and democratic institutions. democracy, methods and mechanisms for implementing democracy, and traditional democratic practices of social communities. Democratic culture is the common achievement of all humanity, diverse and rich development of democratic cultural values, is a reflection of the level of human liberation, human capacity with nature and society.

Fifth, democracy is approached as a social value, a human value. Democracy puts power in the hands of the people and requires everyone to have the right to participate in decisions. This corresponds to the social value of equality, justice and freedom, in which all people are treated equally and with respect, preserving individual liberties. The social value achieved by democracy is the result of people and communities in the process of conquering the natural world and renovating society, which have shown the mastery role of people in real life. Furthermore, democracy encourages diverse dialogue between individuals and society. This requires respect and understanding of the views and values of others, which in turn requires people to seek consensus through dialogue. It is the human value of respect and understanding for different people, empathy, understanding with the thoughts, feelings and needs of others that add to the value of people. As a social and human value, democracy has become an important mode of existence that has brought people from being controlled by the power game exploited by the ruling class, it has gradually liberated people from that power game and turned people into active, dynamic and creative.

From the above analysis, we can see that democracy as a democracy, so it is a historical category, comes into being associated with the state and disappears when the state disappears; as a social value, a human value, so it is a permanent category; as a cultural value, so it reflects the good, the truth - goodness - beauty of people; as a human right, so it reflects the degree of human emancipation; As a social management method, it reflects democratic principles at all times and places. All of these values reflect the state and degree of human liberation in the development process of society. Thus, democracy can be understood in the broadest sense as “the mode of relations between people in all social spheres, between social institutions, between people in all its different levels of existence; is a form of organization of social relations that acknowledges the freedom and equality of each member, and recognizes the people as the subject of power” (Nguyen Ngoc Quang, 2013).

4. Conclusion

Democracy is a very complex concept and there are many different views. However, democracy is commonly defined as “democracy is a category in the political field” (Lenin, V.I, 1977, p.258) and also “democracy is a form of state, one of the forms of state” (Lenin, V.I, 1977, p.123), in which power is vested in the voters and represented by the will of the people. However, the concept of democracy is not an absolute concept and there is no uniformity, and sometimes there is controversy in the process of realizing democracy. Each country has a different form of democracy, the basic values and interests of democracy can be adapted to the civilization and traditions of each country. Currently, although democracy has been applied to many countries around the world, there are still many challenges and problems that need to be resolved to ensure sustainable development and protect the interests of the vast majority people./.

Abstract

This study explores the impact of job characteristics and each aspect of job characteristics on job embeddedness of health workers at public facilities in Vietnam. A sample of 170 health workers in public facilities of the North, the Central Highlands and the South regions was used. The results showed that job characteristics and the aspect of skill variety and autonomy have a positive impact on increasing health workers' job embeddedness. Based on the findings, the authors also proposed some suggestions to better design jobs, thereby increasing employee retention in Vietnam's public health facilities.

Keywords: *job characteristics, job embeddedness, health workers*

1. Introduction

While researches around the world have focused almost exclusively on answering the question "Why do people leave?", Mitchell et al. were interested in a new perspective, which was to answer the question "Why do people stay?" and since then the concept of job embeddedness (JE) was born in 2001 (Mitchell, Holtom, Lee, Sablinski, & Erez, 2001; William Lee, Burch, & Mitchell, 2014). JE theory suggests that we are held in our jobs and the communities in which we live by ties to other people, groups, organizations, places and things. These ties can become "the totality of embedding forces" that results in someone becoming enmeshed in their job (Mitchell et al., 2001; Yao, Lee, Mitchell, Burton, & Sablinski, 2004). Starting from the 21st century, the theory of Mitchell et al (2001) on job embeddedness began to become a new topic of interest (Hom, Lee, Shaw, & Hausknecht, 2017). There are many studies that have investigated JE and suggested many factors affecting JE such as job satisfaction, organization commitment, job search and job alternatives (Clinton, Ng-Knight, & Guest, 2012; Crossley, Bennett, Jex, & Burnfield, 2007; Holtom, Mitchell, & Lee, 2006; Mitchell et al., 2001) and which includes job characteristics (Dechawatanapaisal, 2017; Vinh, 2015).

Medical industry is a specific service industry that requires human resources to be trained for a long time. Adequate health human resources in quantity and quality are indispensable conditions to achieve universal health care coverage, one of the sustainable development goals of the World Health Organization (WHO) (WHO, 2016). However, the

world is facing a shortage of about 18 million health workers in low- and middle-income countries with the most serious shortage is sub-Saharan Africa and Southeast Asia, including Vietnam (Liu, Zhu, & Tang, 2018). According to data published by WHO, Vietnam only reached 0.8 doctors/1000 people and 1.1 nurses/1000 people, while it is recommended to reach the threshold of 4.45 health workers (including doctors), nurses, midwives) for 1,000 people (WHO, 2016). The shortage makes medical personnel more valuable and raises the need for measures to retain this human resource.

From the point of view of work motivation, job characteristics are also one of the factors that enhance work motivation, thereby helping to retain employees (J. Hackman & Oldham, 1976). However, the topic of JE is still relatively new. Studies on the relationship between JE and job characteristics are still very few, especially in the context of Vietnam.

Therefore, this study focuses on examining the impact of job characteristics and each aspect of job characteristics on JE among health workers in public health facilities in Vietnam.

2. Theoretical basis and hypotheses development

Job embeddedness

The concept of JE was first introduced in 2001 to answer the question of why employees stay in the organization (William Lee et al., 2014). The theory of JE holds that workers are tied to their jobs and the communities in which they live and work by their associations with people, groups, organizations, places, and more. All of this becomes a collective cohesive force like a web or net in which an individual can become enmeshed (Mitchell et al., 2001; William Lee et al., 2014).

JE consists of 3 dimensions: link, fit and sacrifice, which are evaluated from both internal and external job perspectives. Link is the formal or informal connection of workers with people, groups, places, things or activities at work or in the community in which they live. Fit is how workers feel compatible or comfortable in an organization or community. And sacrifice refers to the physical or mental costs associated with leaving one's current job or community. Each dimension applies both on- and off-the-job embeddedness, thus creating six factors contributing to JE (Mitchell et al., 2001).

In the early period when it was first introduced, JE was measured by 48 items (Mitchell, Holtom et al. 2001, William Lee, Burch et al. 2014) built in a causal indicator construct with the assumption that all indices have the same weight when summed up. This measure is relatively long and has a major limitation is the inability to apply popular analytical methods such as EFA, CFA, SEM (Clinton et al., 2012; Crossley et al., 2007; Zhang, Fried, & Griffeth, 2012).

To overcome that shortcoming, in 2007, Crossley et al. developed a reflective measure with 7 items (Crossley et al., 2007) which was used in many later studies (Ferreira, Martinez, José Pereira, & Rodrigues, 2017; Huning, Hurt, & Frieder, 2020; Tan, Loi, Lam, & Zhang, 2019). However, Crossley's measure does not distinguish in terms of internal and

external aspects job perspectives, nor is it clear of 3 dimensions like Mitchell's original theory (Clinton et al., 2012; Crossley et al., 2007). Clinton et al. (2012) developed another set of tools to measure JE consisting of 12 questions with 2 questions for each component of link, fit, sacrifice, and measured in both dimensions on- and off-the-job (Clinton et al., 2012) which was used in recent studies (Goštautaitė, Bučiūnienė, Mayrhofer, Bareikis, & Bertašiūtė, 2020; Singh, 2019, 2020).

Job Characteristics

Job characteristics (JC) are the attributes of jobs that can affect employee performance. The most famous and influential theory of job characteristics comes from Hackman & Oldham (1976). This model identifies 5 core job characteristics include: skill variety, task identity, task significance, autonomy, and feedback (J. Hackman & Oldham, 1976).

Skill variety is the degree to which a job requires worker to have diverse skills and abilities. Task identity is the extend to which a job requires a worker to complete all or part of a job or to complete a specific task from start to finish. Task significance is the degree to which the job has an impact on the lives or work of others. Autonomy is the degree to which the job allows the worker to have freedom, independence and full personal authority in planning work or determining how to work. Feedback is the extent to which a job can provide direct and clear information about the level of effectiveness of one's performance (J. Hackman & Oldham, 1975; J. Hackman & Oldham, 1976; J. R. Hackman & Oldham, 1974).

The relationship between job embeddedness and job characteristics

Job characteristics theory, also known as job design theory, provides a set of principles that enrich job in organizations (J. Hackman & Oldham, 1975). Job engagement theory recognizes the relationships between organizational factors and the positive contribution of these factors to employee retention (Mitchell et al., 2001). Among organizational factors, job characteristics have been proven by many studies to have an impact on employee outcomes. Increasing job meaning (skill diversity, task identity, task significance) as well as increasing autonomy and receiving more feedback on work results will increase satisfaction, increase organization commitment, work engagement (Agarwal & Gupta, 2018; McKnight, Phillips, & Hardgrave, 2009; Slattery, Selvarajan, Anderson, & Sardessai, 2010).

JE is also one of the outputs of employees (Mitchell et al., 2001). Currently, there have been a number of studies investigating the relationship between JE and JC. Research on 292 employees of state-owned companies in Hanoi, Vietnam by Vinh, Q. N. (2015) shows that JC include a combination of 5 aspects of skill diversity, task nature, and task significance. service, autonomy, and feedback have a positive effect on JE (Vinh, 2015). Research on 433 health workers (including nurses, pharmacists, doctors, nutritionists...) in Thailand by Dechawatanapaisal (2017) also gave similar results (Dechawatanapaisal, 2017).

Considering each aspect of JC, there is evidence that task significance has a positive impact on JE through the study of Ferreira et al (2017) on 525 employees working at hotels in Portugal (Ferreira et al., 2017) and a study by Amir Mohammad Fakoor & Nosrati (2021) of 510 employees at Iranian universities (Amir Mohammad Fakoor & Nosrati, 2021) There is few evidence on the relationship of other dimensions such as autonomy, skill diversity, task nature and feedback to JE.

Based on the results of the research review, a research model on the relationship between JC and JE was built. In which the dependent variable is JE, the independent variable is JC and 5 aspects constituting JC. The specific research model is presented in Figure 1.

Figure 1. Research model

H1: Skill variety will be positively related to Job embeddness

H2: Task identity will be positively related to Job embeddness

H3: Task significance will be positively related to Job embeddness

H4: Autonomy will be positively related to Job embeddness

H5: Feedback will be positively related to Job embeddness

H6: Job characteristics will be positively related to Job embeddness

3. Method

3.1. Participants and data collection

A cross-sectional study was conducted to collect data from health worker at public health facilities who were studying at Hanoi University of Public Health. Convenient sampling was applied in this study to ensure a minimum sample size for quantitative analysis. A self - report questionnaire was send to participants from classes held in different areas in the North (Hanoi, Phu Tho), Central (Dak Lak) and South (Ho Chi Minh City).

The total number of survey questionnaires collected was 189 records, after removing 19 invalid records, a total of 170 records were included in the analysis. The characteristics of the survey sample are presented in Table 1.

Table 1. Survey sample characteristics

Characteristic	Frequency (n = 170)	Percentage (100%)
Sex		
Male	82	48.2
Female	88	51.8
Age group		
Under 30 years old	15	8.8
From 30 to 34 years old	40	23.5
35-40 years old	57	33.5
Over 40 years old	58	34.1
Occupation		
Doctor	49	28.8
Nursing/Midwife/Technician	39	22.9
Administrative specialist	48	28.2
Other	34	20.0
Education		
Intermediate/College	19	11.2
Graduation	121	71.2
After graduation	30	17.6

Source: Authors

3.2. Instruments

Job embeddedness was measured with Clinton et al's (2012) twelve-item scale, which divided into 3 dimensions: fit, links and sacrifice; each dimension apply both on- and off-the job embeddedness (Clinton et al., 2012)

Job characteristics were measured using Job Diagnostic Survey (JDS) of Hackman & Oldham (1974) including 5 aspects: skill variety, task identity, task significance, autonomy, and feedback. Each aspect was measured by three items (J. R. Hackman & Oldham, 1974)

The study was used a Likert scale with 7 levels from 1 - "Strongly disagree" to 7 - "Strongly agree".

Control variables: previous studies have shown that age, gender, education influence to JE (Ferreira et al., 2017; Karatepe & Avci, 2019; Vinh, Taylor, & Bergiel, 2017). Because in Vietnam, there are different treatment between doctor and other professions in the health care sector, therefore this study gathered information of occupations as the control variable beside age, gender and education.

Cross-cultural adaptation procedure

The questionnaire was translated from English to Vietnamese by one of the authors of this study. The translated version was back-translated in English by a bilingual Vietnamese linguistic teacher. The two translators discussed the inconsistencies and reached an agreement. Then a committee included one sociologist, two medical doctors checked all translations to make sure of the semi-final instrument being fully comprehensible to verify cross-cultural equivalence.

4. Results

4.1. Scale reliability and validity analysis

The result shows that all the observed variables have a total correlation coefficient greater than 0.3. Cronbach's coefficient alphas with the factor of JE is 0.9, showing that the scale has good reliability. Cronbach's coefficient alphas with aspects of JC is from 0.6 and above which is at an acceptable confidence level (Hair, 2009). The reliability values of all scales are reported in Table 2.

Table 2. Results of testing the reliability of the scale in the research model

Factor	Encode	Indicator number	Cronbach's Alpha
Job embeddedness	JE	12	0.906
Job characteristics	JCcha		
Skill variety	JCskill	3	0.727
Task identity	JCtask	3	0.716
Task significance	JCtasksig	3	0.677
Autonomy	JCauto	3	0.695
Feedback	JCfeed	3	0.667

Source: Authors

To test the validity of the scale, exploratory factor analysis (EFA) was used. The results of KMO and Bartlett's Test show that the KMO coefficient is within the allowable range ($0.5 < \text{KMO} < 1$) with $p < 0.001$. This indicates that the observed variables are correlated with each other on the whole and are suitable for analyzing factor accumulation. The results of EFA factor analysis with Varimax rotation show that the Loading factor of the indicators measuring the variables in the model are all > 0.5 . This indicates that the observed variables can be used because of ensuring the convergence of each scale (Hair, 2009).

4.2. Hypotheses testing

To examine the influence of each aspect of job characteristics on JE of Vietnamese healthcare workers, models 1, 2, 3, 4, 5 were implemented. The influence of JC in general on JE is shown in model 6. The results of regression analysis are reported in Table 3.

Table 3. Research model results

Variable	Model 1	Model 2	Model 3	Model 4	Model 5	Model 6
Control variable						
Gender	-0.295	-0.290	-0.296	-0.269	-0.272	-0.277
Age group	0.319***	0.320***	0.324***	0.321***	0.321***	0.336***
Occupation	0.020	0.023	0.026	0.044	0.043	0.029

Note: * and ***: correlation coefficients have statistical significance at 5% and 0.1% level.

Source: Authors

The models include control variables such as gender, age, occupation and education, in which the analysis results show that the age has a positive impact on JE. Specifically, if increasing by 1 age group, the average JE score of medical staff will increase by approximately 0.3 points.

Models from 1 to 5 test the relationship between each aspect of JC and JE under the control of variables of age, gender, education and occupation. In which, the aspect of skill variety and autonomy have a positive impact on the JE of health workers. Specifically, jobs with skill variety increase by 1 point, the level of JE of medical staff increases by approximately 0.4 point. Autonomy is increased by 1 unit, the level of job commitment of medical staff increases by approximately 0.17 units. Hypothesis H1 and H4 are supported with significance level of 0.1% and 5%, respectively.

The results of the study also rejected the hypothesis H2, H3, H5, which did not find a relationship between task identity, task significance and feedback with JE of public health workers in Vietnam.

Models 1 to 5 examine the influence of each aspect of JC on JE. The F-test results of all models are statistically significant at the 0.1%, indicate that the models have a suitable regression function and the models can be used. In which, the estimated results of regression model 4 explain 27.4% of the variation in JE ($F = 8,955$; $p < 0.001$). Model 6 shows that having general JC (combined from all 5 aspects) has a positive impact on JE. For every 1 point that JC increase, the level of JE of health workers increases by approximately 0.508 ($F = 10,526$; $p < 0.001$).

4. Discussion and Conclusion

The purpose of this study was to examine the impact of JC and each aspect of JC on JE among health workers in public health facilities in Vietnam under the control of variables of gender, age, occupation and education.

Model 1 results show that age has a positive impact on JE. This result is different from the results of Vinh, QN (2015) and Ferreira et al. (2017) when no relationship was found between age and JE (Ferreira et al., 2017; Vinh, 2015) but is similar to the results of Felps et al. (2009)(Felps et al., 2009). In fact, the increase in JE with age is understandable because, according to the definition of Mitchell et al. (2001), JE is made up of employees' connections with colleagues, with the organization and with many other things (Mitchell et al., 2001). The older you get, the longer you work and the more embedded you will be with your job.

Hypothesis H1 and H4 are supported that mean skill variety and autonomy have a positive impact on the JE. Currently, according to the review from the author's knowledge, no research has published evidence on the relationship between skill variety and JE or autonomy and JE. So, this can consider a new finding of this research. The relationship skill variety, autonomy and JE can be explained because the job requires more diverse skills, it will need to contact more colleagues, perform more types of activities, so it will create a job link better. At the same time, to be able to do a job with a variety of skills, it requires medical staff to put in effort to learn and gain experience, creating a greater price if they have to sacrifice if they give up their job. Besides, having autonomy will also make health workers feel more suitable, more fit for their current job. Link, fit and sacrifice are also components of JE (Mitchell et al., 2001). Therefore, if the job design requires diverse skills and increases the autonomy of workers, it will have a positive effect on increasing the JE of health workers.

While research of Ferreira et al. (2017) on hotel workers in Portugal and Amir Mohammad Fakoor & Nosrati (2021) on people working in public universities in Iran found that task significance has positive impact to JE (Amir Mohammad Fakoor & Nosrati, 2021; Ferreira et al., 2017), this study show difference. There are no relationship between task significance and JE of public health workers in Vietnam. Such difference may be due to the different of contexts and needs further exploration in future studies.

This study also confirmed that job characteristics in general, synthesized from 5 factors of skill variety, autonomy, task identity, Task significance and feedback have a positive impact on JE. This result is similar to other studies by author Vinh, QN (2015) on employees of state-owned companies in Vietnam ($\beta = 0.522$; $p < 0.01$) (Vinh, 2015) and Dechawatanapaisal on subjects health workers in Thailand ($\beta = 0.302$; $p < 0.01$) (Dechawatanapaisal, 2017).

JE is still a relatively new concept introduced in 2001 and attracted much attention. This study tested and contributed to providing more evidence on the relationship between JE and JC and aspects of JC.

The results also have suggested for managers in public health facilities in Vietnam to increase the level of JE of medical staff. Specifically, in job design and assignment, managers need to expand and diversify activities, diversify types of tasks, giving health workers the opportunity to use and learn many skills that avoid them falling into a boring job situation. In addition, managers should also give more autonomy to health workers so that they have more opportunities to choose their own working time, working location and working method while still ensuring requirements on safety, in accordance with professional and technical procedures in healthcare.

Although there are certain theoretical and practical contributions, this study also has some limitations. First, the sample size is small. Although the participants of this study were chose from health workers who are studying in different programs, from bachelor to master, CKI, CKII with classes held in many different areas from the North (Hanoi, Phu Tho), Center (Dak Lak), and South (Ho Chi Minh City) however, the sample is small, so it is still not possible to ensure the best requirements for representativeness and generalization for public health facilities in Vietnam. Second, the scale used to measure the variables in the model is a perceived scale, so it may be affected by the respondents' subjective opinions. The above limitations are also suggestions for future research to contribute more evidence and expand understanding on the topic of JE in general and the relationship between JE and job characteristics in particular.

Abstract

Based on the Social Cognitive Career Theory (SCCT), the present study investigates the impacts of perceived barriers (lack of support, fear of failure, and lack of competence) on social entrepreneurship intentions among undergraduate students, with the mediating role of self-efficacy. The partial least squares structural equation modeling (PLS-SEM) method was used to test the proposed model with empirical data collected from 476 Vietnamese undergraduate students through structured questionnaires. The results indicated a positive relationship between perceived lack of support, fear of failure, and social entrepreneurial intentions, whereas there was a negative relationship between a perceived lack of competence and social entrepreneurial intentions. In addition, the mediating role of self-efficacy in the relationship between perceived lack of support, fear of failure, and social entrepreneurial intentions was supported at a confidence level of 95%; the mediating role of self-efficacy in the relationship between perceived lack of competence and social entrepreneurial intentions was marginally supported (at the confidence level of 90%). The empirical findings imply that stakeholders in social entrepreneurship should be aware of the factors that may hinder and/or foster social entrepreneurial intentions and take actions to govern these factors. The limitations and future direction were also discussed in the last sections of the paper.

Keywords: *entrepreneurship, perceived barriers, social entrepreneurship intentions, self-efficacy.*

1. Introduction

Social entrepreneurship has significantly aided the eradication of poverty and unemployment and the resolution of other social problems and environmental challenges (Ambad, 2022). Although it attracted much attention from the academic community, studies

on predicting the intention to become a social entrepreneur are still in their infancy (Ambad, 2022). Scholars have attempted to investigate perceived barriers as an antecedent to social entrepreneurial intentions, but results are inconclusive, stressing the necessity of more examination into this relationship. Social Cognitive Career Theory (SCCT), initiated by Lent et al. (1994, 1996) and his associates, states that in the progress of career development, humans always encounter barriers that might inhibit their aspirations to embrace that profession. Standing on the same viewpoint as Dolarslan et al. (2020), our study specifies three aspects, including lack of support, fear of failure, and lack of competency, as perceived barriers to social entrepreneurial intentions. In particular, *lack of support* includes the scarcity of environmental and family/network support, indicating the assistance of diverse stakeholders in the prospective entrepreneurs' surroundings (Dölarslan et al., 2020). The inability to gain institutional backing for budding entrepreneurs, acquire family support, obtain money from lenders, establish supplier relationships, and/or develop a strong consumer base can all be challenges to entrepreneurial intention (Shinnar et al., 2012). *Fear of failure* is mostly referred to as a hindrance to entrepreneurial behavior and functions as a barrier to entrepreneurship (Cacciotti et al., 2016), even when students have a good business idea, it may still be on paper if they are not confident in their ability and are always afraid of failure (Dölarslan et al., 2020). *Lack of competency* includes a lack of skills, training, and knowledge. Dölarslan et al. (2020) combined these three elements into one because of their interaction with entrepreneurs' characteristics and their close association with competencies involving personal background. Operating businesses requires entrepreneurs to possess competencies (Ambad, 2022); Thus, this study aims to fill in this gap proposed by previous studies by examining perceived barriers as a predictor of social entrepreneurial intentions.

SCCT also provides insight into the interactions between perceived barriers, self-efficacy, and career-related outcomes. Self-efficacy is the trust in one's capabilities to establish a brand-new company endeavor (Ambad, 2022), and it functions as an essential element in the career selection procedure. Lent et al. (2000) illustrate that barriers will not refrain people from transforming their interest in a specific career into the intention to choose that profession if they believe in their capabilities of overcoming hindrances and taking responsibility. The effect of perceived barriers has been much found in the career development field, yet not much has been witnessed in the social entrepreneurial intentions. In this research context, we used the metric developed by Schlaegel et al. (2015) and Dölarslan et al. (2020) to measure perceived barriers, which include three specific dimensions: perceived lack of competence, lack of support, and fear of failure. The link between perceived barriers and social entrepreneurial intentions is under-exploited, let alone examining it in relation to SE. Until now, Dolarslan et al. (2020) were regarded as the pioneers in exploring this mechanism. This study, thus, plans to inspect and enrich the empirical knowledge about the linkage between perceived barriers and social entrepreneurial intentions and its mediator - self-efficacy.

Therefore, this study aims to achieve the following objectives: examining the relationship between perceived barriers (lack of support, fear of failure, and lack of

competence) and social entrepreneurial intentions; unboxing the underlying mechanism of the relationship between perceived barriers (lack of support, fear of failure, and lack of competence) and social entrepreneurial intentions with the mediating role of self-efficacy.

Previous theoretical and empirical research identified and tested a wide range of internal and external inhibiting factors preventing the intention to start a new business venture. In this research context, we used the metric developed by Schlaegel et al. (2015) and Dölarslan et al. (2020) to measure perceived barriers, which include three specific dimensions: lack of support, fear of failure, and lack of competence, to investigate the relationship between these factors and social entrepreneurial intentions. Although much research has been conducted to investigate the negative impact of the perceived barrier to social entrepreneurial intentions, however to social entrepreneurial intentions are not much and clear. In other words, research on the impact of perceived barriers on social entrepreneurial intentions is notably underdeveloped and needs more investigation (Liñán & Fayolle, 2015/2014). Thus, we formulate the following hypotheses:

H1: Students' perceived barriers are associated with their social entrepreneurial intentions.

H1a: Students' lack of support is associated with their social entrepreneurial intentions.

H1b: Students' fear of failure is associated with their social entrepreneurial intentions.

H1c: Students' lack of competence is associated with their social entrepreneurial intentions.

Self-efficacy was first introduced by Albert Bandura (1977) in his work about the social learning theory. Instead of measuring one's ability level, perceived self-efficacy refers to one's perception of what he or she can accomplish with their current set of competencies in various kinds of circumstances (Bandura, 1997). The effect of barriers' perceptions on self-efficacy has been much confirmed in the career development field (Dolarslan et al., 2020). These existing studies (e.g. Lent et al. (2018); Mejia Smith and Gushue (2017); Sheu et al. (2010), Lopez and Ann-Yi (2006)) have shown the impact of perceived barriers on self-efficacy, suggesting that people will see fewer obstacles to reaching their career objectives because they believed they were capable of completing particular career responsibilities and had the capability to overcome these vocational difficulties. In other words, perceived barriers serve as a deterrent component for self-efficacy, which demonstrates that people with a high level of self-efficacy will still pay attention to and might be fearful of perceived barriers. Being an entrepreneur is also an occupation so there is an expected adverse relation between perceived barriers and self-efficacy during the process of career development.

Regarding social entrepreneurial intention literature, social entrepreneurial self-efficacy is the most used predictor of social entrepreneurial intentions (Ambad, 2022). A systematic literature review by Ambad (2022) confirms that, on the whole, self-efficacy typically has a beneficial impact on social entrepreneurial intentions, regardless of the situation across many countries, such as China, Brazil, Vietnam, and Singapore. Besides, many scholars have been investigating the mediating effect of self-efficacy as a direct and

indirect variable in the entrepreneurship and social psychology area (as cited in Jiatong et al., 2021). McWhirter (1997) found that if self-efficacy aspirations are strong, actual evaluations of many hurdles might not diminish interest-choice harmony. Besides, Dolarslan et al. (2020) investigated the relationship between perceived barriers and entrepreneurial intention and suggested that perceived barriers negatively influence entrepreneurial intention, and self-efficacy marginally mediated the above relationship. Since social entrepreneurship encompasses business endeavors that combine the terms "social" and "entrepreneurship," it is regarded as a sub-discipline of entrepreneurship literature (Peredo and McLean, 2006). Based on the above discussions, we postulate the following hypotheses:

H2: Self-efficacy mediates the relationship between perceived barriers and social entrepreneurial intentions.

H2a: Self-efficacy mediates the relationship between lack of support and social entrepreneurial intentions.

H2b: Self-efficacy mediates the relationship between fear of failure and social entrepreneurial intentions.

H2c: Self-efficacy mediates the relationship between lack of knowledge and social entrepreneurial intentions.

The conceptual research model is presented in Figure 1:

Figure 1. The conceptual research framework

2. Method

2.1. Participants

This present study's target respondents consist of third- and fourth-year undergraduate students majoring in business or IT/engineering. Since those students have a clear understanding of their goals and intentions are at a stage of considering entrepreneurial careers (Liñán & Chen, 2009), as well as possess a desire to make a positive impact on society with a strong belief in the importance of social responsibility (Ashour, 2016).

Before the mass survey between October and December 2022, a pilot study was conducted with 60 participants to evaluate the questionnaires. Three items with peripheral loadings below 0.5 were revised by providing additional explanations. According to Hair et al. (2017), a minimum sample size of 200 observations can be adequate in many cases with

PLS-SEM, and larger sample sizes can be necessary for more complex models or when estimating high levels of precision. A mix of online and offline questionnaires was administered in physical and online classes. After cleaning and removing unqualified data due to a lack of information and assigning the same number of points to all queries (23 samples), 476 samples were retained for further analysis. Among 476 usable samples (262 responses from an online survey accounting for 45.0% and 214 hardcopies responses), males accounted for 51.1%, and females accounted for 48.9%. Concerning the major of students, 60.1% of respondents are business-related, 39.9% respondents are IT/Engineering-related. Regarding the school years of students, 55.7% respondents are third-year students, 44.3% respondents are fourth-year students. Accordingly, respondents aged from 20 to 21 years old constitute the largest proportion 85.3%, while only 1.0% of respondents aged 19, and above 22 years old with 4.0%. Concerning the locality of students, 58.8% respondents have been from urban, and 41.2% respondents have been from rural. Additionally, 56.7% respondents had working experience. Concerning family's monthly average income per person, 41.8% from 2.3 to 8.4 milVND, 30.2% from 8.4 to 19.6 milVND, and only 9.5% respondents had over 19.6 milVND.

2.2. Measures

In this study, all measurements were adopted from previous relevant studies and scored on a five-point Likert scale (ranging from 1 - strongly disagree to 5 - strongly agree).

All items of perceived barriers are based on Shinnar et al. (2012) and adopted in the special context of the study. Lack of support was based on four items, and Cronbach's alpha value for this variable was 0.767. Fears of failure were based on six items, and Cronbach's alpha value for this variable was 0.844. Lack of competence was based on four items, and Cronbach's alpha value for this variable was 0.842. Self-efficacy was measured by eight items developed by the scales of Chen et al. (1998) and the revised scales of Chen et al. (2011). Sample items included 'I will be able to achieve most of the goals I have set for myself' Cronbach's alpha value for this variable was 0.876.

The dependent variable, social entrepreneurial intention, was measured by six items developed by Linñan and Chen (2009) and adopted in the context of social entrepreneurship. Cronbach's alpha value for this variable was 0.914.

2.3. Data analysis

Data was analyzed by the use of Partial Least Squares - Structural Equation Modeling (PLS-SEM) with the support of SmartPLS 3.3, which contains two main steps (Ringle et al., 2020): (1) measurement model evaluation and (2) model estimation and results evaluation. In the first step, the validity and reliability of research constructs were assessed. The common method bias and multicollinearity were also checked. In the second step, model estimation, and hypotheses were tested with the bootstrapping procedure of 5000 resamples to obtain the values R^2 (explained variance), and f^2 (effect sizes), the Q^2 value (the model's predictive power), path coefficients, t-values, and p-values (Hair et al., 2019; Ringle et al., 2020).

3. Results

3.1. Measurement model assessment

Following Hair et al. (2019) and Ringle et al. (2020/2019), we assessed the measurement model. First, the validity of measurement models was assessed with a two steps approach, i.e., convergent validity and discriminant validity. In order to assess convergent validity, Composite reliability, Cronbach's alpha, and average variance extracted (AVE) values were observed. Cronbach's alpha and Composite reliability have values from 0.767 to 0.914 and 0.851 to 0.933, respectively, higher than the recommended level of 0.7. The values of AVE for the researched constructed ranged from 0.537 to 0.700, which is higher than the critical threshold level of 0.5 (Fornell & Larcker, 1981). Moreover, Fornell-Larcker criterion, Heterotrait-Monotrait Ratio (HTMT), and cross-loadings were assessed for evaluating discriminant validity of measurement models. The results revealed that the square root of the AVE should be higher than the correlations between the constructs, the values of the Heterotrait-Monotrait Ratio (HTMT) were all smaller than 0.85, and the factor loading of variables should be higher than all the cross-loadings (Fornell & Larcker, 1981). All these three principles were met which demonstrates the discriminant validity of our measures.

3.2. Structural model assessment

In PLS-SEM model, the first criterion for the goodness of the structural model is assessing the explanatory power - R^2 . In this study, the R^2 of social entrepreneurial intentions was 0.262, it indicated moderate explanatory power (Cohen, 1988). R^2 of Self-efficacy was 0.099, quite small. According to Hair et al. (2019), the qualified these figures and suggested results is also dependent on research contexts. The effect sizes - f^2 of all relationships is relatively small which indicate the relatively similar roles of all predictor constructs (Cohen & Diamant, 2019). Q^2 value measures the model's predictive power or is considered a measure of an out-of-sample prediction (Henseler et al., 2009). The results of using the reusing sample technique to calculate the Q^2 showed that all exogenous variables have predictive relevance (Q^2 of Self-efficacy was 0.050, and of social entrepreneurial intentions was 0.079).

Table 1. Results of structural equation model estimation

Hypothesis	Path	Original Sample (O)	Sample Mean (M)	SD	t	P	Decision
Total effects							
H1a	Lack of support ==> Social entrepreneurial intentions	0.172	0.174	0.054	3.195	0.001	Supported
H1b	Fair of Failure ==> Social entrepreneurial intentions	0.183	0.190	0.049	3.743	0.000	Supported
H1c	Lack of competence ==> Social entrepreneurial intentions	-0.106	-0.105	0.055	1.931	0.050	Supported

Hypothesis	Path	Original Sample (O)	Sample Mean (M)	SD	t	P	Decision
Indirect effects							
H2a	Lack of support ==> Self- efficacy ==> Social entrepreneurial intentions	0.056	0.058	0.021	2.700	0.007	Supported
H2b	Fair of Failure ==> Self- efficacy ==> Social entrepreneurial intentions	0.035	0.037	0.015	2.310	0.021	Supported
H2c	Lack of competence ==> Self- efficacy ==> Social entrepreneurial intentions	0.026	0.027	0.016	1.670	0.095	Marginally supported
Direct effects							
	Lack of support ==> Social entrepreneurial intentions	0.116	0.116	0.056	2.061	0.039	
	Fair of Failure ==> Social entrepreneurial intentions	0.148	0.153	0.050	2.955	0.003	
	Lack of competence ==> Social entrepreneurial intentions	-0.133	-0.132	0.054	2.463	0.014	

Table 1 presents the results of the structural equation model estimation. Hypotheses 1a, 1b, and 1c proposed the relationship between perceived barriers (lack of support, fear of failure, and lack of competence) and social entrepreneurial intentions. The results indicated that the relationship between perceived lack of support and social entrepreneurial intentions was not statistically significant at $b = 0.172$ ($t = 3.195$, $p = 0.001$). Thus, Hypothesis 1a was supported. The relationship between perceived fear of failure and social entrepreneurial intentions was positively significant at $b = 0.190$ ($t = 3.742$, $p = 0.000$). Thus, Hypothesis 1b was supported. The relationship between perceived lack of competence and social entrepreneurial intentions was negatively significant at $b = -0.106$ ($t = 1.960$, $p = 0.050$). Thus, Hypothesis 1c was supported.

Similarly, hypotheses 2a, 2b and 2c tested the mediating role of self-efficacy in the relationship between perceived barriers (Lack of support, Fair of Failure, and Lack of competence) and social entrepreneurial intentions.

As seen in Table 1, the relationship between perceived lack of support and social entrepreneurial intentions through the mediating role of self-efficacy was positively significant at $b = 0.056$ ($t = 2.700$, $p = 0.007$). The direct effect between perceived lack of support and social entrepreneurial intentions was still significant ($b = 0.116$, $t = 2.061$, $p = 0.039$). In other words, self-efficacy partially mediates the relationship between perceived lack of support and social entrepreneurial intentions. Thus, Hypothesis 2a was supported.

The relationship between Fair of Failure and social entrepreneurial intentions through the mediating role of self-efficacy was positively significant at $b=0.035$ ($t=2.310$, $p=0.021$). The direct effect between perceived lack of support and social entrepreneurial intentions was still significant ($b=0.148$, $t=2.955$, $p=0.003$). In other words, self-efficacy partially mediates the relationship between perceived lack of support and social entrepreneurial intentions. Thus, Hypothesis 2b was supported.

The relationship between perceived lack of support and social entrepreneurial intentions through the mediating role of self-efficacy was positively significant at $b=0.026$ ($t=1.670$, $p=0.095$). The direct effect between perceived lack of support and social entrepreneurial intentions was still significant ($b=-1.333$, $t=2.463$, $p=0.014$) In other words, self-efficacy partially mediates the relationship between perceived lack of support and social entrepreneurial intentions. Thus, Hypothesis 2c was marginally supported at the confidence level of 90%.

The result of PLS-SEM model testing is presented in Figure 2 below.

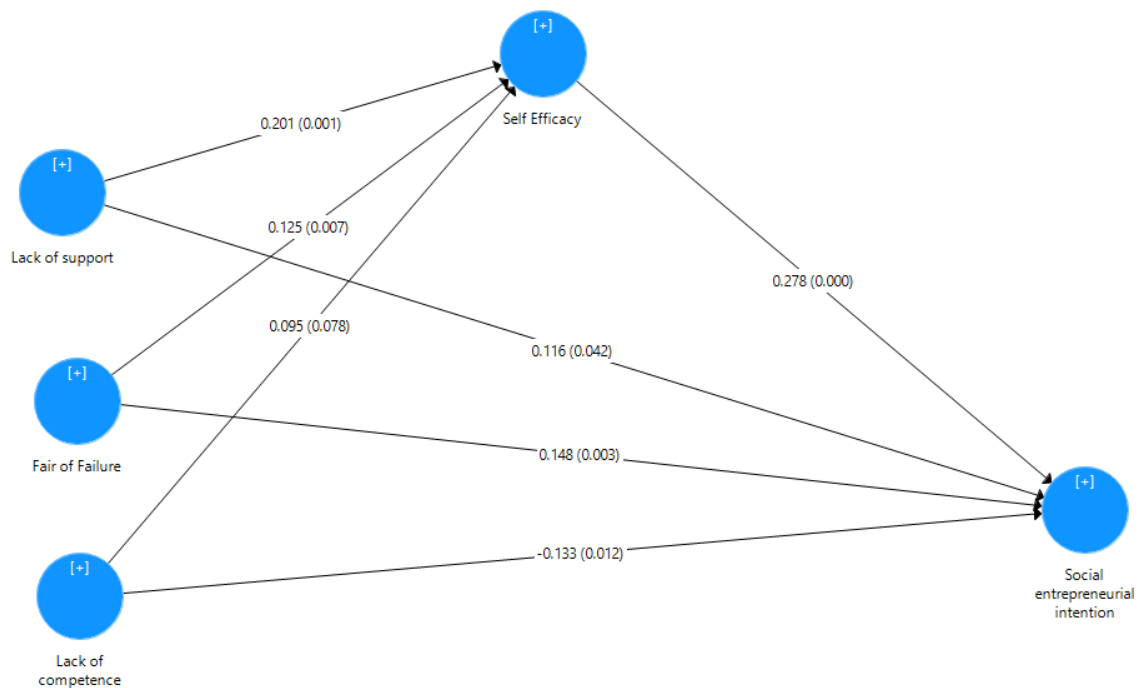

Figure 2. The results of structural equation model estimation

4. Discussion and conclusion

4.1. Discussion

Aiming to investigate the linkage between perceived barriers and social entrepreneurial intentions with the mediation of self-efficacy, this study contributes to the extant literature by demonstrating that three components of perceived barriers have different impacts on social entrepreneurial intentions with separate mechanisms. In contrast to Dolarslan et al. (2020), who found the negative effect of perceived barriers on social entrepreneurial intentions as a

whole, this study shows that lack of competence negatively affects, while fear of failure and lack of support positively affects social entrepreneurial intentions. Consequently, the mediating role of self-efficacy in each interconnection is distinctive.

The finding showed that self-efficacy boosts one's perception of control over a potential circumstance (Bandura, 1977), and a strong belief in one's ability and skills to tackle situations successfully (Zajacova et al., 2005) results in a sense of coping. In an environment without much support, coping efficacy is why students believe they can overcome this lack and initiate their social entrepreneurial intentions. In general, the finding suggests that in the initial stage of forming social entrepreneurial intentions, students believe lack of support merely challenges to their potential and it does not intervene with their plan to become social entrepreneurs in the future.

The study also indicates that a lack of competency is negatively associated with social entrepreneurial intentions, which conforms with findings from other scholars (i.e., Tukamushaba et al., 2011; Shahverdi et al., 2018). Business gifts and abilities are crucial for effective business operations (Ambad, 2022), so when students observe no such knowledge and capabilities in themselves, they are prone to leave their social entrepreneurial intentions behind. Interestingly, this investigation cannot find the mediation of self-efficacy in the correlation between lack of competency and social entrepreneurial intentions. However, it seems understandable because entrepreneurial competencies include specialized and general knowledge, abilities, roles in society, motivations, characteristics, and self-perception that contribute to the emergence, maintenance, and growth of businesses (Bird, 1988). Because students cannot believe in something they themselves do not possess, self-efficacy plays no mediating role in the relationship between lack of competency and social entrepreneurial intentions. This circumstance is antithetical to lack of support since lack of competency consists of internal elements and refers to one's inner self.

The dominant literature body believes that irrespective of desire levels, fear of failure discourages aspirations when determining whether to start a business (Morgan and Sisak, 2016). Surprisingly, this study shows no hindering but motivational effects of fear of failure in the relationship with social entrepreneurial intentions. Accordingly, Vietnamese students consider failure a motivating source in forming their intention to establish social enterprises in the future. Possibly, social entrepreneurship is just an option among various careers to them (Cacciotti et al., 2016). When presented with choices, people more inclined to avoid failure choose a degree of ambition that is entirely contradictory to people who are more willing to pursue achievement (Atkinson, 1957). In the scenario that students have various choices, failure acts as an encouraging ingredient boosting students' intention to become social entrepreneurs. Furthermore, this linkage is marginally mediated by self-efficacy, which illustrates that students perceive fear of failure as a driving force lifting their self-efficacy and exciting them to overcome in their journey to become social entrepreneurs.

According to findings from this research, lack of support and fear of failure no longer play the role of damaging factors and barriers to the start-up process as before; these factors are now considered important driving forces to promote social entrepreneurial intentions. In

practical terms, the study contributes to explaining the strong growth of youth entrepreneurship activities in developing countries like Vietnam in recent years. Despite the difficulties and lack of many things, although the failure rate in starting a business is very high, it does not make them feel afraid or falter. In addition, the role of entrepreneurs' self-efficacy is critical in forming social entrepreneurship.

4.2. Limitations and further research

This study could not be free of limitations. Firstly, the study has not considered the heterogeneous impact of different groups by gender or individual characteristics (family background and region). Therefore, further research should investigate this relationship in different groups for more insights. Second, this study overlooked the effects of boundary and contextual factors in interest relationships. Therefore, it is a fruitful research direction for further studies. Third, this study is conducted with empirical data collected from Vietnamese students in a cross-sectional survey. Thus, the generalizability of the findings is affected. Thus, it calls for further studies with longitudinal design with a larger sample in different regions to reinforce the research findings.

THE IMPACT OF ELECTRONIC WORD OF MOUTH ON DESTINATION PERSONALITY

Pham Long Chau

thanhduy1989@gmail.com

Thang Long University, Hanoi, Vietnam

Abstract

Based on theory of brand personality, this paper evaluates the impact of Electronic Word of Mouth (EWOM) on the destination personality of Vietnamese tourists. A sample with 510 observations were used and the data were analysed by using Structural Equation Modelling (SEM). The findings of multi-variable analysis have shown that EWOM has a direct impact on destination personality. Moreover, with the analysis of the research model according to unidirectional variables, the research results show that Electronic Word of Mouth has a positive impact on the factors of destination personality as: (1) Competence and (2) Contemporary. However, in the context of Vietnam's tourism, Electronic Word of Mouth has a greater impact on the Competence trait than the Contemporary characteristic.

Keywords: *Brand Personality, Destination Personality, Electronic Word of Mouth, Travel.*

1. Introduction

In this day and age, tourism is not only a popular activity but also a key economic sector, contributing 10.3% to global GDP, bringing huge financial resources to many countries and territories (World Travel and Tourism Council, 2021). With the advantage of being an attractive and safe destination for domestic and foreign tourists, Vietnam's tourism has recently had a strong and quite steady growth. Specifically, Vietnam's tourism has grown continuously, especially in the period of 2015-2019, reaching a growth rate of 22.7% per year, ranked among the highest in the world by the World Tourism Organization (Vietnam National Administration of Tourism, 2020). Tourism creates many jobs, promotes the development of service industries in general, develops infrastructure and is also a means of promoting peace and cultural exchange (Nguyen Thi Bich Thuy, 2010). Therefore, tourism has always been an attractive topic that scholars in Vietnam and around the world are interested in researching.

Diverse information sources on the Internet facilitate users to collect information about any product or service, including the information about tourism. Previous studies have shown that travelers have consulted from various sources of information on the Internet before making a decision to choose a destination for their trip (Farrukh et al., 2022; Litvin et al., 2018). Research by Chang and Wang (2019) indicates that about 60% of potential travelers use the Internet to gather information from travel forums and personal blogs about

post-travel experiences, comments, and reviews, information from these sources is called Electronic Word of Mouth (EWOM). According to Bickart and Schindler (2001), comments on the Internet have the potential to reduce the risk, uncertainty and ambiguity associated with a product or service. EWOM helps travelers develop an image of a destination as well as a set of expectations before visiting a destination (Usakli and Baloglu, 2011). They form a mental picture of the destination through their reasoned and emotional interpretation (Kavoura and Bitsani, 2013).

The strong development of the tourism along with the fierce competition of destinations around the world has created challenges for destination marketing. Besides, the attraction of previously popular tourist destinations such as beaches, hills or sunsets does not make a difference among destinations (George and Anandkumar, 2014). Therefore, focusing on the personality of the destination will create greater brand recognition for destinations when the personality of the destination is emphasized (Hosany et al., 2007). The concept of destination personality as a solid foundation for differentiating different travel destinations because travelers with different personalities will choose different travel destinations (Murphy et al., 2007).

Although there have been many studies on EWOM and some studies on destination image in Vietnam, most studies related to Electronic Word of Mouth are usually conducted to examine the relationship of EWOM with components of the planned behavior model of travellers (Ha Nam Khanh Giao, 2022; Ngo Dinh Tam, 2019). There are not many studies on destination personality in Vietnam, most of them only focus on identifying the personality of specific destination such as Da Nang or Ho Chi Minh City (Bui Ta Hoang Vu, 2021; Pham Thi Lan Huong and Nguyen Minh Huy, 2014). According to the research of the authors, currently, there are very few studies on the relationship between EWOM and Vietnamese travel destination personality. In addition to research methodology, studies in this field in Vietnam and in around the world often stop at analyzing unidirectional variables so it is not possible to assess the overall impact of all EWOM factors on destination personality. Therefore, this study uses both unidirectional and multi-directional analysis methods for the variables in the research model. The use of and multi-directional variables will help assess the overall impact of EWOM on destination personality. The unidirectional analysis will help assess the impact of EWOM on each factor of destination personality in order to provide appropriate solutions for managers in the tourism sector. The objective of this study is to provide an integrative approach to examine the causal relationship between EWOM and destination personality.

2. Literature review and Research hypothesis

2.1. Definitions

2.1.1. Electronic word-of-mouth - EWOM)

Word of Mouth is gradually seen as an important source of information influencing consumer behavior (Chevalier and Mayzlin, 2006). Studies by Bickart (2001) and Kumar (2016) indicate that with the strong development of the Internet, it has provided a good

method for people to gather product information and consumption-related advice from other consumers by Electronic Word of Mouth. Consumers can share and exchange information with relatives, friends or even unfamiliar people through social media, which has led to the creation of a very diverse online oral community (Chon and Olsen, 1991). Research by Litvin et al. (2008) defines EWOM as all informal consumer-oriented communication through Internet-based technology that involves the use or information about the characteristics of particular goods and services or about the seller. According to Hennig-Thurau et al. (2004), EWOM is any positive or negative statement made by a former customer, current or potential customer about a product or business and is made available to people and organizations via the Internet. Thus, EWOM can basically be understood as the views, comments, reviews of users about products, services or organizations through the Internet environment.

EWOM is playing an important role in the tourism industry and therefore has a great influence on tourism marketing (Litvin et al. 2018). Wang (2015) has claimed that word of mouth provides travelers with more information about the destination and can influence a traveler's decision in choosing a destination. Furthermore, Farrukh et al. (2022) have emphasized that most travellers use EWOM to identify other people's experiences, gather opinions about a certain destination, and get recommendations. EWOM uses the large, anonymous, unsustainable nature of the Internet and introduces a new method to capture, analyze, interpret and manage the influence of communication in hotel and tourism marketing (Litvin et al., 2008). Research by Vermeulen and Seegers (2009) conducted an experiment and revealed that exposure to online reviews increased awareness of hotels, that those positive reviews improved travelers' attitudes towards hotels. Therefore, it can be concluded that EWOM plays an important role in the tourism sector.

2.1.2. Destination personality

Destination personality is considered an important factor explaining the decision-making process of tourists. According to Kavoura and Bitsani (2013), travellers make purchasing decisions based on their mental images of a particular destination. Destination personality refers to brand personality in the tourism sector (Chen and Phou, 2013). Ekinçi and Hosany (2006) define a destination personality as a set of personality traits that are related with a destination. According to Souiden et al. (2017), the concept of destination personality is still new and has received little interest from travel studies. According to Feli et al. (2016), travellers develop strong emotional ties to certain places and even assign human traits (personality traits of destinations) to destinations. Brand personality influences consumer priorities and trust levels, thus leading to improvement of trust and loyalty. A good destination personality will develop a positive impression and can attract tourists to visit. Destination personality can help travelers see the similarities between their personalities and destination personalities (Chi et al., 2018). The use of additional characteristics for the destination such as personality can contribute to differentiation for tourist sites and encourage travellers to choose a destination (Ekinçi and Hosany, 2006; Usakli and Baloglu, 2011). Destination personality is becoming a viable metaphor for destination positioning and branding (Chen and Phou, 2013). And destination managers are working hard to build their

own personalities for their destinations. Thus, destination personality can be defined as a brand personality referred to in the context of travel and using human personality traits to describe a destination.

2.2. Literature review

According to Aaker (1997), each brand, when it has a strong personality, has the ability to persuade people to consume products bearing that brand. Although the brand is related to the product, people view it as having human characteristics. Aaker (1997) proposed Brand Personality Scales (BPS) consisting of five elements: (1) Sincerity, (2) vibrancy, (3) competence, (4) delication, and (5) wind and dust. Each element consists of many different criteria, with 42 criteria in all. In particular, the sincerity component includes practical criteria, family cohesion, closedness, honesty, frankness, honesty, health, originality, cheerfulness, sentimentality, friendliness; Vibrant includes bold, trendy, exciting, stylish, lively, youthful, imaginative, unique, trendy, independent, modern; competence includes reliability, hard-working, safety, intelligence, achievement, rules, collectivity, leadership, confidence; delication includes upper-class, beautiful, charming, graceful, gentle, flexible; wind and dust includes the criteria of openness, masculinity, style, endurance, strength. The BPS scale has been used in many different fields, Ekinici and Hosany (2006) were the first authors to use it in the field of tourism, and since then the scale has been used quite a lot to explore issues in the context of tourism (Feli et al., 2016).

Ekinici and Hosany (2006) described the European destinations having 3 components: sincerity, excitement and fun. Developed from the research of Ekinici and Hosany (2006), Usakli and Baloglu (2011) announced the Las Vegas destination personality consists of 5 elements: Vividness, delication, power, modernity, sincerity. In Vietnam, Pham Thi Lan Huong and Nguyen Minh Huy (2014) identified Da Nang tourist destination according to international tourists, including 12 personality traits classified into 3 groups: sincere, vibrant and gentle - competence. Bui Ta Hoang Vu (2020) identified Ho Chi Minh City destination personalities into 8 groups: Vivid, Safe, Friendly, Playful, Excited, Open, Vibrant, Forward-looking. As such, the elements that constitute a destination's personality may vary depending on each travel context. A well-constructed destination personality enhances the image in the minds of customers, is instrumental in emphasizing differentiation between destinations (Murphy et al., 2007), help attract tourists to revisit and spread word of mouth of destination features (Stokburger-Sauer et al., 2012).

With the strong development of the Internet, virtual interactions between travellers have become popular, which has led some travel researchers to point out that EWOM plays an important role in attracting and retaining travelers in the age of e-commerce (Litvin et al., 2008; Vermeulen and Seegers, 2009). Some study have analyzed the relationship between EWOM and destination image, concluding that EWOM positively and directly impacts destination image (Doosti et al., 2016; Jalilvand and Samiei, 2012; Ha Nam Khanh Giao, 2022). The concepts of brand image and brand personality have been used interchangeably in a few studies (Graeff, 1997; Upshaw, 1995). Or as the study by Hosany et al. (2006) has investigated the link between destination personality and destination image,

the results have proved that the two concepts of destination personality and destination image are related. Therefore, many studies have shown that if EWOM affects the image of the destination, it can also affect the personality of the destination. This conclusion is consistent with the publication of Feli et al. (2016), according to which, word of mouth positively and significantly influences destination personality. Word of mouth is an important tool in creating and developing a tourist destination personality.

2.3. Research hypothesis

Based on the theory of brand personality of Aaker's (1997), Jalilvand et al. (2012) in their study of 264 international travellers revealed that EWOM positively influences destination image, travelers' attitudes, and travel intentions. Doosti et al. (2016) showed that EWOM indirectly influences visiting intentions through image of the city and attitude towards the city. Abubakar (2016) used a sample of 308 customers in Cyprus and came to the following conclusions: (1) Electronic referrals affect brand image, (2) EWOM affects brand image, and (3) EWOM and brand image influence purchase intent. Research by Graeff (1997), Upshaw (1995), Hosany et al. (2006) has investigated and concluded that there is a relationship between destination personality and destination image, even in some contexts, the two terms are used interchangeably. Thus, the majority of research in the world focuses on the relationship between EWOM and destination image, not much research has explored the relationship between EWOM and destination personality. The results of the study by Feli and Azizi (2016) are that it is rare to demonstrate a direct and positive relationship between word of mouth and destination personality, however this study has not been placed in an internet environment, word of mouth is direct.

In Vietnam, a small number of studies only stop at understanding destination personality characteristics in certain destination such as Da Nang, Ho Chi Minh City (Bui Ta Hoang Vu, 2020; Pham Thi Lan Huong, 2014), has not studied the relationship between destination personality and travelers' behaviors such as destination selection intention, return intention or word of mouth. With a very new study of Ha Nam, Khanh Giao (2022) when conducting a survey with 280 domestic tourists in Ho Chi Minh City about travelling to Da Nang. The results stop at the content that EWOM positively impacts the image of the destination. Therefore, the study exploring the direct relationship between EWOM and destination personality in the context of Vietnam tourism is an interesting content to be explored. From the overview of works in Vietnam and in around the world, the research hypothesis is as follows:

H: EWOM positively and directly affects the personality of the destination.

3. Method

3.1. Study design and study template

The main goal of this study was to examine the relationship between EWOM and destination personality. To do so, the researchers conducted qualitative and quantitative research.

The qualitative study was conducted from September to November 2020 in Hanoi with 2 focus group discussions (100- minute discussion) and 14 in-depth interviews (average time is 40 minutes each) with subjects are Vietnamese. The selected subjects have differences in age, gender, income, qualifications and marital status. Qualitative research serves the objective of checking the suitability of the research model and the suitability of the scale in the context of Vietnam tourism. The research results showed that the interviewees understood the characteristics of domestic tourism, gave their views on the personality characteristics of Vietnamese destinations and commented on the influence of Electronic Word of Mouth on destination personality.

After a preliminary quantitative study in Hanoi and Ho Chi Minh City, the author found that for Vietnamese tourists, travel thinking and behavior are basically homogeneous, therefore, the official survey was conducted in the inner city and suburbs of Hanoi for convenience and cost savings. The paper survey was issued between January and March 2021. The authors designed convenient sample selection, the reason is that because the respondents are easily accessible and willing to answer the survey questionnaire, many researchers have affirmed that convenient sample selection also ensures the reliability of the study (Boo, 2005). The number of respondents was 550, of whom 510 (92.7%) were valid.

In the analysis, the three main contents performed in this research step are: (1) Exploratory Factor Analysis (EFA), (2) Reliability analysis of the Cronbach's Alpha scale, (3) Confirmator factor analysis (CFA) and (4) Regression analysis using the maximum rationalization method on the Structural Equation Modeling (SEM). Data analysis is done through SPSS 23 and AMOS 23 statistical processing software.

3.2. Research scale

3.2.1. Independent variables

The scale of Electronic Word of Mouth was used in the study of Jalilvand and Samiei (2012), which consists of 6 indicators, ranging from Electronic Word of Mouth one to six. All independent variables are evaluated on a Likert scale from 1 to 7, where level 1 is "strongly disagree" and level 7 is "strongly agree".

3.2.2. Dependent variables

The Aaker Brand Personality Scale (1997) was not originally developed to measure destination personality, so some personality traits applied to a person or a product brand were considered unsuitable for certain countries or regions (Souiden et al., 2017). In other words, the relevance and stability of the 5 uncertainties are applied to cities, countries or destinations in general. Inheriting from the scale of Aaker (1997), Usakli and Baloglu (2011) proposed a destination personality that also includes 5 traits: Vividness, delication, competence, epochality and authenticity. The results of a number of studies in Vietnam on destination personality lead to the following conclusions: sincerity, enthusiasm, gentleness - competence (Destination Da Nang) (Pham Thi Lan Huong, 2014) or exciting, lively, safety, friendly, open, vibrant, playful, forward-looking (Ho Chi Minh City) (Bui Ta Hoang Vu, 2020).

After conducting preliminary qualitative and quantitative research, the authors found that the majority of Vietnamese do not distinguish clearly and are confused among delicate characteristic, vivid characteristic and sincerely characteristic. Respondents are confused among the criteria, according to which, the criteria of attractiveness, femininity, grace, good-looking (belonging to delicate characteristics) are confused with each other and are confused with charm, sensuality, energy, liveliness, vitality (belonging to vivid characteristics) and the criteria of friendliness, cheerful (of the sincerely characteristic).

Therefore, in the official quantitative study, the authors used the research scale of Usakli and Baloglu (2012), retaining some of the following destination personality which are suitable for the domestic tourism context of Vietnam:

A domestic tourist destination is considered as a person:

Table 1. Destination personality scale

BPS1: Competency characteristics	BPS2: Epochal characteristics
BPS1.1: Leader	BPS2.1: Unique
BPS1.2: Success	BPS2.2: Modern
BPS1.3: Confident, Assertive	BPS2.3: Daydreaming
BPS1.4: Independent	BPS2.4: Youthful
BPS1.5: Intelligent, quick-witted	BPS2.5: Trendy

Source: Self-synthesized author group

All dependent variables use a Likert scale from 1 to 7, where level 1 is "strongly disagree" and level 7 is "strongly agree".

4. Results

4.1. Data descriptive statistics

After cleaning the data, the result had 510 votes included in the statistical analysis of the sample description to check the suitability and representativeness of the sample.

Table 2. Descriptive statistics of the survey sample

Characteristics	Classify	Number of respondents (people)	Percent (%)
Living and working area	Hanoi Inner City	296	58,0
	Suburban Hanoi	211	41,4
	Other	3	0,6
Gender	Male	243	47,6
	Female	265	52,0

Characteristics	Classify	Number of respondents (people)	Percent (%)
	Other	2	0,4
Education	Not graduated from high school	26	5,1
	Graduated from high school	142	27,8
	Intermediate - College - University	197	38,6
	Postgraduate	145	28,4
Job	Student	73	14,3
	Freelancer	106	20,8
	Housewife	1	0,2
	Civil servants, public employees and officials at State Agencies/Organizations/Enterprises	93	18,2
	Employees, Managers at Private/Foreign organizations/Enterprises	135	26,5
	Senior Manager/Business Owner	18	3,5
	Teacher, Scientist	32	6,3
	Others	52	10,2
Total		510	100

Source: Self-synthesized author group

Regarding the **living and working area**, out of a total of 510 samples meeting the analysis standards, 296 people live and work in the inner city of Hanoi, accounting for 59.0%. And there were 211 people living and working in the suburbs of Hanoi, accounting for 41.4%, 3 people from other areas, accounting for 0.6%. This result is consistent with reality, showing that the majority of respondents live and work in the inner city of Hanoi. In terms of **gender**, 243 people are male, accounting for 27.6%; There are 265 women, accounting for 52% and 2 people, accounting for 0.4%, of other gender. This reflects the reality of Vietnam in general and Hanoi in particular when the proportion of women is always slightly higher than the proportion of men. In terms of **education**, the majority of respondents answered that they graduated from intermediate-college-university, accounting for 38.6%. At least the number of people who did not graduate from college was only 26, accounted for 5.1%. In reality, the level of education does not affect much on Internet access to search for information in general and tourist destination selection information in

particular. In terms of **job**, 26.5% of people worked as employees and managers at private/foreign organizations/enterprises. Many people living and working in the suburban area of Hanoi worked in industrial parks, while those living and working in the inner city of Hanoi do many different jobs: office workers, managers, technicians ... for private/foreign enterprises. The second highest proportion was self-employed with 106 people, accounting for 20.8% of the total 510 respondents. Only 1 respondent worked as a housewife, accounting for at least 0.2%.

4.2. Scale reliability

The personal characteristics include: Competency characteristics and epochal characteristics with Cronbach's Alpha reliability are: 0.847 and 0.747 > 0.7, respectively; At the same time, the indicators all have a total variable correlation coefficient > 0.3, so they have good reliability.

Electronic Word of Mouth is only a single factor with Cronbach's Alpha reliability of 0.886 > 0.7 and total variable correlation coefficients > 0.3, making it highly reliable (Hair et al., 1998).

4.3. Exploratory Factor Analysis (EFA)

For the research model, the authors used factor extraction method based on Eigenvalue > 1 index, Principal Components method and Varimax rotation. The results of EFA analysis with 2 independent variables and 1 dependent variable have a KMO coefficient of 0.847 > 0.8; Bartlett's test has a p-value of 0.00 and cumulative explained variance of 63.658, demonstrating that the three extracted factors explain 63.658% of the data variation of 15 observed variables. In addition, the observed variables all have a factor load factor of > 0.5, so good results are achieved (Hair et al., 1998).

Table 3. EFA analysis and scale reliability

	Cumulative explained variance		
	32,968	53,014	63,658
Electronic Word of Mouth			
EWOM2. To make sure I choose the right destination, I often read other people's travel reviews/comments on the Internet	0,868		
EWOM3. I often refer to other travellers' online travel reviews/comments when choosing an attractive destination	0,867		
EWOM4. I regularly gather information from other travellers' online travel reviews/comments before arriving at a certain destination.	0,845		
EWOM1. I regularly read other people's reviews/comments on the Internet to get an idea of which travel destinations impress people well	0,832		
EWOM6. When I travel to a destination, the online reviews/comments of visitors make me confident to travel there	0,731		

	Cumulative explained variance		
EWOM5. If I don't read traveler reviews/comments, then when traveling to a certain destination, I will worry about my decision	0,645		
Competency characteristics			
BPS1.5. The domestic tourist destination is seen as an intelligent and quick-witted person		0,806	
BPS1.2. The domestic tourist destination is considered as a successful person		0,802	
BPS1.3. The domestic tourist destination is seen as a confident and decisive person		0,798	
BPS1.1. Domestic tourism destination is recognized as a leader		0,734	
BPS1.4. The domestic tourist destination is seen as an independent person		0,717	
Epochal characteristics			
BPS2.2. The domestic tourist destination is seen as a modern person			0,833
BPS2.4. The domestic tourist destination is considered as a youthful person			0,829
BPS2.5. The domestic tourist destination is seen as a trendy person			0,656
BPS2.3. The domestic travel destination is seen as a daydreaming person			0,581
Cronbach's Alpha	0,886	0,847	0,747
KMO = 0,843; $\chi^2 = 1.788,770$; df = 36; sig. = 0,000			

Source: Authors' calculations

4.4. Affirmative Factor Analysis CFA

4.4.1. Unidirectional model

For the first-order construct, the CFA analysis showed that the normalized regression weight of the observed variable BPS2.3 < 0.5 was removed. Cmin/df indicators = 2.768 < 3; GFI = 0.952; CFI = 0.967; TLI = 0.957; RMSEA = 0.059 < 0.08 so the model has a good fit.

At the same time, the epochal characteristics (BPS2), competency characteristics (BPS1) and Electronic Word of Mouth (EWOM) factors had Composite Reliability (CR) of 0.816, respectively; 0.847 and 0.886 > 0.7; at the same time, the Average Variance Extracted (AVE) > 0.5 should ensure convergence. In addition, the MSV coefficients < AVE, and the square root of AVE is greater than the pair correlation coefficient of the factors, thus ensuring the differentiation (Hair et al., 1998).

Table 4. Reliability, convergence, differentiation analysis table (first-order construct)

	CR	AVE	MSV	EWOM	BPS1	BPS2
EWOM	0,886	0,573	0,919	0,757		
BPS1	0,847	0,527	0,859	0.292***	0,726	
BPS2	0,816	0,600	0,840	0,092	0,474***	0,775

***: Statistically significant at 1%.

Source: Authors' calculations

4.4.2. Second-order construct

For second-order construct, CFA analysis results show that the normalized regression weighting of observed variables > 0.5 should be satisfactory. Cmin/df indicators = $2.768 < 3$; GFI = 0.952; CFI = 0.967; TLI = 0.957; RMSEA = $0.059 < 0.08$ so the model has a good fit.

At the same time, destination personality (BPS) and Electronic Word of Mouth (EWOM) had Composite Reliability (CR) of 0.757 and 0.911 > 0.7 , respectively; at the same time, the average deduction variance index (AVE) > 0.5 should ensure convergence. In addition, the $MSV < AVE$, root 2 coefficients of AVE are larger than the pair correlation coefficients of the factors, thus ensuring differentiation (Hair et al., 1998).

Table 5. Reliability, convergence, differentiation analysis table (second-order construct)

	CR	AVE	MSV	EWOM	BPS
EWOM	0,886	0,573	0,919	0,757	
BPS	0,884	0,829	1,559	0,237***	0,911

***: Statistically significant at 1%.

Source: Authors' calculations

4.5. Results of regression analysis

4.5.1. First-order construct

The results of the analysis of the first-order construct have an index: Cmin/df = 3.917; CFI = 0.944; GFI = 0.934; TLI = $0.929 > 0.9$; RMSEA = $0.076 < 0.08$ so the model has a good fit (Hair et al., 1998). In addition, the impact of electronic word of mouth (EWOM) on competency characteristics (BPS1) and epochal characteristics (BPS2) is 0.000 and 0.042, respectively, so electronic word of mouth positively impacts competency characteristics and epochal characteristics. At the same time, the normalized β coefficients of competency characteristics and epochal characteristics are 0.297 and 0.104, respectively, so Electronic Word of Mouth affects the competency characteristic more than the epochal characteristic.

Chi-square/df=3.917
 GFI=.934
 CFI=.944
 TLI=.929
 RMSEA=.076
 PCLOSE=.000

Figure 1. SEM analysis results for unidirectional variables

Source: Authors' calculations

4.5.2. Second-order construct

The results of the second-order construct analysis show the indicators: $C_{min}/df = 2.768$; $CFI = 0.967$; $GFI = 0.952$; $TLI = 0.957 > 0.9$; $RMSEA = 0.059 < 0.08$ so the model has a good fit (Hair et al., 1998). At the same time, the impact of electronic word of mouth (EWOM) on destination personality traits (BPS) has a p-value factor of 0.000 and a normalized β coefficient of 0.237, so electronic word of mouth positively impacts destination personality traits in Vietnam.

Chi-square/df=2.768

5. Discussion and Conclusions

This study still has some limitations, (1) the study has not provided an intermediate or regulatory relationship between Electronic Word of Mouth and destination personality, (2) the study subjects live and work in inner and outer Hanoi, not representing the overall number of Vietnamese and international visitors to Vietnam. Further studies can carry out a survey with the ratio of domestic and international tourists to examine the relationship between EWOM and Vietnamese destination personality. Or analyze the impact of destination personality on traveler behaviors such as: destination selection intent, destination loyalty, or intent to return to the destination. In addition, it is also advisable to conduct a comparative study to better understand the factors related to destination personalities or personalities of different destinations in Vietnam.

There have been measurement studies on destination personality such as Usakli and Baloglu (2011), Kumar (2016), Bui Tá Hoang Vu (2021) or studies on EWOM in the field of tourism (Feli et al., 2016; Doosti et al., 2016; Abubakar, 2016), but have not found research exploring the relationship between e-word of mouth and personality in Vietnam, which is a new contribution to the current study. Based on reviews and feedback from past travelers, potential tourists have an idea of the destination, forming in their thoughts the destination personality. This discovery helps planners come up with ideas for businesses to use online platforms to share information about tourism activities, the uniqueness of destinations on the Internet, thereby helping potential tourists access information. Destinations must consider the natural landscape, facilities and people when planning strategies to develop the desired characteristics of the destination in the traveler's mind. Destination managers should try to encourage travelers to participate in discussions on online communities. When the number of reviews of tourists about a destination is high, then more and more information about a certain destination will be popular among potential tourists and, as a result, the likelihood of destination selection will increase.

Faculty of International Economics, Foreign Trade University, Hanoi, Vietnam

Abstract

The research aims to analyze the influence of traffic and environmental pollution on the intention of economics students in Hanoi to choose a place to work. The data was collected through a survey of 452 economics students from five universities in Hanoi: Foreign Trade University, National Economics University, Banking Academy, Thuongmai University, and the Academy of Finance. Based on data analyzed by IBM SPSS 26 software, combining qualitative and quantitative research methods by linear regression, the results show that the evaluation variables of pollution and traffic congestion, job opportunities and income, cost of living, adapting to traffic congestion, service quality, family support, and relationships all influence the graduates' intention to choose a job location. From the research results, several solutions have been proposed to help attract local talent and improve the quality of life in Hanoi.

Keywords: *Environmental pollution, Graduates, Intention, Traffic congestion.*

1. Introduction

Vietnam's capital, Hanoi, the country's major economic, commercial, and service hub has a high labor force density, particularly for skilled local workers. This puts intense pressure on the city, exacerbating problems related to environmental pollution and traffic congestion. With fine dust levels five times higher than WHO criteria and 3.5 million people affected, Hanoi is currently one of the most polluted cities in the world. The city's water source is heavily polluted, and the districts here have received much negative feedback from

people about the quality of domestic water. Besides, on a daily basis, people in the capital have to endure hours of traffic jams during rush hour. All of the above has a significant impact on the health and quality of life of people living in the city, partly affecting their intention to choose a place to work, especially after graduation.

Numerous studies have been done thus far to demonstrate the elements influencing students' decisions to select a place to work, both domestically and internationally. Employment opportunity is the factor most included in previous studies when considering this intention (Ferry, 2006; Hao et al., 2020; Nguyen et al., 2020; Tran, 2006). Besides the diversity of job opportunities, a lucrative income will also attract workers, leading to migration to higher-salary places (Lewis, 1954; Torado, 1969). Wages in urban areas are often assessed as more attractive than local incomes, thereby attracting young people to stay and work (Ferry, 2006; Huynh & La, 2011). In addition, the quality of urban services is also a decisive factor in a person's settlement in the city (Lin et al., 2019), including the quality of education (Zhou et al., 2020), entertainment, and health care (Zhang & Yu, 2022). Good urban public resources will be a positive signal to increase the likelihood of students staying in the city to work (Hao et al., 2020; Nguyen et al., 2020). The cost of living, including housing costs (Liu & Huang, 2023), transportation costs, and grocery shopping (Hao et al., 2020), has been shown to affect the intention of students to stay in the city after graduation (Hao et al., 2020). Besides, family and university relationships also play a huge role in students' career orientation. Graduates with strong ties to parents, siblings, and extended family are more likely to return to their home country (Tansel & Gungor, 2002). Meanwhile, students who have no obligation to take care of elderly relatives in their homeland are less likely to intend to return home (Morathop et al., 2010). Young people from less disadvantaged families tend to move to cities to gain more job opportunities with more competitive wages and greater equity (Du, 2017). Support from professors and friendships during university studies have a positive impact on the intention to stay (Cui et al., 2016). The social relationships of local relatives also influence the decision of graduates to return to their hometown (Huynh & La, 2011; Nguyen, 2020). Environmental pollution was also mentioned when considering students' intentions to choose a place to work (Khanna et al., 2021; Nguyen et al., 2020).

As can be seen, the above studies only consider familiar factors such as job opportunities, income, service quality, cost of living, family, and relationships. Environmental pollution has also been mentioned, but only in the scope of foreign research focusing on air pollution; Vietnam has not had any research that considers air pollution as an independent factor. Groups of factors such as water pollution or traffic congestion are not mentioned at all when studying the intention to choose a place to work after graduation. From the studies of Higa (2022) and Musumba et al. (2011), which talk about the impact of water quality and traffic congestion on population health, the research team decided to add these two groups of factors to assess the extent of their influence on students' intentions to choose a place to work.

2. Method

2.1. Data collection

The authors collected data from students currently at 5 economics universities in Hanoi, Vietnam by using the online questionnaire through Google Form. After the process of data collection and preliminary processing, processing of blank data, the final obtained data includes 452 responses, the research team comes to the process of regression analysis and statistics by exploiting the SPSS 26 software.

2.2. Sampling method

In this study, the authors selected the survey with a random sample on the basis of determining the sample size of the Exploratory Factor Analysis (EFA) (Hair et al., 2010) and multivariate regression analysis (Tabachnick & Fidell, 2006). The students selected for the survey are studying at five economics universities in Hanoi, Vietnam. The formula determines the minimum sample size for the study to be reliable. A sample size of approximately 500 observations was deemed appropriate, following the rule of thumb of multiplying by 5 for EFA and the minimum rule for multivariate regression.

2.3. Regression model

The author used regression with the dependent variable as Intention (YD) to assess the effect of variables on intention of students from economic universities in Hanoi, Vietnam. The factors described in the exploratory factor analysis (EFA) above are the independent variables affecting. The following is regression model:

$$YD = \beta_0 + \beta_1 * CH + \beta_2 * TN + \beta_3 * MG + \beta_4 * DV + \beta_5 * MQH + \beta_6 * GT + \beta_7 * KK + \beta_8 * NU + u$$

Where as, CH refers to Job opportunity, TN presents Income, MG refers to Living cost, DV indicating Service quality, MQH refers to Family and social support, GT represents Traffic Congestion status, KK refers to Air pollution and NU indicates Water pollution. The values β_i ($i = \overline{1,8}$) are regression coefficients, which represent the impact of each independent factor on the dependent variable's fluctuation. When the regression coefficients are significant (as determined by measuring the significance of the regression coefficient) and them is large, the regression model is considered suitable. In this study, we use regression models to reflect the influence of the independent variables on Intention.

2.4. Scale of variables

Researchers designed a questionnaire with 42 observed variables dividing into 1 dependent variable and 8 independent variables, using the 5-level Likert scale (Score 1: Absolutely disagree, Score 5: Absolutely agree). Dependent variable is Intention to work in the local area (YD), including 3 observed variables.

In this study, the independent variable is the variable that affects the dependent variable or in other words the dependent variable is decided by the independent variable. In this study, there are eight (8) variables considered with eight factors, namely Job

opportunities (CH) with 4 observed variables, Income (TN) with 5 observed variables, Living cost (MG) with 3 observed variables, Service quality (DV) with 3 observed variables, Family and social support (MQH) with 5 observed variables, Traffic Congestion status (GT) with 7 observed variables, Air pollution with 5 observed variables and Water pollution with 4 observed variables. Variable scales are inherited from previous studies of Nguyen et al. (2019), Tansel & Gungor (2002) Nguyen et al. (2020) and Weerasinghe & Subashini (2020)) along with some observed variables developed by the author.

3. Result

3.1. Descriptive Statistical Analysis

The general information related to the demographic information of economics students in Hanoi such as gender, hometown, university is illustrated in the below table.

Table 1. Demographic information of respondents

Group	Categories	Observation	Percentage
Gender	Male	173	38.3%
	Female	279	61.7%
Hometown	Hanoi	112	24.8%
	Other	340	75.2%
University	Foreign Trade University	272	60.2%
	National Economics University	59	13.1%
	Thuongmai University	48	10.6%
	Academy of Finance	39	8.6%
	Banking Academy of Vietnam	34	7.5%

Source: Data processing result by authors

3.2. Reliability Analysis- Cronbach's Alpha

The Cronbach's Alpha coefficient for all items of the final scale is higher than 0.6. The Corrected Item- Total Correlation of each observed independent and dependent variable is greater than 0.3. Therefore, the study's scale remained all 39 observations for subsequent EFA review.

Table 2. Cronbach's Alpha result

Variables	Symbol	Number of observed variables	Cronbach's Alpha
Dependent variable			
Intention	YD	3	0.884
Independent variables			
Job opportunity	CH	4	0.870
Income	TN	5	0.771

Variables	Symbol	Number of observed variables	Cronbach's Alpha
Living cost	MG	3	0.815
Service quality	DV	3	0.797
Family and social support	MQH	5	0.749
Traffic Congestion status	GT	7	0.785
Air pollution	KK	5	0.840
Water pollution	NU	4	0.824

Source: Data processing result by authors

3.3. Exploratory Factors Analysis

After proceeding EFA at first, 7 observed variables were removed from the scale because they are extracted into 2 and 3 factors, the rest is appropriate with factor loading > 0.5 . In the second EFA process, the KMO coefficient computed from the sample is $0.908 > 0.5$. The Barlett test has a p-value of $0.000 < 0.05$, % of variance = $64.707 > 50\%$, the factor loading is greater than 0.5 and the coefficient Eigenvalue is $1.022 > 1$. Thus, the criteria for using the EFA discovery analysis shows that the factors are consistent with the data set of study. Therefore, the survey sample size is sufficient for factor analysis.

Table 3. Rotated Component Matrix

	Component					
	1	2	3	4	5	6
KK1	0.797					
NU1	0.786					
NU3	0.717					
KK3	0.707					
NU2	0.702					
KK2	0.694					
GT1	0.691					
KK4	0.690					
KK5	0.673					
NU4	0.653					
GT2	0.650					
CH2		0.808				
CH4		0.800				
TN4		0.703				
CH3		0.677				
CH1		0.672				
TN3		0.630				

	Component					
	1	2	3	4	5	6
MG1			0.879			
MG2			0.798			
MG3			0.728			
GT5				0.767		
GT3				0.752		
GT4				0.705		
DV1					0.748	
DV2					0.697	
DV3					0.632	
GD2						0.814
GD4						0.691
GD3						0.648

Source: Data processing result by authors

The analysis results show that with 29 observed variables to evaluate the intention of working places by economics students, there are 6 factors that can be extracted. According to the calculation results from the sample, these factors explain 64.707% of the variation of the dataset.

As these observed variables are extracted into factors different from our prior ones, we propose new dependent and independent variables as follows:

Dependent variable: Intention of working in hometown (YD)

Independent variables:

- Awareness of pollution and traffic congestion (DG)
- Job opportunity and income (CH_TN)
- Living cost (MG)
- Readiness for traffic congestion (TNGT)
- Service quality (DV)
- Family and social support (MQH)

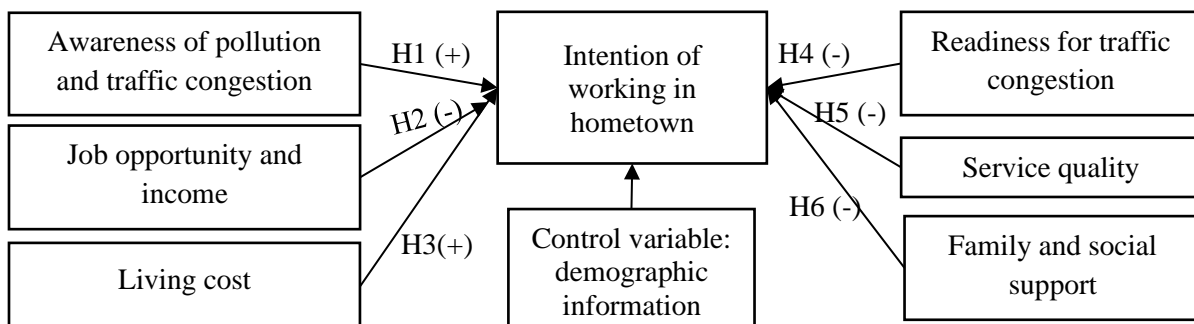

Figure 1. The final model

Source: Author's Compilation

3.4. Regression analysis

Table 3. Coefficient

	B (Unstandardized Coefficients)	Beta (Standardized Coefficients)
(Constant)	4.333*** (0.329)	
DG	0.420*** (0.089)	0.261***
CH_TN	-0.295*** (0.084)	-0.212***
MG	0.300*** (0.053)	0.269***
TNGT	-0.244*** (0.064)	-0.190***
DV	-0.390*** (0.077)	-0.290***
MQH	-0.145** (0.059)	-0.114**
Observations		452
Adjusted R - squared		0.208

*** p<0.01, **<0.05, *p<0.1

Source: Data processing result by authors

The value of determination coefficient Adjusted R Square is 0.208 which indicates that the six main factors explain 20.8% of the variation in the dependent variable (YD). The Sig. values of all independent variables are less than 0.05, indicating that the coefficients are statistically significant at a 5% level. All hypotheses are accepted: the DG and MG have positive effect on the dependent variable, Intention to work in the local area; while the CH_TN, TNGT, DV, and MQH have negative effect on this dependent variable. Based on the above analysis results, the regression equation of the YD is as below:

$$\widehat{YD} = - 0.290 * DV + 0.269 * MG + 0.261 * DG - 0.212 * CH_TN - 0.190 * TNGT - 0.114 * MQH$$

4. Discussion and conclusion

4.1. Discussion

Traffic congestion and environmental pollution are the main factors in the research group's objective, which is also a new point compared to previous studies. The research results indicated that as the evaluation of air pollution, water pollution, and traffic congestion in Hanoi increased, the intention to work in hometown of undergraduates would rise. This

result aligns with studies by Y Hao et al. (2020), Liu & Yu (2020), and Khanna et al. (2021). However, there has been no previous study that directly assesses the direct impact of congestion on the intention to choose a workplace. Previous studies such as Kamruzzaman & Rumpa (2019), and Higa (2022) mainly focused on evaluating the impact of congestion on work efficiency, working time, etc. These indirect impacts influenced the choice of workplace. Currently, the air quality index (AQI) in Hanoi consistently reaches hazardous levels, and people are exposed to PM_{2.5} fine particulate matter concentrations exceeding 45 µg/m³, posing health risks to workers and directly affecting the desire for stability in the lives of migrants and sensitive individuals, who are heavily affected by air pollution (Liu & Yu, 2020).

Readiness for traffic congestion is a negative factor that affects the intention to return to the local area for work among students. However, this factor has a relatively small impact compared to other variables. This is consistent with the theory of reasoned action (Ajzen & Fishbein, 1975) and the theory of planned behavior (Ajzen, 1985, 1991). This result acknowledges and reflects the findings of the previous study by Weerasinghe & Subashini (2020) on the impact of adaptation to congestion on the intention to choose a workplace. Currently, students in Hanoi, as young workers with health and enthusiasm, are willing to accept congestion to work in Hanoi, where they will work for a few years before deciding whether to return to their hometown.

The living cost in Hanoi is the second most influential factor in the intention to choose a local workplace among students in the Hanoi area after graduation. This factor has a positive influence on the intention of students. Therefore, as prices in Hanoi increase, students are more likely to have the intention to work in their hometown after graduation. According to the Spatial Cost of Living Index (SCOLI), Hanoi had the highest prices in the country in 2022, which somewhat reduces the intention to stay in Hanoi for work.

The factor that has the greatest impact on students' intention to choose to work in Hanoi after graduation is the services quality. When the services quality in Hanoi improves, it reduces students' intention to return to their hometowns. Hanoi has many hospitals with excellent doctors, modern equipment, schools with good quality training, developing soft skills and improving foreign language proficiency for students, diverse entertainment areas, and cinemas. These factors will attract young people (especially students) to stay in the city, reducing the likelihood of them returning to their hometowns.

Regarding job opportunity and income, the research results show that this factor has a negative impact on students' intention to work in their hometowns after graduation. Hanoi concentrates on many small and medium-sized enterprises, providing diverse jobs for students. They have a greater chance to improve their skills and use foreign languages in their work, which makes them tend to stay in Hanoi instead of returning to their hometowns.

In addition, the family and social support also have an impact on students' intentions to work in their hometowns. This factor has a negative impact on students' intentions, meaning that when students receive support from their families and relationships in Hanoi, they will reduce their intention to work in their hometowns. It can be seen that students still

depend on their families, but this dependence is decreasing gradually compared to before. This shows that students are becoming more active and independent to demonstrate their abilities, assert themselves, and seek the best and most suitable opportunities for themselves.

4.2. Conclusion

In conclusion, the research results provide valuable information to support stakeholders in providing and developing solutions for local governments, city governments, schools, and students themselves. To attract students who are about to graduate to return to their hometowns to work, local governments need to apply the following solutions based on the strong or weak impact of the factors that affect students' intentions to work in their hometowns, along with the relationships between these factors:

(i) Solutions for government and management agencies:

- Solution to attract graduates to work in the local area:

Government and management agencies should:

(1) Improve service quality and upgrade infrastructure:

Expand and upgrade transportation routes; invest in advanced facilities for hospitals and invite specialized doctors; construct and repair schools, provide new technological tools for teaching and learning; build parks for local residents.

(2) Provide more career development opportunities for workers:

Provide administrative procedure support, preferential tax and interest rate policies, and attract investment capital for local businesses' development, which can attract graduates to work in the area. Establish scholarships and support funds for financially disadvantaged students. Collaborating with businesses to organize career counseling workshops for students helps them understand suitable job opportunities in the local area.

(3) Enhance environmental protection:

Raise public awareness about pollution issues; encourage tree planting; closely manage factories' waste discharge into the environment; control the use of plant protection substances and fertilizers in agriculture to prevent groundwater pollution.

- Solution to ensure a better living environment for graduates working in Hanoi:

The authority should take measures to ensure the most favorable living conditions for graduates working in Hanoi, such as:

(1) Improve air quality in Hanoi:

Increase the number of air monitoring stations in suburban areas; propose measures to limit the sources of air pollution, such as raising community awareness, banning traditional stoves, managing crop residues and agricultural by-products; conduct emission tests for motorcycles and old motorized vehicles circulating in the area; address the existing waste problem and impose severe penalties for businesses causing significant air pollution.

(2) Ensure clean water supply for residents:

Establish regulations for water exploitation units to protect the quality of domestic water sources; listen to feedback from residents regarding the quality of domestic water. The Ministry of Natural Resources and Environment will continue to review and supplement mechanisms to enhance water resource management effectiveness and have legal sanctions for activities polluting domestic water sources.

(3) Solve traffic congestion issues in Hanoi:

Deploy additional traffic police officers to regulate traffic during peak hours; study the expansion of transportation infrastructure, such as installing traffic lights at intersections, increasing investment in constructing overpasses at major intersections; learn from the experiences of other countries in developing public transportation systems; enforce penalties for smuggling and vehicles that do not meet the required standards; promote traffic law compliance and encourage people to avoid peak hours if possible.

(4) Stabilize prices in Hanoi:

Regarding price stability for goods, the Department of Industry and Trade needs to inspect and control the factors influencing prices; impose legal sanctions for violations related to prices; continue to organize tax and price inspection teams at enterprises; provide interest-free capital support for businesses with a significant market share on the local area, and maintain balanced supply and demand by ensuring sufficient reserves of goods.

In terms of housing, it is necessary to implement housing planning for low-income workers, conduct inspections of student rental services, and maintain public order.

Regarding energy prices such as gasoline and oil, the Ministry of Finance and relevant departments need to manage and control the supply of petroleum products, as well as timely understand the energy needs of the population, ensuring a balance between supply and demand, and considering reasonable petroleum taxes.

(ii) Solutions for educational institutions:

Educational institutions and teachers should:

- Educational institutions should regularly organize career workshops and counseling sessions for students; establish a connection between businesses and students, organizing practical visits to businesses.

- Teachers should support students, provide advice on employment opportunities.

(iii) Solutions for students themselves:

Students need to be proactive in considering different intentions for their work location choices. They should focus on improving fundamental skills such as foreign languages, computer literacy, as well as soft skills such as communication, presentation, and interpersonal skills. They should explore their own potential and actively reach out to their teachers for career advice based on their current abilities and qualifications.

IMPACT OF CAREGIVING - WORK DEMANDS AND SOCIAL SUPPORT ON CAREGIVING BURDEN IN VIETNAM

Dr. Tran Thi Mai Phuong

phuongtm@neu.edu.vn

*Faculty of Human Resource Economics and Management,
National Economics University, Hanoi, Vietnam*

Abstract

The population of Vietnam is rapidly aging as a result of decreasing fertility rates and increasing life expectancy. Besides, the elderly mostly live with their children and grandchildren, so the burden on their children, relatives, and friends in caring for the elderly is enormous. This burden can directly affect the quality of life of caregivers. Therefore, it is important to understand how the demands of work and caregiving contribute to caregiving interferes with work conflict and caregiving burden for caregivers who are both employed and unpaid family caregivers. From a theoretical perspective, two factors some theories have pointed out as related to the level of burden on the caregiver, which is social support and role conflict in caregiving, has not been extensively studied. Therefore, this study will clarify the theoretical gap through testing several hypotheses related to work and caregiving demands, social support, caregiving interferes with work conflict, and caregiving burden to identify strategies for improving the lives of caregivers who balance these dual roles and help policy-makers to better support family caregivers, the primary resource for caring for the elderly in Vietnam and other aging countries.

Keywords: *caregiver burden, family caregiving, older people*

1. Introduction

The population of Vietnam is rapidly aging as a result of decreasing fertility rates and increasing life expectancy. The number of people with chronic diseases is also increasing along with the aging trend of the population. The proportion of deaths from chronic diseases increased from 41.6% in 1986 to 61.6% in 2006. Furthermore, this proportion is increasing rapidly, especially in the elderly population (Mwangi et al., 2015). Chronic diseases in the elderly will become a significant burden for families, communities, and the social welfare system. Especially with the traditional cultural values in Vietnam, the elderly mostly live with their children and grandchildren, so the burden on their children, relatives, and friends in caring for the elderly is enormous. This burden can directly affect the quality of life of caregivers. Therefore, it is important to understand how the demands of work and caregiving contribute to caregiving interferes with work conflict and caregiving burden for caregivers who are both employed and unpaid family caregivers.

From a theoretical perspective, factors that affect the burden of caring for the elderly have been demonstrated in some studies. These studies mainly focus on the direct impact of factors related to the caregiver's characteristics, the care recipient's characteristics, and their

impact on the burden of care. However, two aspects that some theories have pointed out as related to the level of caregiving burden, which is social support and role conflict in caregiving, has not been extensively studied. According to Pearlin's (1990) theory of the stress process, the role of social support and role conflict can affect the outcome of potential stressful events. According to this theory, the outcome of potential stressful events depends on the resources of the caregiver, such as social support, and the limits of those resources - the level of role conflict. Therefore, this study will clarify the theoretical gap through testing several hypotheses related to work and caregiving demands, social support, caregiving interferes with work conflict, and caregiving burden to identify strategies for improving the lives of caregivers who balance these dual roles and help policy-makers to better support family caregivers, the primary resource for caring for the elderly in Vietnam and other aging countries.

2. Theoretical Framework

2.1. Some Definitions

Older people

Older people is defined differently depending on the average life expectancy as well as the level of socio-economic development of each country. For international organizations, the United Nations or World Health Organization defines older people as people over 60 years old. According to the classification of World Health Organization, the ages 60-74 are classified as old, 75-89 as elderly, and 90 and over as senility (Tran Ngoc Tu, 2009). In Vietnam, Law on the Elderly defines elderly as Vietnam citizens over the age of 60 years. Therefore, in this study, elderly people are also considered as people over 60 years old.

Family caregiver

Informal family caregivers are people who often provide care without payment or without specialized training. Meanwhile, professional (formal) caregivers include nurses, home health aides, and other professional care workers. Informal carers are usually spouses or adult children, or sometimes other relatives or friends (UNFPA). In this study, the author will focus on the carers who are family members (including spouse, or children, other relatives) of the older people.

Caregiving Burden

George and Gwyther (1986, p. 253) defined caregiver burden as “the physical, psychological or emotional, social, and financial problems that can be experienced by family members caring for impaired older adults.”. Caregiving burden will affect the quality of life of caregivers as mentioned by the study of Wijngaart et al (2007). In this study, caregiving burden is considered as a caregiving outcome that reflects the negative emotional or physical feeling of carers when they confront with both physical and mental difficulties in taking care of an elder person.

Caregiving demands and Work demands

Caregiving demands are driven by the needs of the care recipient. Older persons who need more care put significant demands on their caregivers, in terms of the amount of care

required and the time needed to provide this care. Work demands, on the other hand are inherent to the employment position a person holds and include work conditions, workload, and exposure to risks (Cooper, Dewe, & O'Driscoll, 2001; Schaufeli & Bakker, 2004).

2.2. Conceptual Model and Hypotheses

Demands and Caregiving Outcomes

Caregiving demands may exhaust employees' mental and physical resources, again resulting in role conflict and strain or, as conceptualized in this study, CIW and caregiving burden. Caregiving demands can be understood as stressors in the process of caring for elderly individuals at home. According to the model developed by Johns and colleagues (2011), caregiving needs encompass factors such as the care recipient's health status, caregiving activities, and role demands. Research shows an inverse relationship between caregiving demand and negative caregiving outcomes such as caregiver burden and stress. Kim and colleagues (2012) found that the care recipient's health status is a critical factor explaining the burden of caregiving. Using a national sample of caregivers in the United States, the study included 302 participants randomly selected from a database. The results showed that the care recipient's health status was positively related to the hours of care and caregiver burden. Conde-Sala (2010) investigated caregiver burden comparing spousal caregivers and adult child caregivers of Alzheimer's patients. The study found no differences in caregiver burden between the two groups, and neither age nor the care recipient's health status was related to caregiver burden.

Another study by Morley and colleagues (2012) examined the impact of care recipient health status and contextual factors related to caregiving demands on the caregiver's quality of life. The sample included 238 caregivers with a mean age of 68.2 years in the UK. The results showed that caregiving hours directly affected the caregiver's quality of life. In addition, factors such as the care recipient's level of cognitive impairment and disease severity also influenced the caregiver's quality of life.

As such, the following hypotheses are posited:

Hypothesis 1a: Caregiving demands will be positively associated with CIW.

Hypothesis 1b: Caregiving demands will be positively associated with caregiving burden.

Supports and Caregiving Outcomes

Research approaches have focused on social support variables mainly towards negative caregiving outcomes such as caregiving burden, exhaustion or anxiety levels for caregivers. Typical author groups in this approach include Han et al. (2014), House et al. (1988), Taylor (2012), Rodakowski (2012), and Shieh (2012). According to Han et al. (2014), the author group studied types of social support that could reduce the psychological and non-psychological burdens of caregivers of people with dementia and explored the mechanisms of social support on caregiving burden. The study was evaluated through five types of social support (emotional support, informational support, tangible support, positive social interaction, and emotional expression support) among 731 patients with dementia and their caregivers using a scale. The results showed that positive social interaction and

emotional expression support directly and indirectly reduced the psychological burden of caregivers. Tangible support reduced non-psychological burdens through both direct and indirect pathways. Informational support and emotional support did not have any effect on reducing psychological or non-psychological burdens, and informational and emotional support were not helpful in reducing any type of caregiver burden.

Sherbourne and Stewart (1991) approached social support from two aspects: perceived social support and received social support. The research results showed that received social support was related to caregiving burden. In addition, this author group also identified factors that could predict other burdens such as demographic characteristics, caregiving time, cohabitation status, etc., but received social support was the most significant contributor to caregiving burden reduction, helping to minimize the burden on caregivers. The authors found that caregivers with high levels of social interaction and received social support would reduce the caregiving burden. Meanwhile, Shieh (2012) in his study showed the relationship between perceived social support and caregiving burden. Caregivers who perceived a high level of social support reported lower levels of burden. Based on this overview, this study will test two hypothesis as below:

Hypothesis 2a: Caregiving support will be negatively associated with CIW.

Hypothesis 2b: Caregiving support will be negatively associated with caregiving burden.

Caregiving interfering Work and Caregiving Burden

According to the stress process theory of Pearlin and colleagues (1990), work-family conflict is considered a stressor that negatively affects caregiving outcomes. This impact has been mentioned in several studies, including Opie & Henn (2013) and Wang et al. (2010). Caregivers who have to take on both roles at the same time are likely to experience work-family conflict, which leads to the formation of stressors that negatively impact caregiving outcomes, specifically the burden of care, as mentioned in this study. Over time, the responsibilities associated with caring for an older individual often become increasingly onerous, which can lead to a highly demanding experience for those who simultaneously work and provide care. Therefore, the study focuses on the following hypotheses based on these findings.

Hypothesis 3: CIW will be positively associated with caregiving burden.

Recent studies indicate that the effect between work demand and caregiving domain is vice-versa. The stress process theory proposed that caregivers often face cross-pressures and dilemmas when balancing their caregiving duties with their occupation. The competing demands hypothesis suggests that individuals who encounter difficulties in fulfilling their work obligations may experience a reduction in their family life quality and vice versa, as noted by Frone, Barnes, and Farrell (1994) and Stephens and Franks (1999). Therefore, I propose the following hypotheses:

Hypothesis 4a: Work demands will be positively associated with CIW.

Hypothesis 4b: Work demands will be positively associated with caregiving burden.

Hypothesis 4c: Workplace support will be negatively associated with CIW.

Research on the mediating role of work-family conflict or family-work conflict in the relationship between antecedents and outcomes related to both work and family of family members has been addressed in several studies, such as the research models of Aycan (2008), Greenhaus, Collins, Singh, & Parasuraman (1997); Guerts, Kompier, Roxburgh, & Houtman (2003); O’Driscoll, Ilgen, & Hildreth (1992). For instance, Aycan's (2008) model explores the impact of culture on well-being in the family domain through the mediating variable of work-family conflict. This research model focuses on cultural variables such as individualism, collectivism, etc. The study reveals that individuals who tend to be collectivistic are more likely to feel capable of balancing their work and family roles, thereby increasing their level of happiness in the family domain.

Based on the stress process theory of Pearlin, this study will concentrate on examining the mediating role of care-related work conflict in the relationship between care needs, care support, and care burden. I propose the following mediation hypotheses:

Hypothesis 5a: CIW mediates the relationship between caregiving demands and caregiving burden.

Hypothesis 5b: CIW mediates the relationship between caregiving support and caregiving burden.

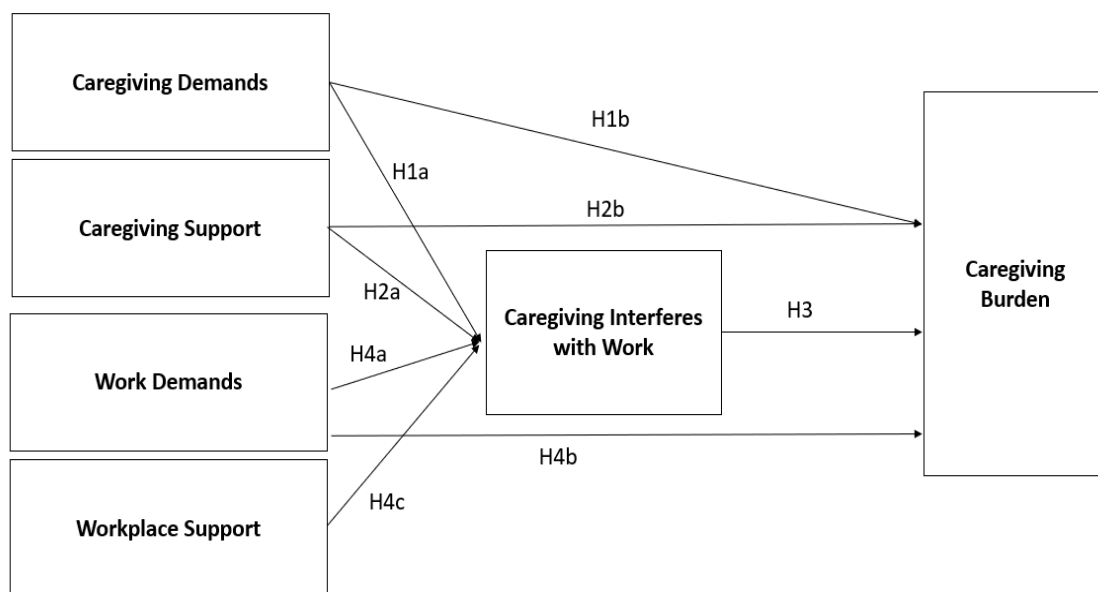

Figure 1. Theoretical framework addressing the factors affecting the burden of elderly family caregivers

2. Method

Sample

The study was conducted in two provinces: Hanoi and Thabinh where having a proportion of elderly population of 8% or higher according to the UNFPA's distribution of elderly population by province in 2011.

The sample size of the study was based on the actual proportion of elderly population in the six aforementioned provinces and the number of observed variables in the study. Based on the calculated results, the minimum sample size needed to ensure statistical power is 104. With a non-response rate of 20%, the estimated sample size would be around 124. However, as the study focuses on the group of caregivers who are children, according to the Institute of Population, Health and Development (2018), the proportion of children caregivers is 79.27%. Therefore, the study will survey at least 156 current caregivers of elderly individuals at home to ensure an adequate sample size for the group of caregivers after the survey.

Data collection and analysis

The study uses SPSS software to process data collected from 180 caregivers, currently caring for the older people at home in two provinces: Hanoi and Thai Binh - those with a high proportion of older people in Vietnam.

The data source is provided by the Elderly Association of wards and communes in Hanoi and Thai Binh. The Elderly Association is the main organization which obtain the information related to the health status, the caring situation for the older people at home. Therefore, using this data source will bring high reliability for the research. The survey will be conducted in three forms: handing out questionnaires, phone surveys, and online surveys. Out of 200 survey questionnaires collected, all 164 answers were valid and used to analyze the research model.

Measures

Caregiving demands

The caregiver demand variable is measured based on two basic measures: the health status of the elderly individual and the time spent providing care each week in hours. These two criteria include information on the number of hours the caregiver is engaged in caregiving; the health status of the elderly individual based on their ability to perform daily tasks such as preparing meals, ability to self-administer medication, etc.; and the number of hours per week that the caregiver spends caring for their parent(s). These criteria are constructed using a 6-level Likert scale.

Caregiving support

Caregiving support was assessed with two measures. First, respondents were asked to name the people in addition to the designated caregiver who helped the care recipient without receiving pay within the past month (informal helpers). The measure was the count of other unpaid helpers who assisted the care recipient. Second, respondents indicated the number of hours of help each of these individuals provided. The measure (informal help hours) was the total number of hours of unpaid help received by the care recipient from anyone other than the identified caregiver.

Work demands

Work demands were measured with the five-item psychological job demands scale (job demands) taken from Karasek's (1985) Job Content Questionnaire. Each item was rated on a 6-point scale from completely disagree (1) to completely agree (6).

Work support

Workplace support included two components: supervisor support and coworker support. Supervisor support was assessed with a four-item scale developed using three items from Clark's (2001) measure of family-sensitive supervision. Respondents rated each item on a 6-point scale from completely disagree (1) to completely agree (6). Coworker support was assessed using a parallel four-item scale and identical response format.

CIW

Measures of CIW were based on questions developed by Carlson and Frone (2003). Respondents used a 6-point Likert-type scale ranging from completely disagree (1) to completely agree (6). Higher scores indicated more conflict.

Caregiving Burden

Many studies use a variety of different measures, such as the Perceived Stress Scale (S. Cohen, Kamarck, & Mermelstein, 1983; 10 studies) and the Screen for Caregiver Burden (Vitaliano, Russo, Young, Becker, & Maiuro, 1991; 8 studies). However, the level of burden in caring for elderly individuals is most commonly measured using the Zarit Burden Interview (Gratão et al., 2019) with 58 different studies. Therefore, this study also used the Zarit Burden Interview to assess the perceived burden of caregivers.

3. Results

Descriptive statistics of caregivers

The average age of the respondents was 43.8 years. The personal annual income reported was as follows: less than 5 million VND (16%), 5.1-10 million VND (33%), 10.1-20 million VND (42%), more than 20 million VND (6%), and not reported (3%). About 45% of the sample reported working 40 hours per week, while 55% worked more than 40 hours a week. Most of the care recipients (63%) were female, with a mean age of 72.5 years. Approximately 59% of the sample were married, and their education levels included less than high school (4%), high school (20%), some college (21%), college degree (33%), and master's degree or more (22%). The care recipients' relationships with their caregivers were as follows: mother (67%), spouse or male partner (9%), father (7%), mother-in-law (5%), sibling (6%), other relative (4%), and other (2%). Half of the care recipients were living with their caregivers. The caregivers provided assistance with an average of 4.9 IADLs and 1.2 ADLs for the care recipients. The majority of the sample (71%) did not receive any paid help with their caregiving responsibilities.

Table 1. Descriptive statistics of older people

Indicators	Classification	Number	Percentage (%)
Gender	Male	68	34,7%
	Female	128	65.3%
Age	50-below 60	18	9,2%
	60- below 70	45	22,9%
	70- below 80	65	33,1%
	Above 80	68	34,8%

Source: Data from research results

Model related Findings

The initial test of the model, depicted in Figure 1, indicated a model fit as follows: CFI = .803, TLI = .72, RMSEA = .066, Hoelter = 124 ($p = .00$), chi-square/df ratio $208.346/30 = 4.315$. All paths were significant with the exception of the following: from caregiving demands to WIC. This path were removed from the model, one at a time. The fit of the model did not change substantially (CFI = .801, TLI = .726, RMSEA = .071, Hoelter = 183 [$p = .05$], chi-square/df ratio $221.708/40 = 3.667$). Table 1 presents unstandardized and standardized estimates from the final model. We tested mediation by removing the direct paths from caregiving demands and supports to caregiving burden. This resulted in a decrement in fit. Specifically, the chi-square rendered was 350.542 (47) as compared with 208.711 (43) in the final model.

Table 2. Model related Results - Impact of factors on the caregiver burden for the older people

	Estimates	SE	Critical Ratio	Standardized Estimates
Caregiving Demands				
CIW	2.871	0.387	4.333	0.214

4. Discussion and Conclusion

This study has contributed to the theoretical aspect by combining Pearlin's stress process theory (1990) and role conflict theory (Goode, 1960; Stephens & Franks, 1999) to develop a research model that examines the impact of caregiving on workers who have to juggle two roles simultaneously. The study has shown that work-family conflict is an important factor in explaining the effects of caregiving responsibilities at home and work on caregiver burden.

The results also indicate that social support plays a critical role in reducing stress for workers who have caregiving responsibilities for elderly family members. Social support for work and caregiving can help reduce pressure and improve the quality of both work and care. Additionally, this study also suggests that work-family conflict may be a mediating factor that explains how social support reduces work-related stress.

Currently, the social support system for elderly caregivers mainly relies on volunteers from non-governmental organizations or through group associations such as the Elderly Association and the Caregiver Union, which focus primarily on provinces with high percentages of elderly people. However, to ensure the quality of care and cope with the rapidly aging population, it is necessary to develop a paid caregiving workforce in households. The cost of wages can be contributed by both the household, non-governmental organizations, and the state to reduce the burden of care. The caregiving workforce can be diversified from people around, such as friends, neighbors, and even professional caregiving teams. Diversifying the caregiving workforce will help households have appropriate options based on their family situation and the health status of the elderly. Research results have shown that social support can reduce the burden of caregiving. Therefore, developing caregiving as a profession, increasing income sources for not only professional caregivers but also those around, will contribute to improving social welfare policies and developing community-based elderly care.

On the other hand, workplace support combined with caregiving support can reduce the conflict between work and family as well as the role strain for workers who are also responsible for caring for elderly family members at home. Organizations can encourage managers and colleagues to support workers through programs that offer appropriate salary and benefits, helping them reduce stress and the burden of caregiving for older adults.

PROPOSED SUSTAINABLE ORIENTATIONS AND OPTIMAL DEVELOPMENT MODEL FOR THE NATIONAL PUBLIC HEALTHCARE SYSTEM IN CONTEMPORARY VIETNAM

Dr. Do Hoang Anh

dohoanganh@vnu.edu.vn

Vietnam National University, Hanoi, Vietnam

Abstract

Despite numerous achievements and efforts towards innovation, Vietnam's public healthcare system is encountering significant challenges due to the rising demand for healthcare services. This study aims to provide insights into the role and challenges faced by the healthcare sector in Vietnam and propose a new public health model and solutions to enhance the quality and efficiency of current public non-business healthcare units.

Keywords: *sustainable development, national healthcare system, and Vietnam's public healthcare model.*

1. Introduction

Arising from the significance of human health in the context of sustainable development and the ongoing transformations in the contemporary global landscape, there is a pressing need to reform the public healthcare system in Vietnam. This necessitates the identification and implementation of appropriate strategies and frameworks.

Health and healthcare, as crucial factors in human life, are inextricably linked to the well-being and prosperity of a nation. Recognizing health as a valuable asset for individuals and a vital resource for national progress, it transcends medical boundaries and encompasses social and humanitarian dimensions. Investments in health signify investments in human capital, productivity enhancement, opportunity creation, sustainable development, and future growth, thereby rendering the promotion, protection, and improvement of public health a paramount objective for developed nations worldwide.

Vietnam's public healthcare system, through improved management and administration, has made significant contributions to healthcare services for the people. It has been successful in many areas, including project management, prevention, examination and treatment, population health, and the application of science and technology, as well as medical digital transformation. Vietnam currently has attained numerous accomplishments in promoting public health, emerging as a notable exemplar in realizing the United Nations Millennium Development Goals. Nevertheless, the nation faces a myriad of contemporary challenges, including population aging, shifting disease patterns, food insecurity, global climate change, escalating healthcare demands, biosecurity threats, and potential destructive biological warfare. Hence, persevering in the efficacious restructuring of the national public

healthcare system shall empower Vietnam to augment its extant successes and competently navigate the evolving impediments it confronts.

In the contemporary global landscape, the healthcare sector transcends traditional boundaries, becoming a vital component of white security forces (biomedical-pharmaceutical security) that significantly contribute to overall national security and public well-being. This force requires enhanced organization, equipment, and coordination to address growing security demands. Moreover, establishing a foundation for scientific and technological advancements, particularly in the biomedical-pharmaceutical industry, is imperative for proactive epidemic management, vaccine production, and economic growth, ultimately contributing to humanity's collective progress. Recent shifts in COVID-19 prevention and control strategies highlight the necessity for achieving equilibrium between cutting-edge technologies and advanced techniques within medical facilities to enhance health and safety. The expertise of the medical profession, encompassing both fundamental and sophisticated skills, plays a crucial role in managing a wide range of disease scenarios. Consequently, Vietnam must implement more robust and comprehensive reforms in the structure and operation of public health to adequately address these objective demands.

Another attention is directed toward the distinct challenges within Vietnam's grassroots health network. This system plays a crucial role in providing primary healthcare services and ensuring universal medical accessibility within the community. However, it is observed that human resources in healthcare at grassroots levels, particularly in underdeveloped regions, are often inadequate in quality, and there is a significant shortage of specialized physicians, including those in emergency medicine, obstetrics, paediatrics, anaesthesiology, and other specialized fields. Furthermore, the need to address the disparities in various domains, such as expertise, facilities, usage, remuneration, financial regulations, and training and retraining programs, has been underscored by recent healthcare practices and epidemic prevention measures. These challenges necessitate robust structural and operational reforms within the current public healthcare system.

Innovation is strongly demanded in the organization of the national public healthcare system at the macro level.

In Vietnam, a public health service unit refers to an organization that is established and administered by a competent state agency in compliance with legal regulations. These units are responsible for providing public services and/or supporting state management in specialized medical domains, including but not limited to: preventive medicine, medical examination and treatment, nursing and rehabilitation, medical assessment, forensic medicine, forensic psychiatry, traditional medicine, pharmaceuticals and medical equipment testing, food safety and hygiene, population and family planning, reproductive health, and health education communication. Public non-business units in the health sector can be classified based on various criteria such as their administrative level (central, provincial, district, or commune), sector of operation (e.g., army, police, transportation), specialty of examination and treatment, and their functions, tasks or coordination in specific regions such as border areas or islands. Public healthcare units hold a pivotal position in safeguarding,

preserving, and enhancing people's health and implementing social security policies, thus making significant contributions to national construction and defense in the current context.

While there are various classification methods for public health care units, the classification based on the state administrative apparatus, specifically the central and local health care levels including provinces, cities, districts, towns, communes, wards, agencies, and schools, holds a predominant position despite its drawbacks. The current classification method of public health care units is based on administrative units rather than the characteristics of industry, field, region, and the pathology of prevention, examination, and treatment activities. Moreover, the unitary state model, the division of functions between the central and local government, and the combination of state management by sector and territory have resulted in a mechanism of bilateral subordination in the division of power and responsibility in the health sector. For instance, many medical facilities are under the management of both the Ministry of Health and the local administration in terms of organization, personnel, and administration. The Minister of Health holds the position of industry commander but is not solely responsible for the quality and effectiveness of health care. The classification method is problematic and is currently facing even greater challenges in similar contexts to that of COVID-19. These factors contribute to the presence of numerous focal points, functional and task overlaps, challenges in defining public duties, as well as issues related to staffing and budget allocation optimization. These factors ultimately lead to a lack of efficiency in internal governance that fails to meet demand.

Another issue that has emerged is the discrepancy in the quality of healthcare between the central and local levels. Various aspects of the health system, including health personnel, equipment, financial investment, and insurance policies, tend to gradually decline from the central level to the lower levels. This discrepancy prompts people to bypass local healthcare facilities, leading to overcrowding at higher levels (especially at the central health care level) and the potential underutilization of local medical centres, health stations, medical staff, and doctors.

The need for non-linear medical care and smart healthcare has become increasingly apparent due to recent practical developments, especially during the peak period of the Covid-19 pandemic, which has led to a high demand for medical examination and treatment.

This non-linearity has provided medical staff with more opportunities to effectively manage the epidemic, improve the efficiency of prevention, examination, and treatment, and increase patient access to optimal medical conditions. The current system of medical examination and treatment requires multiple examinations at various levels, resulting in time and cost inefficiencies and missed opportunities for timely treatment. This can lead to more complicated and expensive treatments with unsatisfactory results. Timely examination and treatment, with services of adequate quality to meet the potential and needs of the people, is an essential requirement for reforming the organization and management of the public healthcare system. Therefore, there is a need for continued reform with the implementation of non-linear mechanisms that are more suitable for present and future contexts.

The COVID-19 pandemic highlights the necessity of developing smart healthcare as an inevitable trend in healthcare. This approach combines interdisciplinary advantages,

leveraging information technology alongside medical, biological, and pharmaceutical technology. It holds great potential for centralized management, efficient information handling, multi-party connections from doctors to technical experts, personalized healthcare processes, and enhanced forecasting capabilities. The reformation of healthcare system organization and management, along with innovative service delivery models that embrace this trend, are objective and significant demands for fulfillment.

In addition, the step-by-step reform of Vietnam's public health system in the current context can bring significant humanitarian and economic benefits, particularly to the disadvantaged populations who are often concentrated in rural, mountainous, remote, and economically undeveloped areas with limited access to quality and affordable medical services. Improving the state's management of healthcare can enhance their chances of leading a healthy and longer life. Effectively addressing this challenge can also create new opportunities for preventing and treating diseases, including those that lack specific treatments, such as cancer and certain social diseases, for other populations, including those with economic means or high-ranking positions in the Vietnamese government. The transition from the current public health model to a new one that addresses existing challenges has the potential to stimulate the early development of an interdisciplinary medical, biological, and pharmaceutical industry with significant economic and humanitarian implications. This transition is crucial to Vietnam's sustainable development and progressive advancements.

Furthermore, the phenomenon of transferring healthcare professionals to managerial positions in healthcare is a problem that needs to be addressed in terms of the proper relationship between healthcare professionals and healthcare managers. Both healthcare management and healthcare professional work require proper training. Therefore, the lack of professionalism in healthcare personnel management and the phenomenon of experienced healthcare professionals being transferred to managerial positions have many profound consequences on the current public healthcare system in Vietnam.

In subsequent phases, the public healthcare model should build upon its successes and experiences while pursuing novel avenues and approaches to address the mounting demands for safeguarding, caring for, and enhancing public health amid unparalleled challenges. Despite ongoing progress in the healthcare sector and continual changes to state management of health, there remain numerous challenges that must be addressed to ensure comprehensive healthcare coverage for the entire population and enhanced protection against medical emergencies. This requires the development of new and improved solutions. The key question is: which areas should Vietnam's state health management prioritize in order to effectively address and overcome these new challenges and requirements?

The crucial demand for continual innovation in the public health system is to enhance its ability to respond to emergencies, ensure universal and equitable access to medical care, provide top-quality medical services to the most impoverished and isolated areas, and position Vietnam as a leading country in biomedical security. This represents a significant requirement and a promising opportunity for advancement, particularly in the context of the COVID-19 pandemic and future similar pandemics.

2. Literature review

The healthcare sector plays a crucial role in fulfilling the objective of safeguarding, attending to, and enhancing human health, with the goal of ensuring that every individual can enjoy a long and healthy life, and that society as a whole can thrive with vigor, stability, and resilience. As a result, numerous scholars are continually drawn to this field of study. Various aspects of the institutional framework and organizational models of the healthcare system have been explored, including the theoretical and organizational management systems, the operational mechanism of Vietnam's healthcare system, the quality of medical diagnosis and treatment, the scientific and technological healthcare workforce, the quantity and quality of healthcare services, healthcare regulations and practices, healthcare financing, as well as global integration and collaboration in healthcare.

Prominent works in this area include: Do Nguyen Phuong, an author who has published three notable works with Medical Publishing House (Hanoi), including "Developing the Healthcare Career in Vietnam in the Present Period" (1996), "Some Issues Regarding the Construction of the Developing Healthcare Industry in Vietnam" (1998), and "Vietnam Healthcare in the Renewal Process" (1999). These publications delve into topics such as medical ethics, medical professions, Ho Chi Minh's perspective on healthcare, and the moral principles of medical practitioners. In addition, the author provides recommendations for promoting healthcare development, such as enhancing the deployment of healthcare personnel to grassroots levels. Pham Manh Hung led an author group that published "Vietnam Healthcare in the Renewal Process" (Medical Publishing House, Hanoi, 1999), which evaluated the outcomes of deploying doctors to work in rural areas and the training of healthcare personnel at the university and postgraduate levels. Medical Publishing House (Hanoi) published the compilation of works titled "55 Years of Development in the Vietnamese Revolutionary Healthcare Career" (1945-2000), which discusses numerous issues related to the healthcare sector's mission of caring for, protecting, and enhancing people's health. Several updated works cover various aspects related to the state management of the healthcare sector, including "Healthcare Organization and Management" (Medical Publishing House, 2016) and "Healthcare Policy" (Medical Publishing House, 2017), edited by Truong Phi Hung, "Socialization of Education and Healthcare Services in Vietnam's Renewal Era" edited by Le Van Chien (2017), "Competition Policy in Healthcare Service Provision in Vietnam" by Truong Bao Thanh (2018), the thesis "State Management of Public Investment Projects under the Ministry of Health" by Tran Van Son (2017), and the thesis "The Current Legal Framework for Healthcare Services Provided by Private Healthcare Facilities in Vietnam" by Dinh Thi Thanh Thuy.

The preliminary analysis and evaluation of previous research from monographs, theses, related works, and articles regarding healthcare innovation suggest that there is a substantial body of research with a significant quantity, content, and accomplishments. The research has provided valuable historical insights that serve as a foundation for the study of healthcare model innovation and people's healthcare models. However, despite this research, there is a dearth of in-depth investigation that explicitly identifies the key challenges in the state management of healthcare in Vietnam today and offers novel and inventive solutions for

the renewal and reform of state healthcare management. Considering the current research landscape and the pressing need for healthcare innovation in Vietnam, it is imperative to conduct a study that addresses the gaps in the literature and presents effective and feasible solutions to aid in the revitalization of state healthcare management. Such a study would be a scientifically and practically significant product with significant humanitarian implications.

3. Method

This study implements an interdisciplinary perspective, integrating domains such as historiography, medical science, political science, administrative science, and management science, while employing the methodology of dialectical materialism and historical materialism. The core research methodologies consist of historical and logical approaches, which are complemented by an array of auxiliary scientific research techniques, encompassing analysis, synthesis, statistical evaluation, comparative analysis, benchmarking, and interdisciplinary cooperation, among others. These multifaceted methodologies are judiciously utilized to effectively meet the specific needs of each research problem addressed within the study.

4. Results

4.1 The Primary Directions for Reform in Vietnam's Contemporary Public Healthcare System

The Vietnamese public health system encompasses several solution-oriented approaches, which can be contemplated as follows:

First and foremost, enhancing the preventive medicine system remains a crucial strategy for Vietnam's public healthcare. Proactive disease prevention, grounded in scientific evidence, offers superior outcomes compared to addressing an epidemic after its emergence. This approach optimizes socio-economic and human efficiency by minimizing health and social costs, as well as alleviating the pain and suffering experienced by patients and their families. To achieve this, it is essential that preventive healthcare facilities bolster their capacity to anticipate, monitor, and mitigate epidemics, paying particular attention to vulnerable populations (such as the elderly and children) and potential threats from hazardous infectious diseases and environmental pollution.

Secondly, it is imperative to foster the growth of the grassroots health network and institutions associated with this level of healthcare. A grassroots healthcare network marked by robust innovation will persist as the front line, providing direct and efficacious support for COVID-19 prevention and control measures as well as the national vaccination campaign in a safe, scientifically grounded, and efficient manner. Key aspects requiring sustained investment attention encompass transitioning towards family medicine, concentrating on the proficiency of physicians and medical personnel, enhancing training and technology transfer, and revamping the financial mechanism based on market rules and the humanitarian nature of the medical industry. This ensures that income serves as a potent incentive for medical staff to work and elevate their qualifications, while simultaneously promoting coordination and integration mechanisms with other public health service levels.

Thirdly, the future healthcare strategy emphasized in this thesis entails building upon existing accomplishments and strengths, overhauling core institutions, and progressively transitioning from the current public healthcare model to a novel paradigm characterized by medical zoning, interactive nonlinearity encompassing regional medical centres, regional clinic systems, and related interdependent structures—commonly referred to as the healthcare region model. The proposed healthcare system model retains the successes and advantages of the extant health system while capitalizing on the established healthcare infrastructure and primarily basing its structure on the objective attributes of prevention, examination, and treatment processes. This innovative model holds the potential to comprehensively address numerous prevailing governance challenges in Vietnam's health sector, including public-private partnerships in healthcare, prompt prevention, classification, and treatment of patients, mitigating healthcare level skipping and overloading, and fostering integration and connectivity in prevention, examination, and treatment. Moreover, it addresses the typical limitations of the grassroots healthcare network, financial concerns, employment and compensation policies, professionalization with a focus on the expertise of medical staff and healthcare staff-managers—particularly the appointment of top positions to prevent resource wastage and mitigate associated legal risks.

Furthermore, the implementation of comprehensive solutions should be pursued in conjunction with other measures, such as leveraging internal strengths and external resources to promote research and application of science and technology, vaccine and drug production, and medical equipment development. This lays the foundation for the growth of Vietnam's medical and pharmaceutical industry. A forceful digital transformation within the healthcare sector should be executed, focusing on enhancing a unified health information system that involves various ministries, departments, sectors, and levels, and is based on cutting-edge technologies. The development of remote healthcare models can be facilitated through the application of modern technologies.

Additionally, diversification of media and health education content should be emphasized, with particular attention given to addressing psycho-psychiatric issues, especially in regions heavily impacted by the COVID-19 pandemic. Close international collaboration with partners possessing significant potential can strengthen Vietnam's healthcare position. The relationship between health insurance agencies, medical facilities, and the public should be revamped, with special consideration given to budgetary and insurance payment concerns. This ensures that healthcare financing operates in accordance with the law and upholds humanitarian principles.

4.2 The Proposed Framework for the Present Public Healthcare System in Vietnam

Firstly, Regarding the General Structure and Principal Operational Mechanism:

The Vietnamese government should conduct a nationwide planning into Health Zones/Regions based on an administrative nonlinearity and interaction model that covers multiple localities. The design of each region should be based on scientific criteria such as

the number of inhabitants, population density, geographical and pathological characteristics, and transportation accessibility. The focus of the health care region should be on disease prevention, examination, and treatment, with equal operational capacity in each region, serving approximately 5-10 million people. Vietnam's experience in managing the COVID-19 pandemic highlights the importance of this approach.

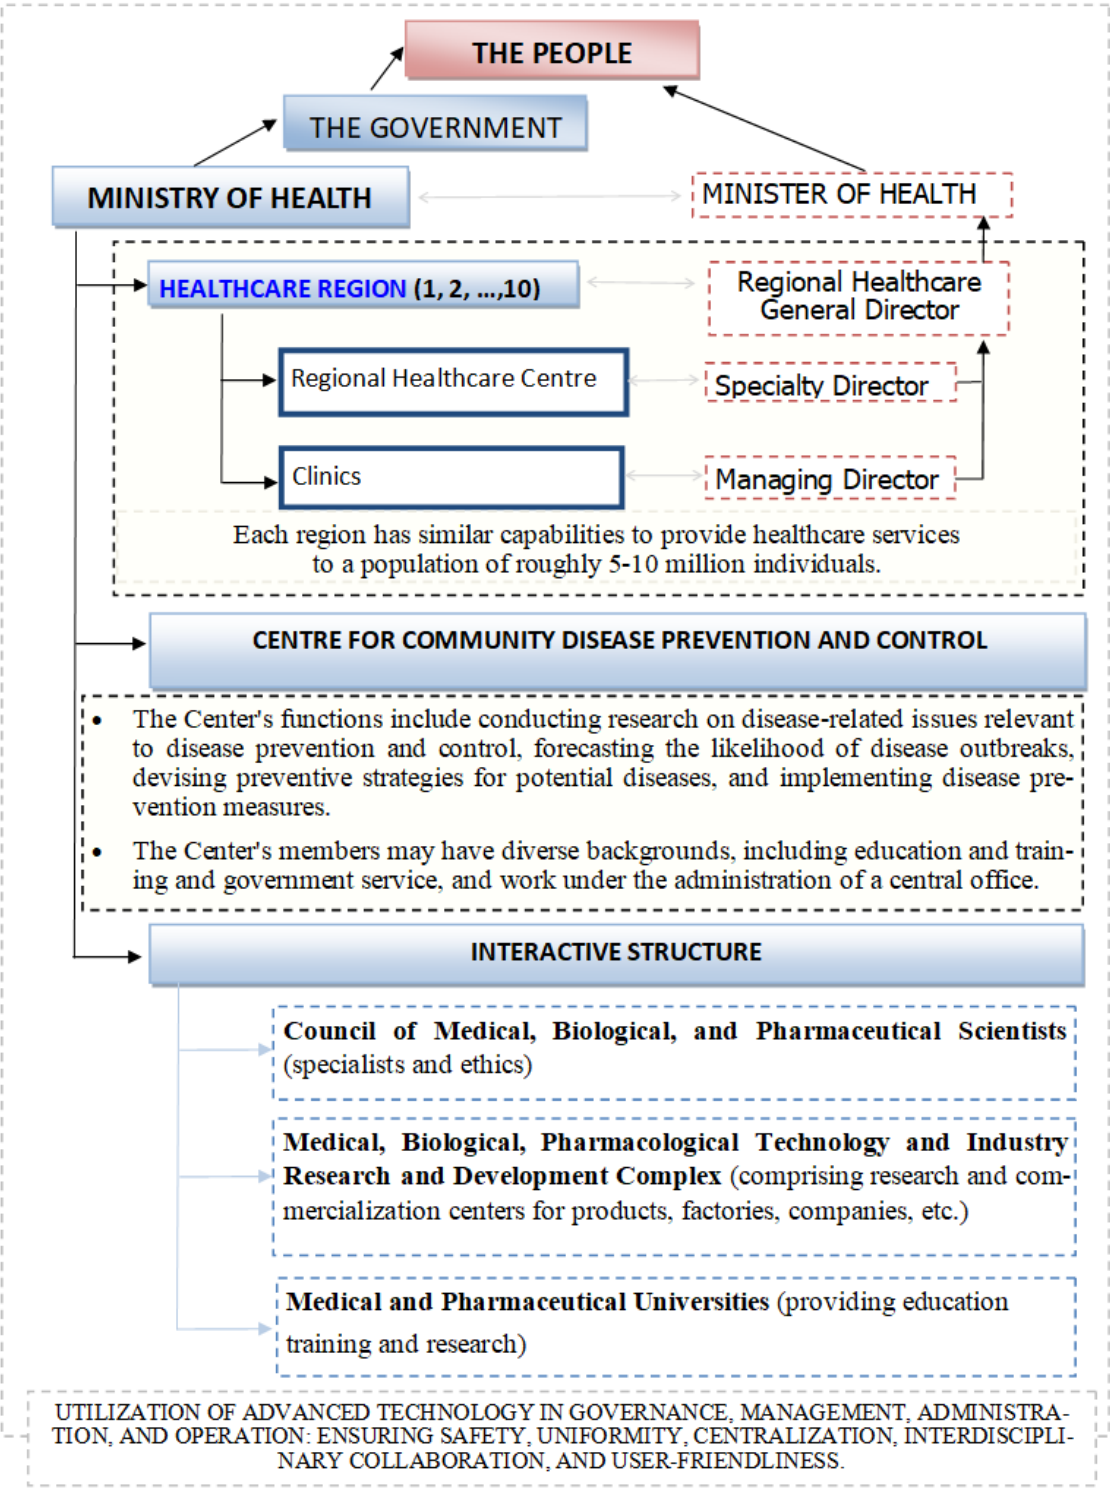

Figure 1. Overall structure of the health care region

Source: The author

The proposed model for the Vietnamese public healthcare system comprises three primary elements: (1) the Health Care Region, consisting of a Regional Health Care Centre with departments, and a network of clinics encompassing general and specialized clinics; (2) the Community Centre for Disease Prevention and Control, with a new organizational structure; and (3) the Interactive Structure, including three branches: the Research and Development Complex for Medical-Biological-Pharmaceutical Technology Industry (comprising centres for applied research and commercialization of products, factories, companies, etc.), the Council of Medical, Biological and Pharmaceutical Scientists (comprising specialists and ethicists), and the Medical and Pharmaceutical Universities (comprising training and research facilities). These departments operate under a professional, modern, and efficient management model that utilizes advanced technologies as a foundation.

The Ministry of Health holds the highest responsibility for health care issues in Vietnam, with the direct person in charge being the Minister. As the state management agency, it assumes the role of regulating health and related administrative issues and coordinates the operation of the entire system. The Council of Medical, Biological and Pharmaceutical Scientists decides on technical matters and professional ethics. The Minister of Health has the power to make strategic, personnel, and financial decisions for the entire system and is responsible for ensuring the quality and effectiveness of health care.

Each Health Region is headed by a General Director who reports directly to the Minister of Health and is responsible for all health care activities in their region. A Health Care Region Assistant may support the General Director in their role. Regional Health Care Centres are managed by Specialty Directors, while Managing Directors oversee Regional Clinics and report to the General Director of their affiliated Health Care Region. The Medical, Biological, Pharmacological Technology and Industry Research and Development Complex and Medical and Pharmaceutical Universities play leading roles in training, research, application, technology transfer, and product commercialization.

A noteworthy aspect of the Health Care Region model's operational mechanism is the importance of professionalism in the planning of specialists and managers. Health care management is a profession that demands a high degree of professionalism, requiring expertise in management sciences such as human resource management, fiscal management, legal management, crisis management and integrated problem-solving methods. Improper planning between these two groups, and the misuse of professionals for management work, is likely to undermine their focus on their profession, while professional managers are not utilized effectively. This tendency may cause competent professionals to seek management positions, leading to a decline in professional human resources. Therefore, at the macro level, the Health Region model must ensure that planning and training of these two groups is carried out methodically, to establish a mechanism for job distribution, job efficiency, and equitable evaluation of labor results between managers and professionals. The reform of emulation and commendation should be based on professional attributes, work efficiency, and avoidance of competition between leadership and management activities and professional activities.

In addition, the financial system of the Health Care Region model should prioritize fairness between dedication and compensation, taking into account the productivity and efficiency of medical staff and in accordance with financial laws, as well as the non-profit and humanitarian nature of healthcare activities. This includes aspects such as medical expenses, medical staff income, insurance payments, and other related financial matters.

Overall, The Health Care Region model is intended to be a professional, modern, and effective management model that employs an administrative nonlinearity and interaction approach combined with advanced technology. The model prioritizes disease prevention, examination, and treatment, and operates under a financial regime that is fair, balanced, and in line with financial laws, as well as the non-profit and humanitarian aspects of healthcare activities.

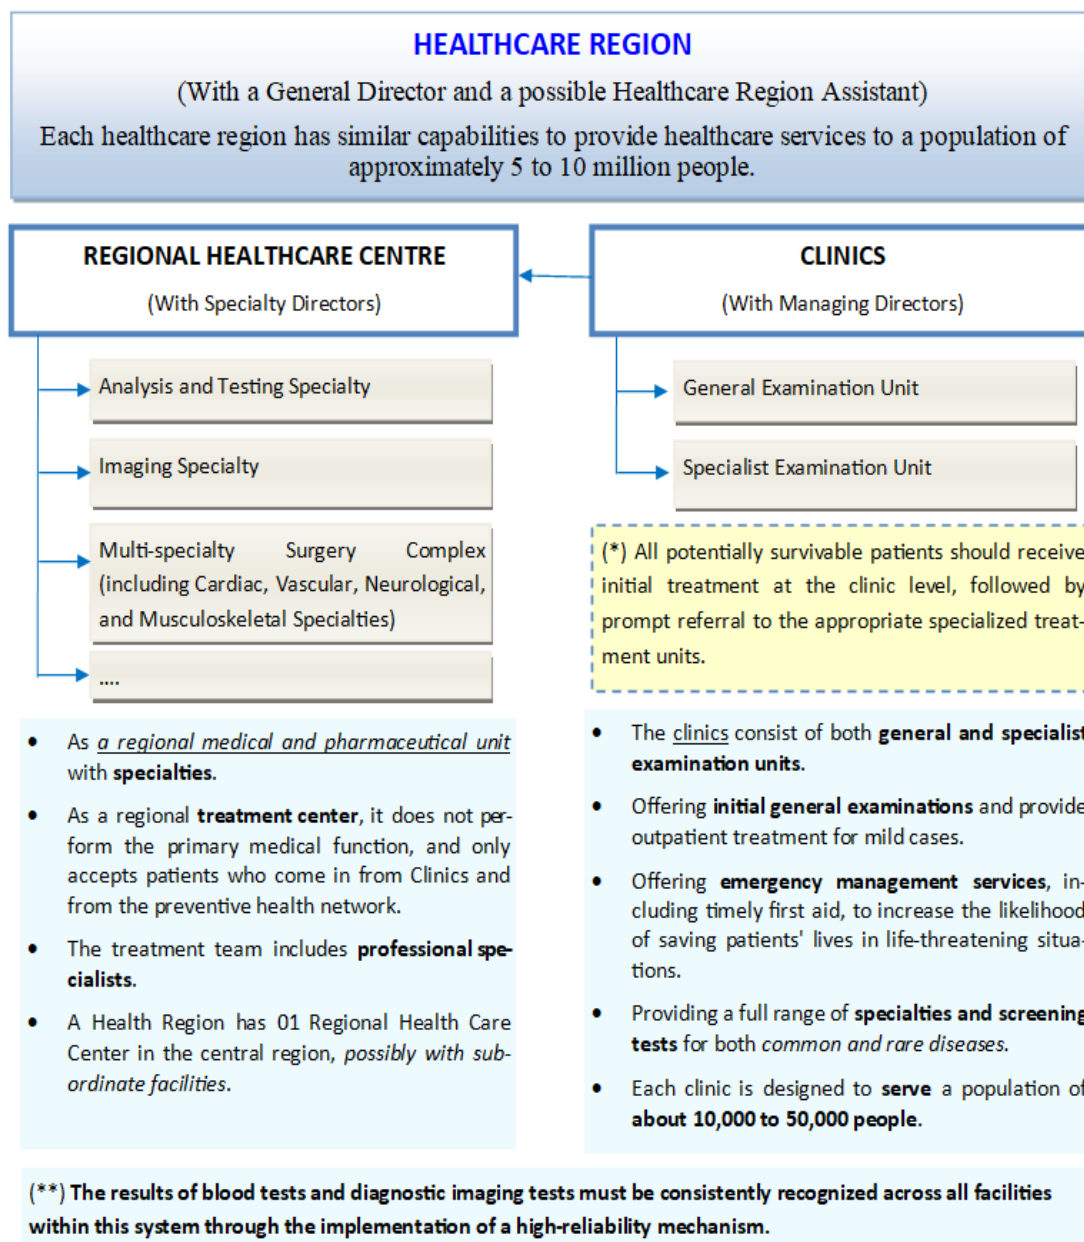

Figure 2. Structure of health care region

Source: The author

Secondly, Regarding the exceptional characteristics of the structure of Regional Health Care Centres

Each Healthcare Region is equipped with a single centralized Regional Health Care Centre, which may have subordinate facilities. It serves as a specialized and centralized medical-pharmacological unit for each Health Region, offering a range of specialties such as analysis-laboratory (Labo), imaging specialists, and complex multi-specialty surgery for cases including cardiac, vascular, and neurological issues. The Healthcare Region manager should be a Health Care Region General Director, possibly with a Health Care Region Assistant. Regional Health Care Centres can be established based on the consolidation of several provincial hospitals, divided into many small groups, with clear specialties, with Specialty Directors as managers.

The Regional Health Care Centre serves as a specialized and centralized medical-pharmacology unit, primarily for treatment rather than initial examination, and should only receive patients transferred from the Clinics and the preventive health network.

Regional Health Care Centres are required to have uniform capacity in terms of surgical expertise, equipment and machinery, financial investment, regulations, policies, and compensation. Furthermore, each centre should cater to a population of 5 to 10 million individuals. The establishment of Health Care Region borders should be based on comprehensive research into factors such as disease characteristics, socio-historical background, transportation, and natural influences.

The healthcare staff at the Regional Health Care Centres should comprise specialized specialists who are experts in treating specific diseases, performing specific techniques, and adhering to their professional authority in treating those diseases. These specialists should not be permitted to open private clinics, as it may distract them from their specialized mission. However, they may serve as lecturers at Medical and Pharmaceutical Universities.

The Regional Health Care Centres are envisioned to serve as the primary medical force with diverse and specialized treatment capabilities ranging from common to advanced techniques. The Centres' specialization in the treatment function and equivalent capacity, along with their reasonable distribution throughout the country, serve as a solid foundation for effectively addressing complex and challenging medical situations such as pandemics, including COVID-19.

Thirdly, Regarding Outstanding Features of the Clinic Structure within each Health Region

In the healthcare and management field, it is recommended that a Health Care Region must have multiple Clinics that are distributed evenly within a population area that ranges from 10,000 to 50,000 people. Each Clinic that follows this model must include both a general examination unit and a specialized examination unit.

The Clinic system primarily serves two functions, namely providing an initial general medical examination and outpatient treatment for mild cases and emergency situations. To minimize the need for interventional treatments, Clinics should be designed with a focus on medical examination functions.

The primary objective of this system is to allocate resources rationally, to accurately diagnose patients and determine the severity of the disease. Severe cases requiring intervention should be referred to a Regional Health Care Centre, while mild cases can be treated as outpatients. Private clinics have effectively provided healthcare services to patients using this method, and this model can serve as a useful reference for establishing a comprehensive network of Clinics in each Health Care Region.

The Clinic model has a crucial function beyond medical examination, which is to provide timely emergency care in life-threatening situations to improve the possibility of saving patients' lives. The Clinic must be equipped with appropriate resources and designed meticulously to ensure that seriously ill patients can be transported promptly and safely to the Regional Medical Centre for further treatment. The staff working in the Clinics must possess comprehensive training and proficiency in first aid, enabling them to provide initial emergency care to critically ill patients, including those experiencing cardiac arrest, surgical emergencies, or bleeding. In essence, every patient who has the potential to survive must be rescued from the Clinic level and expeditiously transferred to specialized treatment units within the Health Region.

To ensure comprehensive healthcare services, it is essential for each Clinic to offer an extensive range of specialties and disease detection investigations that address both common and infrequent ailments. These investigations must include clinical examination and testing for conditions such as blood disorders, cancer, cardiovascular and infectious diseases. Furthermore, the Clinic should possess advanced ultrasound equipment that can conduct ultrasounds for general, heart, pulse, fetus, thyroid, and mammary gland areas. The Clinic should also be equipped with endoscopy equipment for examining the general, stomach, colon, ear, nose, throat, bladder, and other areas. Additionally, the Clinic should have facilities for general tomography, general radiography, modern five-sensory examinations, and an emergency department to provide comprehensive care.

It is crucial that equipment and machinery used in clinics have a high degree of accuracy to enable the transfer of examination results to the treatment center for immediate use, eliminating the need for retesting and reducing costs as well as patient mistrust. Moreover, it is vital that the report of blood and imaging tests be universally recognized across all medical facilities in the system. Each healthcare worker must have a unique identifier that is recorded in the patient's medical record. Although the testing facility need not be specified in the test reports, the answer sheet should explicitly state equipment and operator information such as the equipment name, manufacturer, year of manufacture, chemical substance used, operator's name, and date. This approach facilitates the identification of problems that arise during medical examination and treatment, enabling prompt and thorough resolution.

According to this model, clinics can be set up by reorganizing commune health stations and district hospitals under the supervision of Managing Directors.

The newly proposed model for organizing grassroots healthcare facilities is characterized by a scientific distribution nationwide and the capacity to provide effective

emergency medical care. This model is expected to play a vital role in the early stages of treatment, and such facilities will not be passive or lacking in resources during pandemics or other potential biomedical disasters that may occur in the future.

The Last Elements consist of Preventive Medicine and Interactive Structures:

As emphasized previously, enhancing preventive medicine remains a crucial approach for every nation. Consequently, besides the layer of health examination and treatment, an independent Community Centre for Disease Prevention and Control should be established. This medical entity is responsible for investigating various factors, such as social, economic, natural, climatic, geographical, and biological aspects related to diseases, forecasting the probability of disease emergence, and suggesting preventative measures in the absence of diseases or managing disease prevention. The Centre's members may have backgrounds in education, training, or administration, and it may operate under the supervision of a Central Office. This office will gather comprehensive information (from local, governmental, or global sources), conduct research, make decisions, and guide preventive efforts in the Health Regions. Relevant authorities at all levels must take responsibility for coordinating and supporting this centre.

The Council of Medical, Biological and Pharmacological Scientists operates as an interactive entity within the Health Care Region Model framework, primarily providing consultation and decision-making on professional and ethical matters to support the Ministry of Health in enhancing its management processes. The mission of the Medical, Biological, and Pharmaceutical Technology Industry Research and Development Complex involves concentrating on applied research, innovation, technology transfer, international collaboration, and the commercialization of relevant products. Medical and pharmaceutical universities serve as essential pillars for educating and cultivating professional medical personnel while also acting as fundamental and comprehensive research entities.

5. Discussion and Conclusion

Despite the current healthcare system's adequacy in terms of state management and infrastructure, Vietnam has the potential to establish a novel healthcare region model that addresses past limitations, shortcomings, and challenges while remaining adaptable to evolving healthcare needs, particularly in pandemics such as COVID-19. The new healthcare organization and management system has a notable feature in that it utilizes the current medical resources available in Vietnam. Furthermore, the healthcare units within the healthcare regions have equivalent functions and capacity to serve the population, thus eliminating administrative divisions in healthcare. The financial system will be equitable and proportionate to productivity and efficiency, in accordance with financial regulations and the non-profit and humanitarian nature of healthcare activities.

The efficacy of the proposed healthcare region model can be augmented through the synchronous implementation of solutions in various other domains. These include: promoting transparency and civility in the relationships among health insurance agencies, healthcare units, and the public, thereby ensuring healthcare financing adheres to the

principles of a civilized society; diversifying and modernizing healthcare education and media; enhancing the capacity of preventive medicine units to predict, track, and avert epidemics, especially those originating from environmental pollution; establishing a foundation and fostering continuous growth of Vietnam's medical and pharmaceutical industry; and prioritizing the improvement of the unified information system from the Ministry to healthcare units, incorporating state-of-the-art technologies.

The COVID-19 pandemic and other similar ones, both now and in the future, significantly impact a country's overall development and all levels of society in various aspects, highlighting the need for preparedness in facing future pandemics. Therefore, Vietnam's public health sector must continue to build upon its achievements and gradually transform the current public healthcare model into a healthcare region model while working in tandem with other healthcare solutions. This approach will enable the sector to operate more effectively, better meet the population's healthcare needs, and address biomedical security challenges in the new context.

Ensuring humanity, equity, and equality in the face of disease risks, as well as providing optimal conditions for healthcare examination and treatment for every individual, is a significant challenge. Nevertheless, it is also an opportunity for Vietnam's state healthcare management to courageously seek innovative solutions and contribute to the successful implementation of Resolution No. 19-NQ/TW of the 6th Conference (12th Term, October 25-23, 2017). This resolution aims to continue the renovation of the healthcare organization and management system, improve the quality and performance of public non-business units, and contribute to the creation of sustainable physical and spiritual assets for future generations. Through such efforts, Vietnam's state healthcare management can make a crucial contribution to building and defending a democratic and civilized Vietnamese nation.

Nguyen Thi Phuong Thao

thaop8125@gmail.com

Faculty of Education Sciences, VNU - University of Education, Hanoi, Vietnam

Abstract

School social work goes beyond providing knowledge, values, and skills necessary to address various barriers to students' educational progress. It also aims to achieve equal education goals for all members of society. This article assesses the effectiveness of social work activities in schools based on survey data from a sample of 300 students at Hermann Gmeiner High School in Hanoi, focusing on two main components: prevention activities and intervention measures. The effectiveness of social work through prevention activities (5 items) demonstrated a reliability coefficient of $\alpha = 0.84$, while intervention measures (3 items) exhibited a reliability coefficient of $\alpha = 0.93$. Survey results indicate that the majority of students perceive intervention measures to be more effective than prevention activities in school social work. The study also reveals significant correlations between evaluating the effectiveness of prevention activities, intervention measures, and assistance provided, with demographic characteristics such as gender, grade level, geographical region, and academic achievement. Therefore, adopting a comprehensive approach to school social work is essential in achieving equal educational objectives and promoting sustainable development in education.

Keywords: *school social work, intervention measures for students, prevention activities for students.*

1. Introduction

To date, school social work has been well established in many countries globally and keeps being introduced and implemented in other countries to effectively address educational barriers such as students with disabilities, physical and mental health issues, drug use, adolescent pregnancy, learning difficulties, and family issues including domestic violence, divorce, child abuse, homelessness, and family illnesses affecting students. Discrimination, bullying, and inappropriate disciplinary measures by teachers and school staff are also among the issues within the school system. Even in developed countries with widely accessible and free education, there is still much work to be done to ensure educational equality, particularly for marginalized social groups, students with disabilities, ethnic minorities, and students from the LGBTI community. Therefore, Article 24 of the

United Nations Convention on the Rights of Persons with Disabilities (UN, 2006) requires member states to provide an inclusive education system at all levels. The 2020 Global Education Monitoring Report, *Inclusion and Education*, emphasizes the need to ensure quality inclusive and equitable education for all disadvantaged student groups, including disabled students, as well as those affected by poverty, ethnicity, or other factors.

Additionally, abrupt social changes have posed numerous obstacles for students to earn success in their studies, even for those who are academically talented and high-achieving. These barriers include challenges arising from the students themselves, their families, the school system, and other social issues. Personal problems often manifest through physical and mental health difficulties, substance abuse, and adolescent pregnancy. Family issues including domestic violence, poverty, divorce, child abuse, homelessness, and various other influences undoubtedly affect students' learning process. On the other hand, school system issues are commonly seen as a lack of professionalism in teaching, inadequate infrastructure, ineffective classroom management, bullying, and prejudice, all of which significantly cause negative effects on many students. Therefore, many countries around the world are seeking ways to mitigate the impact of these barriers on students' learning.

Particularly, in the context of the Covid-19 pandemic in 2020/2021, the role of school social work has demonstrated activities on a wide scope but has been significantly affected by serious challenges. As of April 2020, up to 188 countries worldwide had closed schools, ranging from early childhood education to university, and 91.3% (approximately one and a half billion) of enrolled learners were affected by the pandemic and encountered various difficulties in their psychological well-being and learning process (UNESCO, 2020). Moreover, in the rapidly changing social context, the school system has shown increasing obstacles faced by students, leading to physical and mental detrimental consequences. Hence, many school social work practitioners have actively engaged in school safety programs implemented in schools (R. Astor, Meyer, Benbenishty, Marachi, & Rosemond, 2005). However, research on the effectiveness of school social work and school safety from the perspective of contemporary school social workers is still limited (Cuellar, Elswick, & Theriot, 2017a). Previous studies related to school social work and school safety have primarily focused on theoretical foundations and practices to deal with school violence (A. Astor, Behre, Wallace, & Fravil, 1998), the activities and involvement of school social workers mainly demonstrated in bullying prevention programs (R. Astor et al., 2005), and the role of school social workers within a specific intervention framework (Kelly et al., 2016).

In Vietnam, the prevalence of students experiencing violence, sexual abuse, dropping out, truancy, etc. tends to increase and originates from various dimensions such as self-perception, relationships with peers, teachers, and family. However, there are many obstacles which hinder the progress in addressing school-related issues. School social work activities in general, and assistance and prevention efforts in specific, have not adequately met the needs of students in terms of service models, professional levels, and accessibility. Therefore, on January 25, 2017, the Ministry of Education and Training issued Decision No. 327/QĐ-BGDĐT, which outlined a development plan for the profession of school social

work in the education sector during the period 2017-2020. The plan aimed to gradually establish and develop a nationwide professional school social work service system, thereby promoting the improvement of education and training quality and providing high-quality human resources for sectors with a high demand of professional school social workers. Currently, although the school social work model has been implemented in a number of secondary schools in the area, it is relatively autonomous and not well organized without guidance documents from the Ministry of Education and Training and the Departments of Education and Training related to the conditions for establishing the school social work model. Thus, on December 28, 2018, the Ministry of Education and Training issued Circular No. 33/2018/TT-BGDĐT, providing guidance on school social work, outlining the principles, content, and responsibilities for implementing school social work, marking an important development step for school social work in Vietnam.

Particularly, Circular No. 33/2018/TT-BGDĐT on school social work highlighted the role of school social work through intervention and assistance activities, as stated in Article 6, which emphasizes three content areas. However, this study focused on the first content area, which is "Disseminating, promoting, warning, and guiding learners about special situations, risks of being harmed, violence, dropping out, and legal violations. Actively coordinating with media organizations, radio, television, and mass media to disseminate information promptly to the community, reflecting incidents related to learners, and participating in building safe and healthy school environments." Article 7 included (1) receiving notifications and conducting initial assessments of student issues, (2) conducting interventions and providing assistance to students at educational institutions, and (3) engaging in community-based interventions and assistance. Therefore, this article primarily focuses on the effectiveness of prevention activities and intervention assistance, using a Likert scale with five levels proposed by the research group for result evaluation, in parallel with the two content areas in Article 6 and Article 7 of Circular No. 33/2018/TT-BGDĐT. The entire data assessment of the effectiveness of school social work activities, through the prevention and intervention assistance dimensions, will present a comprehensive picture for policymakers and researchers to propose school social work models that are effective and suitable for the Vietnamese context and culture.

2. Method

2.1. The Characteristics of Study Subjects

Survey data from a sample of students were used to assess the effectiveness of school social work activities in terms of intervention and prevention. The survey included a total of 300 high school students, with an equal distribution of 50% rural students and 50% urban students. Correspondingly, there were 33.3% of students in each grade level (10, 11 and 12), and the gender distribution consisted of 52.3% of males and 47.7% of females. In terms of academic performance, student characteristics show the following ratios: 38.0% rated very good (the highest rate), 36.0% good, 14.3% average, 14.3% poor and 9% outstanding. The mean age of the study subjects was $M = 17.00$, $SD = 0.81$. Additional features are presented in the table below.

Table 1. The Characteristics of Study Subjects

		Number	Percentage
Region	Rural	150	50.0
	Urban	150	50.0
Gender	Male	157	52.3
	Female	143	47.7
Grade	10	100	33.3
	11	100	33.3
	12	100	33.3
Academic performance	Poor	26	8.7
	Average	43	14.3
	Good	108	36.0
	Very good	114	38.0
	Outstanding	9	3.0

2.2. Evaluation Content and Assessment Tools

This article focuses on assessing the effectiveness of school social work activities through two main interventions: intervention and prevention, using a 5-point Likert scale proposed by the research group and evaluated based on the content outlined in Circular No. 33/2018/TT-BGDĐT on school social work guidelines. The measurement scale for the variables used in the survey was a 5-point Likert scale (1 = Very ineffective, 5 = Very effective). The questionnaire was divided into three main sections: (1) Information about the respondents, which concentrated on providing details about the purpose and significance of the survey, as well as basic information about the participating respondents; (2) The primary survey responses, which included questions and options for responses at different levels regarding the effectiveness of prevention and intervention activities; and (3) Additional open-ended questions to gather expanded opinions and evaluations aimed at enhancing the effectiveness of school social work activities.

3. Results

In Vietnam, social work in general, and specifically social work in the school setting, are gradually receiving comprehensive attention and development. In 2010, the Prime Minister signed a decision approving the Development Plan for Social Work for the 2010-2020 period, with the aim of establishing social work as a profession in Vietnam and raising societal awareness of the social work profession. Based on this fundamental idea, the Ministry of Education and Training has also issued various documents to develop the field of social work in schools. Specifically, Circular No. 31/2017/TT-BGDĐT provides guidance on implementing psychological counseling for students in general education schools, and Circular No. 33/2018/TT-BGDĐT provides guidance on social work in schools. These are considered important legal documents that set a milestone for the establishment and development of social work in schools in Vietnam. This not only addresses the practical difficulties faced by students but also contributes to enhancing the overall quality of social work in schools, particularly the effectiveness of prevention, intervention and assistance activities.

3.1. Current situation of students' difficulties identification

In recent years, there has been a noticeable increase in the challenges faced by students in educational systems worldwide, including Vietnam. Consequently, the role of social work within schools has taken on a significant focus on addressing these issues and developing targeted intervention and prevention strategies. Circular No. 33/2018/TT-BGDĐT, specifically Article 4, plays a pivotal role in shaping the content and direction of social work in schools. Article 4, Clause 1, places a strong emphasis on the identification of risks that may arise within and outside educational institutions, posing potential harm to students. Furthermore, it highlights the importance of promptly detecting incidents involving students in special circumstances, such as instances of abuse, violence, dropping out, and law violations. This proactive approach aims to safeguard the well-being and overall educational experience of students.

To gain a comprehensive understanding of the obstacles encountered by students, a survey was conducted to investigate the challenges that students within the school have faced or are currently facing. The survey specifically targeted students who are at a high risk of experiencing various difficulties, such as gaming addiction, internet addiction, social media addiction, learning difficulties, frequent absenteeism, and those with special personal circumstances. By identifying these challenges, school social workers can develop tailored approaches to support and address the specific needs of these students. Gaming addiction has emerged as a pressing concern in recent years, affecting students' academic performance and overall well-being. With the proliferation of digital entertainment and online gaming platforms, students are increasingly drawn to these activities, sometimes at the expense of their educational commitments. Social work interventions in schools aim to mitigate the negative effects of gaming addiction and provide students with the necessary skills and support to manage their screen time effectively.

Internet addiction is another significant challenge faced by students in the digital age. With the advent of smartphones and easy access to the internet, students are prone to excessive online activities that can impede their academic progress and social development. School social workers play a crucial role in raising awareness about healthy internet usage, providing guidance on responsible online behavior, and offering support to students struggling with internet addiction. In recent years, social media addiction has emerged as a prominent concern among students. The pervasive influence of social media platforms has the potential to disrupt students' focus, self-esteem, and overall mental well-being. School social workers collaborate with educators and families to educate students about the potential pitfalls of excessive social media usage, promote digital well-being, and foster healthy relationships both online and offline.

Learning difficulties, such as academic underperformance or specific learning disabilities, present unique challenges for students. School social workers work alongside teachers and other professionals to identify and address these difficulties through individualized support, specialized interventions, and collaboration with relevant stakeholders. By implementing appropriate strategies, students with learning difficulties can

be provided with the necessary tools and accommodations to optimize their academic potential. Frequent absenteeism can significantly hinder students' educational progress and social integration. School social workers employ a multi-faceted approach to tackle this issue, which involves understanding the root causes of absenteeism, addressing any underlying problems or barriers, and implementing targeted interventions to improve attendance rates. By fostering a positive school environment and establishing strong connections with students and their families, school social workers can help mitigate absenteeism and promote a culture of regular attendance. Students with special personal circumstances require additional support to navigate the challenges they face. This may include students from low-income families, those who have experienced trauma or loss, or students with disabilities. School social workers play a crucial role in providing these students with the necessary emotional support, connecting them with appropriate resources and services, and advocating for their rights and inclusion within the school community. By fostering a nurturing and inclusive environment, school social workers contribute to the overall well-being and academic success of these students.

School bullying remains a persistent issue that can have severe consequences for students' physical and emotional well-being. Social work interventions aim to create a safe and supportive school environment through proactive measures such as anti-bullying campaigns, workshops on conflict resolution, and the establishment of reporting mechanisms for students to seek help. By addressing the root causes of bullying and providing support to both victims and perpetrators, school social workers strive to eliminate bullying behaviors and cultivate a positive school climate. As the survey was conducted to investigate the aforementioned challenges, the results show that approximately 80% of students are at risk of facing special circumstances, over 70% related to drug use and law violation, while the lowest percentage of risk is abuse.

Table 2. Identification of students' difficulties

Identification of students' difficulties:	Percentage %
Students addicted to games, internet, social networks	90
Students with learning difficulties	89.7
Student with frequent absenteeism	87.7
Students with special circumstances	87
Students suffering from school violence	85.7
Students at risk of dropping out	84.7
Students at risk of falling into special circumstances	81.3
Students with drug abuse/use	77.7
Students violating the law	74.3
Students being abused	50
N=300	

Therefore, the research results partially demonstrate the diversity of the ongoing issues related to student difficulties. Consequently, social work in schools plays a crucial role in addressing the school's problems and serves as a bridge between students, families, and educational institutions to help students have the best learning conditions and unleash their potential, as well as address their mental crises and difficulties they currently face.

3.2. The effectiveness of school social work for high school students

Based on the factor analysis results mentioned above, two activity contents were identified to measure the effectiveness of social work through intervention and prevention activities. The analysis of average scores revealed that "the effectiveness of social work through intervention measures" had the highest mean score, $M = 2.79$ ($SD = 0.94$), followed by "social work in schools through prevention activities" with $M = 2.53$ ($SD = 1.06$). The evaluation of the effectiveness of social work through intervention, assistance, and prevention activities is specifically demonstrated through the following analysis:

3.2.1. The effectiveness of social work in schools through prevention activities

The results of scoring the effectiveness of social work through prevention activities indicate that the activity with the highest average score is "*Dissemination, promotion, warning, and guidance for students regarding risks of falling into special circumstances, being harmed, experiencing violence, dropping out, and violating the law*" ($M = 2.62$, $SD = 1.12$). This is followed by the activities of "*Active coordination with relevant parties to publish information related to students and participation in building a safe and healthy school environment*" ($M = 2.61$, $SD = 1.08$) and "*School providing psychological counselors meeting for students*" ($M = 2.57$, $SD = 1.09$). Among them, the prevention activity with a relatively low average score is "*Providing information, materials, skills, and methods for identifying students' issues*" ($M = 2.52$, $SD = 1.08$), and the lowest is "*Guiding students, parents or guardians, teachers, and educational administrators to access social work services in the community*" ($M = 2.51$, $SD = 1.03$).

In examining the disparities in the assessment of social work efficacy in schools through preventive measures, variables such as gender, grade level, and academic performance were tested. All three variables exhibited a statistically significant level with $\text{Sig} < 0.05$, signifying substantial homogeneity in variance between the effectiveness of preventive activities and the aforementioned factors. The results of the ANOVA analysis further demonstrated the significance of the F-test values associated with gender, grade level, and academic performance, yielding respective Sig values of 0.04, 0.05, and 0.00, all below the critical threshold of 0.5. Consequently, it can be deduced that disparities exist in the evaluation of the effectiveness of social work through preventive activities based on gender, grade level, and academic achievement.

Based on the mean values analyzed from the research results, female students ($M = 2.55$, $SD = 0.93$) evaluate the effectiveness of prevention activities higher than male counterparts ($M = 2.51$, $SD = 1.16$). Pertaining to the aspect of grade level, grade 12 students ($M = 2.72$, $SD = 1.23$) evaluate the effectiveness of prevention activities higher than grade

11 students ($M = 2.53$, $SD = 0.98$) and grade 10 students ($M = 2.36$, $SD = 0.92$). Similarly, with respect to academic achievement, excellent students ($M = 4.0$, $SD = 1.41$) denote the highest level of appraisal concerning the effectiveness of prevention activities, followed by average students ($M = 2.83$, $SD = 1.61$), good students ($M = 2.64$, $SD = 0.85$), low-performing students ($M = 2.30$, $SD = 1.12$), and the lowest evaluation is from satisfactory students ($M = 2.23$, $SD = 0.76$).

3.2.2. The effectiveness of school social work through intervention and assistance activities

The research analysis results reveal three indicators to assess the effectiveness of activities related to receiving difficulties reports, intervening, and assisting students. These indicators are "*The school has comprehensive intervention and assistance plans based on the challenges faced by students*" ($M = 2.85$, $SD = 0.94$) and "*The school collaborates with relevant parties to develop specific assistance plans for students when their issues exceed the scope of school intervention*" ($M = 2.83$, $SD = 0.94$). Among these, the activity of addressing students' difficulties received the lowest average score, "*The school provides a place to address students' difficulties*" ($M = 2.77$, $SD = 0.96$).

The analysis of variance (ANOVA) reveals that the F-test statistics for academic performance and geographical region exhibit significant results, with corresponding significance (Sig.) values of 0.00, all below the threshold of 0.5. This statistical evidence allows us to assert that there exist notable and statistically significant disparities concerning both academic performance and geographical region in the assessment of the effectiveness of social work in schools through intervention activities.

Delving into the examination of academic performance, it is observed that students who demonstrate excellence ($M = 3.0$, $SD = 1.32$) assign the highest evaluation to intervention activities, followed by high-achieving students ($M = 3.05$, $SD = 0.68$), moderately performing students ($M = 2.68$, $SD = 0.73$), while average-performing students ($M = 2.51$, $SD = 1.53$) and low-performing students ($M = 2.46$, $SD = 1.06$) indicate the lowest levels of appraisal. Furthermore, based on the mean values extracted from the research findings, urban students ($M = 2.95$, $SD = 0.74$) evaluate the efficacy of intervention and preventive activities more favorably compared to their rural counterparts ($M = 2.62$, $SD = 1.09$).

4. Discussion and conclusion

4.1. Discussion

The education system is one of many institutional frameworks that will undergo changes alongside other structures, creating new roles and opportunities for school social work. Thus far, due to educational reform policies that emphasize improving socio-emotional learning in schools, the role of school social work has been evolving continuously to provide diverse solutions to school-related issues (Sosa, Cox, & Alvarez, 2017). However, the shift towards prioritizing academic outcomes over the provision of social services has impacted the effectiveness of school social work, necessitating the exploration of effective intervention forms and models (Sosa et al., 2017).

According to the National School Social Work Practice Guidelines, an effective school social work model must support students who are disadvantaged due to unequal access to resources by adopting a social justice lens to eliminate barriers for students. Research findings indicate that students value the effectiveness of school social work through intervention and assistance activities more than preventive measures. In fact, Hermann Gmeiner Hanoi High School has a counseling department that emphasizes the importance of school social work, resulting in increased awareness among students. While preventive activities have been implemented to some extent, they are not as extensive or diverse in attracting students and enhancing effectiveness. This could be attributed to financial constraints and the focus of school counselors on individual student issues rather than large-scale preventive measures. This limitation is also evident in current school social work practices. This is partially reflected in specific studies such as Kelly et al.'s (2015) survey of over 3,700 school social work staff, which showed that they spend the majority of their time working individually with high-risk and identified students. However, in reality, if school social work professionals aim to make significant contributions to the education equity movement, their activities must go beyond micro-level strategies. This is also an aspiration expressed by school social work staff in their reports (Kelly et al., 2015).

Furthermore, the research results also demonstrate statistically significant correlations between the evaluation of school social work effectiveness through preventive activities and variables such as gender, grade level, and academic performance. Additionally, regarding the dimension of school social work effectiveness through preventive activities, there are differences in evaluation related to variables such as geographical region and students' academic performance. These findings serve as important indicators to shed light on students' difficulties through independent variables. Therefore, school social work professionals need to examine students' challenges within the school system based on the current needs of the school system and the available resources of social work personnel. However, schools should also allow social work professionals flexibility in addressing all barriers to the school's success and utilize a systemic approach involving the school, family, and community to address students' issues.

4.2. Conclusion

The school social work encompasses knowledge, values, and skills that are essential for addressing various obstacles hindering students' educational progress and supporting the goal of equitable education for all individuals. It is evident that social work makes significant contributions to educational institutions by addressing students' difficulties and serving as a vital link between students, families, and schools. The results partially demonstrate the significance of school social work in general, particularly the effectiveness of preventive and intervention activities in assisting students. Moreover, the evaluation of the effectiveness of preventive and intervention activities reveals statistically significant correlations between the assessment of prevention activities, intervention efforts, and characteristics such as gender, grade level, geographical region, and academic performance.

However, the relatively low evaluation of the effectiveness of preventive activities also indicates limitations in the current state of school social work. Therefore, school social work needs to prioritize comprehensive attention to students' issues, with an emphasis on effective prevention strategies to mitigate students' difficulties. However, preventing and addressing school-related issues and student challenges entails more than the involvement of education professionals, schools, teachers, or social work personnel alone. It necessitates collaboration among various agencies, departments, and specialized entities. The role of school social work professionals deserves particular emphasis, as they possess the appropriate knowledge and training to integrate social work activities into the school setting in a professional and effective manner.

ORGANIZATIONAL IDENTIFICATION, PUBLIC SERVICE MOTIVATION AND ORGANIZATIONAL COMMITMENT OF LECTURERS

Dr. Dang Hung Vu

dhvu@agu.edu.vn

Dr. Chau Hong Phuong Thao

chpthao@agu.edu.vn

*Faculty of Economic and Business Administration,
An Giang University-VNU HCM, Vietnam*

Abstract

The purpose of this paper is to explore organizational identification, public service motivation and organizational commitment of lecturers in a public university. This exploratory qualitative research was carried out with 24 interviewees, who are lecturers of a public university. Results showed that lecturers' organizational identification and public service motivation are affected by university identity. The positive relationship between teachers' organizational identification and their public service motivation is reciprocal. Both of them have positive effects on organizational commitment, work performance and job satisfaction: Lecturers with strong organizational identification and public service motivation tend to be satisfied with their teaching career, showing a strong commitment to the university and making outstanding performance. Managerial implications were also grasped.

Keywords: *lecturers' performance, organizational identification, public service motivation, university identity, Vietnam.*

1. Introduction

Group/organizational identity is the characteristics of a social group or an organization. The subject of identity is not just the person as an individual; the subject of identity can be a group of people. An organization is a collection of people made into a whole that works for common interests, mistaken for a common purpose, as a type of social groups. Organizational identity is the characteristics that members and others know about the organization (Cornelissen et al., 2007). Similarly, Cornelissen et al. (2007) also defined that corporate identity is the values and image of the company that members and others know about the company. Thus, the values and images that the members of a university and outsiders know about the university are considered the identity of the university, at organizational level.

Social identification is an individual perception when identifying himself in a group: one thinks he/she has the same fate as the group; succeed with the group and fail with the group (Tolman, 1943). Individuals have a feeling of belonging to an organization/social structure (Ashforth & Mael, 1989), thinking that they have typical characteristics of the group (Van Knippenberg, 2000).

Organizational identification is a case of social identity, since society can be understood as an organization in which the people belong to this organization and share the same interests. The term organizational identification can be used interchangeably with social identification (Chughtai & Buckley, 2010; Lee et al., 2015) as the social structure of this study is an organization - a public university.

This study examines lecturers' identification of an organization, which is a public university, defining organizational identification as "the extent to which an organizational member defines himself/herself with reference to his/her organizational membership" (Ashforth & Mael, 1989), cited in the paper by He and Brown (2013, p. 14). Organizational identification occurs when lecturers perceive oneness with their university and feel that they belong to the university.

Previous studies have shown that organizational identification affects his/her attitude and behaviors in the organization (Lee et al., 2015). Individuals with a high organizational identification are those who tend to think about themselves as members of the group (Spears et al., 1997). They also feel closer and more like other members (Doosje et al., 1995), they stick with the group to overcome difficulties (Ellemers et al., 1997), to behave with other groups (Tropp & Wright, 1999) and behave in a way that benefits their-owned group (Smith & Tyler, 1997). Lee et al. (2015) also show that organizational identification affects individuals' attitudes through job involvement, job satisfaction, and affective organizational commitment.

In terms of behavioral management, organizational identification affects job performance: both *in-role performance* and *extra-role performance*. In-role performance is the result of formal actions in the job description that directly serve the organization's goals (Van Knippenberg, 2000). In-role performance includes productivity, job performance, customer-oriented service behavior, and work effort. Extra-role performance is the results of jobs involving actions outside of formal jobs (Podsakoff et al., 2000), such as organizational citizenship behavior, helping behavior, voice behavior, and safety performance.

Previous empirical evidence abroad shows the influence of organizational identity on employee attitudes and performance. The influence of organizational identification on work attitudes is confirmed by the research of Cheng et al. (2016) at Australian public health services, Cassar et al. (2017) at an insurance company, Ding et al. (2017) at an insurance and securities company, Ding et al. (2017) in infrastructure projects in China. The influence of organizational identification on work performance is found in a number of studies such as: Walumbwa et al. (2008) conducted at 6 banks in the United States, Herman and Chiu (2014) in 5 Chinese banks, and Schwarz (2017) at Chinese manufacturing companies. It can be seen that there is a lot of evidence regarding the influence of organizational identification on attitudes as well as individual work performance. Strong organizational identification can lead to positive outcomes, such as employee compliance and job satisfaction (Mael & Ashforth, 1992; Pratt, 1998); and there are also results showing that strong organizational identification can lead to stress and depression when the organization is faced with external criticism (Dutton et al., 1994).

The relationship between organizational identification, public service motivation and performance of public servants needs to be clarified. Rho et al. (2015) argue that the role of image and identification within members of public organizations has been overlooked and needs to be analyzed in more detail. Miao et al. (2019) hypothesized that public servants have a high degree of organizational identification if they believe that their organizations are similarly motivated to serve the public well. Research results of Rho et al. (2015) show that organizational identification plays a mediating role in the relationship between public service motivation and public servants' job performance. This shows that, in public organizations, the motivation to serve the public is a determinant of organizational identification. The willingness of public servants to serve in response to the underlying motivations of public organizations (Perry & Wise, 1990) strengthen the organizational identification of public servants in public organizations. It can be said that public service motivation has a positive relationship with organizational identification. The theoretical basis for the studies of Rho et al. (2015) and Miao et al. (2019) has not clarified the causal relationship of public service motivation with organizational identification recognition. Meanwhile, Ellemers et al. (2004) make a convincing argument for this causal relationship. Therefore, it is necessary to clarify the relationship between organizational identification recognition and public service motivation with work results in this study.

A review of the literature on public service motivation in Vietnam, presented below, has not found studies on public service motivation in education in databases such as Google Scholar and ProQuest. Studies on public service motivation have been found for union cadres, civil servants and many studies for cadres and civil servants at all levels in the state-owned sector. Therefore, studying the motivation of public service in the Vietnamese education sector is also necessary

2. Theoretical Framework

University identity (UID)

Identity is the set of meanings of a person that determine who one is when he or she occupies a particular role in society, as a member of a group, or is distinct to identify this person as a unique individual, different from other individuals (Burke & Stets, 2009). This definition shows that an individual's identity is the set of meanings associated (1) with the role that the individual occupies in the social structure, for example a person may play different roles such as teacher or teacher. teacher, father, member of a music club, called *role identity*; (2) with groups to which individuals identify and belong, called *group identity*; (3) meanings that an individual considers unique, called *personal identity*. The social identity theory of Tajfel and Turner (1979) views group identity as an instance of social identity (Luhtanen & Crocker, 1992). Thus, an individual's identity includes: (1) Social identity: People as members of society/social groups share common characteristics, such as ethnic communities, businesses, universities. Social identity includes role identity and group identity; and (2) Personal identity: Man as a unique individual with his own values, ideas, goals, feelings.

Social Identity is a concept used since the 1970s. The concept of social identity was developed from the original works Social Identity Theory (SIT) of Tajfel (1978) and Tajfel

and Turner (1979) and Self-categorization Theory (SCT) of Turner et al. (1987). Social identity is also known as collective identity in America.

Group/organization identity is the meaning of a social group or an organization. The subject of identity is not just the person as an individual; yet the subject of identity can be a group of people. An organization is a collection of people made into a whole that works for common interests, mistaken for a common purpose, as a type of group. Organizational identity is the meaning that members and others know about the organization (Cornelissen et al., 2007). Similarly, Cornelissen, Cornelissen et al. (2007) also define that corporate identity is the values and image of the company that members and others know about the company. Thus, the values and images that the members of a university and outsiders know about the university are considered the identity of the university, at the level of an organization. In other words, a university is an organization which has its own identity, called **university identity**.

Organizational Identification (OID)

Social identification is an individual's perception when identifying himself/herself in a group: he/she thinks that he/she has the same fate as the group; succeed with the group and fail with the group (Tolman, 1943). Individuals have a feeling of belonging to an organization/social structure (Ashforth & Mael, 1989), thinking that they have typical characteristics of the group (Van Knippenberg, 2000).

Organizational Identification (OID) is a case of social identity identification, since society can be understood as an organization to which the people belonging to this organization share a common number. concerns. Accordingly, individuals form personal identities when they are members of an organization, arguing that organizational characteristics create self-concepts (Dutton et al., 1994). Organizational identity can be used interchangeably with social identification (Chughtai & Buckley, 2010; Lee et al., 2015) when the social structure of the study is an organization. This study examines the identity of faculty members to a university, consistently using the term organizational identification as the extent to which a member of an organization identifies himself or herself as belonging to the organization (Ashforth & Mael, 1989), cited by He and Brown (2013, p. 14): Organizational identification occurs when employees perceive their own unity with the organization they work for and feel they belong to the organization. In general, the term refers to the extent to which a member of an organization defines himself as a member of the organization. Although the stated definitions and measured concepts may be different, organizational identification is generally understood as the individual's perception of self-identity in a group/an organization, as defined by Tolman (1943).

Public Service Motivation (PMS)

Public service motivation emerged in the early 1980s and was discussed both in the public and private sectors. Later, this concept was formally described by Perry and Wise (1990), according to which "public service motivation is an individual's tendency to react to the main or only motives in the public institutions. and public institutions". Individuals

working with a high motivation to serve the public may for the sake of society give up their own interests, disregarding their own safety in order to wholeheartedly help others, and thus would prefer to work in the public sector than in the private sector (Christensen & Wright, 2011; Perry & Wise, 1990).

Since its appearance, a number of studies on public service motivation has continuously increased over time, diversified in research objectives and methods, however, in the last 5 years, experimental research designs are more interesting (Mensah & Amegavi, 2022). Regarding the research content, it can be divided into two main trends: determinants and effects of public service motivation. Considerable determinants of public service motivation include learning opportunities, industry operating environment (Bright, 2016); knowledge base (Sarnacchiaro et al., 2019); workplace spirituality; leadership (Schwarz et al., 2020); culture of well-being (Hassan et al., 2021); organizational support, potential for social influence (Hassan et al., 2021). Major effects of public service motivation are organizational citizenship behavior (Sarnacchiaro et al., 2019); job satisfaction (Crucke et al., 2022; Kjeldsen & Hansen, 2018; Prysmakova & Vandenabeele, 2020); work performance (Schwarz et al., 2020); psychological empowerment (Miao et al., 2018).

Public service motivation is not only interesting in the public sector but also in the private sector. As a result, an interesting research direction is to compare effects of public service motivation in public vs. private sectors (e.g., Kjeldsen & Hansen, 2018). Also, it is interesting to study employees' choice between public and private sectors (e.g., Ko & Han, 2013). In addition, there were various studies on the effects of public service motivation (e.g. job satisfaction) across different regions (e.g., Prysmakova & Vandenabeele, 2020).

In education, the research on public service motivation focuses on the impact of public service motivation on the outcomes of educational service providers. A prominent research by Jin et al. (2018) examined the effects of public service motivation on the work performance of lecturers in public universities, in which the performance of lecturers was measured by many aspects such as service delivery capacity, teaching productivity, research productivity. Research results show that public service motivation has a positive impact on organizational citizenship behavior, yet a negative impact on research productivity of lecturers, mediated by commitment to the organization. Another study by Andersen et al. (2014) shows more clearly the role of public service motivation in educational institutions by asserting that students taught by teachers with high public service motivation get better academic results than the rest of the students. The significant contribution of the author team is to measure the teacher's work performance through the student's learning outcomes, that is, the customer measurement, an objective measurement scale rather than subjective ones. In addition, public service motivation also affects students' tendency to choose a place to work after graduation Ko and Han (2013). Students with high public service motivation prefer working for the public sector. On the other hand, when surveying students enrolled in a graduate program in public policy, Bright (2016) found that learning opportunities and certifications at public policy schools have the effect of promoting student's public service motivation.

In Vietnam, studies on public service motivation have only received recent attention, and the number of published studies has increased in the period 2021-2022. These studies were carried out in public sectors such as public universities, administrative agencies, and state-owned organizations. Research in the private sector was not found in Vietnam.

3. Method

Research process

According to Corbin and Strauss (2015) and Okoko et al. (2023), this qualitative study was conducted to explore organizational identification, public service motivation and organizational commitment and around these themes and not actually derive a conclusion from them. Face-to-face interviews were done for in-depth information on the subject being studied. Interviews were used within a study framework of themes, e.g. organizational identification, public service motivation and job satisfaction, performance and organizational commitment. For developing grounded theory, interviewers listened to what lecturers are saying and doing, and asked questions that can break through their conventional thinking (Corbin & Strauss, 2015).

This qualitative study follows these steps, as suggested by many researchers such as Corbin and Strauss (2015), Sandelowski (1995) and Townsend et al. (2016):

- (1) Designing interview framework, sample and sampling method
- (2) Training of interviewers
- (3) Inviting lecturers to participate in interviews (1 person at a time)
- (4) Conducting in-depth interviews
- (5) Data processing: content analysis
- (6) Going back to step (3) until the answer shows signs of repetition or sufficient numbers design quantity.

Interview guide

A set of open-ended questions by topic (concepts) and relationships among the concepts in research. It is to encourage lecturers (interviewees) to present their perceptions, feelings and evaluations. The researcher (interviewer) narrates, evoking, following the interviewee's flow of information to explore different aspects of the topic.

Sample and sampling

This is an exploring qualitative study to describe in detail the concept, so the sample is selected conveniently (non-probability) with an expected sample size of 24. During the sampling process, this study considers a relative balance of (1) male and female ratio, (2) the voice of lecturers from various faculties, (3) lecturers' degree and qualifications and (4) duration at work of lecturers, providing a comprehensive and objective picture. Statistics show that 58% of interviewees is male; 29% are with doctorate degree; interviewees' years at work range from 2 to more than 25. Interviewers sent an introductory letter and invitation

to lecturers as informants with strong anonymous commitment: all personal information is kept confidential; data obtained through interviews is guaranteed to be voluntarily provided by participants in accordance with research ethics standards.

Data and data processing

The interviews were recorded with the consent of informants. The interviews were conducted face-to-face after the COVID-19 pandemic, as agreed between the interviewer and the informants at office or the refreshment spot near the university. All interviews were recorded as data for the next step of content analysis. NVIVO 20 software was used. Interpretive analysis was performed to investigate how lecturers make sense of their working environment, through sharing their experiences; especially how the lecturers make meaning from their experiences in relation to discussion about organizational identification, public service motivation and organizational commitment (Okoko et al., 2023).

4. Results

The interview results showed that, when discussing organizational identification and public service motivation, the university identity influences lecturers' organizational identification and public service motivation. There is a reciprocal relationship between organizational identification and public service motivation. Both organizational identification and public service motivation affect lecturers' job satisfaction, performance and their commitment to the university. The results of the interviews will be presented in turn by topic.

The effect of university identity on organizational identification and public service motivation

There are various reasons why lecturers choose a teaching career and work for a public university. Many lecturers said that they chose the teaching career because of the convenience for their family life and the flexibility in working hours. Lecturers can actively arrange time and work. The lecturers shared their reasons for choosing the career, and the current university as follows:

“The current university is also a state-owned one. I chose to work here so that I have many opportunities to study more and to apply my knowledge. The second reason is that teaching is my family tradition”, said GV03FNP.

GV02MKT also added that “The goal when I decided to work for the university is to be close to family. I had many job opportunities here, yet I chose to work for this university because I think, while teaching, I am able to meet many people, students. It is more attractive than working as a desk job, e.g. working for State Treasury or the Service of Finance, where I would mostly do office work.”

“I saw the job advertisement on TV. Then my friend encouraged me to apply for this job. I also really love being a teacher. I also read information about the university on its website, looking for key information such as the year of establishment, and the teaching staff. I also asked my acquaintances about the university features, which was really attractive to me at that time” (GV10FVN)

On the one hand, lecturers assumed that a university is an attractive working environment for those who love teaching. This is because teaching career is a noble job; teachers are respected by society as motivation for public service.

On the other hand, lectures were attracted by the university itself. The most interesting image to lecturers was a very well-known professor of the university, who was the Rector of the University at the time they applied for the job. All of the lecturers who applied for the job at the time this professor worked as the Rector agreed that this feature was very attractive to them. Due to the leadership of this Rector, lecturers were eager to work for the university. As a result, they loved to identify themselves as a member of this university.

In addition, lecturers loved the university with a noble ideal when serving the public, when working for the university with its own identity.

“At that time, the leaders of the province very much wanted to have a university in the AKD area (e.g. provinces of An Giang, Kien Giang, Dong Thap, serving mainly for poor students who could not afford studying in Can Tho City or Ho Chi Minh City. That was the enthusiasm to establish this university. That was why I also urged myself to apply for a job at this university when I had just graduated. I also wanted to make a certain contribution to the university and our community. That was the university image, which I drew in my head. It is a university of the province but it still reaches certain quality levels”, said GV01MKT.

Most of the interviewed lecturers did not need to find much information about the university they chose to work for since they believed in the image of universities. In other words, lecturers believed that a university is a good working environment, so it is not necessary to learn much about the university. Only when they became a member of the organization, did the lecturers have a better understanding of the university and its identity. Those who can be integrated with the university would increase their level of organizational identification. However, organizational identification might be unstable as individual goals keep changing, and when lecturers' perception on the university identity becomes unsuitable to individuals.

“The goals of the university are the same, but the goals of individuals change from time to time. For example, in the early stage, when I was young, and I still had a lot of enthusiasm, my goals at that time were very simple, for example, to ensure basically my life. I felt satisfied with such a low payment from the university. Yet when it comes to a more developed stage, for example, when I get married, I have children, it is clear that the income from salary can no longer guarantee a living, then surely I have to take into account the fact that I need some other sources of income for my family and of course, I am unable to spend 100% of my time and thoughts focusing on university work”, said GV01MKT.

Organizational identification and public service motivation change over time at the university. At first, many lecturers chose to work at the school for the convenience of themselves and their families. They did not have much motivation to serve the public. But later, the lecturers continued to engage with the university, have a stronger organizational identity. The change in organizational identification and public service motivation comes from many reasons, including pride in the university identity.

The relationship between organizational identification and public service motivation

It can be seen that organizational identification and public service motivation are positively correlated in the interviewed lecturers. Lecturers with a high degree of organizational identification are also highly motivated to serve the public. The relationship between public service motivation and organizational identity is reciprocal rather than causal. Public service motivation might be weakened due to various causes: getting older with less enthusiasm, psychological and physical problems, work stress, students' studying attitude. However, public service motivation may increase due to strong organizational identification. On the one hand, while perceiving strong organizational identification, lecturers have strong public service motivation:

"I am keen on understanding students, finding ways to motivate students, applying modern teaching methods, reading more to update my knowledge ... I am always renewing myself to teach students effectively, to serve our community, not to show off, not to earn much money or not to get higher promotion. I want to find the best ways to share knowledge with students ... I believe that scarification is necessary for lecturers, for example in terms of finance. Lecturers do not work for money, yet we work for the community.", said GV02MKT.

On the other hand, as increasing public service motivation, lecturers perceive stronger organizational identification:

"I do not think that I am making sacrifices! I accept what I am given, the pay from the university, which is not low, also not high. I can earn for my life since I can apply my knowledge for formal jobs outside the university, for example doing projects, consultancy for enterprises. These jobs bring considerable income for me. I am proud of these jobs, which bring not only incomes but also practical skills that I can share with students and colleagues.", said GV23FNP.

By saying not to consider what she is doing are sacrifices, this respondent means that she has a very strong public service motivation. This lecturer really identifies herself in this university that she has the same fate as the university; succeed with the university and fail with the university, as the definition of organizational identification by Tolman (1943). These evidences imply that public service motivation and organizational identity is reciprocal.

Job satisfaction, performance and organizational commitment as outcomes of organizational identification and public service motivation

The interview results show that lecturers' organizational identification and their public service motivation have positive impacts on organizational commitment, job satisfaction, performance of teaching and doing research. Lecturers with strong public service motivation and organizational identification feel very satisfied with their work, have a high level of commitment to the organization, and perform very well their teaching and doing research. Most of the interviewed lecturers are eligible ones with a lot of passion for the teaching profession, who define themselves as members of the organization. Similar results can be found easily in previous empirical studies on outcomes of organizational identification and public service motivation.

“I have a big, big love for this university... I also give this love to all of my co-workers, and also local people in this province. I am really grateful for them. I decide not to leave this university, although my family has various difficulties as my parents are too old, my older sister is sick and weak. I also have opportunities at another university, which is near my hometown. This is very similar to the case of my co-worker. Yet we stay with the university despite difficulties. In spite of much more convenience and benefits at another university, we don't want to leave this because of something that is not easy to explain.”, said GV15FS.

As a result of this study, the relationship among university identity, organizational identification, public service motivation and their outcomes such as job satisfaction, performance and commitment, was shown in Figure 1 below.

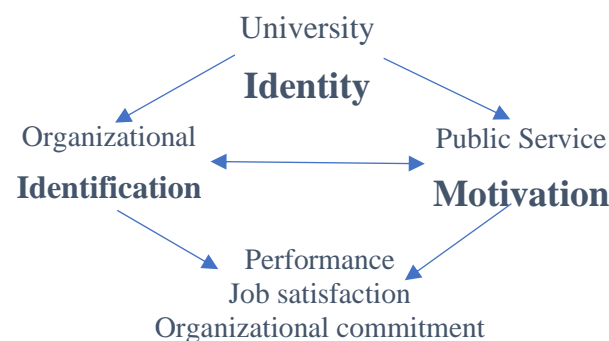

Figure 2. The effects of university identity, organizational identification and public service motivation

5. Discussion and Conclusion

5.1. Discussion

This qualitative study presents an investigation of determinants and outcomes of organizational identification and public service motivation of lecturers in a Vietnamese public university. A theoretical framework showing is suggested in Figure 1, showing the relationship among university identity, organizational identification, public service motivation and their outcomes such as job satisfaction, performance and commitment. The positive outcome of university identity on lecturers' organizational identification was found as in a study by Witting (2006). Although one has his/her owned public service motivation, university identity might change individual public service motivation. Bednarczuk (2018) also suggests paying more attention to the prominence and salience of public service motivation within different types of bureaucrats, e.g. bureaucrats than non-bureaucrats, as public service motivation may be more salient to some than to others. This means that university identity might play a role in strengthening or weakening lecturers' organizational identification. Finally, the outcomes of lecturers' organizational identification and public service motivation (i.e., job satisfaction, performance and commitment) were found, which was mentioned in the literature on organizational identification (He & Brown, 2013), and public service motivation (Ritz et al., 2016).

This research contributes to the extant literature by exploring organizational identification, public service motivation in a public university in Vietnam, which has not been conducted before in this developing country. Research results show that there is a reciprocal rather than a causal relationship between organizational identity and public service motivation, which can be found in the literature on public service motivation (Ritz et al., 2016). Reviewing literature on public service motivation, Ritz et al. (2016) reported that antecedents of public service motivation include organizational socialization, employee's perception of the organization, organizational commitment, organizational culture. This implies that organizational identification might be an antecedent of public service motivation. On the other hand, Ritz et al. (2016) also reported that outcomes of public service motivation include organizational commitment, organizational citizenship behavior, organizational attraction. This means that organizational identification might also be an outcome of public service motivation. As a result, the positive relationship between organizational identity and public service motivation could be reciprocal.

5.2. Implications

This implication aims at strengthening organizational identification. Lecturers tend to have an obligation to reciprocate their university when the university has benefitted them with fulfillment of some socioemotional needs. Lecturers are more likely to have stronger organizational identification, and hence engage in improving job performance (e.g., doing more research, innovating teaching methods) when they perceive higher procedural justice in the organization, when they find a rigorous development strategy, and when they feel pride in their university identity. This implies that universities need to have a sound development strategy of research and teaching quality management, in addition to building a strong and successful identity.

It is very important to build relationships in universities. Results also show that leader-member exchange, i.e. how leaders develop meaningful and long lasting personal relationships with lecturers, is another important antecedent of organizational identification, which is similar to results by Tangirala et al. (2007). Also, other relationships, e.g. relationships among lecturers, relationships between lecturers with students are very vital to lecturers. Apart from pay, most lecturers expect good relationships. This implies that building good relationships in universities is another considerable way to strengthen lecturers' organizational identification.

5.3. Limitation and further research

The present exploratory qualitative study has some limitations. First, the study was conducted only in a public university, which could affect the generalizability of its results. Second, the measurement model in the study needs to be validated in Vietnamese contexts, and research fields, e.g. educational organizations. Finally, it is necessary to conduct quantitative research to confirm results of this qualitative research. These limitations, however, suggest directions for further research on organizational identification in Vietnam.

This calls for quantitative studies to validate measurement scale of organizational identification, and to test possible theoretical models of organizational identification in

relation with public service motivation and their outcomes. It is because the present qualitative study aims at exploring concepts and potential relationship between the concepts, which was conducted with 24 interviews, which has limitations due to convenient sampling and small sample size. Further studies can be done in Vietnamese organizations, including educational organizations. Further studies are to provide better understanding about organizational identification, public service motivation, and their outcomes.

Acknowledgements

This research was supported by An Giang University, VNU-HCM. We also thank our colleagues from An Giang University, VNU-HCM, and Dr. Long Thanh Nguyen from Tra Vinh University, who provided insight and expertise that greatly assisted the research, although he may not agree with all of the interpretations/conclusions of this paper.

Abstract

Compared to others, the Japan markets offers a higher income for workers with a good working environment. This is also a challenge for us, because the Japan labor market is open and is recruiting from almost every country. The level of competition is quite high there. The following article shows the strengths, the weaknesses, the opportunities and the threats for our country in exporting labor to the Japan market. (i) Regarding strengths: The Vietnam government has a longstanding with the Japanese. Labor export activities from Vietnam to Japan was conducted for a long period of time, with respectable standing compared to other countries. (ii) Weaknesses: The quality of labor is not very high in term of qualifications, work ethics and social skills. (iii) Opportunities: Japan has a low proportion of young population with very low natural birth rate, in the future Japan will have a serious labor shortage. Currently in Japan, 47.1% of men and 32% of women are still unmarried in their 30s, while in the 1970s, 90% of population was married by 30. (iv) Challenges: There is significant competition from other countries. The development of technology partly reduced the demand for labor, such as robot that can replace human labor in production. Based on the SWOT analysis, the authors will offer possible solutions to promote the Vietnam's labor export activities to the Japan market.

Keywords: *Challenges, Opportunities, Labor export, Japanese market*

1. Introduction

After opening up its economy, Vietnam has strengthened international cooperation in all fields, and applied multilateral policies in its relationship with other countries. In which, labor export is one of the important connection factors. With the advantage of a country of nearly 100 million people and a young population structure, labor export is one of the important fields, bringing economic benefits as well as social benefits.

From 2019 to 2021, labor export in general and labor export to the Japanese market in particular have been heavily affected by the Covid-19 global pandemic. In 2022, the economic recovery after the pandemic along with the promotion of strategic cooperation between Vietnam and Japan has brought great opportunities for labor export to the Japanese market (*GSO, 2022*).

During the meeting of the Vietnam - Japan Cooperation Committee on May 30, 2022, representatives of the Vietnamese and Japanese governments discussed regional and international issues of mutual concern and agreed to strengthen coordination closely at international and regional forums such as the United Nations, ASEAN, Mekong, etc.; closely coordinate the implementation of the Comprehensive and Progressive Agreement for Trans-Pacific Partnership. Also in this meeting, the governors of Kanagawa and Gunma provinces affirmed to continue to encourage their enterprises to promote investment and business in Vietnam; expand the reception of Vietnamese workers, strengthen local cooperation and continue to regularly organize cultural exchange activities with Vietnam.

The new policy on cooperation in the labor sector provides clear opportunities for labor export to the Japanese market with broader subjects, including low-skilled workers with more diverse industries and longer visa duration corresponding to higher requirements. The new points in this policy also pose great challenges not only to export labor enterprises to the Japanese market, but also to the functional agencies of the two countries in implementation, training and management of labor.

To assess the importance of labor export activities to the Japanese market in all aspects, especially opportunities and challenges. Also, proposal the solutions to promote and improve the efficiency of this activity is very necessary.

2. Literature Review

There are many research projects on labor export in the world. Typically, the research report of the ILO (2013) specifically stated about the rise of the economic crisis in 2013. In 2011, the world witnessed a decline in growth, four million unemployed people was increased throughout 2012. The report also shows quantitative and qualitative indicators of the global and regional labor market, combined with macro-analytical factors to make appropriate policies.

Yumiko Nakahara (2017) referred the research of all aspects of labor export. The export of skilled labor is an area that has not been researched carefully, although it is important for economic growth in developing countries. In this research, Professor Yumiko Nakahara clarified the aspects of labor export. The number of foreign unskilled workers working in the industrial and home care sectors in Taiwan has increased significantly. The research also clarified various controversial issues such as: Cost of using foreign workers, costs related to foreign labor force, etc. This can be considered as a valuable document in the author's research process.

Futaba Ishizuka (2013) said that: labor export is one of the socio-economic development strategies of Vietnam since the beginning of the Renovation period. In recent

years, Vietnam sends about 80,000 workers abroad each year. Vietnam has become a country providing a major source of foreign unskilled workers to high-income East Asian countries. However, in these receiving countries, the defection rate of Vietnamese workers is quite high compared to other countries. This research examines the impact of the policies of accepting foreign workers of Korea and Japan applied and implemented in Vietnam, as well as the impact of the system of sending in Vietnamese workers and the issue of escape by workers.

Patrick Belser (2000) has shown the process of change, structure, quality, labor movement between industries, and the situation of labor export in Vietnam in general in the period of 1993-1998. In addition, the research also analyzed in-depth regulations related to workers, salary and bonus, and necessary procedures when terminating labor contracts, thereby making judgments on whether it is necessary to reform the labor law or not.

In Vietnam, labor export in general and labor export to Japanese market in particular are developing strongly. Researches related to labor export are very rich.

Nguyen Thi Hong Bich (2007) pointed out that in the current globalization process, labor export in Southeast Asian countries is playing an increasingly important role in the development of many countries. Labor export is both a means of attracting foreign currency through deposits of workers working abroad, as well as an opportunity to increase employment and reduce unemployment in the country. Labor export is considered as one of the development strategies of many Southeast Asian countries, including Vietnam. Based on the research result on labor export situation, the book has shown that the process of labor export in Southeast Asian countries faces similar problems in the following stages: Development and marketing of foreign labor market; Protection of migrant citizens in the recruitment and employment process; Policy and legal framework; Structure and mechanism of managing migrant workers; Training and orientation before exporting; Management of workers' deposits; Programs of re-integration and inter-country cooperation through bilateral agreements with labor-importing countries; Regional cooperation mechanisms and multilateral talks, etc...From there, many common lessons can be drawn for countries in Southeast Asia. It can be said that the book has contributed a lot of knowledge around this market. Thereby, it is possible to see the most realistic picture of the current labor export situation in some Southeast Asian countries and see the basic problems they are facing.

Nguyen Tien Dung (2010) gave the theoretical basis of labor export, actual situation of Vietnam labor export in some potential markets such as Taiwan, Japan, China, etc... Through that, the author evaluated results, achievements and limitations and solutions for development are proposed to develop Vietnam's labor export activities in the context of international economic integration.

Dinh Trung Thanh (2017) researched on "Economics of high-quality labor export of some countries and lessons learned for Vietnam". The objective of the study is to analyze the work done by some countries such as China, Taiwan, Singapore... from which to draw

experience for Vietnam in high-quality labor export activities. The study also uses data collection and analysis combined with the comparative method. The data is collected from many rich sources but still limited in the research time. The author has not assessed where Vietnam training high-quality human resources for labor export in the category of human resource training in the world.

Nguyen Thi Tuyet Van and Vu Thi Thanh Huyen (2018) showed the current state of state management of labor export activities in Vietnam and propose some solutions to strengthen the state management of this activity. The authors use descriptive statistics, combined with comparative methods, from the statistical data, the author has made an accurate assessment of the current state of state management of labor export activities. The limitation of this study is that it has not provided solutions corresponding to the analyzed shortcomings for state management. It is necessary to have specific solutions and focus on management according to groups of labor importing countries and regions in order to achieve high state management efficiency with labor export activities.

Vu Thi Nguyet Nga (2019) pointed out that labor export is one of the external economic sectors that bring great economic benefits to many countries, including Vietnam. Among the markets, Taiwan is a fertile market where many Vietnamese workers want to work. The article focuses on analyzing the current situation of Vietnam's labor export to Taiwan market in the period of 2012-2019, thereby showing the results on the strengths and weaknesses of Vietnamese workers in foreign markets. At the same time, propose some solutions to boost Vietnam's labor export to the Asian market in the coming time.

Thus, there have been many studies on labor export, which clearly show the importance of labor export as bringing great values to the development of the country's economy. In general, the studies have generalized the actual situation and offered solutions. However, in the volatile world economic conditions, Japan is always a market containing constantly changing factors that have large and small impacts on foreign labor export. Labor export activities still have many potential problems, difficulties and complicated developments that have not been resolved. Since the beginning of 2020, the Covid-19 epidemic has occurred in many countries around the world, affecting many aspects of life.

3. Method

3.1. SWOT analysis method

In this study, the SWOT analyzes labor export activities with four aspects of Strengths, Weaknesses, Opportunities and Threats; thereby having a more comprehensive view, especially the opportunities and challenges associated with the current Vietnamese context.

The main objective of a SWOT analysis is to raise awareness of the variables that influence company decisions or the formulation of business strategies. SWOT analyses the internal and external environments as well as the variables that may affect the viability of a choice in order to achieve this.

Strengths 🖱️ <ul style="list-style-type: none"> - Someone speaks another language in your team - You have spare manufacturing capacity - You have good financial planning - You have an easy process to change product or packaging 	Weaknesses 🖱️ <ul style="list-style-type: none"> - You will need additional pay for production - You're already tight on working capital - No one understands export docs in your team - Time is often short
Opportunities 🖱️ <ul style="list-style-type: none"> - Your competitors are already active in other markets - Additional staff can be brought cost effectively - You have the ability to access cultural marketing through staff - Trade association trade missions 	Threats 🖱️ <ul style="list-style-type: none"> - There is a lot of activity in your market - Competitors are aggressively pricing - ROI return on investment needs to be short term - Exchange rates vary a lot

Figure 1. SWOT framework for Vietnam - Japan labor export market

3.2. Data analysis

The data is collected through the use of methods of synthesis, analysis to systematize issues related to labor export. Thereby, making a judgment on the current situation and analyzing the strengths, opportunities and challenges of Vietnam's labor export to Japan in order to discover the advantages and disadvantages and propose solutions for this activity.

Data are collected from: Vietnam Legal documents on labor export to Japan; statistical data on labor export of our country to Japan; statistics about Vietnam and Japan

4. Results

4.1. Current situation of Vietnam's labor export to Japan

Although labor export has been carried out since the 1980s, the Japanese market has only really been exploited since 1993, after our country opened up its economy and established the JITCO. The process of bringing workers to Japan is associated with the Japan's economic growth as well as regulations on labor export and the relationship between Vietnam and Japan. The process can be divided into 3 phases: 1993 - 2005; 2006-2013; and 2014-present

Table 1. Statistics of Vietnam's labor export market in the period of 2014-2019

<i>Unit: person</i>						
Year	Total	Taiwan	Japan	Korea	Malaysia	Other
2014	106,840	62,124	19,766	5,500	5,139	14,311
2015	115,980	67,121	27,010	6,109	7,354	8,476
2016	126,296	68,244	39,938	8,482	2,079	7,553
2017	134,751	66,926	54,504	5,178	1,551	6,592
2018	142,860	60,369	68,737	6,538	1,102	6,114
2019	148,000	54,480	80,002	7,215	454	5,849

Source: Department of Overseas Labor, 2020

Figure 2. Number of exported people to Japan over the years

Source: Department of Overseas Labor, 2020

Period of 1993 - 2005: This is the period when Vietnam approaches the Japanese market. Unlike the Korean market, the Japanese market does not allocate quotas according to the needs of companies but stipulates the number of trainees according to the size of the receiving company.

Labor export activities of Vietnam to the Japanese market in this period are generally stable but not much. During this period, due to affected by the Asian financial crisis in the late 1997 and early 1998, the labor force exported to Asian countries decreased. Until 2001, the economy recovered, the Japanese market grew very slowly, in 2003 it grew by 2.4% compared to 2002, in 2005 it increased by 7.3% compared to 2004. By 2005, the number of labor export to Japan only accounts for 4% of the total number of Vietnamese people going to other countries.

Period of 2006-2013: This period marked major changes in the Japanese market with many regulations issued on labor export of Vietnam and regulations on labor import of Japan. Since 2006, Vietnam has sent an average of 5,500 workers to Japan each year. Only in 2008, it reached a record level of 6,142 people. That sudden growth is thanks to the positive impact from both Vietnam and Japan. From 2011 to 2013, along with the recovery of the world economy, the Japanese economy gradually recovered and Japan received more Vietnamese workers, in 2013 the number of Vietnamese workers went to Japan exceeded 10,000 people. On the other hand, Tsunami disaster in 2011 caused great damage to Japan, reducing the GDP of the world's third largest economy by 3% and causing a large deficit of human resources.

Period of 2014 - 2019: This period recorded a sharp increase in the number of workers went to Japan. 2014 marked a milestone as the first year that Vietnam sent over 100,000 workers to work abroad, of which the number of labor exports to Japan accounted for nearly 20%. For the Japanese market only, 2014 was a year of outstanding growth with more than 19,000 workers. Comparing the number of Vietnamese workers working in Japan

with the total number of Vietnamese workers working abroad, we see a strong growth over the years. If in the years of 2014 - 2017, the Taiwanese market always ranked first in attracting Vietnamese workers, since 2018, Japanese workers accounted for the majority, and Taiwan was second.

There are many reasons affecting the change in the above labor rate such as the new policy and regulations of the State. Programs to strengthen cooperation between Vietnam and Japan, expand programs to receive Vietnamese workers in addition to the previous programs (notably the program to bring nurses and paramedics to Japan). Among the countries that are partners of Japan, Vietnam is the second country after China in terms of importing labor

4.2. Labor export activities of Vietnam to Japan market according to SWOT model

4.2.1. Strengths

The Vietnamese government has a long-standing cooperative relationship with Japan. Labor export activities of Vietnam to Japan have also been conducted for a long time, creating its own position compared to other countries. In 2014, the number of Vietnamese workers in Japan accounted for only 4-5% of the total number of foreign workers in this country, when this proportion in China was over 77%, Indonesia was over 9%, the Philippines was about 5.4%. Up to now, Vietnam has risen to the second position after China. Moreover, the Japan market has existed for a long time, the appearance of new potential competitors is very unlikely.

Vietnam's population is young, so Vietnam has a large supply for labor export. With a population of over 90 million people, Vietnam is the 14th most populous country in the world, the 8th in Asia and the 3rd in Southeast Asia. Vietnam has entered the period of "golden population structure" with the highest proportion of young people in the history, the young population from 10-24 years old accounts for nearly 40% of the population (GSO, 2022). This is not only an abundant labor supply for domestic production activities but also a surplus to be able to export to foreign countries.

The number of labor export enterprises is large and quite effective. If in 2010, there were only 167 enterprises operating in labor export field, this number reached to 350 enterprises by 2019 (average increase of 10% per year). In which, according to the evaluation report of the second year of implementing the Code of Conduct for labor supply enterprises, the number of enterprises with excellent performance accounted for 92%, 8% of enterprises with good performance, there is no enterprises with average performance(GSO,2022).

More and more policies clearly regulate the implementation as well as support and investment policies for labor export. With the introduction of the Law on Vietnamese guest workers and guiding documents, created a synchronous legal corridor to regulate labor export activities, in line with domestic and international realities, facilitate the operation of enterprises and protect the legitimate rights of workers. However, this law has many limitations that do not meet the changing needs of reality.

4.2.2. Weaknesses

Labor quality is not really high in terms of qualifications, working style, life skills. Vietnam's labor productivity in recent years has improved significantly, but if the average labor productivity growth rate of the countries remains unchanged as in the period of 2007 - 2012, then until 2038 that Vietnam will only catch up with the labor productivity of the Philippines, and will not catch up with the labor productivity of Thailand until 2069. Notably, if compared with China and India, our country's labor productivity increases more slowly. Specifically, Vietnam's labor productivity was 1.3 times lower than China's in 1994; by 2013 it increased to 2.8 times. Between India and Vietnam, this number increased from 1.6 times to 1.7 times. These are all our competitors in the labor export market to Japan (*Vu Hoang Manh Trung, 2017*).

In addition, there was a time when our labor broke the law quite a lot, causing a bad image and impression. The supply is still not diversified in terms of quality, industries and forms. Especially for occupations that require high qualifications, we have not yet met the needs of the host country.

The activities of enterprises are still small, fragmented and unconnected. In addition to the achievements, it should be noted that labor export enterprises are mostly small-scale enterprises, with little capital investment and have not paid much attention to skills training for staff in the field of labor export so the labor export activities are still ineffective. Some businesses do not pay attention to management, causing damage to employees' benefits, even violating the law, and losing employees' trust.

Support policies, management are still limited and education and training, information dissemination do not have a certain standard, lacks consistency. Although there are many regulations on activities related to the education and training of workers before going to work in the host country, there are no standards frameworks, each enterprise and organization self-drafts and self-trains according to their content. Most of the training content focuses on language training to be able to meet the control of the receiving party without equipping employees with socio-cultural understanding, working processes or laws of the host country.

4.2.3. Opportunities

Japan's young population and natural birth rate is low, so Japan will have a serious shortage of labor in the future. The trend of getting married and having children later and the high rate of single people living in Japan are directly causes for the decline in the birth rate of Japan's population. In Japan, 47.1% of men and 32% of women in their 30s are still unmarried, compared with married in the 1970s is 90%. Japan's population growth rate has fallen below 1% since the 1980s and was at -0.2% for the first time in 2005. Old population: 22.7% of the population is over 65 years old, the number of Japanese under 14 years old last year accounted for only 13.6% of total population, a rate is too low to guarantee human resources in the future. With the above figures, it can be said that Japan will have a serious labor shortage in the coming years. Moreover, with the rebuilding of the country after the tsunami and hosting the Olympics, Japan will need more labor. Therefore, this is clearly an attractive market for labor export.

Cooperation programs with Japanese business organizations are being expanded and entered into the common process. The Vietnamese government encourages labor export and has taken many actions to support for this activity. Japanese enterprises as well as the government always highly appreciate Vietnamese workers and always create favorable conditions such as increasing cooperation programs, signing treaties and agreements on labor with Vietnam.

Labor export enterprises are proactive in finding markets, negotiating and signing contracts, organizing recruitment, training, and managing overseas workers, contributing to the development of new markets and large numbers of workers, having high quality, stable income, timely solving arising problems. The enterprises are very dynamic to quickly adapt to new difficult conditions, especially those that have cooperated with foreign partners to train according to market requirements...

4.2.4. Threats

There is competition from the labor export of other countries. The Japan market is an attractive market for many reasons. It is not easy for other countries with a surplus of labor to ignore the market with many factors both in terms of income, working and living conditions like Japan. In fact, compared with other countries, our diplomatic relationship with Japan cannot have a long history, not to mention that competitive countries all have experience in sending workers to export, including the countries specializing in labor export such as China and the Philippines.

We also face with difficulties due to Japan's policy of restricting labor import and entry procedures. Although, there are many improvements and openings in the immigration law; in fact, the workers have to go through many stages, applying for a visa is not easy.

The development of technology makes the demand for labor also partly decrease, robot technology develops to replace human labor in production. Especially, for a country that develops science and technology, especially robot manufacturing technology, the replacement of humans with machines is predictable in the future. Currently, robots have participated in taking care of the elderly and children, helping the family.

5. Discussion and Conclusion

5.1. Discussion

5.1.1. Solutions by State

➤ Develop the market in the direction of diversification

Diversification can be done in two ways: diversification of occupations and diversification of workers' qualifications. The Japan market has so far received mainly the unskilled labor force of Vietnam. However, in reality, the Japan market also needs high-quality labor. Therefore, Vietnamese labor export needs to understand these things to diversify types of workers to work in Japan. In addition, it is possible to diversify labor export industries, only restricting occupations that are especially dangerous and toxic or not suitable with Vietnam's fine customs and traditions.

➤ *Develop a financial support program for labor export*

Financial support for labor export activities is necessary but has not been properly focused and implemented. When going to work in Japan, workers need to pay a lot of fees lead to limit the workers with no financial conditions. Therefore, financial support for this activity is extremely necessary.

5.1.2. Solutions by enterprises

➤ *Expand markets and partners*

Enterprises need to comprehensively research, collect different information on demand, quantity, type, and procedures for receiving in Japan, study the competitiveness of labor export enterprises of competitive countries. At the same time, it is advisable to establish close relations with representative agencies in Japan, with the Department of Foreign Labor in deploying markets, looking for partners, signing contracts.

➤ *Promote compulsory training and education activities for employees*

Japan is also an Asian country, but Japan's living culture and business principles and regulations in production have many differences with Vietnam. Japan always has high requirements for Japanese language proficiency, punctuality, standardization, and respect for hierarchy at work. Therefore, workers need a good training before going to work in Japan. The skills that need to be trained for workers are: vocational and language skills, life skills. However, it is very difficult to fully train the above skills because businesses often have new contracts to recruit and educate workers with only 3, 4 months; this is too short a time to master all of the above skills.

5.1.3. Solutions by the workers

➤ *Equip with the most basic knowledge about labor export activities*

Equipping themselves with the most basic knowledge about labor export includes professional knowledge, foreign languages, culture and laws of Japan's labor export. This action helps employees to ensure their rights as well as be aware of their responsibilities and obligations.

➤ *Look for reputable, responsible, open-operated labor export enterprises*

In fact, there are many companies that do not have the function of labor export activities but still post recruitment information in order to take advantage of customers' trust to scam money. Employees must know how to protect themselves against inaccurate information by thoroughly researching the business, can go directly to the enterprise for the most accurate information

5.2. Conclusion

Our labor export activity began in 1980 and it has spent nearly 40 years to gain many results than expected. Although there are many limitations, it is undeniable that the positive aspects of this activity bring to employees, businesses and national interests.

The Vietnamese government has always identified labor export as an economic activity that needs to be focused on promoting development. In recent years, Vietnam has

always increased the number of workers going abroad. In many markets, Vietnam's labor export has created its own place and it can be mentioned to some familiar markets such as: Malaysia, Korea, Japan....

Japan is a traditional market and gives Vietnam certain preferences based on the good relationship between the two countries. Vietnam's labor export to the Japan market has steadily increased over the years, especially from 2014 to 2019, with a strong growth rate. Japan rose to become the most attracting country with Vietnamese workers, followed by Taiwan ranked second. Vietnamese workers gradually improve their quality to meet the requirements of the market.

Abstract

Using an education-based methodology, this study assesses the situation of human capital in all regions of Vietnam and suggests policy recommendations for sustainable human capital development. The majority of regions have a favorable golden population structure, and locations with high human capital tend to have a significant labor force, urban areas, cities, and industrial zones. However, the Mekong River Delta lags behind in terms of educational attainment, which is worsened by the outmigration of young workers to other regions. Focusing on secondary and postsecondary education, Vietnam's human capital development plan has to change from quantity to quality. Improving the quality of general education should be a top priority in regions with low human capital quality.

Keywords: *Education-based Approach, Human Capital, Scio-economic Regions, Vietnam*

1. Introduction

In the period of economic recovery and development, after the COVID-19 epidemic is under control, the quality of human capital is an important factor in helping countries stabilize and develop production and business. Human resources are a decisive factor in the realization of socioeconomic goals, and it is also decisive in the process of accelerating industrialization and modernization of the country in order to quickly integrate our country's economy with the regional economy and internationally because, in the end, it is people who are the most basic and important factor of the entire productive force. However, for a long time, the issue of human resource training has not been given due attention and appropriate steps have not been taken. The rapid population growth pressures society to allocate and train a high-quality workforce to meet the economy's needs. Vietnam has advantages with a

large labor force and a young labor structure. However, human resources are still weak in quality: there is a shortage of skilled workers, not meeting the needs of the labor market and integration; the gap between vocational education and the needs of the labor market is getting bigger and bigger, labor is lacking in dynamism and creativity, professional style.

The International Labor Organization (ILO) forecasts that in the next 5 years, one-third of jobs will change according to practical requirements, of which 40% of workers are unlikely to meet new requirements when Labor skills are not improved. According to the Ministry of Labour - Invalids and Social Affairs, in Vietnam, the country's human resources in general have increased in size, from 50.4 million people (in 2010) to 56.2 million people (in 2020). Regarding the quality of human resources, also according to this Ministry, the percentage of trained workers also increased from 40% (in 2010) to about 65% (in 2020); in which there are a number of industries reaching regional and international levels including healthcare, mechanics, technology, construction...

According to the Ministry of Labour - Invalids and Social Affairs, what concerns us today is the quality of labor. According to statistics, the trained workforce is currently only about 66%, of which only 26% have diplomas and certificates. In addition, working style, skills and professional sense are also important to mention because these are also the factors that make up a high-quality labor.

Economic regions are specific economic and territorial divisions of the national economy with production specialization combined with overall development. An economic zone is a place that can really engage customers with a territorial division of labor. The territorial division of labor is both the basis and the driving force of the formation of economic zones. The basic characteristics of an economic region are systematic, hierarchical, specificity, synthesis and organization. Human resources are one of the most important factors to the development of each economic region. Population growth, training and development of high-quality human resources can provide labor force for each economic region, improve labor productivity, improve product and service quality, and make positive contributions to economic growth.

Vietnam's socioeconomic areas are increasing according to the national trend, while the economic structure is shifting toward industrial and agricultural applications. In addition to the construction and expansion of industrial zones and clusters, business, commerce, service, and tourism institutions, socioeconomic development necessitates human capital of sufficient quality to meet the demand for human resources. Because human capital is one of the most important contributors to economic growth. Human capital plays an increasingly vital role, especially in the context of the economy's continuous shift to a knowledge-based economy and the trend toward globalization. Recent economic growth theories have revealed that, in order for an economy to grow rapidly and at a high rate, it must be supported by at least three key pillars: the application of new technologies and the expansion of infrastructure. Human capital-centric and contemporary. Which characteristic human capital is the most important aspect in sustaining economic development? (Becker, 1964).

2. Literature review

Economic scholars have argued for millennia, as portrayed in numerous economic literature, that human capital is a key ingredient of economic growth (Romer, 1986; Mankiw et al., 1992; Barro and Sala-i-Martin, 2004; Qadri and Waheed, 2014; Abdouli and Omri, 2021). Economist Theodoe W. Schultz first proposed the human capital theory in the 1960s. The premise of this theory is that investing in one's own education and training might eventually boost one's productivity and financial potential. In Schultz's opinion, people's knowledge, skills, and abilities as a result of their education and training are referred to as human capital. These skills and abilities can be viewed as a form of capital that people can invest in themselves in order to boost their future earnings, much like physical or financial capital.

The Organization for Economic Co-operation and Development (OECD) in 2011 defined Human capital can be broadly defined as the stock of knowledge, skills and other personal characteristics embodied in people that helps them to be productive. This article identifies several general approaches to measuring human capital: cost-based, income-based, and education-based.

The cost-based measure of human capital assesses human capital based on the quantity of inputs. In essence, human capital is computed as the aggregate of investments in the accumulation of human capital; hence, an individual's human capital is the sum of his or her investments or expenditures in human capital. According to Fraumeni (2021), human capital is comparable to the cost of investing in people, such as child raising, education, on-the-job training, and health care. In addition, the author explains that human capital is approached following individual elements at work, such as knowledge, skills, capacity, and personality.

The education-based measurement approach is a common way to estimate human capital. The simplest way to describe the education level of a population is the proportion of the population that has completed formal education. This indicator shows how many people complete each level of education. According to Alizera Behroozni et al (2016), human capital can be expressed by macro parameters, in her study, Alizera Behroozni compared the school attendance rate of primary school students, the attendance rate school of middle school students, attendance rate of students entering college.

Similar research by Faisal Sultan Qadri et al (2014), also relies on macro-parametric variables to represent human capital such as: School attendance rate of primary school students, attendance rate of students secondary school and the attendance rate of higher levels. However, this method does not fully reflect the skills or knowledge of workers.

The school enrolment rate, on the other hand, is a number that is important solely for students and has minimal bearing on the labor market. Years of education can legitimately represent the workforce's human capital stock, but this just represents the quantity of human capital and does not indicate the workforce's skill level. This takes us to test scores, a measure of human capital proposed by Hanushek and Kimko (2000) that indicates educational quality and is closely associated with individual competence. Test results make it exceedingly challenging to obtain a measurement that can be accurately extrapolated to the full workforce. In fact, Hanushek and Kimko (2000) and later Hanushek and Woessmann (2009)'s country-level measures of average

cognitive skills are not based on a random selection of schools or students and may not be nationally representative of the skill level of students, much less of the workforce.

In addition, human capital is also measured by criteria such as literacy rate. The literacy rate, which counts the percentage of the population that can read and write, is a crucial indicator of well-being but it does not account for the level of education or skill of the labor force. Usually defined as the proportion of the population aged 15 years and over who can "read and write a simple sentence about their daily lives" (UNESCO, 1993, p. 24), the percentage of adults who are literate with meaningful information about the general educational status of a country. This index has been used in early empirical studies controlling human capital in growth equations, including Romer (1989) and Azariadis and Drazen (1990). Unsurprisingly, such a defined human capital variable has shown limited explanatory power in cross-country growth regressions. One reason, perhaps minor, is that literacy is not objectively and consistently determined across countries and thus creates biases in international comparisons. A more important reason is that, while reflecting a fundamental component of human capital, adult literacy rates ignore most human capital factors beyond that basic level, including calculus, logical reasoning and analysis, and scientific and technological knowledge. Thus, using adult literacy as a proxy for human capital ignores the contribution of more advanced skills and knowledge to productivity. As Judson (2002) assesses, literacy rates can be a good proxy for human capital accumulation in countries where people have low levels of education, but not for those with low levels of education primary school universalization.

3. Method

Education-based metrics of human capital, such as literacy rates, school enrollment rates, and average years of schooling, are simple to calculate and have extensive data coverage across regions. These indicators provide a rough estimate of a country's or region's human capital.

3.1. Adult literacy rates

Typically defined as the percentage of the population aged 15 and older who can "read and write a short statement on his or her everyday life" (UNESCO, 1993), adult literacy rates provide valuable insight into a country's educational standing. This indicator has been utilized in early empirical research that compensate for human capital in growth equations, such as Romer (1989) and Azariadis and Drazen (1990).

As expected, the so-called human capital variable has demonstrated minimal explanatory power in cross-country growth regressions. The fact that literacy is not objectively and uniformly defined across countries generates biases in international comparisons, albeit a minor one. Despite reflecting a vital aspect of human capital, adult literacy rates omit the majority of characteristics that go beyond the elementary level, such as numeracy, logical and analytical reasoning, and scientific and technological knowledge. Using adult literacy as a proxy for human capital disregards the importance of higher-level skills and knowledge to production. According to Judson (2002), literacy rates may be a suitable proxy for human capital in nations with low levels of education, but not in nations with universal primary education.

3.2. School enrolment rates

The school enrollment rate is the ratio of the number of pupils enrolled at a certain grade level to the age-group population that, according to national law or tradition, should be attending school at that grade level. The ratio's numerator distinguishes net and gross enrollment rates. Gross enrolment rates account for the entire number of students enrolled at a specific grade level, whereas net enrolment rates exclude pupils who do not fall within the specified age range.

Barro (1991), Mankiw et al (1992), Levine and Renelt (1992), and Gemmell (1992) are studies that use school enrollment rates as proxies for human capital in enhanced growth models (1996). Such an application is justified because the enrolled population reflects the flow that adds to the existing stock of education to establish subsequent stocks. In other words, enrollment rates represent the current investment in human capital that will eventually be reflected in the stock of human capital.

However, enrollment rates do not adequately represent the current stock of human capital. First, as measures of flows, enrollment rates represent only a portion of the continual accumulation of human capital stock. Second, there is a lengthy lag between investment in education and additions to the human capital pool; hence, present enrolment rates are indicative of the schooling level of the future labor force, not the current one. Thirdly, the education of present students may not completely contribute to the (future) stock of productive human capital since graduates may not enter the labor force and investments may be largely wasted due to grade repetition and dropouts. Fourth, the change in the stock of human capital is the difference between the human capital of those who enter and leave the labor force; however, school enrollment rates do not account for those who leave the labor force. Enrollment rates do not adequately reflect even future flows of the human capital stock, let alone current flows or the stock itself.

Moreover, enrollment numbers in poor nations are frequently unreliable. According to Barro and Lee (1993), UNESCO enrollment statistics are derived mostly from annual surveys of educational institutions in each nation, and reporters frequently inflate enrollment figures for the benefit of their schools. In addition, there may be a reverse causal relationship between enrollment rates and productivity increase; high enrollment may be a result of high productivity growth, rather than the other way around (Wolff, 2000).

In some countries, school enrollment rates can serve as acceptable surrogates for human capital, whereas in others, they cannot. For instance, secondary enrollment rates will only be reliable indicators of human capital accumulation in nations where secondary education is expanding the quickest (Judson, 2002). In fact, the author detects positive correlations between growth and human capital accumulation at the primary level for low-income nations, at the secondary level for middle-income countries, and at the tertiary level for high-income countries, but no link is observed for the pooled sample.

Vietnam was one of the world's poorest nations in 1990, with a per capita gross domestic product of \$98 US dollars. The World Bank classifies Vietnam as a middle-income country based on its per capita gross domestic product (GDP) of \$1,024 in 2008 (Ohno, 2009).

3.3. Average years of schooling

The average number of years spent in school has various advantages over literacy rates and enrollment ratios. First, it is a genuine measure of stock. Second, it measures the current labor force's accumulated educational expenditures. Under certain plausible assumptions, Wachtel (1997) demonstrates that the number of schooling years is equivalent to cost-based metrics of human capital.

Psacharopoulos and Arriagada (1986) were the first to assemble information on the average number of years countries spend in school. By employing a projection method, Kyriacou (1991) attempted to address the shortcomings of Psacharopoulos and Arriagada's (1986) work. He regressed the years of schooling data available from Psacharopoulos and Arriagada (1986) for 42 countries in the mid-1970s (from 1974 to 1977) on the UNESCO Statistical Yearbook's lagged gross enrolment ratios. Lau et al. (1991) utilized a perpetual inventory technique, which calculates the stock of education S at year T by adding the enrollments E at all grade levels g for all age cohorts.

The average number of years spent in school is determined by dividing the total number of years spent in school by the total population aged 25 and older (in full age) (UIS, 2013).

4. Results

Vietnam has a large population, a relatively young population pyramid, and is in the "golden population structure" period with abundant human resources (Tu et al., 2021). Population growth in recent years has led to an increase in the labor force. As of 2019, Vietnam's labor force reached 65.4 million people (accounting for 68.0%, more than 2/3 of the total population). In general, each year Vietnam has more than 500,000 people entering the working age, this is an important advantage of Vietnam in socioeconomic development (see Table 1).

Table 1. Labor force and labor force participation rate by scio-economic region

Scio-economic regions	Year 2009		Year 2019	
	Labor Force	Labor Force Participation Rate	Labor Force	Labor Force Participation Rate
Entire Country	59,338,939	69.1%	65,420,451	68.0%
Northern Midlands and Mountains	7,449,155	67.4%	8,484,236	66.1%
Red River Delta	13,615,971	69.5%	14,871,968	66.0%
North and South-Central Coast	12,522,820	66.5%	13,350,802	66.1%
Central Highlands	3,265,841	63.8%	3,831,469	65.6%
Southeast	10,403,702	74.0%	13,168,971	73.9%
Mekong River Delta	12,082,450	70.3%	12,013,005	69.5%

Source: General Statistics Office

Table 1 shows that the labor force is still most concentrated in the Red River Delta, followed by the North and South-Central Coast, and the Southeast. These are areas with large land areas, concentrated in many big cities, urban areas and many industrial zones, which are convenient for production and business, so they attract a large number of workers to concentrate in these areas. The Southeast is an example of attracting labor force in industrial development, mostly young migrant workers, increasing by nearly 3 million workers after 10 years, accounting for 17.5% of the labor force in 2009. growth of the whole country to 20.1% per year. Areas with a low percentage are areas with narrow land area, many hills, few urban areas and industrial zones, so they do not attract many workers here. The Mekong River Delta is the only region in the country that tends to reduce the number of workers.

The labor force participation rate decreased by 1.1% nationwide. Except for the Central Highlands, this rate decreased in the remaining 5 socioeconomic regions, in which the largest decrease was the Red River Delta (see Table 1). This shows the trend of population aging, increasing dependency ratio in Vietnam. This trend is not uniform across socioeconomic regions.

Figure 1. Adult literacy rates by socio-economic regions

Source: General Statistics Office

The results of the 2019 Census show that the literacy rate of the population aged 15 and over is 95.8%, an increase of 2.3 percentage points compared to 2009. This proves the policy of universal primary education and eradicating illiteracy effectively. The Red River Delta has the highest literacy rate (98.9%). The Northern Midlands and Mountains have the lowest literacy rate (89.9%). The Red River Delta, North and South-Central Coast, and Southeast are regions with higher literacy rates than the national average (see Figure 1).

Figure 2. School enrolment rates in secondary school by socio-economic regions

Source: General Statistics Office

Efforts to send children to school have contributed to a significant increase in the enrollment rate at the right age for lower secondary schools nationwide and in all regions. The North and South-Central Coast are a typical example of increasing the school attendance rate at the right age at lower secondary level (increasing by 19.3%). The school enrolment rate at the right age at lower secondary level is highest in the Red River Delta and North and South-Central Coast. This rate is lowest in the Mekong Delta and the Central Highlands. The highest disparity between socioeconomic regions is 12.5 percentage points at the lower secondary level (see Table 2).

Figure 3. Average years of schooling by socio-economic regions

Source: General Statistics Office

The average years of schooling in the entire country is 9.0 years, corresponding to the number of last years of secondary education. The Red River Delta has the highest average years of schooling (10.6 years), 3.5 years more than the Mekong River Delta, which has the lowest average years of schooling (7.1 years). The Southeast and North and South-Central Coast have the 2nd and 3rd largest number of years of schooling.

4. Discussion and Conclusion

Statistical results show the similarity between human capital indicators by socioeconomic region based on access to education. Most regions have a golden population structure. Areas with high human capital index are those with a large labor force, concentration of large cities, urban areas and many industrial zones, which are favorable for production and business. However, the Mekong Delta is an exception, with an abundant labor force, qualities that are not commensurate with the size, the rate of attendance at the right age in lower secondary level and the average number of years of schooling, lowest army in the country. Migration of young workers to the Southeast for a long time has significantly reduced the quantity and quality of human resources in the Mekong Delta. Besides, the trend of decreasing labor force participation rate and population aging are reality for Vietnam's human capital, leading to many social security consequences.

In order to take advantage of the golden population structure for socioeconomic development and further human capital development, the following policy solutions should be implemented:

- Vietnam's human capital development strategy needs a change, gradually shifting from quantity to quality. To become a developed, high-income country, Vietnam must shift its focus to secondary and tertiary education to increase quantity and quality. The first and more favorable socioeconomic regions will focus resources on developing higher education and vocational education, creating high-quality human resources. While socioeconomic regions with low quality of human capital need to persevere to send children to school and improve the quality of general education.

- The favorable conditions for the three socioeconomic regions with abundant human capital are the Red River Delta, the Southeast, the North Central and the Central Coast. High-quality human resources, digital human resources, vocational education innovation associated with regional strengths and development orientations, consider this as one of the breakthroughs for regional development. Invest in building facilities and improve the quality of operations of a number of large universities to become prestigious training centers in the region and the world. Review and rearrange the vocational education network. Focus on prioritizing investment in vocational education schools in the region to perform the country's and region's central function in terms of high-quality vocational training and practice. Strengthening scientific research, technological development and innovation activities.

- The quality of education from high school and below in Vietnam is very good, especially in natural subjects. But higher education remains a dilemma and impractical. It is an easy to see fact that higher education today is still heavy on theory and lacking in practice.

Recruit faculty and professors from different agencies, companies, and organizations in the labor market to provide diverse student experiences. Do not only hire teachers who are excellent graduates of the school. In addition to specialized knowledge, teach students everyday but important working skills such as communication, foreign language, thinking, analytical, and problem solving skills. urgent. On the macro side, the state should have special incentives for talented people so that they have the opportunity and environment to serve the country. If we can do the above, investing in human capital will be more efficient and bring prosperity to an individual and the whole country.

- It is necessary to develop planning and reasonably organize the national territorial space, best to promote the specific advantages of each region and locality, and to strengthen the inter-regional and inter-regional linkages to participate in global value chains, creating new development space... Develop holistically, organically, closely linking localities in the region into a unified whole.

The study uses data from the 2009 and 2019 censuses to analyze Vietnam's human capital by socioeconomic region based on access to education. Research results show that there is a difference in human capital between socioeconomic regions associated with the development conditions of each region. In order to develop human capital, besides the overall solutions on regional linkage, education and training solutions should pay attention to the specificity of each region and locality.

Education-based human capital metrics, such as literacy rates, school enrollment rates, and average years of schooling, are quantifiable and have extensive international data coverage. However, they have been criticized for failing to capture essential human capital characteristics fully and for placing a premium on number over quality. By relying on a rudimentary proxy for past education, these measurements neither represent the depth of knowledge embodied in persons nor quantify the flow of future advantages earned via education. In fact, it has been determined that they are applicable to one group of countries but not to another group at a different stage of development. Inadequacies in the data have also hindered the application of these indicators. Recent data demonstrates that how they are measured, as opposed to what they measure, makes these indicators poor surrogates for the underlying stock of human capital.

Abstract

After many decades of applying population control policies, countries have begun to develop and implement policies that encourage childbearing. In developed countries of Europe and Asia. Measures adopted by governments were financial support, paid maternity leave, and child allowances to support families to raise fertility. However, the effectiveness of these policies were not high despite huge costs. This challenge faced by developing countries including Vietnam. Vietnam has begun to enter the period of the Total Fertility Rate (TFR) drops below the replacement level (2.1 children/woman) with a continued downward trend. Especially, this happen in urban areas. The question is, if there were possible solutions to raise fertility in developing countries including Vietnam, that can be implemented inspite of limitation of country's resources. This article will attempt to answer questions through an overview of childbearing promotion policies implemented in Europe and some East Asian countries, thereby drawing lessons that can be applied in Vietnam in the current period.

Keywords: *Population Policy, Childbearing Promotion, Total Fertility Rate, Vietnam*

1. Introduction

The world population explosion in the early years of the 19th century (Van Bavel, 2013) led countries to promote birth control, and by the second half of the 20th century, the birth control movement spread worldwide. (Robinson, 2007). However, when the fertility rate began to decline and when it was below 1.5 and the population began to age rapidly, governments began to formulate policies with the goal of restoring and increasing fertility. Population policies in this period were built on socio-economic measures (Davis, 1967) on

the basis of integrating gender approaches (Bongaarts (1994), culture (Robinson, 2007). and economic-political science (Lush, 2000). However, the pioneers in Europe and Asia with long-term costly reproductive incentives are seen as having little effect, difficult to quantify (Sobotka et al., 2019; Luci, 2011).

After nearly 20 years of implementing the population control policy, Vietnam began to see a fertility rate below 2.1 since 2007. Although the country's fertility rate is still higher than 1.9 so far, there are some regions, especially in areas with a developed economic level, the fertility rate will only reach 1.6 in 2020. This figure in Ho Chi Minh City - the most developed urban area in the country will only reach 1.53 in 2020 (Tổng Cục thống kê, 2022). This fact has attracted the attention of the Vietnamese government and transformed its population strategy from the point of view of population control to the point of view of population development with the goal of maintaining a replacement fertility rate of 2.1 children/woman. In particular, recently, Prime Minister Nguyen Xuan Phuc signed Decision No. 558/QĐ-TTg dated April 28, 2020 approving the "Program to adjust fertility levels to suit regions and subjects until 2030". This program aims to maintain replacement fertility in Vietnam until 2030 and avoid falling into an aging population like today's developed countries (E-Newspaper of the Communist Party of Vietnam, 2020).

The question is, how can Vietnam apply lessons learned from population policy in the direction of encouraging childbearing in the world in the context that the country belongs to the low-middle-income group? Could there be a cost-effective solution that is feasible and has measurable performance? Those are the main research questions of this article.

2. Method

The data is processed by thematic analysis method according to the following procedure:

1) Identify key research questions. The question is how are policies to encourage childbearing in the world implemented (in the world, in the European region, in the Asian region)? What are the policies to encourage childbirth in Vietnam through history? What can Vietnam learn from policies around the world to apply to its own country?

2) Search for suitable documents. Materials from scientific journals on demography and sociology as well as from the website of the General Statistics Office of Vietnam were used. Most of the articles are studies describing the situation of population and family policy in the world and in Vietnam. Selected articles are from reputable experts in the field of population policy, published as early as 1967 until as recently as 2022.

3) Categorize by topic. Information from the articles is categorized under the following topics: 1) Global population issues and population control policies, 2) Birth promotion policies in the world, Europe, and Asia. and Vietnam.

4) Analyze information. Based on the classified topics, the article attempts to select the birth promotion policies that have been proven to be successful and can be applied in the current socio-economic conditions in Vietnam.

3. Result

3.1. Population explosion and population control policies

The world population explosion in the early years of the 19th century (Van Bavel, 2013) led countries to promote birth control, and by the second half of the 20th century, the birth control movement spread worldwide with the World Population Conferences in 1974, 1984, 1994 (Robinson, 2007). The successes of countries in Asia, America and Africa have shaped the family planning program for the whole world. The first phase of population control policies focused on educating and supporting people to access family planning methods and created the "Contraceptive Revolution" around the world. (Thévenon, 2012). Subsequently, policies aimed at increasing fertility have resulted in governments using more socio-economic measures (Davis, 1967) on the basis of mainstreaming gender approaches (Bongaarts (1994), culture (Robinson, 2007) and economic-political science (Lush, 2000).

There is a longstanding scholarly debate about the real effectiveness of fertility reduction policies. Some researchers, such as Lush (2000), Caldwell (2005) are skeptical and argue that state funding has no impact on fertility decline. Tsul (2001) has a more positive view, arguing that population programs are the main factor reducing fertility but asserting that modernization is an intrinsic driver and population programs are only a means. However, despite disagreements about the causes of fertility decline as well as the effectiveness of population programs, most scientists and policymakers assume that population growth is danger to development. As a result, there are few voices expressing concern about population decline and its consequences. People only realized this when humanity entered the early years of the 21st century.

3.2. Global population decline and population-family policies

In the 2010s, countries, especially developed and newly industrialized countries, began to notice the growing prevalence of fertility decline and gradually changed their population policies. During the first three decades of the 21st century, countries with fertility rates below replacement level accounted for half of the global population. Facing this change, more and more countries are developing population policies towards the goal of increasing fertility. The number of countries pursuing policies that encourage childbearing has increased from 19 to 55 (Sobotka et al., 2019). Typically, countries begin to shift towards fertility targets when fertility is below 1.4 children (Van Dalen & Henkens, 2020).

The policies considered most effective to increase fertility are: 1) Promoting work-parenting harmony combined with financial support for low-income families, 2) Providing comprehensive child care services (widespread, accessible, high quality), 3) Ensuring policy consistency, stability and predictability criteria. This practice is applied consistently in Nordic countries, France, Belgium, Germany, and S. Korea. Some other policies considered less effective and only effective in the short term include paid leave, providing financial rewards for childbirth (Sobotka et al., 2019; Luci, 2011). Suggested future policies to increase the fertility rate are recommended: 1) Adapting to diversity (of family types, childbearing preferences) and change (in terms of gender roles as well as economic

inequality) towards creating a family-friendly society (Sobotka et al., 2019), 2) Focusing on supporting the socialization of children (support child-rearing funding) (Kolk, 2021). Thus, measures to raise fertility in the future should not only focus on childbearing but should also include child-rearing support. In other words, effective policies should go beyond the framework of population policy and need to approach an approach within socio-economic policy.

Policies that are considered effective to varying degrees are quite expensive. However, the difficulties in formulating and applying policies depend not only on the national budget but also from the approach point of view. It is the contradiction between the views of globalization and nationalism, between the left and the right. Population globalists will be concerned with ensuring that fertility is kept low so that the global population does not exceed the world's tolerance level while keeping in mind the low fertility rates present in their country. Therefore, they cannot take a definitive position on the fertility limit from which the reproductive incentive policy should be applied (Van Dalen & Henkens, 2020). In situations where there is a choice between the global interest and the national interest, nationalism often prevails because politicians will often act on the basis of the votes of the electorate in their country. Therefore, creating consensus among countries in population policies creates stable population sizes at the national and global levels as suggested by Kolk (2021) although a noble goal. but it seems too idealistic and not feasible. Another polarization is the conflict between left and right in population policy. As Thévenon (2012: 200) puts it: "Demographic issues are not analyzed pragmatically, [but] are often framed by the traditional antagonism between the Left and the Right". But the Leftists often expect the government to intervene in the reproductive affairs of citizens while the Right opposes State intervention in this matter of their own personality (Dailen, 2020). The Left view is deeply rooted in the interventionist position, which holds that everything cannot be left to nature and that the state needs to take measures to regulate social processes. In contrast, the Right-wing view derived from liberalism believes in the theory that the "invisible hand" - natural processes - will gradually regulate social problems and state intervention is not necessary and even harmful (Thévenon, 2012). Faced with this contradiction, Thévenon (2012) proposes a conciliatory view for this contradiction, arguing that while formulating population policies, the government should develop population programs so that they work in sync. with other socio-economic changes in the country.

3.3. Policies to encourage childbirth in Europe

In Europe, population policy is designed to address three main issues: 1) Fertility below replacement level, 2) Population aging, 3) Immigration (Thévenon, 2012). Policies to encourage childbirth in Europe are based on three main solutions: 1) Financial incentives: Financial transfer for the cost of childbirth, 2) Maternity leave: Apply to both parents, 3) Provide childcare, including pre-primary child care (Davies, 2013). Among European countries, France is considered a prominent country because of its high and relatively stable birth rate. Many researchers believe that one of the important causes of the above phenomenon is the French government's application of consistent, long-term, diverse and universal family policies (Thévenon, 2012). Sweden also contributes a unique approach to

fertility solutions. The country has a fertility rate higher than the European average, but its policies are not directly aimed at encouraging childbearing. The Swedish government focuses on supporting women's participation in the labor market (with measures to help women reconcile family and work life) and promoting gender equality (in public and private life) (Andersson, 2008). The situation is more complicated in Central and Eastern European countries due to budget constraints. This leads to many shortcomings in family support policies to promote childbearing in these countries (Frejka & Gietel-Basten, 2016).

Despite certain successes, the implementation of policies to raise fertility in the euro area still faces many difficulties. The first is the issue of funding. The three solutions of financial support, maternity, and child care services require huge financial resources and sometimes the effectiveness is unclear or not high (Davies, 2013). That makes it difficult for all countries to have the same determination and long-term implementation as France or the availability of a high-welfare state environment like Sweden. It is evident that these costly policies do not work well in Central and Eastern European countries and thus lead to many shortcomings in family support policies to promote childbearing in these countries (Frejka & Gietel-Basten, 2016). In addition to financial difficulties, the dominant multiculturalism in the minds of Western rulers has also contributed to a reduction in the determination to build strong reproductive incentive programs. With the idea of encouraging cultural diversity in the context of strong immigration to Europe, politicians have little incentive to implement policies that raise fertility in their countries despite the risk of "reverse colonization" creates the risk of shrinking demographics. The lack of long-term demographic vision combined with fragmented agendas by lobbying groups with divergent policy goals has caused "leaders as well as the public to turn a blind eye." to the pressing problems" of demographics (Thévenon (2012: 172).

3.4. Policies to encourage childbirth in Asia

Faced with similar population problems as European countries, developed Asian countries such as Japan, S. Korea, and Taiwan have developed policies to encourage childbirth similar to Western models but with stronger determination because of the importance of preserving national identity and social cohesion. (Thévenon, 2012). The specific measures to be applied are: child allowance, maternity and childcare leave, child care services, bonuses for large families, housing allowance, job support for the mothers, work-life balance. However, as in Europe, the effectiveness of these measures is weak, difficult to quantify and consumes a large amount of government financial resources.

Japan started to develop a policy to encourage childbirth when the fertility rate among Japanese women reached 1.57. Japanese policies went through stages from supporting child care (1994-1999) to improving gender equality (1999-2004) to focusing on work-family compatibility (2004) -2007). Although the above measures are considered to have a very small effect on fertility, they also help to convey the message that the government wants to support parents in raising children. The population policy of S. Korea is divided into three periods: the anti-birth period (1962-1996), the neutral period (1996-2004), the assisted-birth period (since 2004) with similar measures. in Japan. A special feature is that there are

communication methods aimed at reinforcing family values (Suzuki, 2013). Singapore has a rather unique policy to encourage fertility, but it also causes a lot of controversy. The country went from a comprehensive fertility reduction strategy (phase 1: 1965-1986) to a stage of encouraging eligible Singaporeans to have more than one child (phase 2: 1987-2012) to the current policy is a complement to phase two. These policies are seen as having a lot in common with selective reproductiveism when the government gives many incentives and focuses on supporting women who have graduated from university and is somewhat less interested in those who are poorer and less educated (Yap, 2015).

3.5. Policies to encourage childbirth in Vietnam

Population policy in Vietnam began in 1961 and was built into a population development strategy through the following stages: 1) Period 1961 - 1975 with the goal towards "family size of three children" (Le Hong Hanh, 2010), 2) The period 1975 - 1992 with the goal of reducing the natural population growth rate (Le Hong Hanh, 2011), 3) The period 1991 - 2010 changed to "stop at two children to raise pawns" (Le Hong Hanh, 2010), 4) The period from 2017 - now moves from population control strategy to population development with the goal of maintaining replacement fertility (Ha Viet Hung & Tran Thi Minh Ngoc), 2020).

The fertility rate of Vietnamese women has decreased from 3.8 children (1989) (Ha Viet Hung & Tran Thi Minh Ngoc, 2020) to 2.11 children (2005-2006) and from 2007 onwards has always been lower than 2.10 children (lower replacement fertility) but higher than 1.9 children. Except for the years 2013, 2015 and preliminary 2020 there are 2.1 children. This shows that the fertility rate in Vietnam is quite stable and does not seem to have reached an alarming level. However, when looking at fertility rates in Vietnam by location, some disturbing data emerged. Preliminary calculation in 2020, the birth rate of provinces in the Southeast region is 1.62 and the Mekong River Delta is 1.82 which is the lowest in the country. (Tổng Cục thống kê, 2022).

Faced with this situation, some scientists, such as Huynh Pham Dung Phat (2015) recommended maintaining low fertility until 2020 because the population size and population growth rate in Vietnam are still high. compared with some countries such as Japan and the United States (Huynh Pham Dung Phat, 2015). However, some other demographers such as Nguyen Duc Vinh (2017:53) suggested that "consider easing and diversifying the current policy of birth restriction" when considering the risk of population aging. as well as regional differences in fertility rates in Vietnam. This is similar to the point of view of some population experts in Ho Chi Minh City when they think that the city should allow people to have a third child and need to introduce a new slogan, "Every married couple is free. to decide how many children they have". (Thuy Duong, 2019).

4. Discussion and conclusion

After a period of implementation of population control policies, in the last years of the 20th century, concerns about the decline in birth rates and population aging in developed countries promoted population policies. shifted to the goal of increasing fertility. Common

solutions offered are: 1) Financial transfer for the cost of childbirth, 2) Maternity leave, 3) Child care provision, 4) Other support policies such as: providing housing, supporting employment for mothers, encouraging a working environment to create a harmony between work and family life. Despite some certain success, the costs of these policies are enormous, and their effectiveness is unclear and difficult to quantify. The competition between demographic views between globalism and nationalism, Left and Right, makes the process of policy formulation and implementation more complicated, inconsistent and unstable.

Policy implications

It is very difficult to develop and implement a population policy with the goal of increasing fertility at a low cost in developing countries like Vietnam. However, rapid population transformation and ongoing population aging force us to act quickly. Based on the experience of countries around the world, we make some recommendations as follows:

Population policy makers need to be more open-minded in their approach to population development. Stemming from the ideological tradition of communism, Vietnam's population policies have traditionally been more interventionist in the leftist tradition. While that may be appropriate during a period of large population growth and rapid population growth, it is now necessary to select from Right-wing liberal views in order to design measures to raise fertility. After all, the decision to have a child is still a personal decision.

Focus on supporting women, including job support for them during their youth and after maternity leave. With limited financial resources, Vietnam cannot apply the same measures as the developed countries in Europe and Asia mentioned above. Not to mention the quantitative effectiveness of such costly solutions remains in doubt. Preferably policies in the immediate years should focus on supporting mothers with finances, maternity, childcare and other ancillary services. This is both budget-saving and in line with the current tradition of childbirth and child-rearing in Vietnam.

Focus on disseminating the value of large families. The decision to have children and the decision about the number of children are heavily influenced by economic conditions and living values. At the stage of industrialization and modernization in Vietnam, the increasing proportion of nuclear families and small families can spread the model of small family quickly into society as a new cultural norm. However, the mentality of having multiple children (from 2-3 children) still exists and it needs to be encouraged through appropriate communication measures through mass media, social networks and social media. art products, movies, etc. This is an inexpensive, easy-to-implement and measurable way of doing and contributes to preserving the normative values of traditional marriage.

Policies need to be flexible but consistent. Although the effectiveness of policies that encourage fertility can be frustrating for those in charge, their implementation needs to show a high degree of consistency over the long term. Because having a baby is a big decision and couples will have to raise a child for a minimum of 18 years, it's reassuring to see supportive policies that the government shows interest in helping. long-term support for families with children. After all, people's trust is one of the key factors that makes policy and government work successfully.

Abstract

Healthy elderly people can prolong their life, and also reduce the risk for diseases, medical and public health expenditures. The study employed qualitative research. In-depth interview was chosen to obtain data from ten elderly school leaders in five provinces: Chiang Rai, Phrae, Lamphun, Mae Hong Son, and Phayao. Obtained data were analyzed by using content analysis. This study was certified for human research ethics code number PYU_REC 65/003. The results of the study revealed that the elderly school has launched activities according to elderly's interest in order to improve their knowledge and life skills. After participating in various activities, the elderly maintained good physical, psychological, social, and spiritual health. Since the activities aimed to educate about the appropriate consumption, physical exercise, psychological care, and vocational skills. Lastly, to achieve the sustainable development for the elderly school, it is necessary to work collaboratively with both the elderly members and the authorities.

Key words: *Elderly School, Health promotion, Elderly*

1. Introduction

There are about 1,000 million of aging people worldwide which accounts for 10 percent of the world population. In ASEAN region, the population adding 60 years and above accounts for 11 percent and 7 countries in this region become to be the aging society. Singapore is the first county of the complete aging society (20-30 % aging people). Also, Thailand will become to the complete aging society like Singapore and Japan in 2031 (28% aging people). This is because Thailand has a birth rate due to successful contraception and people live longer. During 1963-1983, the country's birth rate was more than 1 million per year and the next 20 years a number of aging people will reach 21 million people. This is especially in northern Thailand where it is leading to be a complete aging society, in fact, Chiang Mai province ranks third of the country behinds Bangkok and Nakhon Ratchasima province in terms of the aging society. In other words, its number of aging people was 394,273 on 31th December, 2022. As a whole, a number of aging people in upper northern

Thailand (Chiang Mai, Chiang Rai, Phrae, Nan, Phayao, Lamphun, Lampang and Mae Hong Son province) was 1,348,005 (Department of older persons, 2022)

The preparation to cope with the aging people situation is an important issue since the aging people is a group at risk for chronic health. This will result in many expenses for medical treatment with continuity. The research office for the Development of Thai Health Insurance has estimated that the budget required for long-term care for the elderly in dependency on average is about 15 billion baht a year (0.1% of GDP) (Department of Health, 2020). Furthermore, the occurrence of aging society has impacts on. Share of the labor force: elderly people: Children originally is at 4:1:1 and expected to be 2:1:1: in 2036 (Office of National Higher Education Science Research and Innovation Policy Council, 2021). Indeed, keeping older people healthy is one way to enable them to deliver social and economic benefits.

The elderly school can be regarded as a tool used to develop potential of aging people. Its knowledge transfer is systematic which enhance skills in self-care taking and reliability. It mainly arises from group forming of aging people in the society. The school has diverse activities-no fixed pattern. This depends on local context, need of aging people, and coordination of all concerned parties i.e. the public sector, the private sector and the government sector (Thai Health Promotion Foundation, 2021). In 2022, Thailand had 2,303 school for the elderly which 828 schools were in northern Thailand (Department of older persons, 2022).

The promotion of aging people to be health in terms of body, mind, socialization and spirit is one way to help them slow down the deterioration of the body (Pender, 2002; Kantamoon & Wongsawat, 2016). Factors determining health including human biology, health care delivery, life-style and environment. However, the factors on human biology and health care delivery account for 10 percent only (US Department of Health and Human Services, 2000). This article is interested in roles of schools for aging people to promote their health in northern Thailand. Roles of schools for aging people may help them be in a good health which reduces their medical treatment expenses.

2. Method

This study employed qualitative research. Data were collected from organizational information provider - organizational informant leaders of aging groups president of the sub-district elderly club, vice-president and/or secretary. They lived in the following northern provinces: Chiang Mai, Chiang Rai, Lamphun, Lampang, Phrae, Nan, Phayao, and Mae Hong Son province. All of them were obtained by purposive sampling (16 persons).

In-depth interview and focus group discussion were used for data collection. Questions used in the interview and focus group discussion were examined by three experts. Data were collected during March - November 2020 which was the time of COVID-19 pandemic. However, the team of researchers followed public health measures to prevent and reduce the risk during data collection (sanitary gel, face mask, vaccination, and detection by ATK).

Content analysis was done by bringing the tape recorder in the interview to transcribe word by word. There was individual interview separation as well as individual group conversation together with validation. The texts or contents gained from review of related

literature were coded and organized to group for research objectives. Incidentally, this research had been approved for human research ethics number PYU_REC No.65/003.

3. Results

The aging people school context

Schools for aging people are different from ordinary schools which mainly focus on the teaching/learning facilitation as measurement/evaluation. In contrast, schools for aging people focuses on doing activities together and aptitude such as wickerwork, flower cone, playing music, norther dialect writing, etc. Meanwhile there are resource persons joining activities of aging people without wages or compensation.

“...Talking about the school, it make me think about activities provide. There were drawing sewing, flower cone making, cooking, etc. with assistance of resource person or local scholars...”

Aging people participating in activities of the school do not pay money but they must inform their purposes and the school will prepare provide them materials/equipment for doing activity.

“...Everything is free. Sometimes, there are public minded persons providing many things beneficial to group activities such as pen, pencil, book, t-shist, etc....”

School for aging people in each area have different opening day such as on the first Friday of each month, the last Friday of each month, on every Wednesday, on every Sunday. However, the opening day schools for aging people is from collective agreement of member of the school, depending on their convenience or available day. Schools for aging people have 2 types of the teaching/learning facilitation system: 1) open for application and management of leaching in each batch. The school curriculum is different depending on area context but its common goal is life subjects as knowledge and skills beneficial to those who have accomplished school training and 2) There is no division of senior school students into batches but those who come to train can continue to do activities in the school (Lifelong learning). However, there is no awarding of certificates.

“...Senior’s school are unlike any other in that they have completed coursed and received a certificate. But there are no courses because it is a lifelong learning course; that is, if no one dues, they will continue to study...”

Roles of schools for aging people in the promotion of their health

School for aging people in each area play vital roles in the promotion of health of their health. It arises from need of people in the community to have senior school for group forming, learning and promoting their health. There is group leader and community’s selection for doing aging people activates or school project implementation. It aims to promote good health of aging people supported by the government or public sector for the development of quality of life. Concerned agencies include Department of Older Persons, Ministry of Social Development and Human Security, local administrative organization, etc.

“...Here, there is a group of senior citizens and the municipality has come to promote it until the establishment of a school for senior citizens, with admission for people aged 55 years and over, each generation having about 50 people and above. Learning in the school involves various activities promoting good health and quality of life development in the form of academic based recreation. It tritely focuses on good health of the elderly. It is like to invite the elderly out of the house to improve their quality of life with a group of friends at school...”

Carrying activities in school for aging people is part of the enhancement of an opportunity to do activities according to their aptitude and interest. Meanwhile, there are activities for enhancing professional skills facilitated by resource persons. This includes; physical health care, food consumption, physical exercise, physical therapy, epidemic prevention, etc. In this respect, staff of the district hospital in the area are responsible for it. An old man said:

“...In the senior school, it teaches exercise methods, eating healthy food and others. For example, if you have a headache or back pain, there will be a nurse with knowledge of physiotherapy to teach you how to prevent it...”

Getting the knowledge from resource person makes the elderly can apply acquired knowledge to use in their daily lives. This is particularly on self-health care such as consuming vegetable and easy-to-digest, low-fat meat.

“...For the first week of the school training, the district hospital will suggest about healthy food which is easy to digest such as vegetables or avoid food that is difficult to digest...”

Aside from the training about health care and disease prevention, the school for aging people facilitates activities promoting its member to acquire knowledge about occupations such as cooking, mushroom culture, non-toxin vegetable production, wickerwork, etc. This aims to encourage aging people to do actual practice and exchange accumulated knowledge/experience as an elderly said:

“...as taught and then can really do it such as food preservation and wrapping snacks. Sometimes, there is a change of knowledge of each person's secrets, which the cooking of each person is shared with each other...”

The promotion of aging people in the school to perceive about physical/mental health care is happened next to the participation in activities of the elderly group. Having an opportunity to meet the elderly of the same as aerates social networks which helps reduce stress, loneliness and lonesome as some of the elderly said:

“...It is good for older people to join on be member of the school for aging people. It is because are need not to be stressful. The elderly life is uncertain based on fussy problems, financial problems, undesirable behavior of offspring. Thus, it is good to go to the school for aging people...”

“...The elderly group forming to do activities makes them be happy and have unity. In the morning, the school director usually meet and inform us about interesting news or

information. Besides, it will be told in case of illness or some of us are alone since their off springs have to go to work in another place...”

Another activity suggested by the school for aging people is bringing lunch meal to eat together. This aims to promote a close relationship among aging people. It truly gives an opportunity for aging people to show their cooking capability. Meanwhile, sharing or exchange of food enhances good relationships among them as an elderly said:

“...Going to school for aging people makes us gain more knowledge, meet friends and have fun. Actually, sitting at home smiling alone is lonely but when coming to school everyone is happy and beaming...”

Roles of schools for aging people in upper northern Thailand to promote health can be concluded as shown in Table 1

Table 1. Roles of schools for aging people in upper northern Thailand

Roles of schools for aging people in upper northern Thailand to promote their health			
Physical health	Mental health	Social health	Spiritual health
Gaining knowledge about health care through actual practice	Doing wanted activities for relaxation and lonely reduction	Having social network for knowledge/experience exchange	Self-accepting and understanding perceiving self-value and letting go of happiness

Management for sustainability of the school in health promotion of aging people

Schools for aging people in part of locale of the study are well supported by concerned agencies in the area such as the local administrative organization, municipality and other agencies. The support includes budgets, materials/equipment and resource persons. Consequently, schools for aging people can carry out activities continually and effectively. Aside from the said support of are mentioned, the schools for aging people provide transportation of aging people from home to the school (Back and forth), medical and public health services, including other welfare care as one old person said:

“...The municipal truly takes part in support. It is a hub that everyone loves. And every community loves the municipality because it takes good care of us...”

Some schools for aging people have limitations in budget and equipment support. This makes their schools cannot fully promote good health of aging people. Besides, another one obstacle of schools for aging people’s activities is continual participation in activities of aging people. Main problems may be health problem, earning a living and home responsibility of some aging people.

Therefore, to get support from concerned agencies is very important to make the school for aging people keepable to facilitate activities continually. At the same time, school members who are aging students must be willing to participate in activities continually to promote sustainability to the school for aging people.

4. Discussion and Conclusion

Most of the schools for aging people in this study arrange activities to promote good health of aging people in terms of physical, mental, social and spiritual health. There are resource persons extending knowledge and skills of aging people through interesting activities. It aims to encourage aging people to show their potential, knowledge and skills through activity participation. They also have an opportunity to exchange knowledge and experience with their friends. Activities provided for aging people include medical checkup, health focusing on participation, knowledge/experience exchange, and other educative activities (Patsat & Rujiranukul, 2022). Importantly, the school plays crucial roles in the promotion of lifelong learning of aging people. Hence, activities occurring in the school are based on interest and aptitude of aging people which are beneficial to their livelihoods-increased knowledge and needed skills (Department of Older Person, 2016). This implies that schools for aging people play crucial roles in the facilitation of activities promoting good health and quality of life of aging people. Examples are extension of knowledge and skills about cooking, mushroom culture, physical exercise, non-toxin, vegetable production, illness prevention, wickerwork, etc. (Kongjareon & Boriboon, 2019). Thus, the promotion of aging people to attend training in the school for aging people or the establishment of the school for aging people can be a mechanism to develop good health and quality of life of aging people. According to forecasting by the Thailand Development Research Institute, it is estimated that seniors with average income in urban areas must have about 4.3 million baht after retirement. In rural areas, however, they must have about 3.4 million baht. In addition, expenses for the elderly who only stay at home is about 120,000 baht and that of those who only stay in bed is about 230,000 baht (Thailand Development Research Institute, 2019).

The management for sustainability of schools for aging people to promote their good health-support from concerned agencies is very important to enhance the school to carry out activities continually. Meanwhile, members who are aging students must understand and want to join school activities continually to help sustain the school for aging people. A study of Srisupan, Thammigwon and Krisanajutha (2017) found that factors effecting the school planning on activities; aging people who are the school's member do not have enough available time; inadequate supporting budgets; and inconvenience to go to the school.

Meanwhile, schools for aging people play crucial roles in quality of life development of aging people in the community. This is because the school is a place promoting lifelong learning, self-value, health care, illness prevention, occupational skills, use of technology, innovation, etc. For social interaction, it puts the importance on working as a volunteer (Srisupan et al., 2017). Likewise, a study of Homsombut, Ketnakhon, Fangkham and Sorousakda (2022) found that important roles of the school for aging people are the enhancement of lifelong learning and good health.

A REVIEW OF FLOOD DISASTERS VOLUNTEERING AMID CORONAVIRUS SURGE IN KUMAMOTO PREFECTURE, JAPAN

MSc. Nguyen Thuy Linh

thuylinh@neu.edu.vn

*Graduate school of Urban Environmental Science,
Tokyo Metropolitan University, Japan; National Economics University, Vietnam*

Abstract

Building a sustainable society by strengthening disaster resilience is a common goal in the world. It is crucial to promote cooperation between the general public and the science community by sharing data, information, knowledge, experiences, and ideas. Japan has routinely been beset by catastrophic floods caused mainly by destructive typhoons and critically active seasonal fronts. With the turn of the 21st century, changes in climate and society required additional realignment into the standardized procedures that had evolved over the previous half-century. In early July extensive flooding struck southern Kumamoto and other parts of Kyushu. The evacuation and disaster recovery measures since then have been the nation's first in the midst of the COVID-19 pandemic. Only Kumamoto residents are allowed to volunteer for the recovery work, and online meetings to make up for the resulting labor shortage are part of a new style of disaster response for the coronavirus age.

Keywords: *Flood response; Disaster management; Kumamoto; Japan*

1. Introduction

Flood management and control have been key issues in Japan's policy history due to its unique climatological, meteorological, and hydrological conditions. Japan experienced severe flood damage particularly in a period immediately after World War II. Serious flood disasters claiming more than 1,000 deaths occurred almost every year (Takahasi, 2009). After each disaster, new approaches, methods, and design standards were introduced, including improvements to methods for flood frequency analysis, changes in economic assessment procedures, and various structural measures such as dams, embankment, erosion and sediment control, sewage systems, as well as high-level embankment and comprehensive flood control. As a result, the number of victims and flooded areas decreased drastically in the rapid economic growth period during the 1950 and 1960s. However, recent climate changes, causing more frequent and severe torrential rainfall events, have increased human losses and economic damage. In addition, due to the outbreak of COVID-19 pandemic, Japan's society becomes increasingly vulnerable (Suppasri et al., 2021).

On July 4th, 2020, the southern prefectures of Japan, particularly Kumamoto and Kagoshima, experienced record-breaking heavy rain, which caused devastating floods and landslides in many areas of these prefectures. The disaster, which was officially

named as “Reiwa 2-Nen 7-Gatsu Gou” (meaning heavy rain of July 2020), killed 83 people, 65 of whom were in Kumamoto prefecture. Beyond these most devastating losses of life, the latest data notes 15,335 buildings destroyed by this disaster (Surya Satria Ridwan et al, 2022).

The flood of July 2020, unfortunately, happened at a time when the whole country, as well as most other countries of the world, was fighting a pandemic. Japan has been relatively successful in keeping the spread of the Covid-19 virus somewhat in control compared to other developed countries, which could be related to its culture (such as non-touch greeting and sanitation practice since childhood), food habits and advance healthcare system. However, Japan has been managing the response to COVID-19 under a separate structure from the one used for dealing with natural disasters, instead of adopting a multi-hazard approach recommended in the Sendai Framework for Disaster Risk Reduction (SFDRR, widely known as “the Sendai Framework”) (Busayo et al, 2020). The state of emergency that went into effect in April was declared on the basis not of the Disaster Countermeasure Basic Act that covers natural disasters but of the Special Measures Act to Counter New Types of Influenza. The pandemic affected both the preparation and the response of the July 2020 flood, highlighting the importance of a multi-hazard approach as called for by the Sendai Framework.

2. Method

Volunteering is a well-established approach in environmental management. This review of literature revealed a development in volunteering in connection with floods in Kumamoto Prefecture. Evidence from the local reports and publications, along with secondary sources provided examples of plans across the Prefecture, which involved volunteers in flood disasters management, were collected and summarized.

3. Results

3.1. Why engage volunteers in flood disasters management

Benefits to local communities: volunteers and flood groups provide communities with communication channels to the authorities associated with flooding. They help communities become more aware of flood risks and the likelihood that flooding will occur again in the future. Communities benefit from the skills, experience, leadership and commitment of volunteers, e.g. by helping them to organize into groups, prepare flood plans, and share knowledge, information and support (Simm, 2016).

Benefits to partner organizations: volunteers can ensure flood plans and community emergency plans are prepared realistically, have local buy-in, and are implemented effectively. Volunteers can work alongside emergency services, e.g. to provide awareness and training that helps evacuations run as smoothly as possible (Simm, 2016).

3.2. The importance of matching victims' needs with aid potential

The evacuation and disaster recovery measures since then have been the nation's first in the midst of the COVID-19 pandemic. Only Kumamoto residents are allowed to

volunteer for the recovery work, and online meetings to make up for the resulting labor shortage are part of a new style of disaster response for the coronavirus age. Every evening at six, a group of people gather in front of their computers to do the voluntary works. They include volunteers who've just finished their work on-site; officials from Kumamoto's prefectural government, as well as those from the national cabinet office, Ministry of Environment, and more; and staff from nonprofit and nongovernmental organizations. After everyone exchanges greetings, each organization offers a report on their situation and discusses any needs that arise. Individuals or residents who want to help are also welcome to the voluntary group. Floods related issues discussed at the 90-minute meetings can be quite specific and come directly from workers in the field. They include points as diverse as the removal of mud and ruined floors from flooded homes, provision of drinking water supplies, and refuse disposal consultation, all the way down to supplying people with air conditioners and wireless routers.

With "once-in-a-century" natural disasters coming every year recently, modern disaster response could not function without intermediary support organizations, which help to match the needs of disaster victims with the support capabilities of volunteers and organizations. The Kumamoto Disaster Volunteer Organization Network (KVOAD), which is an organization that coordinates disaster relief and sustainable recovery/reconstruction, strengthens cooperation among related organizations, and develops human resources, was established to fill that function after the Kumamoto earthquakes of 2016, and ever since it has served as a hub for volunteer organizations inside and outside the prefecture.

3.3. The Importance of Intermediary Support

Regular meetings were held twice a week at the Kumamoto Prefecture Welfare Center but moved the meetings online as an anti-COVID-19 measure. Once the voluntary organization began meeting virtually, they found the format offered benefits not found offline. Not only can they match needs with support more quickly, but they can share information with members all over Japan in real time and receive advice immediately. People can even join while they're on the move in the disaster area using their smartphones. It's also easier to join or leave part-way through. Every participant introduces themselves and shares information at each meeting, so everyone learns to recognize everyone else's face. Meeting notes are kept in real time, date-stamped, and posted to the organization's website. Only recently, the group had been discussing how difficult it would be if a natural disaster struck amid the pandemic, and then came the torrential rains of early summer 2020. On July 7, KVOAD held a meeting to specifically discuss the July 2020 flooding, and NGOs from all over Japan took part. It has met every single evening since then, and has seen participation grow to include government organizations, research bodies, and the mass media.

3.4. Care Going Beyond Supplies

Experience has shown that that the victims of disaster need more than just daily supplies. Mental health care is also vital. The Kumamoto city NPO Keicho Net Key Station offers volunteers to help counsel the elderly and disabled, as well as those who help prevent

dementia. However, the current COVID-19 crisis makes it difficult to visit the evacuation centers in person. Another consultation came regarding a large number of high school girls who came to the disaster volunteer briefing. They wished to join but were unsure if they could be of help or would just end up getting in the way.

3.5. Increasing Requests to Allow Outside Volunteers

There are many people from outside the prefecture hoping to volunteer. Around 80 percent of recovery volunteers after the 2016 earthquakes were from outside Kumamoto, and they brought enormous help. On July 25, there was an emergency symposium online that included calls to allow volunteers from outside the prefecture. However, KVOAD is not rejecting volunteers from outside the prefecture across the board. Those in the so-called pro volunteer sector, or those with professional skillsets like heavy-equipment licenses, can be approved on request from local government in the disaster area, and from late July two such groups have joined the relief efforts. However, individual volunteers are still only allowed from within the prefecture as an effort to stem the spread of the COVID-19 pandemic. The reasoning behind this is that the PCR tests are not 100 percent accurate, and outbreaks among volunteers and evacuees must be avoided at all costs. On July 29, the Kumamoto Nichinichi Shinbun published the results of a survey of prefectural residents. It showed that 70 percent of residents, and 80 percent of those in disaster areas, support the limiting of volunteers to those from inside the prefecture. It implies that anxiety over the spread of the pandemic outweighs recovery delays that lack of volunteers may bring.

3.6. Approaches to volunteering

Capture the value of volunteering: Decisions about the allocation of resources to flood disasters volunteering are made on the basis of cost-benefit analyses, which fail to capture the often intangible, indirect and unseen ways in which flood disasters volunteers avoid losses associated with flooding.

Training of volunteers and staff: Training and guidance is provided inconsistently to volunteers with similar roles in different parts of the country. Training to a recognised standard can support volunteers in their roles, and in some cases help them obtain insurance cover. While training is provided internally within the environmental agency on issues around engagement, there may be a need for training that is designed specifically to help staff engage with volunteering.

4. Conclusion

Flooding disaster has given local authorities an opportunity to rethink what disaster volunteering can be. In August, the typhoon season begins in earnest, and now all of Japan is dealing with anxiety about flooding. There will be no dramatic end to the COVID-19 pandemic. It will continue at least through two or three years, and recovery work is also going to drag on; therefore, there has been a great need of volunteers and the ability to do that is what really determines a community's strength.

COMMUNITY SPORTS INSURANCE IN VIETNAM OPPORTUNITIES AND CHALLENGES OF A PRIMITIVE MARKET

MSc. Nguyen Xuan Thanh

xuanthanh@vnu.edu.vn

*Faculty of Political Economics, VNU University of
Economics and Business, Hanoi, Vietnam*

Abstract

In recent years, the community sports market has thrived with events of thousands of people. This development opens up a new market: community sports insurance. With much larger scales and much lower risk than professional sports, this customer group is attracting the attention of insurance companies. This study explores the current situation and finds factors supporting the development of the community sports insurance market. The study used the method of synthesizing information and in-depth interviews with experts in organizing running events and the insurance field to understand the current supply-demand situation of the market. The study also proposes the role of state management in the sustainable development of this market.

Keywords: *sports insurance, community sports, insurance market, risk management.*

1. Introduction

In recent years, along with the development of the economy, community sports events have also grown enormously in size and number. Many community sports activities involve amateur athletes, such as running, cycling, swimming, and triathlon (swimming - cycling - running). Thanh (2021) made statistics on the size and number of running races in the country in 2021, which shows a very fast growth rate of running races. Research also shows many positive impacts of community sports on the economy and society (Thanh, 2021).

Sports always come with risks. Research by Dugalić (2011) lists the types of risks that may be encountered when organizing large-scale sports events: (1) Risks from event equipment and infrastructure; (2) risks in event strategy and operation; and (3) risk in the perception and behavior of managers. Risk can also come from the nature of the sport. For example, skating has a higher injury rate than football (Fuller & Drawer, 2004). In addition, the risk can come from the personal problems of the participants themselves. Community sports such as marathons involve many amateur athletes, making the risk even higher. Unlike professional athletes, amateur athletes may not be trained or have no awareness of the problems of injury and sports risks when participating in physical activities. Therefore, to operate a sports tournament, risk management needs a detailed scenario: possible problems, manageable problems, and level of risk that must be accepted (Leopkey & Parents, 2009).

Recognizing the possible risks, sport event organizers must have plans to avoid and minimize damage from the risks. The Sport Safety Risk Decision Model of Spengler et al.

(2006). generalizes the safety options used by sport event organizers. According to Spengler et al. (2006), five main groups of factors directly affect risk management in sports events (see Figure 1): (1) Liability Issues; (2) Legal Mandates; (3) Self Evaluation; (4) Risk Evaluation; and (5) Management Issues. In detail, risk management includes cost management, support from higher management levels, information management, education and training, and forms of insurance.

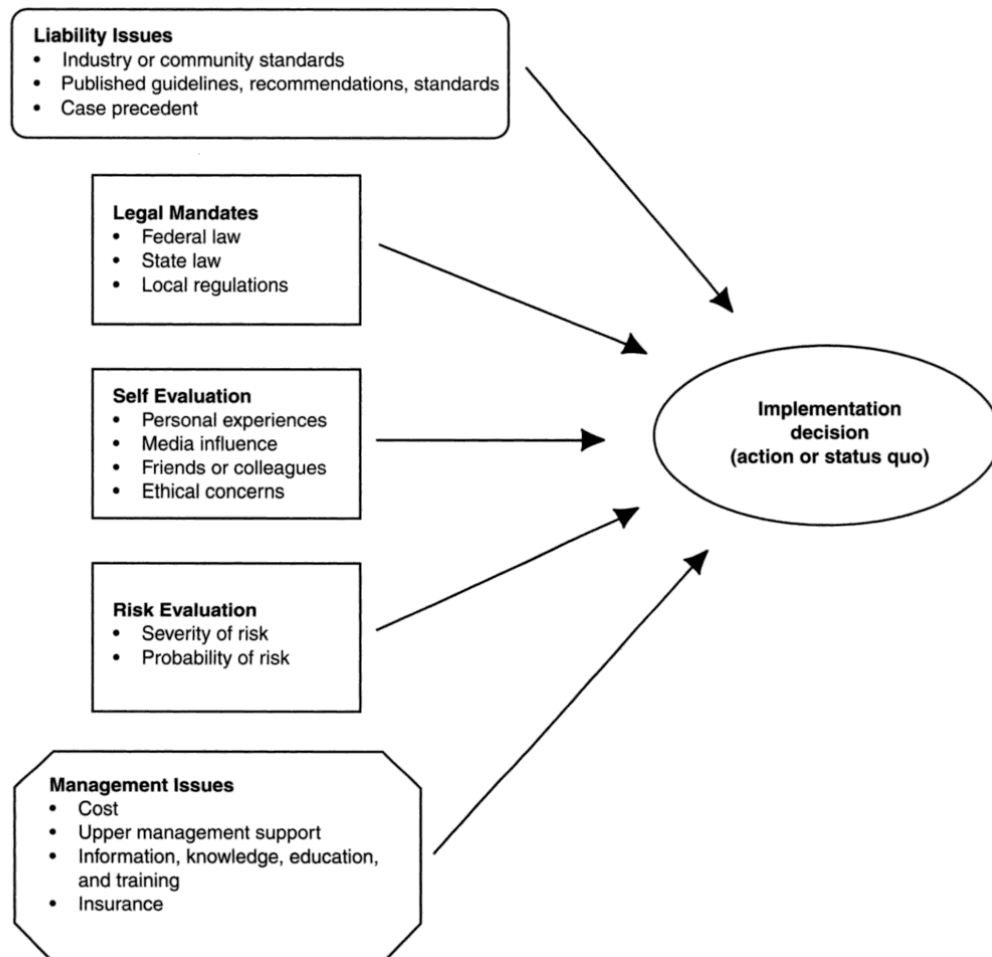

Figure 1. Sport Safety Risk Decision Model (Spengler et al, 2006)

According to Xu's research (2013b), organizers can transfer risks from their responsibilities in many ways: (1) Share risks with partners: selecting professional partners is a good option to limit risks; (2) transfer the risk to athletes by requiring them to sign a waiver of liability in the event of an accident, and not to take responsibility of caring the athlete's valuable goods; and (3) transferring the liability of the risk to a third party, usually the insurance provider. Xu (2013a) considers that the purchase of insurance is a win-win situation between sports event organizers and insurance companies. Through purchasing insurance, organizers can pass the damage to professional service providers. Insurance companies, relying on their expertise, can profit from a large customer base from sporting events. In addition, athletes also feel more secure when participating in large-scale sporting events.

While the need for sports insurance is essential, the market faces challenges. Lubell (1987) points out that running event organizers have problems negotiating insurance policies for their races. From insurance providers' perspective, sports are too risky to cover. Even if insurance contracts are signed, they are unreliable by themselves. The amount of liability coverage may be so significant that some companies cancel their contracts or increase the insurance premium. There were many case study (Lubell, 1987). Besides, the legal system does not protect sports participants. According to Lubell (1987), the American judicial system considered sports insurance a normal purchase agreement, not a mandatory condition. This view is contrary to the social welfare. In the modern view, governments need to develop legal frameworks on sports insurance to ensure social safety, in general, and ensure risk management for sports events, in particular (Xu, 2013a).

In the sports insurance market, what hinders the sustainable development of the market is the asymmetry information between the parties (Akerlof, 1970). Asymmetric information is a common problem in transactions. This happens when one of the trading parties does not know all and exactly what information needs to be known about the other parties to make the right decisions in the transaction. Then, the market price will be greatly deviated, possibly too low or too high compared to the market equilibrium price (Rothschild & Stiglitz, 1976).

This situation creates significant impacts on the involved parties (Stiglitz, 1987) (Rothschild & Stiglitz, 1976):

- *Adverse selection*: refers to the situation where a party with private information selects a transaction that is unfavorable to the other party. This situation arises when one party has more information about the quality of the good or service being exchanged, and the other party is unable to do so. This situation leads to some market failures: the party with better quality information may take advance in the transaction, or the suppliers may not provide good service due to the fear of being treated as low-quality.

- *Moral hazard*: occurs when a party takes actions that are in their best interest but are not in the best interest of the other party due to the lack of complete information. This situation creates passive mental of the group with information, pushing risks and losses to other parties. In the long term, this lead to unsustainable business environments.

- *Signaling*: is a mechanism by which a party can convey private information to the other party to increase their benefit in the transaction. By providing a signal, sellers deliver the message to buyers that the quality of the good or service is high.

- *Screening*: an action used by the party with less information to obtain information from the other party to make more informed decisions.

In general, sports insurance, especially community sports insurance, is still a new and undeveloped market. There are very few insurance products available for community sports. Mechanisms to enforce the rights and obligations of community sports are still not specific in insurance contracts. The legal regulations lack behind the development of this market. This study asks questions to assess the current community sports insurance market: How are the demand forces? What products are being supplied in the market now? Which barriers block the development of the market? And what are the supporting factors for the development potential of the insurance market?

2. Method

2.1. Research subjects

The study only focused on analyzing long-distance running events, namely, marathons, half marathons, and triathlon events, because of their large scale. These events scale up to thousands or even tens of thousands of participants. The fast development of their scale and numbers is a recent social phenomenon (Thanh, 2021), and it has significant social impacts. On the other hand, these events are at great risk from many factors: weather, infrastructure quality, and diverse participants' capabilities. Especially the level of risk of these events also fluctuates complexly: it can be only a minor injury requiring rest or a serious one, which impacts life permanently, and if the rescued action is slow, life will not be saved.

In Vietnam, there are a number of other community sports activities with high risks, such as cycling, swimming, or community football. However, the major prestigious bicycle races in Vietnam have too few participants, about 100 people. Most community football tournaments are locally organized. The scope of the events is in the small space of the football field, which dramatically reduces the risk factor from the uncertainty of the external environment. Besides, football players and society are aware that this sport has a high probability of injury but not a high risk to life, so most of them accept the way of the game, traditionally. In addition, the trekking services of sports companies may be rated as a high-risk community sport. Some professional trekking services also have an insurance policy. However, the scale of trekking is relatively small and does not have enough liquidity for a fully functional market. Therefore, the study only focuses on running events such as marathons, half marathons, and triathlon events.

2.2. Research instruments

The research uses the method of synthesizing data on sports insurance products available in the market. Information sources are obtained from mass news sources through the Internet. Information related to death in sports is often reported by many press agencies very quickly and objectively. Through published information about sports accidents, the research learns about the existence of sports insurance products, as well as existing problems related to sports accidents. Online information is fast and catches the focus of society; thus, the top of the problems about sports accidents can be detected.

Besides, by the method of document synthesis, the study reviews the legal provisions on the issue of insurance in sports. Through the review, the study shows the point of view of state management in this regard. State regulations play an important role in the market development orientation, especially the insurance market, so understanding the state management situation is an essential part of the research on the sports insurance market, in general.

Second, the study uses in-depth interviews with experts in the fields of organizing sports events and sports insurance. The study interviewed two running event organizers and one sports insurance service provider. Based on this qualitative method, the study finds out the current state of the sports insurance market and the existing problems hindering market development. The experts interviewed requested anonymity and information related to their

work and events to ensure confidentiality. Insurance and sports accidents are sensitive issues, so they do not allow official numbers to be released. Also, their number is subjective, estimated by their experience. Therefore, the research only used them to understand the current changes based on the relative comparison.

In order to analyze the potential risks and opportunities of sports insurance, the research uses Porter's Five Forces framework. This tool was created by Harvard Business School professor Michael Porter in 1979 and was developed further in 2008. It is used to analyze the level of competition within a certain industry (Porter, 1979). According to Porter (2008), there are five forces that represent the critical sources of competitive pressure within an industry. They are: (1) Competitive Rivalry. (2) Supplier Power. (3) Buyer Power. (4) Threat of Substitution. (5) Threat of New Entry. The collective strength of these forces determines the potential of an industry. Therefore, many managers in the insurance industry use the tool to evaluate the attractiveness of the sports insurance market. This research also used this framework as a guideline for interviewing about company market strategy.

3. Results

3.1. Sports risk management from the perspective of state management

First, the study reviews the legal provisions related to insurance in the sports sector. Through the review, most of the regulations on insurance related to sports only focus on the field of professional sports and high-performance sports. There is no clear provision for insurance for community sports.

Particularly, the state considers athletes and coaches to be a specific, high-risk profession: According to Article 15 of the Law on Social Insurance (2014), athletes and coaches have the same rights in social security as ordinary workers when they are participating in the sport during their career: participating social insurance and health insurance. In addition, athletes and coaches are protected by their rights under the Law on Physical Training and Sports (2006) and the Law amending and supplementing a number of articles of the Law on Physical Training and Sports (2018) No. 26/2018/QH14, which includes additional rights for high-performance coaches and athletes: participating the regimes of occupational accident and occupational disease insurance, health insurance, social insurance, and voluntary insurance. Detailed instructions are mentioned in Decree No. 152/2018/ND-CP dated November 7, 2018, of the Prime Minister. In addition, Decree 36/2019/ND-CP of the Prime Minister gives details on health care and treatment of injuries. High-performance sports athletes may receive health care and treatment for injuries at domestic medical facilities. In exceptional cases, the Minister of Culture, Sports, and Tourism decides for high-performance sports athletes to have treatment abroad.

In community sports, although there are no legal provisions on compulsory sports insurance, insurance companies have been providing insurance for athletes in community sports events for many recent years. Through public media sources, the study collected a number of sports events mentioning insurance for participants:

Table 1. Summary of insurance companies that have participated in providing sports insurance products up to now (2022)

Insurance companies	Years	Events - Detail about insurance coverages	Sources
Post and Telecommunications Insurance Joint Stock Corporation (PTI)	Many years (until now)	<ul style="list-style-type: none"> - Paying for medical expenses incurred due to injury treatment during training and competition in the National Professional Football League System. - The highest coverages: 300 million VND/person/case 	Thu (2022)
VASS Assurance Corporation (VASS)	2016 2017/2018	<ul style="list-style-type: none"> - Sponsor to buy insurance for athletes, coaches, referees and members of the organizing and operating committee of the National Table Tennis Championship - Maximum coverages: 200 million VND/person/case. - Scale: nearly 200 people 	Khai (2018)
Baoviet Insurance (BHBV)	2016	<ul style="list-style-type: none"> - The official insurer for the entire Vietnamese sports team to attend the 5th Asian Beach Games (ABG 5) - Maximum coverages: 200 million VND/person/case. - Scale: 450 athletes 	Baoviet Insurance (2016)
Baoviet Insurance (BHBV)	2019	<ul style="list-style-type: none"> - Sponsor insurance for the national running championship Tien Phong Marathon 60th - 2019, held in Vung Tau city, Ba Ria Vung Tau province - Scale: nearly 2,500 professional and amateur athletes 	Anh (2019)
Military Insurance Corporation cooperates with F.I.S Vietnam Consulting Service Co., Ltd	2021	<ul style="list-style-type: none"> - Olympic Insurance Program: A specialized insurance program for athletes to protect against sports injuries. - The program is designed to be flexible and applicable to many sports such as marathon, swimming, hiking, badminton, tennis, table tennis... - Coverages: from 50 to 500 million VND/person/case, depending on the insurance package. 	Military Insurance Corporation (2021)
Baoviet Insurance (BHBV)	2022	<ul style="list-style-type: none"> - Sponsor for all members of Vietnam Sports Delegation at the 31st Southeast Asian Games (SEA Games 31). - Scale: 1,341 members 	Huy (2022)

In short, these are some insurance regulations for professional sports. In this field, athletes are treated like workers, operating in high-risk fields with a high probability of occupational accidents. The law also favors athletes with good performance. This is a mechanism that uses to encourage performance in athletes. In the field of community sports, there are no clear regulations relating to sports insurance. However, in recent years, many insurance companies have appeared in the sports insurance market, accompanied by the emergence of large-scale community sports events.

3.2. The demand for community sports insurance is clear

Through interviews, sports event organizers are always interested in insurance issues for athletes. Long-distance running: 10km, 2km - half-marathon, 42km - marathon, and triathlon are endurance sports activities with high risks of sports accidents: heart attack, heat stroke, or injury related musculoskeletal. The causes can be objective such as weather or infrastructure conditions. There are also many subjective reasons: athletes lack sleep, use alcohol or stimulants before participating in competitions, or they do not have a suitable training plan for their competition goals.

Based on event organizers' experience, they estimate that the probability of cases requiring medical assistance for a 10km race is 1/2000, most of which are minor problems such as cramps or sudden muscle spasms. For the half marathon - 21km, this probability doubles with the estimated ratio of medical assistance at 1/1000, and for the marathon - 42km, this probability quadruples, up to about 1/500. Especially for long distances like marathons, the risk of serious medical problems can occur, requiring actions of emergency teams to take athletes to the hospital. From there, medical costs arise emergency costs, hospital beds for recovery, special service costs, and overall examination costs.

According to the event organizers, the biggest expectation when they buy insurance is peace of mind when they organize the event. This is one of the risk management tools in sports events mentioned in the Sports Safety Risk Decision Model by Spengler et al. (2006). The action of buying insurance shows that the organizers have been very thoughtful and carefully evaluated the risks. The organizers may rarely activate insurance benefits, even if there are medical expenses, but buying insurance helps the organizers create peace of mind for participating athletes. As a result, participants feel the security of the sporting event, so the scale of events continues to grow, creating direct benefits for the organizers.

Another considerable driving force of sports insurance demand comes from the need to exempt the Organizing Committee from liability when a sports accident occurs. The running event organizers are aware of the risk of severe accidents because running is an endurance sport with a long running time. This sport requires participants to have a long-term accumulation of physical training, but this is too easy to join for newbies, including many people without running knowledge and experience. Hence, it makes the race more vulnerable. Additionally, it scales up to thousands or tens of thousands of people, making it impossible to eliminate risk completely. Therefore, the organizers need to prove that they have done all they can to ensure safety. Agreed with Xu's study (2013b), many risk

management options are adopted by the sport event organizers: designing a detailed medical plan, recommending athletes take care of themselves, and even requiring athletes to sign waivers. Therefore, event organizers do not have to take serious responsibility if something goes wrong. As an additional layer of disclaiming responsibility for the organizers, they actively buy insurance for athletes as a form of risk prevention, especially the financial risk if any serious injury may occur. In other words, the event organizers are actually buying insurance for themselves. They want to prove to the community and participants that they have foreseen the possibility of a risk and have taken measures to mitigate the damage by purchasing insurance.

On the other hand, one reason the event organizers have to buy insurance is the pressure from the local government. Running races are considered a sociocultural activity under the responsibility of the local authorities. As a member of the organizing committee, the local government pays special attention to the safety of the events. Currently, there is no legal corridor that regulates the responsibility and scope of authority of the local government in organizing large-scale events. Therefore, with a fear of responsibility, local authorities put pressure on event organizers, asking them to buy insurance as a move to show the best possible preparation for such situations. Large-scale events, especially community sports, require support from senior management. Building trust between management levels will make administrative procedures and development vision easier (Spengler et al., 2006). In this case, the support of local governments plays an important role in the success of large-scale sports events at the moment and in the future.

3.3. Supply force appears and tends to develop

According to statistics from public media sources, there are four major insurance companies that are implementing community sports insurance products: Post and Telecommunications Insurance Joint Stock Corporation (PTI), VASS Assurance Corporation (VASS), Baoviet Insurance (BHBV), and Military Insurance Corporation (MIC) (see Table 1).

Especially in recent times, there has been the participation of MIC in cooperation with F.I.S Vietnam Consulting Service Co., Ltd to launch Olympic insurance program, the sports insurance product. The package is designed in detail. Products are also segmented according to customer needs: basic program, bronze program, silver program, gold program, diamond program, and platinum program; and the risk characteristics of sports: low-risk sports (running, hiking, swimming, athletics, badminton, table tennis, tennis) and high-risk sports (climbing, bike racing, horse racing, football, boxing, Ping-Pong, sailing, skydiving, paragliding) (Military Insurance Corporation, 2021). This shows that the insurer already has deep research into the product and market when approaching this new market.

In addition, another motivation for insurance companies to participate in community sports events is the potential customers. According to Linh (2020), taking a comment from an insurance business leader, insurance businesses have sponsored large-scale sports events with the main purpose of brand promotion, not for revenue. Sports insurance is an unique

product that often generate compensation and also has a high compensation rate, so it is not effective for doing business. In fact, MIC also utilized the launch of a sports insurance product to introduce the company's "super speed" digital insurance service (Military Insurance Corporation, 2021).

Using the large-scale race in the brand communication strategy has been applied by many insurance companies worldwide. Examples include Standard Chartered Singapore Marathon, ING New York City Marathon, and Generali Milano Marathon. In Vietnam, Manulife Co., Ltd. has been a brand sponsor for the Manulife Da Nang International Marathon (Manulife DNIM) for many years. The customer base of the running events is very suitable for the target customer group of insurance companies: those who care about health, are of working age and have good financial capacity. In 2022, the scale of Manulife DNIM was about 5000 participants (Manulife, 2022). This scale is a successful communication strategy for Manulife. "The trend of sponsoring the race, promoting the brand image through running events will be continuing in Vietnam in the coming years," a running event expert said.

3.4. Existing problems in the sports insurance market

3.4.1. Demand: There are many remaining obstacles in the design of sports insurance products

Through interviews with running event organizers, children under 15 years old and older adults over 60 years old are usually denied by insurance companies. The insurance company considers them too risky. However, the event organizers share that it is normal for them to participate in sports activities in Vietnam and the world. In fact, from the organizers' experience, they obtained that there was little medical support for senior runners because they knew their strengths and did not push themselves beyond their limits. Therefore, the event organizers think that they can be covered by sports insurance. This not only ensures safety responsibility for all athletes equally but also makes insurance contracts easier.

The procedure for paying insurance coverage is also not clear in detail. The circumstances of sports insurance are unpredictable and unclear in contracts. The characteristic of the marathon events is open-air, wide-ranging events. Thus, there are many objective impacts on athletes, such as weather, road surface quality, and people around the events. The anticipation of risks and the design of insurance payment procedures are mostly handled case by case. Many negotiations must take place to reach a decision. Hence, more time and costs incurred lead to a decrease in the quality of insurance services and an increase in the price of insurance products.

In addition, the insurance coverage is still low. Currently, MIC Olympic sports insurance product pays 50 million VND/case for the bronze package and 500 million VND/case for the platinum package, which is the most advanced package (Military Insurance Corporation, 2021). Table 1 shows the highest coverage levels are 200 million VND/case and 300 million VND/case. In fact, PTI Gia Lai agency paid 15 million VND for a case of death during a sports competition in 2018 (Ministry of Finance, 2018). Hence, this level of payment compared to the cost of sports accidents is not commensurate. Some serious sports accidents can leave permanent sequelae for people who are of working age and maybe

the main labor force of their family. Therefore, insurance buyers demand higher insurance coverage products.

3.4.2. Supply: Insurance products are still very difficult in pricing

For insurance providers, market data is still very limited to design various products suitable for different target groups. Accessing historical data is very difficult. Most of the medical data of sports events had not been reported nor published by the organizers. Only severe cases, customarily related to death, had been reported to the media. Minor incidents but still incur costs: ambulance, emergency assistance, and special monitoring had not been reported. Getting data directly from the organizers also does not guarantee the reliability and quality of the data because medical issues are always a sensitive issue in the organization's work. This information affects the quality of their services.

In addition, large-scale outdoor sports events are influenced by too many different objective variables. Weather changes by season or by day. Athlete health is concerned with individual habits, genetics, or what they did the previous day. The running track also has many unpredictable variables because of outdoor sports characteristics, stretching over a large space. These variables vary greatly. Therefore, it is difficult to design optimal insurance packages.

Besides, the price of the product depends on the demand of the market. There will be no suppliers when the market has not accepted high prices for good products. Sporty people gradually understand the importance of insurance but have not experienced it. They have not experienced much of the severity of the sports injuries. Hence, it is difficult to get them to go to the next step: paying for insurance products. Educating customers about insurance products takes a long time, insurance experts said. For sports insurance products, the market still needs a lot of time to be trained and explored.

4. Discussion and Conclusion

4.1. Quantitative changes lead to qualitative changes in the sports insurance market

The change in market size: Market size is an important factor affecting the decision to enter the market of companies. Large markets, and many buyers, help increase supplier power (Porter, 1979). In the past, community sports events only involved a few hundred athletes, so this scale was not attractive to designing many sport-supporting products. Since 2015, marathon events have increased rapidly in number and scale. Marathon events have appeared more and more. The scale has also increased significantly. Major marathon events in Vietnam have reached tens of thousands of people (Thanh, 2021). According to the interviews, the event organizers admit that the growth rate of the number and the scale of running events are unprecedented, up to 100% annually. With the current fast growth rate and large scale, the perception of the sports market has completely changed.

The changes in financial capability: The races have attracted a set of customers who have good financial situations. According to an organizer, runners aged 30 to 50-year-old make up the majority. In particular, the race is a fee-based event, pricing about 500,000 VND/participant, excluding accommodation, travel, and support expenses. Therefore, those

who participate in running events have good financial status. This is a big move. In the past, community sports were mostly launched by the state, serving political and cultural goals. Therefore, most community sports events were free to participants. An event organizer said: "Old people were shocked when they knew about how much runners paid for their races". In addition, the interest and ability to pay for health-related problems increased markedly. Insurance companies are well aware of this change. The change in customer financial capability for activities related to health and health-related entertainment is an essential factor affecting the demand for sports insurance products. According to Porter (1979), the increase in buyers' financial ability helps improve sellers' position. Therefore, insurance companies are seeking more opportunities in this market, shared by the insurance company representative.

Increased financial ability means that customers can buy better-quality products. According to the perception of a leader from an insurance company: "This is a very high-risk segment, so it is understandable that the insurance company is not interested. Sometimes, insurance companies exclude athletes from buying personal accident insurance" (Linh, 2020). However, the recent entry of insurance companies into the market is a testament to the change. The representative of the insurance company said: "The problem here is not that they do not dare to cover high-risk customers. The core issue here is whether customers are aware of the risk and willing to pay for "premium" products, worth to covering their risk".

The change in the level of risk: One of the difficulties in designing sports insurance products is the lack of historical data on sports risks. However, over the years, the running movement has evolved, and the market has more and more historical data. As a result, insurers can set prices and design different insurance packages. In fact, MIC Olympic insurance product has calculated in detail the different insurance levels according to the needs of customers (6 levels) and the risk level of sports (2 levels). The product also details the compensation for death, permanent disability, inpatient treatment costs, and emergency expenses (Military Insurance Corporation, 2021). This is a big step forward in the sports insurance market. Future products have a good case study to rely on.

In addition, sports insurance products are difficult to expand because almost no reinsurers want to accept insurance policies for professional athletes. The compensation rate is too high (over 50% / revenue) (Linh, 2020). It is a risky situation in the professional sports environment, where athletes see it as a lifelong career, so they play hard to achieve their goals. In contrast, the risk in a community sports environment is reasonably low. According to experts, the rate of medical assistance is estimated at 1/500 for a marathon distance - 42km, a tough race. The probability of using medical services, such as emergency or inpatient treatment, is much lower. This is due to differences in the participants' motivation to play sports. Amateur athletes mostly participate in sports to maintain good health, so they exercise moderately and usually pay attention to their own safety first. With a much lower risk ratio than professional sports, sports insurance products will be able to be designed at a more reasonable price.

4.2. State management should take an active role in supporting the sustainable development of the market

Insurance is a specific industry related to risk management. Because the law of supply and demand lags in practice, the organic development of the market will be distorted, causing many market failures. Therefore, for the market's sustainable development, state management intervention is required. The state needs to have specific regulations on community sports activities, with a large scale and wide influence, ensuring the safety of athletes is necessary. The state needs to make synchronous regulations so businesses can compete fairly and equally.

On the other hand, state regulations also need to be open, transparent, and reasonable to avoid becoming a barrier for new businesses to enter the market. The sports insurance market is growing rapidly and has great potential. The insurance companies that have participated in the market are large enterprises; once this market takes shape, they will take action to protect their market positions. Barriers to entry, especially legal barriers, have always been a good tool used by large firms (Porter, 1979). Legal barriers are state management tools to protect the right of citizens, but too many barriers will reduce market competition, lead to increased prices, and affect the interests of consumers. Therefore, the state needs to have clear and reasonable policies so as not to destroy competition and avoid becoming a tool to protect the market share of large enterprises.

4.3. Conclusion

Using the data synthesis method and in-depth interviews with experts, the research obtains that the sports insurance market is undergoing rapid qualitative changes, leading to a quantitative transformation.

The size of the potential customer base increases rapidly. The financial capability of customers improves significantly. Customers have better awareness about insurance. The community sports environment has a lower level of risk. Consequently, the sports market is being better and better. Insurance businesses are aiming to enter the market. Currently, some insurance companies have considered the sports environment as a brand communication channel and reach for further future steps.

Currently, big buyers are large-scale event organizers, especially in marathons, half-marathons, and triathlons. Besides the need for hedging insurance, their buying motivation is to be exempt from liability when the risk occurs. They are not obligated to buy by any legal provision, but they actively buy insurance to prove to their customers that they have fulfilled their responsibility for sporting events, which are perceived as high-risk activities in general.

Some difficulties still exist for insurance product providers. Designing suitable products is not easy. Product pricing requires a lot of historical data. The reinsurers do not cooperate well. Awareness of the need for sports insurance is low. Educating the market about the price and value of products takes time. Therefore, insurance products are still in the research and development stage. Insurance providers take a long time to test, get feedback, and, most importantly, get customer acceptance.

In short, the sports insurance market is still in its infancy but full of potential. Demand is changing markedly. The suppliers are also making moves to explore the market. For state management, this is a specific market affecting social benefits, so the state needs to design the legal system for community sports insurance. Policies need to ensure fairness and publicity to protect the best interests of citizens and avoid becoming a policy tool to protect the interests of large enterprises. For researchers, this market has a lot of problems to continue studying because this is a multi-disciplinary field, combining the market mechanism and state management, involving many stakeholders: people, consumers, organizers, insurance providers, and the state. Hence, further researches are needed.

VIETNAM-US RELATIONSHIP AFTER NORMALIZATION

Dr. Nguyen Minh Trang

trangdav@gmail.com

Nguyen Khanh Ly

khanhly06@gmail.com

Diplomatic Academy of Vietnam, Hanoi, Vietnam

Abstract

After the establishment of bilateral relations in 1995, the U.S and Vietnam are trusted partners with a friendship grounded in mutual respect. U.S.-Vietnam relations have become increasingly cooperative and comprehensive, evolving into a flourishing partnership that spans economic, political, security, and social ties. At present, the two countries' economies are complementary and are each other's top trading partners, with two-way trade turnover in 2022 reaching 123.86 billion USD, an increase of 275 times compared to the time when the two countries normalized relations in 1995. The United States is Vietnam's second largest trading partner. In 2022, it becomes the first export market of Vietnam to surpass the 100 billion USD and ranked 11th out of 140 countries and territories having FDI in Vietnam. Two countries also facilitate cooperation in areas including political and diplomatic relations, defense and security, science and technology, education and training, environment and health, humanitarian assistance/disaster relief, etc... Vietnam is a developing country in the globalization process, searching for relationship with diversity, substance, efficiency and harmonized interests. The U.S is becoming more and more important in the development strategy of Vietnam.

Keywords: *Normalization, Relationship, U.S, Vietnam*

1. Introduction

The world context is undergoing many changes, as competition between major countries increases, the world situation is being reshaped, global and regional issues are complicated, ... Each country needs to have more flexible foreign policies in order to take advantage of the advantages of integration for the country's socio-economic development. After 27 years of normalizing relations since 1995 and 9 years of implementing the Comprehensive Partnership, Vietnam and the U.S have gained huge achievements in many sectors. The cooperation on the basis of equality, mutual benefit, respect for independence each other's sovereignty, territorial integrity and political institutions, compliance with the United Nations Charter and basic principles of international law is the right choice of Vietnam and the United States. This is an inevitable trend and completely consistent with the common interests of the two peoples, demonstrating the efforts, determination and strategic vision of the leaders of the two countries. Over the years, the relationship between the two countries has made important developments in the economic field with the signing of the Bilateral Trade Agreement (in 2000); The United States adopted the Permanent

Normal Trade Regulations for Vietnam (2006); the two countries signed the Framework Agreement on Trade and Investment (2007); established the Vietnam - US Comprehensive Partnership (2013). The achievements of the relationship between the two countries are reflected in the many areas.

2. Method

The authors combine various methodology to analyze the Vietnam-US relationship after normalization such as: Interest analysis method to assess the interests of Vietnam and US in cooperation; Method of history, chronology to organize information, learn about the history of international, regional and domestic contexts of Vietnam and US after many events; Comparative - contrast method to show the changes before and after Vietnam and US established the diplomatic relationship; Forecasting method to make a forecast about the Vietnam-US relationship; Besides, many techniques such as logical analysis, statistics, synthesis, data processing...etc. are used to clarify the research arguments and the author's judgment.

3. Results

3.1. Economic relationship

About volume of trade, Vietnam and the USA witness a surprisingly low value of trade volume in the period before 2000. However, it was when the BTA was signed in 2000 that observed the most dramatic leap in goods exchange between the two nations: the total trade value reached over 1 billion dollars for the first time. After years of negotiating, the two countries could ultimately reach a significant commitment that would create necessary conditions for the products, businesses, and nationals of the other side to have fair access to compete in the other's markets. The first BTA was finally published after almost five years of negotiations and covered trade in goods, intellectual property rights protection, trade in services, investment protection, business facilitation, and transparency.

Figure 1. Vietnam - US trade, 1992-2022

Source: Author self-complied

As soon as the trade agreement went into force in December 2001, the US, the world's largest economy, gave Vietnamese goods access to its market on the same terms as it did for other nations with which it had regular trading ties. The most significant reduction in tariff rates was seen in manufacturers (while the general tariff rate was nearly 47%, the MFN tariff rate was only 3.8% which was 16 times lower). On the other hand, there was no noticeable decrease in the MFN tariff rate and general tariff rate of oil, both were around 0.5%). Both of these products were in the top 10 of the most exported products to the US. As payment, to ensure that its laws are compatible with the BTA and international laws, Vietnam's National Assembly began the process of revising more than 170 laws, thus changing its trade and investment policies to provide a fair environment for American companies operating there. The process undoubtedly accelerated Vietnam's transition from a centrally planned economy to a market-based one and created the foundation for many further developments afterward. After the BTA, the trade value between Vietnam and USA continued to rise at a dizzying speed. Two-way trade reached 9.7 billion dollars in 2006, a six-fold increase over the figure recorded in 2001, the year that saw the BTA taking effect. More remarkably, from 1 billion dollars in 2001, Vietnam's export earnings from the USA rocketed to 8.6 billion dollars in 2006; meanwhile, the country's imports from the US stood at 1 billion dollars on average (Every CRS Report, 2002).

The normalization in 1995 also gave way to a milestone in the two nations' economic ties when Vietnam's entry into the World Trade Organization was successfully negotiated. It was worth note-taking that Vietnam had applied for WTO's membership in 1995 and had been through several ups and downs in joining this organization. The agreement with the United States was the last and, seemingly, the most difficult of the bilateral agreements that Vietnam had to negotiate. The WTO membership would grant Vietnam the Most Favoured Nation (MFN) status which reduced taxes on a wide variety of exchange products. Furthermore, becoming the 150th member of the trade body, the country was also given fair treatment in which every firm from Vietnam would be treated as equally as domestic firms when they entered the market. The US also adopted a bill to grant Permanent Normal Trade Relations status to Vietnam. The event was of primary importance in Vietnam-US relations, marking a full normalization in commerce and trade. This step would probably benefit both nations: while Vietnam was offered the best conditions to thrive, the US could also exchange goods much easier.

WTO's membership has proved to be the driving force behind Vietnam's growth. Since 2007, the volume of trade has shown nothing but a dramatic rise. This had so many things to do with the MFN - most favored nation treatment provided by the trade body, with which all companies in Vietnam had equal access to the markets of every other member of the organization. Also, the reduction of trade barriers, primary tariffs, and quantitative restrictions played a key role in boosting Vietnam's foreign trade. When joining the WTO, Vietnam had the opportunity to expand the export of products in which

the country has strengths, such as agricultural products, aquatic products, garments, footwear, handicrafts, and labor-intensive goods. Strictly complying with WTO frameworks, Vietnam's government adjusted to the new situation. All the firms and the economy had successfully adapted themselves and turned the new situation to their advantage without experiencing any trade shocks. The country has successfully expanded its trade footprint in almost all markets worldwide and actively participated in global value chains and production networks. During the Covid-19 pandemic, facing with a protracted Covid-19 epidemic and ongoing trade disputes, the US continued to be Vietnam's top export market in the 2020–2022 era, and Vietnam continued to rise to become the US' eight-largest trading partner, a significant rise in the pandemic condition. In 2022, The United States was the first export market to surpass the US\$100 billion with the overall bilateral trade between Vietnam and the United States was US\$ 123.86 billion, up 11% compare with 2021 (Vietnam financial times, 2023).

About the export structure, Vietnam's main exports to the United States have also changed in line with recent trends globally. Although Vietnam is an agricultural country, the top export categories were electrical machinery, furniture and bedding, knit apparel, and machinery. Since economic reforms were introduced in the 1980s, light manufacturing has dominated Vietnam's economic growth, but during the past ten years, the nation has been repositioning itself to become a prominent player in the global microelectronics sector. With the successful accession to WTO and the BTA, it is much easier for Vietnamese manufacturers to trade their products and introduce their newest technology to many countries worldwide. Vietnam was the fourth-largest supplier of electrical products and components to the United States in 2022. Based on goods exported under Chapter 85 of the Harmonized Tariff Schedule, exports have increased by 50% over the last four years and are now greater than \$19 billion, surpassing Taiwan, Japan, and Korea. The US government has furthermore levied tariffs of up to 25% on practically all furniture categories over the recent years, which led to a huge drop in some countries' furniture shipments to the US. Vietnam, on the other hand, witnessed an opposite trend, from just 4.2 billion in 2018, the value of furniture exports in Vietnam grew by more than half and reached over 11 billion in 2022. Even in the outbreak of the Covid 19 pandemic which reduced the need for furniture in many American households, the export value of Vietnam showed no sign of decrease, from 9 billion in 2020, it rose to 10.1 billion in 2021 and 11 billion in 2022 (VCCI, 2023). This trend has brought tremendous benefits to both Vietnam and the US. Vietnamese manufacturers can diversify their scope of potential customers, switching from only Vietnamese buyers to both domestic and international buyers. Consequently, these sellers can boost their revenue as they have access to a wide variety of markets in the world. As for the US, they can expand the range of electronic products on the market, enabling US citizens to purchase highly cost-effective and sophisticated products from Vietnam.

Figure 2. Comparison of Vietnam exports to U.S in 2000 and 2001

Source: Author self-complied

In comparison with the EU, although Vietnam had a long history of exporting furniture to this union, the export value was just around 500 million dollars, which was significantly lower than that of the US. Even though the trade of furniture has been established between the two nations for not so long time, it has reached several milestones, making it one of the most potential trading products of Vietnam and the US. In 1998, the US's imports of knit apparel were much lower than those of Japan and the EU and they grew slowly because of the high tariffs on many apparel items. The non-MFN tariff on many wearing apparel items was ten times the MFN rate. Therefore; during that time, Vietnam could not afford to boost apparel exports to the US, instead, Japan was the main destination. Japan imported 130 million dollars of these items, compared to 7 million in the US. As time passed by, Vietnam was granted reduced tariffs from US officials, which made the exchange of wearing apparel a lot easier in the country. In 2022, US imports of these rocketed to approximately 9.7 billion dollars, far overcoming that of Japan or European countries (VCCI, 2023).

Vietnam has grown to be the second-largest supplier of clothing and shoes to the United States after the country's trade embargo was abolished in 1994. Actually, during the past several years, imports of footwear from Vietnam into the United States have increased significantly, from more than 3 million dollars in 1995 to 7 billion dollars in 2021. The discrepancies between footwear MFN and non-MFN tariffs are a contributing factor to the rise in imports of footwear. While MFN duty rates for many footwear items are 20 percent, US tariffs for the majority of imported footwear are 35 percent or less. Additionally, Vietnam has a competitive advantage thanks to the high labor content in footwear. In 2021, Vietnam exported 19.9 billion dollars in footwear which that of the US accounted for 7.6 billion, making it the main destination for footwear exports of Vietnam. Also, the US held the place of the fastest growing market for footwear of Vietnam in that from 2020 to 2021, the value of footwear exports rose by over 1 billion dollars (T.V. Thuong, D.V. Toan, 2022).

About investment capital, Vietnam has transformed from one of the poorest and most remote countries in the world to a force to be reckoned with for foreign investment. Vietnam, a young, middle-income nation, offers a variety of options for firms looking to expand there. An increasing number of brands are willing to enter Vietnam as a result of the country's

expanding middle class, increased manufacturing, and increased exports. Before the embargo on Vietnam was removed by US President Bill Clinton on February 3, 1994, a number of US companies had made investments in Vietnam through the third nation. As a result of the Bilateral Trade Agreement (BTA) between the two nations, which went into force in 2001, Vietnam experienced a wave of American investment beginning in 1995. Since that time, both the registered and dispersed capital of US investments in this country have increased. Overall, the BTA opened the way for US companies to have a broader view of Vietnam’s potential and invest in many projects.

Figure 3. Accumulated FDI from US to Vietnam, 2017-2022 (billion \$)

Source: Author self-complied

In recent years to come, US’s total FDI in Vietnam has displayed a sharp growth. During the Covid 19 pandemic, the uncontrollable outbreak of the disease forced both countries to implement national lockdowns in order to prevent the spread of the virus. Existing investment initiatives have been hindered by the closure and social isolation measures implemented in several nations worldwide in reaction to the COVID-19 epidemic. Even worse, the possibility of a recession has forced international corporations to evaluate new initiatives. On a global scale, FDI inflows have decreased by 35% from \$1.5 trillion in 2019 to less than \$1 trillion in 2020, the lowest level since 2005 and less than 20% from the trough of 2009 during the global financial crisis (FIA, 2021). In Vietnam, things got even harder as the governments used to take the Zero-Covid solution which made many large firms close for a long time. However, US’s FDI to Vietnam still increased, even marginally, but it was such an unexpected achievement in the scene of Covid 19. This has come to show that however hard the condition is, US companies still had great faith in Vietnam and entrusted considerable investment to this country. This result could be attributed to mutual trust which has been built up and strengthened through the years after the normalization.

In 2021 and 2022, Vietnam had a quick recovery of the US's FDI after the two countries had successfully controlled the pandemic. From below 10 billion dollars in 2020, the total investment climbed to nearly 12 billion and 15 billion in 2021 and 2022, respectively. The volume of trade between the two countries partly contributed to this recovery. Although under stricter regulations, Vietnam's exports to the US still increased, making the country one of the biggest exporters and importers of the US. Furthermore, thanks to the US vaccine program, the rate of vaccination in Vietnam was considerably high, allowing workers to return to work earlier than expected. Not only the value, but the quality of investment projects also increases. Before the normalization in 1995, there was hardly any US cooperation appearing in Vietnam's market. But until now, a huge number of US multinational companies have come to Vietnam to lay the first foundation for long-term development opportunities such as Pepsico, Coca-Cola, Intel, P&G, Procter & Gamble (P&G), General Electric (GE).)... In the first two months of 2023 alone, the total newly registered capital, adjusted capital, contributed capital to buy shares, and purchased capital contributions from US investors reached 11.68 million USD. In which, there are 8 newly licensed projects with a total newly registered capital of more than 7 million USD; 11 projects contributed capital to buy shares, with the value of contributed capital reaching about 4.7 million USD (Investment news, 2023). Also, projects processed by the US are also of large size. For example, Steelman Partners, an American construction company, has helped design various projects in Vietnam. This includes Happy Land (a large entertainment complex) and The Grand Ho Tram Strip (a five-star resort with a spectacular beach view). Similarly, ExxonMobil, an US oil company, wants to invest in a series of liquefied natural gas (LNG) ports and warehouses and refining and petrochemical operations in the northern city of Hai Phong.

About investment sectors, manufacturing and processing attracts the most FDI. The reason for this trend is Vietnam's cheap labor costs. The minimum wage in Vietnam varies by location and is between \$140 and \$202 per month. Although these wages have been rising steadily, they are still less than the minimum wage in the US, which is approximately \$4000 per month. Vietnam is therefore particularly well-suited to manufacturing labor-intensive goods like shoes or clothing. And over the past ten years, businesses have slowly shifted where they produce these goods; even many US corporations now have plants in Vietnam. Furthermore, Vietnam's workforce is youthful and expanding, and the nation is now experiencing a "golden population" era that is anticipated to extend until about 2040. Apart from the manufacturing and processing sector, the US also invests in the energy sector. Due to its reliance on inexpensive resources like coal and hydropower, Vietnam has one of the most effective energy markets in Southeast Asia. In comparison to its neighbors, the nation has electrified about 99 percent of its population at a comparatively modest cost. Moreover, Vietnam has a wide variety of energy sources, including coal, oil, natural gas, hydropower, and renewable energy. 47,750MW of installed capacity was available as of November 2018. According to the 2018 Vietnam Electricity Annual Report, gas, and renewable energy were in second and third place, respectively, behind hydropower and coal-fired power.

US firms also invest in the real estate field. Since 2011, the urban population has grown by 2% annually along with the economy. Ho Chi Minh City and Hanoi, Vietnam's

two largest cities, have had growth rates of 4% and 3.8%, respectively. Due to the concentration of the majority of corporate activity, including foreign direct investment, a sizable section of the workforce is moving into these two cities, creating a significant demand for urban housing. VinaCapital estimates that by 2025, half of the world's population would live in cities, necessitating the construction of 5.1 million dwelling units. Also, the number of international tourists to Vietnam quadrupled to 10 million between 2010 and 2016 (VCCI, 2023). Particularly in popular tourist locations like Nha Trang, Da Nang, Phu Quoc Island, and many more specialized places, this growing tendency generates a huge potential for the real estate market for the tourism industry. *About investment location*, US's FDI mainly concentrates in large provinces and cities with relatively favorable infrastructure conditions. According to the Ministry of Planning and Investment, the provinces and cities receiving the most investment capital from the US include Ba Ria - Vung Tau (45.8%), Ho Chi Minh City (12.4%), and Binh Duong (9%). Ba Ria - Vung Tau, though not one of the biggest cities in Vietnam, comes first on the list. This city has significant competitive advantages due to its location near the ocean, which includes a deep-sea port and established technological and transportation facilities, particularly a favorable transport network. All five modes of transportation—land, railroad, inland waterway, maritime, and aviation—can reach the Southeast region. Other leading regions in attracting FDI are all big cities. It is understandable why investors tend to do their business in such major cities instead of remoted ones. Nowadays, people are likely to flock to big regions in search of opportunities for jobs with high salaries and chances of getting promotions. Therefore, foreign nations can take advantage of the fact that the elite tend to gather in big cities to get access to academic excellence and idea hub. Major regions are often the places where large domestic firms cluster. Ho Chi Minh City is home to a wide variety of leading companies which include Vietnam Oil and Gas Group while Binh Duong is where big industrial companies cluster.

Overall, the Vietnam-US economic relationship has grown at an unprecedentedly fast rate in term of quantity and quality. The word “spectacular” can be used to describe the development of economic cooperation between Vietnam and the US. Vietnam – US relations have made significant strides since 1995, with the most salient aspect being the economic cooperation.

3.2. Politics and defense

In the field of politics – diplomacy, the US and Vietnam upgraded the Liaison Office established in January, 1995 of the two countries into embassies on August, 1995. The relationship between the two countries is getting closer when there are continuous high-level visits. On the US side, four US presidents have visited Vietnam: Bill Clinton (2000), George W. Bush (2006), Barack Obama (2016) and Donald Trump (2017). Vietnam also has visits to the US by late Prime Minister Phan Van Khai (2005), President Nguyen Minh Triet (2007), Prime Minister Nguyen Tan Dung (2008), President Truong Tan Sang (2013), General Secretary Nguyen Phu Trong (in 2015), Prime Minister Nguyen Xuan Phuc (2017). These visits have enhanced understanding, created momentum for relations, through declarations to establish frameworks. framework of which the most important is the comprehensive partnership in all fields between the two countries.

In addition, many well-known politicians of the US and Vietnam attach great importance to this relationship and have made visits or organized activities to tighten ties between the two countries. On the Vietnamese side, typically Ambassador Le Van Bang, former Foreign Minister Nguyen Co Thach, former Foreign Minister Nguyen Manh Cam; the US side, typically Secretary of State John Kerry, Senator Patrick Leahy and Senator John McCain. Most recently, on August 27th, 2019, US Ambassador to Vietnam Daniel Kritenbrink visited Truong Son Martyrs Cemetery and Hien Luong Bridge. It can be affirmed that this is a symbolic visit of reconciliation and mutual respect. The two sides still strive to solve humanitarian issues and war legacy, such as searching for missing Americans, demining bombs and mines, dioxin decontamination, etc., towards a global development.

In the field of security and defense, cooperation between the two countries has developed rapidly, marked by the organization of more and more high-level military and political security dialogues to enhance mutual understanding, trust and support each other. Vietnam has been identified by the United States as one of the central countries in the "Free and Open Indo-Pacific" strategy. Along with that, with their favorable geo-economic and geopolitical positions, Vietnam and the United States cannot help but cooperate in defense and security to protect their interests in the East Sea, the region and the world. Defense and security cooperation have been actively maintained with diverse cooperation contents, notably the exchange of delegations, high-level contacts, cooperation in overcoming war consequences and improving maritime capacity. In December 2009, Vietnam's Defense Minister visited the US and in November 2019, US Defense Secretary Mark Esper visited Vietnam. The two sides had a memorandum of understanding on defense cooperation in 2011; statement on a shared vision for defense cooperation in 2015 and a defense cooperation plan for the 2018-2020 period with 5 major contents including: Strengthening policy consultation; cooperation in overcoming war consequences such as clearing mines and dioxins; United Nations peacekeeping cooperation; overcoming consequences of natural disasters, seeking relief; cooperation in the field of maritime security on the basis of international law and the laws of each party. In recent years, the United States and Vietnam have held 11 security dialogues to discuss security issues. bilateral security cooperation. These dialogues have fostered the growing bilateral relationship between the two countries and reflect the two countries' shared commitment to a free and open Indo-Pacific region.

Regarding the settlement of war consequences, Vietnam and the United States cooperated closely in the search for martyrs of the two sides. The United States is committed to solving humanitarian issues and overcoming war consequences, including a major project on cleaning Da Nang airport that has been completed from 2012 to 2018. After Da Nang airport Danang is Bien Hoa airport, the largest remaining dioxin pollution hotspot in Vietnam, which is also being treated with an estimated cost of over 300 million USD within 10 years for environmental restoration activities in the airport. and surrounding areas. In addition, activities to remove mines and explosives, and search for remains of soldiers during the war were also conducted as cooperation agreements. The United States is ready to support, share experience, information, and train personnel for Vietnam's maritime law enforcement forces, as well as provide Vietnam with some equipment for law enforcement

in the sea (providing ships and boats for patrolling the sea), cooperation in the field of military medicine and consultation on defense mechanisms among ASEAN countries.

In particular, in 2017, the US transferred to Vietnam a coast guard ship (Vietnam named the 8020 Coast Guard ship - the most modern Coast Guard ship in Vietnam). This was once the Hamilton-class Morgenthau Coast Guard Ship of the US Coast Guard, which was transferred by the US government to the Vietnam Coast Guard through the Redundant Defense Equipment Sale (EDA) Program. In March 2018, for the first time a US aircraft carrier (the USS Carl Vinson) visited Vietnam. Within 3 years (1917 - 2020), the US Coast Guard has transferred 24 patrol boats to Vietnam (Political - Military dock, 2021). In March 2020, the aircraft carrier USS Theodore Roosevelt entered Da Nang port, making a visit to Vietnam to conduct humanitarian and friendship exchanges on the occasion of the 25th anniversary of the establishment of diplomatic relations between the two countries (Communist Party of Vietnam, 2021).

3.3. Other cooperation

Cooperation in education - training and science - technology has achieved many encouraging results. Currently, the number of Vietnamese students and interns studying in the United States is about 17,000. Regarding science and technology, the two sides enhanced cooperation in the fields of environment and climate change, information technology, biotechnology, oceanography, and space technology. In particular, with the help of educational centers in the United States, such as the University of Portland and the University of Arizona, many Vietnamese students and lecturers have been trained methodically, contributing to the success of the university. long-term investment and development project of Intel Corporation in Vietnam. The signing of the Agreement on Cooperation in the Peaceful Use of Nuclear Energy by the two countries (Agreement 123) on May 6, 2014 (officially effective from September 10, 2014) has opened a new field of cooperation between the two countries. new cooperation, attracting the interest of many leading US technology companies in the development of civil nuclear in Vietnam.

Medical and humanitarian cooperation has been focused on by both sides with many practical projects. In June 2013, the two sides signed a Memorandum of Understanding (MOU) on cooperation in medicine and medical science. The United States continues to maintain and commit to aid Vietnam's Emergency Assistance Program for HIV/AIDS Prevention and Control (PEPFAR) until 2018, with an average value of nearly 100 million USD/year in the following years. recent years. Vietnam has been working hard to help the US Government inventory the cases of US soldiers missing during the war (MIA). The US side also provided information, helping Vietnam find over 1,000 remains of Vietnamese soldiers; at the same time, continue to maintain and increase the budget for activities to overcome the consequences of the war in Vietnam, including the project of decontamination of dioxin-contaminated hot spots, support for victims of dioxin contamination. Agent Orange/dioxin. In 2014, the United States disbursed \$29 million in the 2014-2016 budget of \$84 million for the Da Nang airport decontamination project and medical assistance for disabled people, including victims of poisoning. orange/dioxin. In addition, the United States also sponsored Vietnam projects on overcoming the consequences of mines and explosives

left over from the war with a total aid of \$94 million through non-governmental organizations (NGOs), from 1993 to present (Ha Kim Ngoc, 2023). During the Covid-19 pandemic, U.S government has sent nearly 40 million doses of COVID-19 vaccines to Vietnam, supporting Vietnam to overcome the difficulties and protect human's life (Tuoitre, 2022).

4. Discussion and Conclusion

The prospects for the development of relations between the two countries are great. Vietnam is a good partner for the United States to cooperate to implement the Indo-Pacific strategy. The United States is an important partner for Vietnam to develop and prosper, when we are lacking and weak in capital, science and technology, production methods and management, and labor productivity. In the coming time, in order to protect, preserve and promote the achievements that the two countries have achieved, it is necessary to raise awareness and act decisively.

The two countries continue to consolidate and strengthen mutual political trust, build a solid social foundation, and promote multifaceted cooperation between the two countries, focusing on improving efficiency and practicality.

Continue to strengthen the comprehensive partnership in the fields of economy, foreign affairs, national defense, security, people-to-people diplomacy, health care and education. The two sides need to contribute to important economic and business conferences such as the Vietnam-US Business Summit, the annual ASEAN Economic Ministers Meeting, including the role of the United States.

The two sides need to work together to implement commitments, international treaties, cooperation agreements on economy, investment, trade, especially digital economy and e-commerce; actively review, amend, or negotiate and sign cooperation documents to create a legal corridor in economic, trade and investment cooperation; attach importance to connecting the two economies, especially connecting information and communication technology, science and technology, operation methods, services...

Besides economic cooperation, it is necessary to pay attention to cooperation in defense and security. Accordingly, it is necessary to maintain a peaceful and stable environment in each country for development; strengthen information exchange and closely coordinate to jointly respond to developments, not to be passive in all situations with issues of national and regional sovereignty and security; strengthen coordination in patrolling, maintaining security and order, and rescue at sea; continue to coordinate well in overcoming war consequences and searching for martyrs; good international duty...

Continue to strengthen close coordination and mutual support at regional and international forums and institutions. Vietnam and the United States are both located in the Asia-Pacific region, so they have common interests. Therefore, the two countries need to strengthen close coordination and support for each other at regional and global forums and institutions for the benefit of both sides, for a peaceful, stable and developed world.

In summary, the relationship between Vietnam and the United States since the two countries normalized and resumed diplomatic relations has made strong and extensive

developments. With the goodwill of both sides, mutual understanding and respect, and mutual contribution to peace, stability and cooperation in the region, the Vietnam - US relations are entering a new stage of development, with strong, comprehensive and substantive progress in many fields of cooperation.

THE EFFICIENCY OF JAPANESE KANJI INSTRUCTION FOCUSING ON THE COMPONENTS FOR VIETNAMESE LEARNERS OF JAPANESE

MA. Nguyen Thi Phuong Lien

lienntp@hanu.edu.vn

Department of Japanese Studies, Hanoi University, Hanoi, Vietnam

Abstract

Learning kanji is one of the most difficult things for non-kanji background learners of Japanese. Therefore, how to enable learners to learn kanji comfortably and effectively is a constant challenge for all Japanese language teachers, including Vietnamese teachers. Various strategies are used in kanji learning. Among them, there is a learning strategy based on "Radicals", one of the components of kanji and appear repeatedly in many kanji. It is considered that knowledge of the components is useful for learners to be able to refer the sounds and meaning of the kanji. The purpose of this research is to consider whether the ability of kanji of the students will improve by being taught additional knowledge of the components. In particular, the author will conduct an experimental class of 17 students for seven sessions and investigate the changes in information processing skills of Vietnamese learners related to the shape, sound, and meaning of kanji. As the result, instruction of the components is not very effective in distinguishing similar kanji characters for short-term skills, but it has a meaningful effect for long-term skills. Besides, the learner's ability to guess the on-reading of newly introduced kanji improved and there is also a great effect in guessing the meaning of newly introduced kanji. Several suggestions: use the results of this study to make teachers and learners aware of the efficiency of focusing on the components, create appropriate teaching materials, create an effective teaching method.

Keywords: *Components, Japanese kanji, memory strategies, Vietnamese learners*

1. Introduction

According to their origin, Japanese vocabulary can be broadly divided into four types: Japanese words, Sino-Japanese words, foreign words, and hybrid words. Among them, Chinese language occupies a large proportion and plays an important role. Concretely, 47.5% of the words in magazines and 40% of the words in spoken language are different Chinese words (Akimoto Miharu, 2002). However, according to Hiroyuki Kaiho (2001), learning kanji is one of the most difficult things for non-kanji background learners of Japanese. Although Vietnam is considered to belong to the areas using Chinese characters, the usage of them has gradually declined since the national language was shaped in the Roman alphabet in the 17th century. Currently, only a few Chinese character researchers and the elderly are able to read and the general Vietnamese no longer use Chinese characters. For that reason, there are many Vietnamese learners of Japanese having worries such as "I'm not good at kanji" or "I don't like studying kanji". Therefore, how to enable learners to learn

kanji comfortably and effectively is a constant challenge for all Japanese language teachers, including Vietnamese teachers.

Various strategies are used in kanji learning. Sakano and Ikeda (2009) listed 10 strategies such as “Write kanji repeatedly”, “Associate kanji with visual images”, “Associate kanji with stories”, “Get similar kanji characters into group”, “Use cards” etc.. and considered effective learning methods based on them. Among them, there is a learning method based on “Radicals”. Radicals are one of the components of kanji, and appear repeatedly in many kanji. Kanji characters are numerous and complex in shape, but they have far fewer components such as radicals which are simpler in shape. Each kanji has multiple sounds and is difficult to remember, but the components are related not only to the sound of the kanji containing them, but also to the meaning. With the above characteristics, it is considered that knowledge of the components is useful for learners to be able to refer the sounds and meaning of the kanji. Therefore, in this research, I would like to focus on learning methods based on the components of kanji such as radicals.

In Japan, the teaching of radicals is introduced from the beginning of learning Kanji for Japanese students and it plays a major role in teaching kanji. However, in Vietnam, methods using knowledge of components such as radicals are not used much in learning kanji. The reasons for that can be considered as following. Firstly, it is the lack of appropriate teaching materials. Many researchers have originally been interested in materials for kanji education and developed kanji textbooks for various levels and purposes. However, the fact is that there are very few materials on kanji instruction that focus on kanji components such as radicals. Secondly, the time for kanji classes is limited compared to the time for other skills such as grammar, listening comprehension, reading comprehension, and conversation. Also, teachers and learners may not be fully aware of the efficiency of component knowledge on learning kanji. The reason for this is that although there are a lot of researches investigating the components, most of them are limited to knowledge about the essence of radicals and methods of teaching radicals. There is not many researches that examine the actual efficiency of kanji instruction that utilizes knowledge of components in learning kanji.

Based on the evaluation of the current state above, this research examines how the instruction focusing on the components affects Vietnamese learners when they learn Japanese Kanji.

2. Literature review

2.1. Relevant studies

In recent years, as the increase of the number of Japanese language learners, many studies have been conducted on kanji, which play an important role in the Japanese language. There are many studies on the components of kanji among them. Some representative studies are described below. First, I will take up researches that study the essence of the components of kanji and the obtained results are useful for teaching and learning kanji.

The first one is Taeko Ogawa (2013) “Study on the semantic similarity of groups of kanji that share parts (radicals) for educational kanji”. In this study, since many Japanese

kanji characters are divided into left and right, the researcher examined the semantic similarity of kanji groups with a common left radical for 1,006 educational kanji characters taught in elementary schools in Japan. The following results were obtained. (1) She reported the top 25 most used radicals in educational kanji. (2) She surveyed the top 25 radicals and reported on the extent to how the meaning of the left radical matched the meaning of the kanji that shared that radical. The degree to how the meaning applies varies from “does not apply at all” (1 point) to “strongly applies” (7 point). The results show that the top “Kanehen” (金) 6.31 point, “Tsukihen” (月) 5.79 point, “Kihen” (木) 5.52 point, and “Risshinben” (丩) 5.52 point are highly applicable. On the other hand, it became clear that the three lower ranks of “Ouhien” (王), “Nogihen” (禾) and “Kotozohen” (冪) were not very applicable. It was shown that when the semantic similarity is high, it is effective to understand the meaning of the whole kanji while recalling the meaning of the radical. However, when the semantic similarity is low, it was said that if the meaning of the radical is used, it may interfere with the understanding of the meaning of the kanji.

Next, Townsend (2011) "Phonetic components in Japanese characters" approached from the aspect of voice. She clarified that there are many kanji characters whose On-reading (Chinese-derived reading of a kanji) is determined by the right component or the upper-right component, and listed 92 components and the On-readings of kanji that have these components. Concretely, among the 92 components, the On-reading of 74 components and the On-reading of kanji that have those components are the same, and 18 are almost identical. This list is believed to help learn the On-readings of many kanji characters.

In addition, Yukihiro Ikeda (2009) “Basic survey of Kanji towards learning and teaching Kanji using components” conducted a survey to measure the efficiency of kanji learning focusing on the components of kanji and using them to connect multiple kanji characters. Concretely, from the aspect of the character shape of kanji, the radicals and components of the kanji used in the textbook "Genki for Beginners" were investigated, and the corresponding kanji and their quantity were considered. There, it was shown that it is effective for presenting newly introduced kanji characters in kanji education. Besides, it is effective for creating and implementing exercises as well. An example of kanji teaching using the components was also proposed. At the beginner's level, the number of kanji characters to be learned is few, so there are few components that can be presented. Therefore, it is said that teaching the components is not very effective at the beginner's level, but if you practice using the components, you will be able to become more aware of the shape of kanji from the beginner's level and the acquired knowledge will work effectively for learning from the intermediate level onwards. However, considering the most appropriate time to teach the components of kanji, the presenting of radicals should be done at a stage when the learner's learning of kanji has progressed to some extent (beyond the intermediate level).

Next is a study to verify the efficiency of kanji instruction using the components on kanji learning. Williams (2013) focused on the fact that radicals basically have the same meaning wherever they are placed in kanji so she developed videos as teaching materials

basing on radicals for English speakers. After using it for two years with learners from the second half of elementary to intermediate level, the following results were obtained. (1) Knowledge of radicals is useful as a strategy for learning kanji. (2) The efficiency was seen on learning motivation.

Last, the study of Than Thi Kim Tuyen (2020) interviewed 7 intermediate-level Japanese students who have good kanji skills or are interested in learning kanji to find out the most commonly used and rarely used strategies they use when learning Kanji. The results show that, although there are differences between the types of strategies that each student uses, the common point is that all 7 students use and appreciate the strategy of paying attention to the components.

2.2. Research gaps

From the results obtained in the above previous researches, it cannot be denied that the components certainly have various effects on kanji learning. However, in the researches so far, there are very few studies that verify the effects on learners by utilizing them. In particular, no research has been conducted focusing on the effects of this method on Vietnamese learners of Japanese. Therefore, in this paper, the author focus on Vietnamese learners of Japanese and examine their influence on their kanji learning.

2.3. Objectives and research questions

Learning strategies are considered as the most essential tool to help language learners gain active and self-directed involvement in the learning process (Oxford, 1990). Oxford defines language learning strategies as the “specific actions taken by the learner to make learning easier, faster, more enjoyable, more self-directed, more effective and more transferable to new situations.” She divided them into two main groups, direct and indirect strategies. In Oxford’s opinion, direct strategies involve new language directly and these are classified in memory, cognitive and compensation strategies that require mental processing of the language. Among them, memory strategies involve the mental processes for storing new information in the memory and for retrieving them when needed. These strategies entail four sets: creating mental linkages, applying images and sounds, reviewing well and employing action.

This study investigates the changes in information processing skills of Vietnamese learners related to the shape, sound, and meaning of kanji. Regarding the timing of instruction, it is not suitable to teach the knowledge of the components at any learning stage, but it is also necessary to consider when the instruction should be given. As Ikeda (2009) stated that “The stage from the intermediate level is the most appropriate period for teaching the components of kanji”, this paper sets the intermediate level as the target. Therefore, the objectives of this experiment are 17 students (16 females, 1 male, all are 19 years old) of the Japanese language department at Hanoi University who had just finished the second semester of their first year and were about to enter the intermediate level. They had studied Japanese for approximately 480 hours.

The final purpose of this research is to consider whether the ability of kanji of the students will improve by being taught additional knowledge of the components. According to Chieko Kano and Takako Sakai's research (2003), kanji characters have multiple pieces of information which are shape, sound, meaning and to master a kanji, it requires complex processing skills. Thus, to measure the efficiency of teaching, I decided to focus on processing skills related to these three main information. In this way, the research question is set as following.

Question: Did the students improve their information processing skills related to the shape, sound, and meaning of kanji after acquiring the kanji instruction focusing on the components? If yes, how did they improve?

3. Method

With the aim of examining the efficiency of kanji instruction focusing on the components in term of learners' information processing skills related to the shape, sound, and meaning, the author conducted an experimental class.

The class was organized for seven sessions with the length of 30 minutes for each. In the first session, the author guided the students through the outline of the experiment then taught them while confirming their basic knowledge of kanji, including the components. From the second to the sixth sessions, the students were taught six kanji characters in each session in 25 minutes. Among them, three characters were given knowledge of the components (name, meaning of its radical and how to read its note which is called onpu - 音符 in Japanese), and the other three were not. At the end of each session, a 5 minute - small test is given to test short-term information processing skills. The final session (seventh) was a 15 minute - final test to test long-term information processing skills of the students. The details of the teaching content of the experimental class are shown below.

❖ *1st session - Basic knowledge of kanji, including their components:*

- The origin of 6 types of kanji characters called Rokusho (六書)
- Percentage of On-reading and Kun-reading for 1,684 kanji at elementary level
- Overview of components, notes and meanings

❖ *2nd ~ 6th sessions – Kanji instruction:*

As a criterion for selecting kanji to teach, the author selected kanji by referring to Townsend (2011)'s list of 92 radicals and the On-reading list of kanji with those radicals. Townsend's study provided a list of 92 notes with identical or nearly identical readings and 413 kanji characters containing these notes, while also providing a list of 29 notes with very different readings and a list of 45 kanji containing these notes. The author had intended to select N3 level kanji suitable for the student's Japanese proficiency, but the number of kanji on this list is limited, so N4, N2, and N1 kanji were also selected as below.

Table 1. List of instructed kanji characters

Session	Instruction of Components	Kanji	Level	Session	Instruction of Components	Kanji	Level
2nd	Yes	忙	N3	4th	No	驗	N4
		記	N3			跳	N1
		性	N3			秘	N1
	No	欲	N3	5th	Yes	零	N2
		痛	N3			房	N1
		過	N3			粉	N2
3rd	Yes	政	N3		No	刊	N2
		官	N3			符	N2
		級	N1			資	N3
	No	被	N2	Yes	恭	N1	
		荷	N2		舗	N1	
		招	N3		艇	N1	
4th	Yes	個	N2	No	罨	Not listed in JLPT	
		担	N2		殊	N1	
		嗣	N1		顛	Not listed in JLPT	

Test

➤ *Small test*

Table 2. Description of small test

Question	Information processing skill	Requirement	Purpose
1	Shape	Choose the kanji corresponding to the Chinese-Vietnamese sound	Distinguish kanji characters that contain the same component
2	Sound	Choose a kanji that has the same sound (on-reading) with the learned kanji	Guess the on-reading of the new character containing the same component
3	Meaning	Choose which the meaning of the new kanji is related to	Guess the meaning of the new character containing the same component

➤ *Final test*

In order to examine the long-term information processing skills of the students, the content of the final exam was generally set to be the same with the content instructed in second, third and fourth session. Question 1 and 3 are the summarization of these three sessions. Question 2 is divided into 2A and 2B. 2B is the same as the three sessions' tests while 2A is to write the on-yomi of the learned kanji.

4. Results

4.1. The short-term information processing skills

The changes in the scores of the three questions through five sessions are analyzed in two ways. The first way is in the scores for all students: total scores of student number 1 to number 17 with or without instruction of components. The second is in the scores for each student: each student's score for each of the three questions over five sessions with or without instruction of components. The perfect score for all students is 51 points, and the perfect score for each student is 15 points.

For the first way, charts are used to represent the change in the scores of all students. For the second way, the author use the paired t-test of Cohen's D (1998) which is the most commonly used measure of effect size. In particular, the author use the statistical software called SPSS to analyze data gained from the experiment.

Question 1 (Shape): Differentiate the shape to select the correct kanji from similar kanji characters

➤ *All students*

Figure 1. Change in the total scores of all students for question 1 over 5 sessions

According to Figure1, there is not much difference in the scores of all the students regarding of the presence or absence of component instruction in this question. There is a student who made only one mistake in the 4th and 5th test of a kanji without component instruction.

➤ *Individual*

Table 3. Paired samples statistics of total scores by student for question 1 over 5 sessions

		N	Mean	Std. Deviation	Std. Error Mean
Pair 1	Without instruction	14.88	17	.485	.118
	With instruction	15.00	17	.000	.000

Statistics for the paired samples show that the mean increased from 14.88 for "Without instruction" (hereinafter referred to as "Without") to 15 for "With instruction" (hereinafter referred to as "With"), but the change in this figure is very small.

Table 4. Paired samples test of total scores by student for question 1 over 5 sessions

Pair 1	Without - With	Paired Differences					t	df	Sig. (2-tailed)
		Mean	Std. Deviation	Sdt. Error Mean	95% Confidence Interval of the Difference				
					Lower	Upper			
		-.118	.485	.118	-.367	.132	-1.000	16	.332

In addition, as a result of examination with a paired t-test, there was no significant difference at $p > 0.05$, and it was found that the score of "With" did not increase much compared to "Without". Therefore, it is considered that teaching the components is not very useful in distinguishing similar kanji characters in a short period of time.

Question 2 (Sound): Guess the on-yomi reading of new kanji that contains the same note as the learned kanji

➤ All students

Figure 2. Changes in the total scores of all students for question 2 over 5 sessions

The scores of kanji with component instruction are always higher than those without instruction. And as the tests progressed, the difference grew.

➤ Individual

Table 5. Paired samples statistics of total scores by student for question 2 over 5 sessions

Pair 1		N	Mean	Std. Deviation	Std. Error Mean
		Without instruction	11.24	17	1.855
	With instruction	14.29	17	.920	.223

It can be seen that the average value rose from 11.24 for "With" to 14.29 for "Without".

Table 6. Paired samples test of total scores by student for question 2 over 5 sessions

Pair 1	Without - With	Paired Differences					t	df	Sig. (2-tailed)
		Mean	Std. Deviation	Sdt. Error Mean	95% Confidence Interval of the Difference				
					Lower	Upper			
		-3.059	1.919	.466	-4.046	-2.072	-6.571	16	.000006437

As a result of examination with a paired t-test, there was a significant difference at $p < 0.05$, and it was found that the test score increased significantly in the case of "With"

compared to "Without". In addition, as a result of calculating the effect size of Cohen, it was found that $d=3.33$, indicating a large effect. It can now be asserted that teaching the components has a definite effect on inferring the on-reading of newly introduced kanji.

Question 3 (Meaning): *Guess the meaning of new kanji that contains the same radical with the learned kanji*

➤ *All students*

Figure 3. Changes in the total scores of all students for question 3 over 5 sessions

The results revealed that "With" was higher than "Without" for all tests. However, since the difference in scores does not tend to increase continuously after each test, it can not be said that the more you study radicals, the better students' ability to guess the meaning.

➤ *Individual*

Table 7. Paired samples statistics of total scores by student for question 3 over 5 sessions

		N	Mean	Std. Deviation	Std. Error Mean
Pair 1	Without instruction	7.71	17	2.144	.520
	With instruction	12.35	17	2.262	.549

It can be seen that the average value rose from 7.71 for "Without" to 12.35 for "With".

Table 8. Paired samples test of total scores by student for question 3 over 5 sessions

		Paired Differences			95% Confidence Interval of the Difference		t	df	Sig. (2-tailed)
		Mean	Std. Deviation	Std. Error Mean	Lower	Upper			
Pair 1	Without - With	-4.647	2.597	.630	-5.982	-3.312	-7.379	16	.000001557

A paired t-test showed a significant difference at $p<0.05$. As a result of calculating Cohen's effect size, $d=2.05$ indicating a large effect, this result also indicates that the instruction of the components is clearly useful for inferring the meaning of newly introduced kanji.

4.2. The long-term information processing skills

After finishing five sessions, a final exam was organized. To verify long-term skills, only knowledge in the first three classes was set as the content of the test. The content of the test is basically a compilation of five small tests before, but question 2 has two requirements. Problem 2A to write the on-reading of the learned kanji, and problem 2B to select the kanji with the same on-reading from two kanji characters containing a part of the learned kanji. Again, the scores for all students and each student are analyzed.

➤ *All students*

Table 9. Total scores by question for all students

Final test	Q1		Q2A		Q2B		Q3	
Instructions	Without	With	Without	With	Without	With	Without	With
Total	108	136	89	101	106	125	82	108
Improvement	26%		13%		18%		32%	

In all questions, the scores with instruction outperforms the one without it. Among them, Q3 (32%) exceeded the most, followed by Q1 (26%), Q2B (18%) and Q2A (13%). In other words, what improved most by being taught the components is guessing the meaning, followed by differentiating the shape, guessing the pronunciation, and finally memorizing the reading.

➤ *Individual*

Question 1 (Shape): Differentiate the shape to select the correct kanji from similar kanji characters

Table 10. Paired samples statistics of total scores by student for question 1 of final test

		N	Mean	Std. Deviation	Std. Error Mean
Pair 1	Without instruction	6.35	17	1.115	.270
	With instruction	8.00	17	.935	.227

Statistics for the paired samples show that the mean increased from 6.35 for "Without" to 8 for "With."

Table 11. Paired samples test of total scores by student for question 1 of final test

		Mean	Std. Deviation	Paired Differences Std. Error Mean	95% Confidence Interval of the Difference Lower Upper		t	df	Sig. (2-tailed)
Pair 1	Without - With	-1.647	.786	.191	-2.051	-1.243	-8.641	16	.000000201

As a result of examination with a paired t-test, there was a significant difference at $p < 0.05$, and it was found that the test score increased significantly in the case of "With" compared to "Without". Furthermore, as a result of calculating the effect size of Cohen, it was found to be $d = 1.76$, indicating a large effect. This proves that component instruction has a great effect on distinguishing similar kanji characters in long-term skills.

Question 2A (Sound): Memorization of on-reading of learned kanji

Table 12. Paired samples statistics of total scores by student for question 2A of final test

		N	Mean	Std. Deviation	Std. Error Mean
Pair 1	Without instruction	5.24	17	1.954	.474
	With instruction	5.94	17	2.487	.603

It can be seen that the average value only increased from 5.24 for "Without" to 5.94 for "With".

Table 13. Paired samples test of total scores by student for question 2A of final test

		Paired Differences				t	df	Sig. (2-tailed)
		Mean	Std. Deviation	Sdt. Error Mean	95% Confidence Interval of the Difference Lower Upper			
Pair 1	Without - With	-.706	1.929	.468	-1.698 .286	-1.509	16	.151

Since $p > 0.05$, there is no significant difference here, and it was found that the score of "With" did not increase significantly compared to "Without". As a result, it can be said that in the long-term skill, the instruction of the components has no effect on the memorization of the readings of the learned kanji.

Question 2A (Sound): *Guess the on-reading of the new kanji that contain the same notes as the learned kanji*

Table 14. Paired samples statistics of total scores by student for question 2B of final test

		N	Mean	Std. Deviation	Std. Error Mean
Pair 1	Without instruction	6.24	17	2.538	.616
	With instruction	7.35	17	2.370	.575

It can be seen that the average value increased from 6.24 for "Without" to 7.35 for "With".

Table 15. Paired samples test of total scores by student for question 2B of final test

		Paired Differences				t	df	Sig. (2-tailed)
		Mean	Std. Deviation	Sdt. Error Mean	95% Confidence Interval of the Difference Lower Upper			
Pair 1	Without - With	-1.118	1.728	.419	-2.006 -.229	-2.667	16	.017

In the paired t-test, there was a significant difference at $p < 0.05$. In addition, Cohen classified effect sizes as $d = 0.47$, indicating a moderate effect. In other words, teaching the components has a moderate effect on guessing the on-reading of newly introduced kanji.

Question 3 (Meaning): *Guess the meaning of new kanji that contains the same radical with the learned kanji*

Table 16. Paired samples statistics of total scores by student for question 3 of final test

		N	Mean	Std. Deviation	Std. Error Mean
Pair 1	Without instruction	4.82	17	1.667	.404
	With instruction	6.35	17	1.902	.461

Statistics for the paired samples show that the mean increased from 4.82 for "Without" to 6.35 for "With".

Table 17. Paired samples test of total scores by student for question 3 of final test

		Mean	Std. Deviation	Paired Differences Std. Error Mean	95% Confidence Interval of the Difference		t	df	Sig. (2-tailed)
					Lower	Upper			
Pair 1	Without - With	-1.529	1.841	.447	-2.476	-.583	-3.425	16	.003

There is a significant difference at $p > 0.05$. In addition, Cohen classified effect sizes as $d = 0.8$, so it is found that the effect was large. Therefore, it became clear that the ability to guess the meaning of new kanji characters increases by being instructed the components.

5. Discussion and Conclusion

5.1. Discussion

From the above results, there are several recommendations that should be carried out in the future to support teachers and learners in kanji studying process. The first is to use the results of this study to make both teachers and learners aware of the efficiency of teaching kanji focusing on the components. Next, it is required to create appropriate teaching materials to be used for this teaching/learning method. In addition, I think that it is necessary to create an effective teaching method. As a reference, it is also possible to use the teaching method implemented in this study.

In this paper, the author examined the students' improvement of information processing skills after acquiring the kanji instruction focusing on the components. The results are clarified as following.

For short-term skills, instruction of the components is not very effective in distinguishing similar kanji characters. However, by being taught the components, the learner's ability to guess the on-reading of newly introduced kanji will improve, and the more they study, the better. In addition, the components provided clues for guessing the meaning of newly introduced kanji. Specifically, knowing what the meaning of the kanji is related to should increase the possibility of guessing the meaning of the kanji correctly.

For long-term skills, as mentioned above, in the short-term, knowing the components of kanji is not very effective in distinguishing similar kanji, but in the long-term, it has a meaningful effect. There is no visible effect on memorization of new kanji readings, but there is a moderate effect on guessing ability. Besides, it has become clear that there is a great effect in guessing the meaning of newly introduced kanji.

Overall, it can be concluded that the learning of the components has the significant efficiency in improving the information processing skills related to the form, sound, and meaning of kanji for the learners.

On the other hand, this research is still limited to verifying the efficiency of this kanji teaching method. Correspondingly, there is a need for more specific studies with the aim of improving the quality of kanji teaching and learning that focuses on the components.

University of Economics Ho Chi Minh City, Vinh Long Campus, Vietnam

Abstract

This article describes the tools and methods of assessing university students' English ability that have been in use throughout four English modules: "English for Business Communication - Module 1", "English for Business Communication - Module 2", "English for Business Communication - Module 3," and "English for Business Studies - Module 4" that have been lectured at the University of Economics Ho Chi Minh City- Vinh Long Campus (UEH_ CV). The aim is to precisely show the English proficiency of the students enrolled in the 46th and 47th courses of the full-time university standard program. Score data are collected and analyzed based on the results of the final examinations. The study' findings show that the majority of students received scores below 5 on a scale of 10. Based on these results and subjective analytical opinions, recommendations are given to improve the ability of non-major English students at UEH_ CV in particular and in Vietnamese higher education in general.

Keywords: *English language proficiency, Business English, four English language modules, UEH_Vinh Long Campus*

1. Introduction

English is an international language that expresses general truths. It can be said that there is no other country in the world that emphasizes the role of foreign language ability, namely English, in training and developing human resources like Vietnam in terms of language policy. In recruitment, foreign language proficiency is one of the most essential criteria for selecting and appointing personnel in the public sector. In training, while in most other countries, the teaching of foreign languages is only carried out in high schools, in Vietnam, foreign languages are also taught at the university as a compulsory subject. English proficiency is also a criterion for admission to graduate training programs such as master's and doctoral training and is also one of the mandatory conditions for participating in graduate training programs funded by the state budget.

In fact, universities still have strict regulations on students' foreign language ability, and achieving the prescribed levels is a mandatory condition for being recognized as a university graduate. To be considered for graduation at the University of Economics Ho Chi

Minh City (UEH) and the University of Economics Ho Chi Minh City Campus in Vinh Long (UEH_CV), students must have one of the following international English language certificates: a minimum TOEIC score of 550 (≥ 550), a minimum TOEFL iBT score of 60 (≥ 60), a minimum IELTS score of 5.0 (≥ 5.0), and a minimum VPET (Versant Professional English) score of 50 points (≥ 50), this decision is granted issued together with Decision No. 1827/QĐ-ĐHKT-ĐT dated July 12, 2021 of the Rector of the University of Economics Ho Chi Minh City.

With the motto "Training global citizens, acting for sustainable development", English is not only one of the compulsory subjects in all training programs of the school, but also the preferred language used to teach all disciplines if students are admitted to a high-quality training program in which all subjects are taught in English. As a result, it can be stated that English has a significant role in the digital era, which necessitates students actively equipping themselves with both the professional knowledge and English abilities to compete in the more integrated working environment.

Currently, what tools and methods has the campus implemented to assess students' English ability? A research report titled "*English language competence of students through English courses lectured at the University of Economics Ho Chi Minh City-Vinh Long Campus (UEH_CV)*" is one of the efforts to answer the question. The English courses given on campus and the assessment process for each module will be specifically stated in the paper. Score data will be collected through the end-of-course exams to see the English ability of students in the 46th and 47th courses who are studying a full-time undergraduate program at the campus.

2. Literature Review

2.1. English ability

Shobikah (2020), "the competences in English learning are cognitive, psychomotorist, and affective competences acquired by students related to the competences in learning English. Specifically, the competence in the mean of language learning is communicative competence between students and teachers in the form of interaction inside and outside the classroom as the realization of language use for communication".

According to the dictionary of the University of Southern Queensland (2016), English competence is defined as "the ability of learners to use English to convey information through oral or written form during their learning".

In this paper, English proficiency of students studying at the campus is considered within a statistical range based on the results of the final exam after each module.

2.2. Business English

When comparing Business English (B.E) and General English (G.E), *Francesco Pierini (2014)*, emphasized, General English is used to designate the English language without special content and is used to communicate in everyday life and situations, from very simple contexts to very complex contexts so language of *General English* used in all

ways and in all contexts. On the contrary, when we use the phrase Business English, we are referring to a very broad field of study and applications used mainly in the field of English for specific purposes (ESP) related to the use of English in the working environment. It can therefore require very versatile and complex linguistic and foreign language skills, because it is used in many situations, in both verbal and written interactions. The most common contexts in which Business English occurs are as follows: attending business meetings and shareholder meetings, preparing internal company documents (memorandums and reports) and paperwork inter-company (letters, offers and brochures), communicating between colleagues, arranging commercial contracts, participating in negotiations and business phone calls.

According to Juan Gu (2020), Business English, in general, refers to the English that people use in business activities. It's really specialized English for the underpinnings of that country's economy. Therefore, it is a branch of English for Specific Purposes. Business English includes both English skills and business knowledge. Also, according to Juan Gu (2020), it is the subject of integration between English language learning and economics. Related theories of English language learning, economics and management are the theoretical basis for the development of the major. In addition to the study of the language itself, it also covers the intersection of culture, economics, commerce, management and law, so Business English has the characteristics of “interdisciplinary” and “composite”. As a result, Business English courses not only improve students' ability to use English in listening, speaking, reading, writing and translation, but also equip students with business expertise and master business practice skills. When it comes to the nature of Business English, we can conclude: First of all, Business English is complex in nature. It not only means business vocabulary and terminology, or business knowledge combined with learning English, but it is also a practical major that is practically oriented and closely related to the profession. Therefore, a Business English Language Course may include topics such as business English in reading, writing letters and resumes, business phrases, or terms of sale, advertising, and marketing aspect.

2.3. Non-English major students

Non-English major students at UEH-CV are those who are not majoring in English but in other majors, such as business administration, accounting, finance, etc., and English is just one of the compulsory subjects in their program.

3. Method

The descriptive approach was adopted in this investigation. It describes how course outlines are being applied as a tool and method to assess the English language ability of formal university students enrolled in school. The researchers used the descriptive statistics, particularly frequency counts and percentages, in analyzing the final exam scores of the 46th-course students and the 47th-course students who had already completed four modules of Business English: "English for Business Communication - Module 1," "English for Business Communication - Module 2," "English for Business Communication - Module 3," and

"English for Business Studies - Module 4". The final exam scores of each module were given a corresponding weight value, with one as the lowest and ten as the highest (according to the scale in the Vietnamese educational system). Descriptive equivalents or verbal descriptions were also provided for the outcomes of a review of the actual English ability of the students.

4. Results

4.1. Brief information about UEH - Vinh Long campus

UEH_CV, commonly called the Campus of UEH in Vinh Long, formerly known as Vinh Long College of Economics and Finance, was signed by Mr. Nguyen Van Phuc, Deputy Minister of Education and Training, on the fourth of December 2019. UEH_CV was founded and operates with the mission of training high-quality human resources, researching, consulting, and criticizing policies to contribute to the development of the Mekong Delta.

The campus enrolls students with permanent residence in 13 provinces of the Mekong Delta, including: An Giang, Bac Lieu, Ben Tre, Ca Mau, Can Tho, Dong Thap, Hau Giang, Kien Giang, Long An, Soc Trang, Tien Giang, Tra Vinh, and Vinh Long, for majors in Business Administration, International Business, Finance - Banking, Corporate Accounting, and Marketing, and six nationwide enrollment programs, including: Logistics and Supply Chain Management, E-commerce, Economic Law, Agri-business, Management of Tourism and Travel Services, and Business English. With the criteria "Studying at Vinh Long: A Quality Degree from the University of Economics in Ho Chi Minh City", all final-year students at Vinh Long Campus will participate in the campus rotation program, which includes studying at the Ho Chi Minh City campus. Moreover, Students of Vinh Long Campus are able to join the Integrated Dual Program, then receive two degrees in just 3.5 years or 4 years if they choose to study majors as Logistic and Supply Chain Management, Agri-business and International Business.

From 2020, the campus will start enrolling and training students in formal university programs, transfer formal university programs, second-degree formal university programs, international association formal university programs, on-the-job university training programs, master's degrees, and short-term courses. Up to now, the campus has enrolled students in three full-time undergraduate training courses, bringing the total number of students in the three courses—Course 46, Course 47, and Course 48—to more than 1,200.

4.2. Student's English ability before being admitted to the Campus

According to "Regulations for Learning English and English Proficiency Standards for Formal University Students at UEH" (issued together with Decision No. 1827/QĐ-ĐHKT-ĐT dated July 12, 2021 of the Rector of the University of Economics Ho Chi Minh City),

Regarding the consideration for admitting students who are currently enrolled in the formal university standard program on the campus in relation to learning English Module 1;

- Students who meet the English entry requirements will be allowed to study English Module 1. If a student does not meet the standards, he or she must take an additional English course known as English Module 0.

- Students must meet one of the two conditions listed below in order to study English Module 1.

+ Have an English high school graduation exam score of 5.0 or higher (≥ 5.0);

+ Have an average English grade 12 score of 5.0 or higher (≥ 5.0).

In addition, the campus also has a number of regulations on the English proficiency standards of students during their studies, as follows:

Time	Minimum standards students need to meet	Note
Conditions for students to register for further courses in Semester 5.	Students must pass English Module 1 and English Module 2.	If students do not meet English standards during their studies, the number of registered credits will be limited. Students are only permitted to register for a maximum of 10 credits per semester.
Conditions for students to register for further courses in Semester 7 (registration for a graduation thesis or Enterprise semester).	Students must pass English Module 3 and English Module 4.	

Non-English major students at the Campus can also convert points from international English certificates such as TOEIC (Test of English for International Communication), TOEFL iBT (Internet-based-test), IELTS (International English Language Testing System), and VPET (Versant Professional English) with scores that meet the score conversion table below and are still valid.

TOEIC	VPET	TOEFL iBT	IELTS	CONVERTED POINTS			
				English Module 1 (4 credits)	English Module 2 (4 credits)	English Module 3 (4 credits)	English Module 4 (4 credits)
≥ 550	50	60	5.0	10	9	8	7
≥ 600	55	70	5.5	10	10	9	8
≥ 650	60	80	6.0	10	10	10	9
≥ 700	65	90	6.5	10	10	10	10

4.3. The English courses being taught at the campus and how they are assessed

The objective is to actively prepare the students for the "Global and Local Generations" of the digital era by giving them professional knowledge in the economic field as well as English proficiency. Because of this, all students in non-English majors must take business English as one of their required courses on campus. There are two semesters in the first academic year. English for Business Communication—Module 1 and English for Business Communication—Module 2 are the two required Business English modules for students. The remaining modules, "English for Business Communication—Module 3" and "English for Business Studies—Module 4", will be lectured in the next two semesters of the second school year, respectively. Each module has 60 periods, of which 70% of the lessons are in class; the remaining 30% of the lessons are on the LMS (Learning Management System), the school's online training system.

4.3.1. Assessment tools and methods for the English Courses; Modules 1, 2, 3, and 4

Based on "Decision No. 1843/QDDHKT-KHTKT dated July 14, 2021." And in "Decision No. 2063/QD-HKT-KHTKT dated July 19, 2022, about "organizing the exam in the form of an online exam of the University of Economics of Ho Chi Minh City" and based on the course outline, the authors briefly summarize the assessment of students' English ability through the English modules being lectured at the campus.

The final grade of every course is divided into two main columns: (1) the midterm assessment score (midterm assessment) in proportion to 50% of the total score, and (2) the final exam score (final exam paper) in proportion to 50%. The campus currently offers the online final test.

4.3.2. Midterm assessment score (proportion to 50%)

This score column includes the attendance score *in proportion from* 10% to 15%, the average score of the five end-of-unit tests (EOU tests) that students can do as their homework on the LMS *in proportion from* 10% to 15%, and finally the score of the speaking test or the group presentation test *in proportion from* 20% to 30%.

In detail, the attendance score is the scale that assesses the extent to which students come to class to fully participate in class sessions with lecturers. Instructors are responsible for grading attendance by randomly taking attendance in any class or in all classes (12 sessions; the maximum score for this score column is 10 points if the student is not absent from class). If students are absent without asking permission from the lecturers during any session, they will be deducted one point for attendance in that class).

The content of five end-of-unit tests is compiled based on the content of each unit that students have learned in class, like a homework assignment for them to review previous lessons. Teachers are allowed the range to choose the most flexible way to

encourage students to experience and familiarize themselves with doing the five end-of-unit tests on the LMS but have to ensure that the score is in proportion from 10% to 15%. According to observations, English teachers at the campus use two methods to calculate EOU test scores:

Method 1: After setting the time for completing each EOU test, the teacher will take the average score of 05 EOU tests to calculate the final score. For example, if student A has the score of each EOU test in turn as (8.6; 9.6; 8.9; 9.4; 9.5), the average score of the LMS score column for the five EOU tests of this student will be $46/5 = 9.20$ points.

Method 2: If the student completes the EOU test on time and gets a score of 5.0 or more in each test (≥ 5.0), then the student will be counted through that EOU test and get a full 3% of each test. If there is any EOU test worth less than 5 points, students will lose 3% of their LMS score. Example: Student A's scores on the five EOU tests are as follows: 6.0; 5.5; 7.5; 5.0; 7.0. The final LMS score of Student A is 15%. Student B has a score on the five EOU tests as follows: 3.5; 5.0; 6.0; 5.5; 6.0. The final LMS score of Student B is 12% (because Student B only has 4 of the 5 EOU tests over 5.0 points).

The framework of the five EOU tests is intended to be 90% similar to the structure of the final exam in order to familiarize students with it. This includes vocabulary and grammar: Guided cloze test: 10 sentences to complete with answers A, B, C, and D; 30 multiple-choice questions on vocabulary and grammar; Reading Comprehension (10 sentences, including 3 multiple-choice questions and 7 essay questions related to vocabulary and grammar). The Listening Comprehension section includes two listening parts, the first of which is selected from Part 2 of the TOEIC English textbook, and the second of which is to fill in 10 words or numbers in the blanks of the summary passage.

Designing EOU tests on the LMS system has certain advantages. Students do not have to work in class with the lecturer but can do it anywhere if they can access the school's LMS system, but it requires them to meet deadlines that the system has allowed. Students are not under pressure to do the EOU tests because there is no teacher supervision. Furthermore, because this exercise is designed online, students can see their grades as soon as they are completed and submitted to the system, teachers do not have to spend time grading, and students are allowed to redo the test at least one more time to improve the score if desired, depending on the class teacher's setting for the number of times, but most students can do at least twice on each EOU test.

For the speaking test or group presentation test, the teacher is allowed to choose a topic but must stick to the content of the five units of lessons in class and decide on the test format, for example, speaking tests in pairs or presenting in groups of 3-5 students. The criteria are as follows:

Vocabulary

Whether the students have chosen the right vocabulary for the topic.

Grammar

First, the teacher will see if the student's speech is grammatically correct, and then he/she will find out if the speech has a variety of simple, complex, and compound sentence structures.

Pronunciation

In the scoring criteria for the pronunciation part, the teacher will check whether the student's speech has errors in single sound, last sound, word stress, sentence stress, intonation...

Fluency and development of ideas

Whether or not the student's speech is clear and fluent, and whether or not students will be able to develop and expand their ideas related to the topic.

Discourse Management

Whether the students' ideas are consistent with the content of the topic or not, and if the students use words or phrases to connect ideas within and between sentences. In addition, if the students have to conduct a dialogue, body language, student interaction, and interactive communication will be judged.

Eye- Contact

During the presentation, whether students have a connection with each other. If there is something hidden, inferior and avoidance will show a lack of confidence, the examiner may think that the student has not prepared well for the talk. Therefore, a lack of confidence can leave a negative impression.

Attitude

Through the test, it has also been shown to the examiner whether the students have prepared the presentation in the best way, whether they are active, positive, or not, and whether they are ready to answer other related questions that the examiner wants to ask. All of this is reflected in the attitude of students in the exam.

4.3.3. Online final exam paper (proportion to 50%)

As mentioned above, the end-of-course exam is designed to have a 90% similar structure to the form of the previous EOU tests; only the first 10 questions are changed to be in the form of a "Cloze test". Furthermore, writing an email is a required component of the final exam, which accounts for 20% of the total test score. The exam is conducted online, the tests are scored by the system, and the results are given except for the writing part. The lecturer must log in to the system to give marks for the emails-writing part by the student. The criteria for grading the emails in the final exam are agreed upon by the teachers in charge of grading and are as follows: task fulfillment (the level of completion of the task), organization, the layout of the written emails, vocabulary, and grammar.

4.4. Statistic and analysis the results of the final exams

MODULE 1

MODULE 2

- from 9,0 to 10
- from 8,0 to 8,9
- from 7,0 to 7,9
- from 5,0 to 6,9
- from 1,0 to 4,9

MODULE 3

MODULE 4

- from 9,0 to 10
- from 8,0 to 8,9
- from 7,0 to 7,9
- from 5,0 to 6,9
- from 1,0 to 4,9

Statistics on the percentage of final exam scores of the 46th- course students in four modules in Business English

Statistics on the percentage of final exam scores of the 47th- course students in three modules in Business English.

- English for Business Communication - Module 1 (English –Module 1)

For this module, the students in the formal university program course 46 take the paper-based test (offline). Statistical results show that up to 140 out of 229 paper tests scored from 1.0 to 4.9 points, accounting for 61% of the tests with scores below five. For the students of the formal university program course 47, at this time, the school has applied the form of online exams for all subjects, and the results have been recorded for up to 286/472 paper tests, with scores ranging from 1.0 to 4.9 points, which also account for 61%.

- English for Business Communication - Module 2 (English –Module 2)

In this module, 61% of students have test scores below five, equating to 155 out of 255 exam tests with scores ranging from 1.0 to 4.9 points. The ratio of this score compared to the students of course 47 is 27%, or 127 out of 473 exam tests.

- *English for Business Communication - Module 3 (English – Module 3)*

The number of tests with scores ranging from 1.0 to 4.9 points is extremely high in this module for students enrolled in Course 46. With a total of 184 out of 228 exams, up to 81% of the exams have below-average test scores. However, this rate is even lower than that of 47th-course students, accounting for 85%, or 376 out of 444 exams with below-average scores.

- *English for Business Studies- Module 4. (English – Module 4)*

The percentage of exams with scores ranging from 1.0 to 4.9 points accounted for 21% of the total in this module, corresponding to 46 out of 224 exams.

5. Discussion and Conclusion

5.1. Discussion

As previously stated, the student's final grade is based on two main score columns: the midterm assessment score column and the final exam score column, each of which accounts for 50% of the final grade.

In this article, the authors will explain why the team does not assess the students' English ability through the results of the entire course, including the midterm assessment score and the final exam paper score, but instead, only analyzes the results of the final exam of each module to show the English ability of the students. As has been analyzed above in how teachers judge midterm grades for students, objectively, it can be found that: firstly, scores of the five EOU tests are done by students on the school's online learning system (LMS: 05 end-of-unit tests), and students are free to do these exercises anywhere and with anyone. As a result, it is difficult to judge their ability accurately through the assignments. Secondly, for the assessment of the attendance score, students only need to attend all the sessions as prescribed (12/12 sessions) to get the maximum score. It is said that this is not an impossible task for a hard-working student. Finally, there is the speaking test score or group presentation score, which is directly assessed by the classroom teacher, who acts as a judge when the groups in the class perform what they have previously prepared. In fact, it is unavoidable to include the subjective opinion of the examiner when marking oral exams, even though the examination criteria have been fully and clearly announced to the learners. These are also some of the subjective reasons the authors want to raise for the explanation.

In terms of the score of the final exam, it is easy to see that, of the four English modules that the students of course 46 have completed, most final tests get scores below 5, which accounted for more than half of the tests in the whole class; English Module 3 accounted for the highest percentage at 81%. When carrying out the research, the students of course 47 had only completed three of the four English modules mentioned above. However, the rate of low-scoring tests is quite high, even in English Module 3, where 85% of the tests have scores below five.

Students in both courses 46 and 47 have currently completed a total of seven final exams in English in accordance with the prescribed curriculum. Six of the seven exams were online. (With the exception of Course 46's English Module 1, which took the offline exam.)

According to the statistical results, the majority of final exams have less than five, which has made both of us, as the authors of the article and the lecturers who directly teach these students puzzled. In our opinion, firstly, it is difficult to conclude that students are still confused with the format of the test while they have been familiarized with this test format by practising the five EOU tests on the LMS, each of which is tested on the LMS at least twice. Secondly, it cannot be said that they have difficulty because they have to take the online test; in fact, they have been used to the online exam form since the end of 2019 when the COVID-19 epidemic first appeared in Vietnam.

For the reasons stated above, we have some concerns about whether the students' English competence is inadequate in comparison to the exam standards or because the exam questions are too complex for the students to answer. It is also claimed that in terms of the form of organizing the online exam, it is easier than taking the offline exam; the students can decide where to take the test, and there is no direct supervision by the examiner. As a result, they frequently have dependent attitudes and do not prepare effectively for the exam until the final exam began.

Within the scope of this research paper, the above are temporarily the subjective doubts of the author's team formed through the teaching process of observation and perception. Further research and more precise surveys are required to properly investigate and determine the causes of the low final test scores.

5.2. Recommendations and Conclusion

According to the statistics, the English abilities of non-English major students studying on campus, although having previously met the standard English requirements, qualify them to study at the school. However, the actual exam results show that the majority of students received scores below 5 on a scale of 10. The causes can be subjective or objective, such as the teacher, the program, the technique of compiling the final exam questions, the evaluation, and the students themselves. For these reasons, program developers, educators, and others must pay attention to the actual competency of students in order to create more relevant approaches for them.

One of the solutions proposed by the group is to first review the entire assessment process and the content of the final exam papers. The second option is to impose further restrictions, such as not allowing students to take the second final exam if their overall course grade is less than 5.0 and requiring students to re-register for the discipline in which they previously failed. (the same as the main campus of UEH is doing). In the hopes that students will no longer experience thoughts of neglect and dependence. We believe that it requires the great determination and desire of the whole school community to implement this policy with the aim of creating a more positive learning environment for students if they want to improve students' English abilities and high-quality human resources, which are critical for the development of the nation in order to meet the increasing demands for human resources for Vietnam's economic integration process.

SOLUTIONS TO IMPROVE ENGLISH SPEAKING SKILLS OF GEOGRAPHY STUDIES STUDENTS AT THE DEPARTMENT OF GEOGRAPHY, HO CHI MINH CITY UNIVERSITY OF EDUCATION

BA. Tran Dinh Khang

khangtd00@gmail.com

Faculty of Geography, University of Education, Ho Chi Minh City, Vietnam

Abstract

In the process of globalization, English proficiency is becoming more and more important to students in many aspects. Social science students, who are not majoring in English, need English proficiency the most, especially speaking skills. Therefore, this article aims to clarify the reality of English-speaking skills of students in Ho Chi Minh City University of Education (HCMUE), including three following majors: Geography Studies, Vietnamese Studies and International Studies. By making a survey, we collected valuable primary data. After making a comparison about English speaking skills among the three groups of students, we suggest appropriate and effective study solutions for students in Geography Studies in order to improve their English-speaking skills.

Keywords: *English speaking skills, social science students, Department of Geography.*

1. Introduction

Nowadays, in the era of globalization, English proficiency is becoming increasingly important for many aspects of students' lives. English not only provides students with opportunities for broad learning and research, allowing them to read and understand foreign documents, especially research documents that are not yet available or not deeply explored in their native countries, but also provides students with greater job opportunities after graduation, as English is now considered the international language of business.

According to Babbel - an online language-learning platform, currently there are nearly 7.5 billion people in the world, including over 1.5 billion English speakers (including both native and non-native speakers). The number of countries that speak English reaches up to 101, including major countries such as Australia, Canada, England, Ireland, New Zealand, Northern Ireland, the United States, and Wales.

In addition, countries such as Botswana, Cameroon, Fiji, Guam, Hong Kong, India, Kenya, Malaysia, Nigeria, the Philippines, Puerto Rico, Singapore, South Africa, and Zimbabwe recognize English as one of their official languages, most of which were once part of English-speaking countries. European countries with more than half of the population speaking English including Austria, Belgium, Cyprus, Denmark, Finland, Germany, Greece, Luxembourg, Malta, Slovenia, and Sweden.

The widespread distribution of English worldwide has made it one of the main languages used in the United Nations, in the process of trade between countries, businesses,

and companies to exchange work experience, production technology, manufacturing, cultural exchange, translation, and tourism, all of which require the use of English. Therefore, it can be affirmed that in the era of globalization, the ability to speak English is a great advantage for students and workers in this period of integration. Especially for non-language majors who are studying social sciences, job positions after graduation are fields that require the use of English such as tourism, media, public relations, event organization, and foreign affairs.

According to a study from the recruitment company Euro London, knowing and using a foreign language (especially English) fluently can increase an individual's income level by up to 15%. The more foreign languages one knows, the higher their income level and the more likely they are to be promoted to hold important positions in companies.

Nowadays, the Social Sciences sector in Vietnamese universities trains a workforce for fields that require strong English-speaking skills to develop personal careers and contribute to the growth of the businesses where individuals work. For example, Vietnamese Studies educates a workforce for research institutions, organizations that apply Vietnamese knowledge, tourism-related production and business, culture, and more. International Studies prepares a workforce for research institutions, organizations that apply international knowledge, production and business organizations, non-governmental organizations, foreign companies, multinational corporations, and international entities. Geography Studies educates a workforce to understand and research issues related to natural and socio-economic areas, and to work in training, research, and tourism management positions.

At Ho Chi Minh City University of Education, the three fields of Geography Studies, Vietnamese Studies, and International Studies share one job position in the tourism industry. Workers in this field need language skills, and good speaking skills are an opportunity to develop their careers. The jobs include tour guides, tour operators, and tourism advisors.

The ability to speak English can be considered a key to help workers improve their skills and develop their careers. For example, through contact and service provision to international visitors, a tour guide/tour operator will understand how to behave, welcome, and deal with more diverse situations than when dealing with domestic tourists who are Vietnamese. Additionally, English is also a key to increasing personal income and contributing to the development of businesses where individuals work.

If every tourism student can effectively use their English language skills in their work after graduation, it will not only benefit their personal development but also enhance the reputation of the businesses they work for. Having skilled and professional tour guides and advisors who are fluent in English will improve the credibility of these businesses, which in turn will boost the tourism industry in Vietnam. As a result, both the tourism industry and the overall economy of Vietnam will continue to grow, which is the goal of the authors.

For these reasons, the authors believe that it is necessary to conduct a survey of the English language proficiency of three majors (Geography Studies, Vietnamese Studies, and International Studies) at the Ho Chi Minh City University of Education. Through the survey results, the authors can evaluate the English language proficiency of Geography Studies students in comparison to Vietnamese Studies and International Studies. At the same time, the authors can identify the strengths, weaknesses, and difficulties of Geography Studies students in improving their English language skills. This will provide a foundation for the authors to propose appropriate learning methods and development strategies for English language proficiency for Geography Studies students in the Geography department.

2. Method

- Document analysis method:

The method of collecting and processing secondary data is important and necessary for scientific research in general. Using this method, the author's team has collected and synthesized materials from various sources such as textbooks, scientific journals, scientific research papers, master's theses, statistical data from domestic and foreign agencies... From these reputable and relevant reference sources to the research topic, the authors have a more comprehensive and intuitive view of the subject.

- Survey method:

The survey method was carried out by obtaining survey results based on a sample survey. The survey was conducted to assess the English-speaking skills of non-language major students in social sciences and humanities through an online survey and evaluating the survey results. From there, the author group could research, collect, and process data in a logical and scientific way, ensuring the objectivity of the survey results. The sample survey method chosen by the author group in the research project is "Probability Sampling Method - Stratified Random Sampling."

The survey sampling method was implemented as follows:

- Divide the population into groups according to one or more criteria related to the research purpose.
- In each group, use simple random sampling or systematic sampling to select units of the sample.
- The sample rate taken in each group is equal to the proportion of that group in the population.

The "Probability Sampling Method - Stratified Random Sampling" was chosen by the author group for the research project to ensure the representativeness of the survey and because of its convenience, low cost, and simplicity.

Table 1. The number of students joining the surveys

Course	Geography Studies			Vietnamese Studies			International Studies		
	Size	Ratio	Sample size	Size	Ratio	Sample size	Size	Ratio	Sample size
42	-	-	-	84	0.20	17	110	0.19	21
43	29	0.27	8	137	0.33	46	150	0.26	39
44	49	0.45	22	100	0.24	24	160	0.27	44
45	33	0.30	10	88	0.21	19	160	0.27	44
Total	111	-	40	409	-	106	580	-	148

3. Results

- Students' opinion about the importance of English proficiency and English-speaking skills

Over 97% of students from all three majors agree and strongly agree that English proficiency and English-speaking skills are important for their future careers. The majority of students from all three majors believe that speaking skills are the most important skills and that study habits have the most influence on English speaking skills.

Nearly three-fourths of students from all three majors believe that establishing clubs or groups for the purpose of practicing and improving English speaking skills is necessary and very necessary. Over 50% of students from all three majors believe that group studying is the most important form of learning to develop English speaking skills.

Over 60% of students from all three majors believe that the purpose of learning English is to serve their future careers after graduation. More than half of Geography Studies students believe that listening skills are the most difficult, while nearly three-fourths of Vietnamese major students and over half of International Relations students believe that speaking skills are the most difficult.

The majority of Geography Studies students spend less than 30 minutes per week studying English, while Vietnamese major and International Relations students who participated in the survey spend about 1 hour. However, the proportion of Geography Studies students who spend more than 2 hours per week studying English is higher than that of Vietnamese major students (20.2% > 14.2%) and nearly double the proportion of International Relations students who participated in the survey (9.5%).

- English certificates

Table 2. Students' English certificates

Certificate	IELTS		TOEFL		TOEIC 4 skills		TOEIC 2 skills		CEFR	
	Number	Average score	Number	Average score	Number	Average score	Number	Average score	Number	Level
Geography Studies	2	5.5	0	-	0	-	0	-	1	B1
Vietnamese Studies	1	6.5	0	-	0	-	6	522	0	-
International Studies	7	5.86	0	-	0	-	6	676	1	B1
									3	B2

Table 2 shows that the proportion of students with English language certificates is not high: the highest percentage is found among International Studies students, but it only accounts for 10.8%, while the percentages for Geography Studies and Vietnamese Studies are 7.5% and 6.6%, respectively.

The highest average IELTS score belongs to Vietnamese Studies students, followed by International Studies students and Geography Studies students ($6.2 > 5.9 > 5.5$). However, the number of students with IELTS certificates in Vietnamese Studies is the lowest, followed by Geography Studies and highest in International Studies ($1 < 2 < 7$). The highest average TOEIC score in Listening and Reading belongs to International Studies students, followed by Geography Studies students and Vietnamese Studies students ($676 > 522$). There are no Geography Studies students with TOEIC certificates in both Listening and Reading.

No Vietnamese Studies students participating in the survey have CEFR certificates, while in Geography Studies, there is one student with a B1 level CEFR certificate, and in International Studies, there are four students with one B1 level CEFR certificate and three B2 level CEFR certificates.

Among the three majors, International Studies students have the most impressive number of certificates and average scores. None of the three majors have students with TOEIC 4 skills (Listening, Reading, Speaking, Writing) and TOEFL certificates. Since the TOEIC 2 skills (Listening and Reading) are not directly related to speaking skills, they can only reflect students' vocabulary and grammar proficiency, which can serve as a basis for proposing learning methods to develop students' speaking skills.

The certificate data partly reflects students' speaking skills, but it cannot fully represent the overall situation because there may be cases of students who have good speaking skills but have not taken the language proficiency test (although this proportion is usually not significant). However, the proportion of students with language certificates in all three majors is still low, and the number of students with certificates achieving good scores is also very low. Overall, it can be concluded that the current situation regarding students' English-speaking skills in all three majors is not promising enough to meet the professional requirements after graduation, regardless of whether they have language certificates or not.

- English speaking skills assessment

* *English speaking skills*

Table 3. Students' assessment of their own English-speaking skills

Assessment level of English-speaking skills	Very weak	Weak	Neutral	Good	Very good
Major					
Geography Studies	2 (5%)	9 (22.5%)	23 (57.5%)	6 (15%)	0 (0%)
Vietnamese Studies	8 (7.5%)	30 (28.3%)	53 (50%)	15 (14.2%)	0 (0%)
International Studies	6 (4%)	15 (10.1%)	88 (59.5%)	38 (25.7%)	1 (0.7%)

More than 50% of the surveyed students from 3 majors rated their speaking skills as average. Only one International Studies student self-assessed their English-speaking skills as good. The proportion of students who assessed their English-speaking skills as fair in the International Studies major (25.7%) was higher than that of Geography Studies (15%) and Vietnamese Studies (14.2%) majors. However, the proportion of students who assessed their English-speaking skills as poor in the Geography Studies (22.5%) and Vietnamese Studies (28.3%) majors were similar to each other and higher than that of International Studies (10.1%).

* *Psychological factors*

Table 4. Students' confidence in the elements affecting English speaking skills

Elements	Students have the MOST confidence			Students have the LEAST confidence		
	Vocabulary	Grammar	Pronunciation	Vocabulary	Grammar	Pronunciation
Geography Studies	14 (35%)	12 (30%)	14 (35%)	10 (25%)	12 (30%)	18 (45%)
Vietnamese Studies	36 (34%)	38 (35.8%)	32 (30.2%)	43 (40.6%)	33 (31.1%)	30 (28.3%)
International Studies	56 (37.8%)	60 (40.6%)	32 (21.6%)	61 (41.2%)	35 (23.7%)	52 (35.1%)

The Geography Studies students were the most confident in the vocabulary and pronunciation factors, while in Vietnamese Studies and International Studies, the grammar factor was the least confident. As for the factor that students were least confident in, the highest proportion of Geography Studies students lacked confidence in pronunciation, while in Vietnamese Studies and International Studies, it was vocabulary. However, the factor that had the highest proportion in all three majors was not significantly higher than the other two factors.

- Solutions to improve English speaking skills of Geography Studies students

* *For Geography Studies students*

- *Study awareness*: Study awareness is considered the foremost important factor that determines whether students achieve their goals of developing good English-speaking skills or not. At the Geography Department, students should participate in sharing sessions between lecturers and students on the importance of English proficiency and speaking skills in the era of integration. Moreover, students should refer to official information sources of the department to reinforce their English learning awareness. Additionally, they should participate, maintain and promote the spirit of the English for Geography Contest, a representative English contest of the department, to learn and develop their speaking skills under the guidance of the contest's judges, who are also lecturers.

- *Study time*: Arranging time for studying, practicing, and completing set goals is extremely necessary. Spending too little time on studying will not bring effective results as

much as dedicating more time. Students should balance between different activities and studying, practicing English speaking skills. They should spend at least 30 minutes a day studying English and set study slogans such as "5 vocabulary words per day" or "1 grammar point per day" to make their learning journey more specific.

- *Personal plan*: Setting the ultimate goal of learning and practicing English speaking skills leads to smaller goals in the learning journey that depend on each student's personal plan. Students need to answer their own question "What do I need English speaking skills for?" to set goals in their learning and practicing English speaking skills. This will create a higher motivation for studying than studying without any plans or goals.

- *Learning methods*: Learning methods are the decisive factors in each student's learning journey. Regarding learning and practicing English speaking skills, there are numerous methods that students can apply. Therefore, finding a suitable learning method for oneself is key to making English learning and speaking skill practice effective. Specifically:

+ *Study in groups*: Each individual participating in a study group will have different English proficiency levels and each individual also has a different purpose for learning English. Therefore, when studying in groups, the task is to set a common goal for the whole group to aim for. When studying in groups, especially practicing speaking skills in groups, it will help us develop a reflex in the form of English that is here together with familiar friends, creating a comfortable feeling and avoiding initial shyness. From there, students learn useful things from others and can share what they know with everyone and help each other improve their English-speaking ability.

+ *Classroom learning*: Vocabulary, grammar, and pronunciation training when learning English achieve high effectiveness when applying this learning method because the learning process is directly supported and scientifically accurate by instructors. Students should apply this learning method more and actively ask questions to the instructor to clarify their doubts, reinforce their knowledge throughout the learning process without worrying, being confused about the accuracy of the answer as in a study group (no professional instructor). At the same time, students can also interact with other students in the same class to learn together, develop and create a communication environment, and practice English speaking skills under the guidance of the instructor.

+ *Online learning*: When learning English in general, applying online learning will save time for students because they don't have to spend time traveling to study points, while still ensuring all the characteristics of studying in groups and in classes when applying this learning method. The disadvantage of this learning method is that when the connection is unstable, it will cause missed knowledge or interrupt the exchange and Q&A during the learning process, affecting learning efficiency. This is something that students need to pay attention to.

+ *Offline learning*: Students should often apply this traditional learning method because although it consumes the learner's travel time to study points, it does not cause any risks related to network connection that affect learning efficiency as online learning does because this learning method is not associated with the concept of distance and online learning.

Currently, students have many methods and forms of learning and practicing various English language skills. The development of the subjective creativity and ability to support and create good forms of English language learning objectively in schools and society will be a good premise to enhance the ability to practice speaking English for students.

At Ho Chi Minh City University of Education, students in general and Geography Studies students have access to 3 English language courses at B1 level (Level 3/6 according to the Vietnamese Language Proficiency Framework) where the teaching process integrates all 4 skills: listening, speaking, reading, and writing. Among these skills, speaking is emphasized by the lecturers who create communicative learning forms in English. Here, students have the opportunity to practice and improve their speaking skills by organizing group learning forms, participating in the school's English communication clubs.

- *Real learning environment*: In order to develop English speaking skills, especially for future career purposes (tourism industry), Geography Studies students need to actively seek a real learning environment to become familiar with the job. Students should participate in internships and job-related English language practice in tourism companies, restaurants, hotels that require English language skills. In addition, students should actively seek a practical learning environment outside of the faculty and school by participating in activities organized by the Department of Tourism, as well as participating in competitions and activities of non-governmental organizations related to tourism.

- *Learning space*: Creating a good learning space will help students maximize their time and effectiveness in learning and practicing speaking English, whether in group learning, class learning, online or offline. Students should create a comfortable space for themselves to feel excited about developing their speaking skills, which will then maximize their learning effectiveness. For example, in group learning, students should use any comfortable space such as their home, lobby, stone benches, parks, anywhere they feel inspired to learn. At Ho Chi Minh City University of Education, there are always learning spaces for students such as self-study areas, exchange and sharing spaces at English club meetings.

- *Learning mindset*: Learning is an endless process of creativity and thinking. Ask what you don't know and explore what you're not sure of. If there are things that you don't know or aren't clear about during your learning process, search for answers by asking questions. Ask your teachers, friends, search the internet or look for information in books. By all means, develop a habit of thinking and asking questions about the things you don't know or understand. This is how students can progress and improve their English-speaking skills through learning and practicing.

- *Perseverance in learning*: English is a language, it is not a problem to be solved or a movie to be watched in a few hours or days. Mastering a language is a long journey that requires persistence and overcoming oneself. As mentioned in the goal setting section above, be persistent in achieving every learning goal you set for yourself, from short-term to long-

term. Don't rush in practicing your English-speaking skills, as students may easily burn out. Persistence is the guiding principle, try your best to complete each short-term goal, until one day you will see a significant improvement in your English-speaking skills.

- *Taking notes and listening*: Speaking English means using English to communicate in daily life and work. Therefore, take notes of frequently encountered English words, important grammar rules, words that are easy to forget or confuse. Take notes everywhere and place them in a visible place for you to remember. This is a useful daily learning technique that you can apply to develop your English-speaking skills. To develop good English-speaking skills, students need to develop good listening skills to serve the interactive speaking format. Listen carefully to English lectures, how actors pronounce English in movies, how singers sing English songs, and how native speakers speak English... to train your listening skills. This is also a good opportunity to practice your pronunciation and intonation, as you can adjust your pronunciation and intonation to be as close as possible to that of native speakers.

- *Learning everywhere*: Learning is a lifelong process, and the ultimate goal of improving English speaking skills is to serve many other purposes in the future. Therefore, try to practice speaking English everywhere. In addition to reliable sources such as books, with the Internet, you can easily look up information, but make use of all resources, not just the Internet. It could be textbooks, newspapers, magazines... Or simply everyday entertainment methods like watching movies, listening to music, or watching news...

- *Learning and sharing*: When we have an apple and we give it to each other, each person only has one apple. But when each of us has a stream of knowledge and we share it with each other, it will create many different streams of knowledge because knowledge is endless. Learning and improving English speaking skills are also similar, learning from others or sharing your own knowledge with others also helps us improve, master, and expand our English-speaking skills.

- *Practice goes hand in hand with learning*: Speaking English is a skill that requires practice. Because if students only learn through one-way methods without multidirectional communication and practice speaking English, they will not be able to develop this skill. Actively create an English-speaking environment, use English with friends around you, or interact, make friends to communicate with international friends through social networks, etc.

* *For the Department of Geography and Ho Chi Minh city University of Education*

Within the Faculty of Geography and the Ho Chi Minh City University of Education, the establishment of academic English clubs for students is a very meaningful and practical way to develop students' English language skills in general and speaking skills in particular. Recognizing this, the Faculty of English at the University of Education in Ho Chi Minh City established the HCMUE English Zone Club (formerly HCMUP English Club) at the

beginning of the 2013-2014 academic year. This English academic club regularly organizes a variety of activities, events, and contests on different topics in daily life in English. The club aims to create an English-speaking environment for students both inside and outside the university. If the club's communication activities and events continue to be effective and attract more students from different majors, both linguistics and non-linguistics, it promises to be a more beneficial playground than ever before.

In addition to the above general English academic club, it is recommended to establish another English academic club specifically for non-linguistics students in the Faculty of Social Sciences. This club should regularly organize activities, events, and contests related to students' career opportunities in English, focusing on topics related to tourism, culture, history, and international issues. Through this, non-linguistics students both inside and outside the university will have the opportunity to develop their English language skills for future work.

At the department level, the Geography Department holds an annual English for Geography Contest at the end of the second semester, starting in the 2017-2018 academic year. This academic contest is organized to improve the English language skills of Geography Studies students, with content revolving around natural geography, economics, society, and tourism, attracting a large number of student participants.

The authors hope that the leadership of the Department of Geography at Ho Chi Minh City University of Education will maintain and promote the spirit of this competition, as well as increase communication measures so that students both inside and outside the department who are passionate about geography and tourism have the opportunity to participate in order to improve their English proficiency. In addition, there should be more English competitions related to tourism business, such as dealing with situations in tourism, presenting about tourist attractions and cities, in order to train students' vocational skills in an English-speaking environment. This will be very useful for students because it not only helps to improve their English proficiency but also familiarizes them with the job that their major is aimed towards. In addition, during the students' learning process, the teachers are the most significant factor that can influence their English proficiency and speaking skills. Therefore, during the teaching process, the teachers can provide opportunities for students to learn English through looking up terminology, referencing materials, presenting in English based on students' abilities, and encouraging them with bonus points to motivate them to study harder, getting closer to common English and the field of geography and tourism in particular.

** For the Youth Union and Student Association at the Department of Geography*

In the current process of globalization, English is the prerequisite for individuals to integrate and become global citizens. Therefore, "The mission of the university" is to help students integrate well, and English is not only important for Geography Studies students but also for all students at Ho Chi Minh City University of Education.

In order to promote the spirit of "Good learning" and "Good integration" - 2/5 criteria for the title "Excellent student", the Youth Union and Student Association of the Department of Geography at Ho Chi Minh City University of Education has implemented enthusiastically and effectively communication measures to encourage students' English learning spirit in the department. Encourage students to participate in academic activities related to English, recently typified by the activities "Creating English flashcards", "Translating scientific articles on research topics"... It can be said that thanks to the efforts of the Union and Association, Geography Studies students increasingly realize the importance of English for their study and work career.

The authors hope that the leadership levels of the Youth Union and Student Association of the Department of Geography at Ho Chi Minh City University of Education will continue to encourage students to learn English, organize more English learning activities such as pronunciation practice, grammar chart construction... in addition to vocabulary learning and English translation activities for students. Join hands towards the goal of developing English language proficiency and speaking skills for Geography Studies students in particular and non-language majors in Social Sciences in general.

4. Discussion and Conclusion

Geography Studies students recognize the importance of English language proficiency in general and speaking skills in particular. They consider speaking skills to be the most important and listening skills to be the most difficult. Most students believe that establishing clubs (associations, groups) to practice English is necessary, and they feel that group learning is the most important form of learning to develop their English-speaking skills. The majority of students study English to serve their future careers, and they consider learning consciousness to be the most important factor when studying. An interesting point is that the percentage of Geography Studies students with English language certificates is low (about 5.5%), which is the lowest among the three social science fields surveyed in the study (Vietnam studies 6.6% and International Studies 10.8%).

Most Geography Studies students rate their English-speaking skills as average, just like Vietnam studies and International Studies students. The majority of students spend less than 30 minutes a week studying English. Geography Studies students are most confident about their vocabulary skills, which is completely different from the two other fields where grammar is the most confident skill. It is hoped that the proposed learning methods and English-speaking skill development suggestions in the research will help Geography Studies students in the Geography Department to determine their own learning methods. If students identify what they need to learn and how to learn and practice seriously, their English-speaking skills will undoubtedly make significant progress in the near future.

THE SAYINGS OF KACHIN ELDERS' IMPACT ON KACHIN SOCIETY

Dr. K. Roi Ja

rojajakumje9@gmail.com

*Head of Philosophy Department, University of Myitkyina,
Kachin State, Northern Myanmar*

Abstract

This paper is an attempt to point out the ethical values from Kachin elders' sayings. Sayings give advice about life and general truth. Kachin has custom, manner, principles, belief, morality, daily habits, sayings and attitudes. Human being learnt from the experience of their forefather and followed the traditional ways. Elders can guide and give advice to the young generation with the sayings, that the way to benefit and loss, right and wrong, just and unjust, fair and unfair, good and bad, is and ought and dos and don'ts. So the young generation will adapt himself to correct his faults and wrong ways and do what is right from past experience. Some of the Kachin elders' sayings can provide guidelines for their ways of life. Sayings are guidelines of action and adjustment for the life of the group. The aim of this paper is to organize the various ethical and moral views found in Kachin elders' sayings to gain some understanding of the general social outlook.

Keywords: *Admonish, Advice, Good livelihood, Social duty.*

1. Introduction

Kachin who mostly live in Northern Myanmar is one of the nationalities in the Myanmar family. Kachin has distinct cultural systems which were handed down from their ancient ancestors. They love and greatly respect their culture which has been conserve and sustain since ancient times.

Society is an organized group who has agreed to live together according to certain rules for the survival and existence of the individual and family. But to improve economic life knowledge and experience is necessary for from this human being learn how to improve provision of not only basic needs but also to live a better life.

There is a saying in Myanmar literature, "If the culture is lost the race will be lost." So, we must care, and preserve and protect our culture which is valuable heritage obtained from our elders and ancestors.

According to Robert Alan, culture can be defined as follows:

"Culture differences should not separate us from each other, but rather cultural diversity brings a collective strength that can benefit all of humanity."

Culture therefore includes all ways of life. Culture is a value concept and it stands for utilities and activities which are beneficial to the enrichment of human life. So, we should

keep and preserve every part of culture. Every race, every ethnic people and every nationality has its own culture. As there are so many nationalities in the world, there are different kinds of culture can be found in the world. Generally, cultures can be divided into two, Eastern and Western culture. The two cultures are not the same due to the different customs, different beliefs, different perceptions, different religions and different values. If we failed to love and preserve our cultural life, we will lose our nationality, identity, our country and finally our sovereignty.

They are the invaluable heritage and pride of the respective race. Through culture, they have built unity, love, peace, contentment, compassion, happiness among their nationalities. While they respect their institutions and culture, they also live together with other races and ethnic groups in peace and friendship. This is an admirable character of the Kachin peoples. The Kachin culture is an ancient one and there have been anthropological studies of their traditions and culture, but there has not yet been any study of their ethics and moral traditions.

Ethics is the study of morality. Besides, it studies and investigates the nature, meaning and definition of ethical terms such as good, bad, justice, injustice, moral, immoral, right, and wrong. It studies the moral behavior and lays down guiding principles to distinguish between good conduct and bad conduct. Ethics is a part of philosophy as well as an important part of culture. They are intimately related. In this way, ethics can make men and society better and more harmonious. So, it relates to culture and ethics. It shows the enrichment of Kachin culture which is descended from their elders. Kachin has a distinct and advanced culture of their own and it can be seen Kachin elders' sayings concerning morality, sayings concerning social duty, sayings concerning livelihood, some other general sayings.

The existence of an ethnic group and its society is related to the development of its culture including the spiritual forces of its society. Kachin, a nationality of Myanmar, has its own historical and traditional systems of institutions, customs, thoughts, creed, art and language etc. ... These cultures, as enriched heritage, have been handed down from their elders and ancestors. They are the pride and glory of the Kachin.

Kachin are important in the development of Kachin culture. The genesis of Kachin is not shown clearly. It is based on legend. But even legend is said to be the sources of culture. Sayings arise from experiences. Sayings are reflection from daily happenings and events. Some sayings refer to well- based events of the experience right and wrong that to guide what humans ought to do, obligation, duty, benefits to society, fairness and specific virtues.

Some sayings are adequate principles of moralities because they are supported by consistent and well-founded reasons. Some sayings also refer to development of personal ethical standards as well as community ethics, in terms of behavior, feelings, laws, social habits and norms which can deviate from more universal ethical standards.

Sayings are continuous effort of studying of our own moral beliefs and conduct. We are striving to ensure our community and the institutions we try to shape, lift up to our standards. Some sayings are reasonable and solidly based for the progress of the moral of humans being and society. Sayings are reflection from humans' attitudes. Some sayings are accessories for speech and preach.

2. Method

This paper has been used Descriptive Method, and the Evaluative Method.

3. Results

Ethics is the study of the basic principles that underlie moral rules and also tries to identify moral values and the true values of life. The aim and objective of this paper is to show how Kachin elders' sayings contribute to uplift moral and morality of Kachin peoples. It will be supported to preserve the traditional culture and to build love and unity in society.

Some traditional Kachin elders' sayings

Kachin elders still admonish the younger with sayings. The following sayings are concerning morality. Some are dealing with social duty and manners some are related to business and how to earn a good livelihood and some others are more or less general.

Sayings Concerning Morality

There are some sayings concerning morality in traditional Kachin elders' sayings.

(1) *N gup gaw bawlaw, lata gaw lagyaw (Kachin)*

He who speaks boastfully but does nothing.

Meaning: It implies that one should speak less and do more.

Talk less action more.

(2) *Apu magaw ai hpe mu tim, amyit magaw ai gaw n mu ai (Kachin)*

We cannot see the ill will of a person even if we can see her coiled intestine.

Meaning: A persons' may hide his or her ill will. It is hard to judge a person's mind or character through a person's behaviour. It would in fact be easier to see his or her intestines. A persons' may be all smile but may be hiding evil thoughts. It A persons' may be all smile but may be hiding evil thoughts. may be just pretense. It warns us to beware of such person and also not to behave like such a person. One should be frank and honest when dealing with others. If members of a society are all full of such presence they are being dishonest and a society of such dishonest people will not prosper.

This is the moral lesson of the saying.

(3) *Tinang mara gaw magap, masha wa a mara gaw shadap (Kachin)*

Cover own mistakes and reveal mistakes made by others.

Meaning: The person who finds faults in others of covers his own fails and weaknesses. Human beings are weak-they are full of greed, hatred and jealousy. Everyone more or less has done something bad. So, one should not pretend to be virtuous and talk ill of the sins of others. It is a moral lesson in sympathy and compassion which are moral values.

(4) *Du Ke ai she ra ai, myit magaw nra ai (Kachin)*

People may have the same kind of shoulders but their mental make up is different.

Meaning: A human being may have the same physical form but they differ in attitude, deeds, ideas and thoughts. That is why there are people who are clever or stupid, moral or immoral, bad-tempered or good-tempered and so on. It teaches one to make allowances for human nature. It teaches us to have good will and sympathy.

(5) *Ma hpe kayat ai gaw shingna, myit su ni hpe kayat ai gaw tara (Kachin)*

Children are punished with a stick and elders with the law.

Meaning: It is a warning for us not to evil deeds. This saying shows that people do wrong in spite of the moral rules of conduct laid down by their society. People have freedom of choice and when they are motivated by extreme greed, hatred or envy, they will forget about what is good or right and commit crimes; they will rob, kill, steal or injure others. So to prevent this society needs laws to supplement morality and protect innocent people in society. Just as a child who is naughty with a stick, so an adult will be punished by the law.

(6) *Jum jat yang hka ai, ga lai yang bra ai (Kachin)*

Too much salt will make eat salty. Too many words will break friendship.

Meaning: Here again is a warning not to go to extremes. There is also a further word of caution not to talk too much. There is also a Myanmar saying: "If your foot goes through the floor boards it can be extracted. But when your mouth lets slip too many words they cannot be withdrawn. Words spoken carelessly, without thought can hurt other's feelings which means friendship is broken and a friend becomes an enemy. The power of words is great. It can lead to happiness or misery. Words can break down moral behaviour and social stability.

These sayings in essence are rules for moral conduct. They point out the difference between good and bad, right and wrong, justice, and injustice are found in traditional Kachin elders' sayings.

Sayings Concerning Social Duty

In addition to the sayings on morality, there are other sayings which guide the people to maintain harmonious relations and for the smooth functioning of society.

(1) *Tsi Kaja gaw hka, jinghku ga gaw hta (Kachin)*

Good medicine is bitter, and the words of relatives are admonitions.

Meaning - It means if a medicine is bitter, it is a good medicine that will cure disease. So also, pay attention to the words of relatives. They are admonitions for your welfare. This is a lesson for young people.

(2) *Bawng hkut sai bungli gaw, mara ningtsi ai (Kachin)*

A work carried out after much discussion cannot be faulted even if it goes wrong.

Meaning - It urges that before doing an important job, it is wiser to discuss it with others. For many heads are better than one. It is also the first step in democracy.

(3) *Aga nau tai yang shabyi bum, ashi nau htawn yang kaya hkrum (Kachin)*

Too much react leads to swollen cheeks and gossiping is shameful.

Meaning - This is a very wise saying. When people gossip, it leads to disunity in society. Gossip and rumors can lead to a break-down of society.

(4) *Sa jang danam du hkra sa ra ai (Kachin)*

Escort a guest to the jetty. (Do not say good-bye at the door).

Meaning - If you wish to help others do it with good will till you have fulfilled all that is required. This will maintain friendly relations.

(5) *Du Kajawng yang mare bya (Kachin)*

If a leader is frightened, the village will be ruined.

Meaning - To be chief one has to have all the qualities of leadership and the most important is not to be cowardly. Leader and chief must be brave.

(6) *Sara law yang adap mat (Kachin)*

Too many instructors will make the kitchen vanish.

Meaning - This is similar to the English proverb "Too many cooks spoil the broth" and the Myanmar equivalent. "Too many physicians will lead to the death of the patient".

The tendency of human is always to seek the benefit of self. But as he is part of human society, one must be good to others so that others will be kind to you in turn. That there must be certain codes of conduct for man-in-society is undeniable. These sayings show clearly the sense of social responsibility of the peoples.

Sayings Concerning Livelihood

In traditional Kachin elders' sayings that gives advice on the best way to earn a livelihood.

(1) *Myitsu hpe hkum tat, hkanu hpe hkum pat (Kachin)*

Do not lose a wise man, do not block the river.

Meaning - If we block a river we have no water to use. Similarly, if we do not approach a wise man we get no advice to improve, our welfare. In earning livelihood whether as a farmer or trader one should always have wise men around you and listen to their counsel and remind.

(2) *Manang hte chyu chyai, tinang na amu hprai (Kachin)*

If you spend time only having, fun with friends, you will never successfully finish a job.

Meaning - This saying wants to remind us like this "work while you work, play while you play, that's the way to be happy and gay."

(3) *Madu Lagawn yang aga si ai (Kachin)*

If the master himself is lazy, his workmen will not work.

Meaning - It shows masters or leaders must set a good example to his employees and work diligently.

(4) *Hpu nau myit hkrum hpyen n shang, ula myit hkrum sharaw n dang (Kachin)*

If brothers are united no enemy can divide them. Unity even among bulls can overcome a tiger.

Meaning - It shows that unity is strength. This is true of a family, a community a race and a nation. We should try to have a union spirit and cooperation in every works.

(5) *Jum shanam gaw shum, tsup ni lahpa gaw Lum (Kachin)*

Salt and ginger make the curry tasty. So also, old clothes can give warmth. Meaning - It shows the value of the small things or old things. The small things or old things should not be discarded for they can be useful.

These sayings are shown concerning livelihood from traditional Kachin elder's sayings.

General Sayings

There are some other general sayings that give knowledge and wisdom.

(1) *Bu midu, zai mi mu (Kachin)*

Traveling gives us knowledge.

Meaning - If we travel places we can know many things from many places. A well-traveled person has wider experience and greater knowledge.

(2) *Hpawt ni ngu ai gaw galoi n htum lu ai (Kachin)*

Never ending tomorrow.

Meaning - We should not delay our work. Today's work should be finished today. The future is endless, so do not procrastinate.

(3) *Hka Ka-ang e she, sham bat daw ai (Kachin)*

The oar broke in the middle of the river or lake.

Meaning - This reminds us that man is not master of everything. There are situations where it is best not to resist, but go with the tide.

(4) *Hka rum gaw wu ai, du salang gaw daru ai (Kachin)*

Like hearing the sound of a water fall, one will always hear the voice of elders giving advice.

Meaning - One should always listen to the advice of elders who are wiser and more experienced.

(5) *Lamu mung n na marang htu, maran htu nna Lam manen, Lam manen nna ka taw ai (Kachin)*

It rains because it is cloudy. It is slippery because of the rain and one falls down because the road is slippery.

Meaning - It shows the habit of always giving excuses or reasons. Another interpretation is that there is a chain of causes that leads one to fall down. If one has knowledge of causal relations, mishaps can be avoided.

(6) *Sa mit hkrat hku Kadai npat (Kachin)*

One does not patch a hole made by a needle.

Meaning - It means small matters should not be exaggerated.

Discussion

- These valuable sayings are becoming lost gradually and need to be maintained by used in speech, seminars, and use as teaching course in schools.

- Other Western and Eastern sayings can be found ethical instructions for relation to each other's, so it also need to be taught in schools.

- Sayings are short and can easy to get understand and recall.

- From sayings we can get autonomy moral philosophy.

- It can be found the values like, wise advice, help each other, respect, cooperation, obedience, get some good ideas and unity from Kachin elders' sayings.

- By learning sayings, we can get a wide- ranging knowledge and make ourselves to get a better life.

4. Conclusion

Nothing is more important than living a good life. Our thoughts are the seeds of our lives. Our actions and words are our methods of planting those seed. Our actions and words establish our standards of living. Our lives will always go to the level of our conversations. With our words and actions, we constantly paint a public picture of our own inner selves. We will discover how to actually action ourselves to the top.

Primitive man followed the traditional ways. The same ways of methods are called sayings. These sayings passed down from one generation to precede generations by applying to become guide-line and by practicing the ways to have a good life. The individual ways of action, feeling and thinking are controlled by the group. All the morality depends upon the group and the social development.

The past can point out the win and the loss, right and wrong, just and unjust, fair and unfair, good and bad, is and ought and do's and don't. If man has made progresses in the past, then he will also make progresses in the future. The future depends on the past time. Sayings passed down from parents to children, old aged ones to young ones by instructions, imitations, duties, responsibilities, tradition, obligations and morality, and they become a powerful society force moral.

These sayings are old and venerable because we believe that they serve the needs of living generations and have inherent worthy. Sayings are the outcome of past experiences and reflections, and there is no immediate need to question their wisdom. Some sayings remind us how to practice good ways and how to avoid bad ways in our works.

We should discuss each other before any problem occurs. We ought to give complete help others. Small matter should not be made into problems. We should not find faults without any reason. Good deeds are loved by all. Some sayings show about human social situations and it can be followed and practiced.

It is a necessity to approach a wise man to improve. We should have to listen to our relatives' words as those are precious preaching. We should rather observe us owns mistake than point out other's faults. We are also not to neglect the small things or the old things far they are useful in some ways. Some people dare to give excuses or reasons. It is not the good habit.

So, mentioned above all the sayings can apply in our daily life. All these Kachin elders' sayings can guide us as a moral philosophy to have a good life for the Kachin society.

HOME INDUSTRY OF WEAVING AND CULTURAL VALUES IN MYITKYINA, KACHIN STATE, MYANMAR

Prof. Dr. Seng Aung
sengaung@gmail.com

Department of Geography, University of Myitkyina, Myanmar

Abstract

Human work is influenced by natural environment, thinking and behavior patterns. Weaving as a result of human culture is considered as an important. This study aims to describe the development of weaving as home industry form of management. There are several areas textile cottages can be studied in Myitkyina. Traditional textile cottages such as weaving, garments both man and woman (by both hands and machines) can be studied. Many ethnic people prefer wearing Kachin traditional weaving materials due to fit local climate. Historically, the Kachin people practiced in the form of textile production for family and sociological needs which later in the century developed into a form of market scale production. Materials needed for weaving were obtained from the natural forest leading to the appearance of hand-woven fabrics weaving. Then, the economic interests of textiles in the Myitkyina lead to a variety of materials with new designs. Research problems have been formulated as: How is the development of Kachin traditional weaving products? How the field of design and trade? The purpose of this study is to discuss the status of Kachin cultural weaving and production scale to be able to more qualified and scientific manner.

Keywords: *traditional textile, culture pattern, economic interests, production scale.*

1. Introduction

Myitkyina, Capital of Kachin State, owns natural environment and human resources for traditional weaving in home weaving industries. Native people are historically creative and talented and skills in the weaving traditional handicrafts and creates home industries. The creativity comes from relationship with their daily livelihoods and natural environment. Their experiences are causing skills and individual has the potential for job creation through the generations. Creative industries such as blacksmithing, gold and silver smiting, pottery, wood carving, are including as typical examples in human history and local environments. The weaving fabric is traditionally carried out by age old women of descendant ethic communities and has become part of their daily activities. To make cultural fabric, dyes are needed which will give a pattern as colour. Variety of plants and animals were used as symbols that have meaningful, beautiful and brilliant colors then relationship with natural environment they live. The used of dyes derived from plants and animals had been used for interpretation of human history. These were widely used from the leaves of plants obtained from the forest.

This study aims to describe the traditional weaving of home industry in Myitkyina Kachin State; design forms of the history of Kachin culture; and suitable management to

applied international trade. This study also aims to focus on the community development of traditional textiles, which is a potential source for local economies, contributing to increase the value of the material, and cultural identity. Local silk handloom textile production in Shatapru ward, Myitkyina and the wear of silk fabrics to be studied as ethnical sources of Kachin culture. The objective of this study is the point of cultural and traditional awareness, which try to maintain cultural symbols, traditional patterns and designs and promote quality and quantity for local, regional and international markets scales in home industries. This study is expected to emit reference needs for public creativity in general and also expected to be able to further improvement in the construction of the community development.

2. Method

This study used a qualitative research method where the data obtained from observations, interviews, literature reviews, and documentation is presented in descriptive form. The materials used in this study are digital cameras and writing in computer accessories. Interviews with weavers and owners of the home industry, the local silk producers, and weavers have been carrying through in the 2020s in weaving as primary resources. Analysis of the data used in the form of presentation of data, discussion, and conclusion to evaluate the impact of local textiles on culture designs.

3. Results

3.1. Weaving history

The history of weaving culture is evidence regarding ornaments that the people have characteristics in several ways, both in daily life and customs. According to F. Adiatmono (2017), describes clothing model consists of daily clothes, clothing for cultural ceremonies, clothing for worship, and war clothing. In essence, the meaning in the form of clothing is the result of reflection of the world in his life.

The history of Kachin culture has anthropogenic characteristics in both daily life and customs. In the art of anthropological field of weaving by designing and its relationship with the creator of the cultural patterns are based on descendant history of Kachin people that now indicate a history and weaving can be a function of social, economic, and aesthetic history. The colour and patterns describe that the Kachin clothing model consists of daily life or livelihood, clothing for cultural ceremonies (Manau Festible), clothing for worship (spiritual), and war clothing etc. In essence the meaning of clothing and patterns are the result of reflection of the cultural life and related to the presence of weaving and anthropological art of artistic activities. The craft weaving is made by hand that made from yarn and is very beautiful traditional origin. This type of applied art focuses on hand skills to process raw materials around the environment into functional and aesthetic value. Age old women have a lot of expertise in traditional weaving and cultural patterns to produce a product for necessities and marketing needs.

The history of weaving in Kachin, it can be identified through several factors as follows:

1. Cultural meaning patterns:

Weaving has been passing down from generation to generation. Culture is based on many complex elements, including the system of livelihoods, religion, customs, language, clothing, buildings, politics, and works of art. Culture is a comprehensive lifestyle and social activities.

2. Economic functions:

The weaving is considered capable of producing material as a livelihood and improving the people's economy.

3. Esthetical factors: It is a form of expression of beauty of people that try to decorate themselves as weaving.

4. Lifestyle

It is a form of behavior, which applies something to be used as a social life pattern in everyday life such as custom rituals and certain forms of association.

Economically weaving should be focused on the creative industry a shift towards craft product, prioritizing skills and techniques and IT capabilities and innovations.

3.2. Anthropological Approach

According to Fendi-Sdiatmono (2019), textiles are no longer produced only for the body protection, but for decoration as well. Maiwada (2009) states that modern-day scholars believe that the dress gives a sign of identity and through which non-verbal messages are communicated. It also believes that in traditional societies, the function of clothing is almost as a language that can indicate a person's age, gender, and marital status, place of origin, religion, and social status for Kachin ethnic tribes. Clothing and accessories are the most important forms of aesthetic expression. Clothes and accessories not only cover the body, it shows the sex, character, situations, wealth, and status of a person. Weaving is one of several types of textile products that received a positive response in the Kachin communities. Kachin traditional weaving fabrics have experienced a long history with the development of the Kachin community. Historically, the fabric of woven fabric in the Kachin communities were as traditional clothing such as wedding ceremonies, custom equipment, funeral and so on.

The cultural factors are one of the contributing factors choosing to make woven cloths as a system of livelihood for their lives as cultural factors, which are known according to the information given that work is passed down from their parents or ancestors. Knowledge in weaving cloth is based on informal education but of knowledge that is passed down from ancestors to generations. Deep cultural meaning can be found in the designs of woven fabric based on the pattern of the symbols.

Culture value: Kachin traditional woven fabric is a high-value cultural heritage for the Kachin communities living in Myanmar, China and India.

Economic Value: Weaving is economically source of income and their livelihoods. Weaving which was originally a traditional garment worn by people, now is developed in various forms of clothing materials. This development benefits that their livelihood and their

knowledge of weaving is increasing with their innovations. Currently, Kachin traditional weaving materials are popular to wear suitable with climate condition. Weaving that exists today needs to be preserved cultural meaningful symbols and developed as a cultural heritage.

Social value: Traditional weaving is a cultural characteristic of Kachin people. Weaving indicates the culture life that the result of a combination of one culture with their natural environment. This is characterized by cultural in terms of language, equipment, art, clothing, utensils and so on.

Kachin indigenous knowledge consists of a local idea that is wise, full of wisdom and experience, good value, embedded and followed by the community. indigenous knowledge contains goodness for human life and principle of descent and strongly attached to the life of Kachin communities.

There are differences and complexity in the character and their cultural social relationships in creating a life of mutual dignity and prosperity.

Indigenous technology is a matter of their identity and it distinguishes a local community from other communities. The differences can be seen easily from the types of local culture and tradition that can be traced as relation to food related to the local environment that the food source of society can be maintained, relation to the production system as part of the effort to meet the needs, adapted to the climate and raw materials available in the region, in relation to clothing in human relationships that a system of local knowledge as a result of the continuous interaction built upon their needs.

Educative: The character values contained in the weaving activity that takes days in working on one product woven fabric, creative thinking and do something to produce new fabric products, attitudes and behaviors.

Weaving home industry is ensuring that organizations and practices can be adapted to the demands of optimism in the present creative economy. According to F. Adiatmono, 2015, the weaving logic is inherent in it capable of capturing the substance of the structure and anatomy of the basic forms of nature that surround them, then poured into simple and core substantive visual language (F Adiatmono, 2015). Human relations with surrounding habitats are based on the assumption that their existence lives in nature which is seen as an orderly and hierarchically arranged order in a culture that is always maintained.

The functions of woven fabric in aspects of life are:

a) **Social Aspects:** In the social aspect woven fabrics are widely used for traditional ceremonies such as birth, marriage, or death. Even the symbol and color have been adjusted. For example, materials wearing in wedding design and materials wearing in Manau Ceremony are not the same symbols, colour, designs and patterns.

b) **Economic Aspects:** Woven fabrics in economic aspects are used as a means of exchange. Exchange in the sense of goods exchanged with other items. In current days, demand and supply cannot be balanced due to population growth. Kachin traditional handloom weaving materials are growing prefer by the people and market is wider day by day. It is opportunity of local economic development by production of handloom fabrics and

one side of consideration for home industry is challenging for handloom weaving practices due to digital machinery creation products are becoming growing to replace handloom fabrics in some areas.

The cotton farm cannot be seen in agricultural land to produce commercial scale for weaving. The cultivation of cotton and mulberry plantation is rehabilitation status that is challenging for commercial scale production for handloom weaving in Myitkyina.

The people lived on the self-sufficient production and the people produced their necessities and handlooms were put on in the homes of rural community and produced home-spun clothing.

Cotton and mulberry plantation need for one of the principal cash crops as an important item. Weaving necessary of varieties of yarn are imported from China and India expansively.

c) Aspects of cultural identity: traditional wearing is beautiful, uniqueness, express clear cultural meaningful lifestyle. These are mutually supportive, referring to the work that is compared with other multidisciplinary sciences.

The craft weaving is made by hand from yarn and is very beautiful. This type of applied art focuses on hand skills to process raw materials around the environment into objects that have functional and aesthetic value.

The approaches of anthropology in the field of weaving by designing are its relationship with the creator and the influencing factors. According to Aesthetic Theory, art theory that history and visual weaving can be a function of social, economic, and aesthetic history that explains the basic principles involved in creating a woven-cloths.

The most complex woven handloom textiles are patterned of silk textiles.

Traditional handloom textiles have played a crucial role in creating awareness as cultural heritage and cultural identity and sustainability in design. Traditional handloom textile weaving is threatened by market scale in home industry production; it is rapidly growth in Myitkyina.

Sustainable and ecological awareness play a very minor role in traditional textiles. design and business potential, contribute to local identity value, contributing to the local economy, traditional materials in making use of indigenous knowledge, value and experience, creating design process that connected to a local system and provides locals income and cultural identity.

In the Kachin textile culture, the value of the traditional silk textiles, considered to be a resource for the development and support for local economies. The definition of patterns and symbols express their cultural identity and their design process as contributing to the production of collective memory.

Silk handloom weaving played an important role in the Kachin cultural and traditional life of Kachin ethnic societies. Silk-worm culture is family practical activity for family members. In mordent days, it is based on development of textile, silkworm production and hand-woven textiles in Myitkyina, being an important employment for local workers, created a local economy for the region.

Skill weaver on handloom weaving and indigenous techniques, which requires experience and patience, each piece of the silk fabric is a unique creation.

The result of this study is that can be utilized by stakeholders, through weaving home industry and produce scientific research publications, and teaching reference.

4. Discussion and conclusion

4.1. Discussion

The weaving with natural coloring material is one form of traditional knowledge of ethnic society that needs to be supported by scientific research, so that it can be better preserved to develop.

Updates on fabric-making techniques to gain high quality and mass quantity, raw materials production, scale of trade should be considered.

Cultural diversity of the study area is a social potential that can form the character and image of its own culture in each region, as well as an important part for the formation of image and cultural identity of Kachin people due to modern fashion designs are growing every day in globalization.

Cultural diversity is an intellectual and cultural property as part of a cultural heritage that needs to be preserved.

With the improvement of technology and cultural transformation towards modern life the influence of globalization, cultural heritage and traditional values of Kachin indigenous people could face the challenge to their existence. This needs to be studied deeply because the cultural heritage and traditional values contain much local indigenous technologies that are highly relevant to relationship between livelihood activities such as cultural symbols, traditional patterns, designs and natural environment in the modern periods need to be preserved.

The uniqueness of Kachin cultural symbols and patterns that relationship between human and natural environment, richness of biodiversity, their experience and working colander have been indicating.

4.2. Conclusion

Weaving craft is one of Kachin's traditional cloth culture arts produced mostly in Myitkyina. Weaving has varieties of meaning, historical and cultural value due to weaving patterns represents human being as symbols and technique color and type of material and yarn (silk and cotton) used and each region has its own characteristics. Weaving is one of the high cultural heritage values of the Kachin people, and reflects the cultural identity.

The development of woven fabrics began to occur marketing system in modern periods. The use of natural dyes in the handloom weaving of woven fabric was valuable for Kachin ethnic communities than synthetic dyes because it can provide its own privileges. The use of natural dyes can provide several benefits, because it is not toxic to the skin, cheaper and durable that could be obtained from natural environment. Some examples of plants that are often used by weavers as coloring material are the red color, purple color of tree leaves and some kinds of bark and roots.

CREATING JOURNALISTIC CONTENT IN THE CONTEXT OF INDUSTRIAL REVOLUTION 4.0: OPPORTUNITIES AND CHALLENGES

MA. La Thuy Linh

ltlinh@ictu.edu.vn

Faculty of Multimedia Communication, The University of Information Technology and Communication, Thai Nguyen University, Vietnam

Abstract

Content creation - characteristic labor of journalism is not only influenced by content strategy in each editorial office/ broadcasting station/ television station, the professional capacity of journalists, and the information needs of the public but is now also strongly affected by the 4th Industrial Revolution. Using collecting, synthesizing, and analyzing documents, the argument has pointed out the opportunities and challenges that technology 4.0 brings to creative content activities in journalism. Technology 4.0, especially artificial intelligence (AI), has partially liberated journalists' intellectual labor, helping them have more conditions to focus on creativity, and telling more complete and attractive stories. Technology 4.0 also provides press agencies with tools for producing content faster and more efficiently like automated content production software, and online analysis tools to track trends and preferences of the audience... However, the increasingly fierce information competition, the demand for personalized content to increase audience reach, the rapid development of technology, and the increasing prevalence of fake news are challenges that require appropriate solutions from press agencies and journalists to prevent being dominated by technology, ensure the quality and reliability of produced content.

Keywords: *Artificial intelligence, Creation of journalistic content, Digital communication, Industrial Revolution 4.0*

1. Introduction

Today, with the rapid development of the Internet and the achievements of the scientific and technological revolution, the face of Vietnamese and global Journalism is constantly changing, especially in terms of information transmission. A news/article is no longer just a few hundred to a few thousand words accompanied by illustrated images or supplemented with a sound or video clip but also combines everything that can be presented most attractively and understandably appropriate to the modern public's information reception habits.

According to the Digital Transformation Strategy for Journalism until 2025, with an orientation towards 2030 issued by the Prime Minister on April 6, 2023, the goals of digital transformation for 2030 are as follows:

"100% of press agencies publish content on digital platforms; 90% of press agencies use centralized data analysis and processing platforms, apply AI to optimize operations; 100%

of press agencies operate in converged editorial models and models suitable for the development of advanced science and technology worldwide, producing content according to digital journalism trends”.

In the digital media environment, content becomes a competitive factor and the survival of each journalistic product (such as newspapers, magazines, radio, television, and online newspapers). Creating content - characteristic labor of the journalism profession is not only influenced by the content strategy in each editorial office/ radio station/ television station, the professional capacity of journalists, and public demand but is now also strongly affected by 4.0 technology. Studying the creation of journalistic content in the context of the Industrial Revolution 4.0 to clarify the opportunities and challenges of journalists and press agencies in Vietnam is extremely important and necessary.

To carry out this paper, the author uses the method of document research, synthesis, and analysis based on secondary data obtained. After systematizing the basic theoretical framework related to the topic, the author analyzes and evaluates the opportunities and challenges of journalists and press agencies in creating content in the 4.0 era. From there, the author proposes some solutions to support journalists and press agencies in Vietnam to innovate content as an indispensable task in the process of digital transformation.

2. Conceptual framework

a. Creation of journalistic content

Content creation is considered an activity that generates "new" and "valuable" elements. According to Pham Thanh Nghi (2012, p.28), creativity can be seen as "the process of moving towards something new, the ability to create something new, evaluated based on new, unique and valuable products". Le Huy Hoang (2002, p.39) defines creativity as follows: "Creativity is a human activity, based on understanding the laws of the objective world, creating new material and spiritual values, meeting the diverse needs of society".

When it comes to creative work in journalism, the group of authors including Duong Xuan Son, Dinh Van Huong, and Tran Quang (2007, p.193) explained that "to talk about journalism is to talk about creative work. Creativity means creating something new that is useful for people's lives" and "creative labor in journalism brings many joys and interests but also many difficulties, even dangers".

According to the Vietnamese dictionary (2006, p.738), "content is the inside part of an object, contained or expressed by its form". Content is seen as the indispensable soul of an object. In philosophy, content is understood as a general concept that synthesizes all aspects, elements, and processes that make up an object and occur within the object. Content plays a decisive role in the movement and development of an object.

Thus, content creation in journalism can be understood as the daily work of journalists to produce new and valuable works for society. From these journalistic works, editorial offices/broadcasting stations/television channels can produce media products with attractive content to fully meet the needs of the public for information, entertainment, education, etc.

Especially in the context of the Fourth Industrial Revolution, content is referred to as the king while technology is the queen, so content creation in journalism cannot be without the support of 4.0 technologies such as the Internet of Things (IoT); Artificial intelligence (AI); Virtual reality (VR); Big data; Cloud computing; Social networks, Mobile networks,... Therefore, each journalist and press agency needs to master the internal changes of content in the current period to gradually adapt and develop together in the new situation.

b. The Fourth Industrial Revolution

Klaus Schwab (2016), founder and executive chairman of the World Economic Forum, provides a simple view of the Fourth Industrial Revolution as follows:

“The first Industrial Revolution uses hydropower and steam energy to mechanize manufacturing activities. The second one took place as electricity is utilized for mass production. The third revolution used electronics and information technology to automate production. Now, the fourth Industrial Revolution is blooming based on the third one. It integrates technologies and blurs the border among physics, digital, and biology”.

The essence of the Fourth Industrial Revolution is the integration of technology, creating connections between physical, digital, and biological spaces. Billions of people can connect through mobile devices with immense computing power, large data storage capabilities, and unlimited access to human knowledge. The core technologies of this digital revolution include IoT, AI, Big data, cloud computing, VR, social networks, mobile networks, and more.

The application of these 4.0 technologies allows press agencies to create smarter products than ever before, with the development of data journalism, mobile journalism, embedded journalism, multimedia journalism, multichannel journalism, and multiplatform journalism. One of the fundamental factors in creating a "digital" editorial office is owning a rich and modern database based on Big data and cloud computing technology.

In particular, AI technology helps media producers search for and process information, automatically/generate news articles, turn text into spoken voices for video news, podcasts, and audio, or study the information consumption habits of modern audiences. The application of VR technology can provide diverse digital content alongside traditional news stories. Modern audiences can receive information through both their senses and emotions as if they were participating in events in 3D or 4D simulated spaces thanks to virtual reality technology. The publishing process of press agencies also becomes simpler with supportive techniques and technologies.

3. Results

Opportunities and Challenges from the Fourth Industrial Revolution to Content Creation in Journalism

a. For journalists

Journalists are the direct creators of independent and complete journalistic works through a process that involves selecting and determining topics, making the outline, collecting and processing data, and presenting content and form. After completing the work, content, and form continue to be carefully reviewed and edited before being published or broadcast.

With the support of technology, the process of creating journalistic content has been shortened. For example, in data collection and processing, before the Fourth Industrial Revolution, journalists typically used three basic methods: reading and studying documents, conducting interviews, and observing. Nowadays, with the development of IoT, Big data, and AI technologies, journalists can take just a few minutes or even seconds to search for and verify data (numbers, images, information, audio, and video files) instead of spending hours searching through piles of documents or personal data on their computers, or even days or weeks gathering necessary information based on fieldwork.

AI can also support journalists in monitoring sources on social networks (analyzing real-time data, identifying characters who have influence and interact with readers) or automatically fact-checking information. Through data systematization, AI can help journalists identify connections between investigative stories or detect trends and highlights among millions of data points, providing foundations for in-depth journalistic content.

In recent years, some press agencies have used AI to support news production. For example, at The New York Times, creators use a tool called "Editor" to determine the most important information to provide to the public. "Editor" analyzes data from sources such as social networks and Google Trends to determine which topics readers are most interested in and searching for. Then, "Editor" suggests the stories most likely to generate interaction based on that data.

In October 2022, the release of Chat GPT (Chat Generative Pre-training Transformer), a chatbot interface developed by OpenAI, is a typical example of AI's support in data processing for journalists. ChatGPT helps journalists analyze data from various sources and quickly return completely automatic analysis results.

In addition, in the process of completing journalistic work in terms of content and form, AI can help journalists create simple content or part of the desired content. By using predictable data patterns and programming them to "learn" variations over time, an algorithm helps journalists sort, classify, and create content at speeds far beyond traditional methods.

Currently, at some press agencies, simple repetitive content such as sports information, weather forecasts, financial bulletins, etc., are automated through the application of AI technology. AI software can input data from multiple sources, recognize trends and patterns, then apply natural language processing to place those trends in specific contexts, writing complex sentences with many adjectives or using metaphors and comparisons. The Associated Press (AP) was one of the first units to use robots to write news articles. Wordsmith Robot was used to write financial reports for listed companies in 2014. By 2016, Wordsmith had written and published 1.5 billion news articles (Miroshnichenko, 2018).

According to CNBC, in the news technology industry, AI has shown a superior advantage in terms of the speed of news production. If an AP economics reporter produces an average of nearly 400 articles on the stock market in three months, when applying AI, the number of articles is almost multiplied by 10 to around 3,700 articles. In addition, an AI application called Tobi from Swiss media conglomerate Tamedia produced nearly 40,000 news articles about election results in the country within just five minutes. Moreover, "an AI software named Wibbitz from USA Today can create short video clips. Wibbitz selects a story presented in text format, shortens it, collects images or videos, and adds commentary" (Le Quoc Minh, 2019).

The author group Browyn and colleagues (2022) presented the classification of AI tools that can produce news content in journalism based on case studies from the BBC. This research organizes data into a list of technologies with relevant systems, categorizing them and modeling the AI tools.

In Vietnam, Lao Dong is one of the pioneering press agencies in applying science and technology to carry out digital transformation in publishing journalism operations. With an automated news production model and process based on AI technology, the editorial team can

produce a series of regular TV news bulletins and breaking news reports at any time to provide information to readers (Dung Anh, 2021). Similarly, VietnamPlus uses AI to support the production of graphic products and long-form articles (in-depth reports using graphics, large images, and impressive motion effects) to meet stricter audience requirements in the context of the Fourth Industrial Revolution.

Thus, the Fourth Industrial Revolution empowered journalists with strength and energy in creative activities. Technology allows journalists to go anywhere in cyberspace to seek ideas, collect and verify diverse data sources, and connect them in just a few seconds or minutes to perfect brainchild in both content and form. Thanks to technology, journalists can easily detect major issues to create modern and in-depth journalistic works that are attractive to readers, such as E-magazine (multimedia articles), Long-Form (articles with 1,000 to 20,000 words), Infographic (graphic information), Mega Story (super journalistic work)...

Technology also allows journalists to free intellectual labor from boring tasks such as writing template articles or editing videos and audio recordings, allowing them to save time and focus on more creative work that requires higher skills (Chou et al., 2021). Journalists have the opportunity to read hundreds of thousands of documents or millions of images within a few hours - a task that may take weeks or months to complete; thereby giving journalists enough time to develop more interesting tasks such as investigating, interviewing people, or focusing on detailed, and meticulous journalism... (Noain-Sánchez, 2022).

Although the Fourth Industrial Revolution has brought many opportunities and benefits for journalistic content creators, new technologies, especially AI applications, have replaced some simple and repetitive tasks of journalists. However, this challenge is an opportunity for journalistic content creators to express their imprint on modern media works clearly and powerfully. Certainly, machine-generated news writing or video production is being used in many newsrooms but cannot completely replace the role of journalists in this uniquely creative profession.

The real challenge that journalists face is controlling the sources of information in cyberspace, data sources, and content recommendations searched and suggested by AI. Algorithms can also cheat. "Machines are programmed by humans, and humans always have prejudices and errors in logical thinking that can lead to incorrect conclusions" (Le Quoc Minh, 2018).

AI algorithms only handle well requests within the range of data they are trained with. News or articles generated by AI are often evaluated to have lower quality than those written by humans because AI lacks the emotions and creativity of humans. In addition, stories generated by AI are often biased compared to those written by humans, which can lead to incorrect and subjective news (Shin, 2021). Furthermore, applying AI can reduce the diversity of news, as AI algorithms can only recognize certain aspects of a story and therefore provide a biased perspective. This can lead to decreased public trust due to a lack of transparency about how AI algorithms produce content (Ansari, 2022).

Furthermore, if technology, particularly AI, is frequently "abused" in the creation of journalistic content, journalists may become dependent on it and even lose their creative

abilities, sensitivity in thinking, and human emotions that machines cannot have. Journalists may even violate professional ethics and intellectual property rights by using AI-generated content as their own work.

b. For press agencies

The Fourth Industrial Revolution has been strongly influencing the development of the journalism industry, especially the change in the journalism process in the digital age (Nguyen Thanh Loi, 2021). Press agencies that know how to use tools and platforms in the production of new journalistic products can keep up with the speed of adapting to new technologies by the public. Moreover, when content is compared to the king while technology is compared to the queen, Industry 4.0 brings good opportunities for press agencies in terms of speed of coverage, personalizing user content to retain readers, and creating more journalistic works that affirm the brand identity of the newsroom...

In the competition for information, applying Industry 4.0 technology to process data helps press agencies quickly make correct predictions about public interests, and news flows in society. Thanks to the three typical core technologies - AI, Big Data, and IoT, press agencies can easily observe the access behavior of each reader for better interaction and timely improve the quality of news products. In particular, AI allows press agencies to reach and engage larger and more diverse audiences, leading to greater success for press agencies in the digital age (Yang, 2020).

Some Radio - Television stations and converged newsrooms can apply the automatic production of repetitive structured content for some news such as weather, sports, technology, etc. by building natural language generation software (NLG). Most recently, the research team of Ho Chi Minh City Television Station has successfully tested the application of Chat GPT to produce television reports on technology.
