In the process of creating journalistic content, analyzing big data with different volumes and formats helps press agencies to find hidden patterns, unknown correlations, and new perceptions of the world. When "joining" massive data sets, instead of reflecting information about phenomena (Who, What, Where?) and explaining the roots of "How?" and "Why?", big data helps media agencies explore correlations and causes of issues, find coincidences to make predictions about "What will happen?" (Kenneth & Viktor, 2013).

However, in addition to the opportunities mentioned above, press agencies face new challenges in managing creative content. For example, when applying AI to filter and select stories that are most likely to attract interactive readers, one of the potential risks is that the content generated by AI could spread misinformation. The reason is that news may be biased during the AI filtering and data selection process. The public only gets exposed to one aspect of the story, and therefore, their perception can be shaped by the bias generated by AI. Furthermore, AI can be used to spread misinformation and fake news to the public by presenting fake stories alongside real ones (Sen & Ganguly, 2020).

Besides, AI can also be the object of being deceived by fake news. AI algorithms are designed to process data quickly and accurately, which means it is difficult to distinguish

between real and fake news. Moreover, AI lacks the ability to understand the emotional and ethical meaning of the news and data that AI delivers. As AI becomes more advanced, the risk of being attacked by fake news will increase, making it even more difficult to distinguish between what is true and what is false (Gradoń, 2020)."

3. Discussion & Conclusion

According to Reuters Institute (2023), in just a few years, the criteria for evaluating digital transformation in press agencies will not be the speed of digital adoption but rather the transformation of digital content to meet readers' expectations - something that is constantly changing.

Press agencies and journalists must quickly adapt to technological changes; continuously improve their wide-ranging and in-depth skills while learning and updating the latest advancements and mastering technology to serve daily creative work.

Some free AI software such as Google Alerts, Meltwater, Google Trends, Tubular Labs or paid software such as Chartbeat, Sharablee, Parsley, Newswhip, and Social News... can help journalists receive the latest information from installed keywords with topics ranging from social life to science, sports, securities... via email or text messages.

In addition, journalists need to increase their responsibility when using 4.0 technology in content creation. Instead of relying on technology, journalists need to have the ability to control technology to ensure the authenticity and transparency of information generated from applications. To verify information, journalists can use reputable sources such as Official websites of state agencies, international organizations, or reputable organizations in related fields; Website credibility checking tools such as URL Void, Sucuri, UnMask Parasites, PhishTank, Dr.Web Anti-Virus Link Checker, UnShorten.it, VirusTotal or Scamadviser.com; Websites with clear origins and verified by national or international databases for business registration or domain names...

Each press agency needs to aim to become a "digital technology enterprise" by building cooperation with technology enterprises to have standardized data, improve forecasting capabilities and provide technology training for journalists. Press agencies apply digital technology to create conditions for journalists to learn, experiment, and apply content creation content to have distinctive journalistic works/products. At the same time, press agency administrators also need to monitor, check and immediately identify signs of journalists abusing or using technology for the wrong purposes.

Therefore, technology cannot completely replace the role of humans in the press agencies. Instead of seeing technology as a "competitor", press agencies and journalists should see technology as an "ally" to help them work more efficiently and creatively. By "collaborating" with each other, 4.0 technology and creators can tell stories perfectly and attractively, while ensuring professional ethics principles and fully meeting the information needs of the public in today's digital media environment.

Abstract

This article approaches the concept of ecological morality from a Buddhist perspective, clarifying the Buddhist view on this issue through various doctrines such as the theory of emptiness, dependent origination, and karma. The author analyzes the Buddhist perspectives on the ecosystem, the position, role, and relationship of humans with the ecosystem based on Buddhist doctrines. From there, the article clarifies the role of Buddhism in the current issue of ecological moral education. It clarifies the position of humans in the material world, changes human perception of their role in nature, and encourages positive actions to transform the ecosystem.

Keywords: *Buddhism, Buddhist perspectives on ecological morality, ecological morality, ecological moral education, role of Buddhism in ecological moral education.*

1. Introduction

Buddhism is a religion that has influenced many countries around the world, including Vietnam. According to the Government's Committee for Religious Affairs, the number of Buddhist followers in Vietnam was over 4.6 million in 2020, spread across different regions. With a long history of formation and development, Buddhism has always actively participated in sharing social responsibilities. The teachings of Buddhism form a vast system of beliefs with a well-structured framework that addresses various aspects of human relationships with the world around them. The positive values in Buddhist teachings need to be absorbed and implemented to contribute to building a society that aims to achieve the general goals of the national revolutionary cause: "rich people, strong country, equitable society, democracy, and civilization."

In the context of industrialization, modernization, and the trend of international economic integration, the ecological environment is increasingly changing with many risks and challenges for human beings. The issue of ecology is no longer a problem of any particular country but has become a global issue, and only the joint efforts of all nations can solve it. Among them, religions also play a role in promoting action not only among believers but also in society. The influence of Buddhism in Vietnam and the world today plays an important role in helping people reassess ethical and ecological issues. From there, it encourages people to take positive actions against climate change by forming the right awareness that leads to the right actions. This article will clarify the perspectives and roles of Buddhism in this regard. Having the right awareness leads to the right actions. Therefore,

this topic always receives the attention of researchers. Some specific studies, such as the work "The Path of the Buddha's Teachings for Peace and Ecology" by Zen Master Thich Nhat Hanh, discuss the issues of peace and ecological morality in the world from the perspective of the Buddha's teachings. The Zen master uses the perspective of Buddhism to explain the existence of nature and points out the role of humans in it. At the same time, the Zen master also clarifies how humans should behave towards other humans and nature in order to continue to develop [12]. Author Pham Cong Nhat has also discussed the fundamental principles and ethical standards of ecological morality in Buddhism in his research work "Ecological Morality from the Perspective of Buddhism" [16]. Analyzing the basic teachings of Buddhism such as Impermanence, Non-self, and Dependent Origination, authors Nguyen Thi Le Thu and Nguyen Thi Hoai demonstrate the values of ecological morality in Buddhism [17]. Author Phuong Lap Thien, a Taiwanese researcher, analyzes Buddhist theories of ecological morality to understand the significance of ecological morality in Buddhist doctrine in the study "Buddhist Ecological Philosophy and Modern Ecological Consciousness" [18]...

Most of the above studies focus on analyzing and clarifying the perspective of Buddhism on ecological morality and how humans should behave towards ecological morality. However, there has been no study that clarifies the role of Buddhism in ecological moral education today. Therefore, to clarify this issue, in addition to analyzing the perspectives of ecological morality from the perspective of Buddhism, the article also clarifies the role of Buddhism in ecological moral education today.

2. Method

Based on the principles of dialectical materialist methodology with comprehensive perspectives, developmental perspectives, and historical-specific perspectives, the author approaches and clarifies the concept of ecological morality - a relatively new concept. Accordingly, ecological morality is placed in relation to social and economic factors, in the environment, in the relationship between humans and nature, and as a part of human participation in the wider nature.

In addition to dialectical materialist methodology, other research methods such as synthesis analysis, logic combined with history, statistics, and system are also used by the author to clarify the research problem. Each method plays a different role in the research process. Specifically:

Synthesis analysis is carried out with the aim of building Buddhist views on ecological morality. Based on analysis, accessing Buddhist documents such as the Buddhist scriptures, studies on Buddhism by authors, research articles in Buddhist journals, etc., the article synthesizes and systematizes Buddhist views on ecological morality, an indispensable part of Buddhist doctrine.

Logic combined with history is used to examine views on the relationship between humans and the environment, and between humans and nature in the flow of Buddhist teachings, and to combine dialectical relationships with the times to see the Buddhist

perspective on ecological morality in the present. The views are analyzed based on their relationship with the social and economic factors that Buddhist teachings recognize and teach their disciples.

Statistics and system are used by the author to systematize Buddhist theories, thereby approaching the Buddhist perspective on ecological morality. Systematizing these views helps the author to establish connections and see the coherence and dynamics of Buddhist theories in the current period, based on which the author clarifies the role of Buddhism in ecological morality education today.

3. Results

3.1. The concept of ecological ethics

Ethics, according to the philosophical tradition, is a Sino-Vietnamese word that consists of two elements: "đạo," which means path or way, and "đức," which means goodness. Thus, when referring to ethics, it is about cultivating the virtues of human beings. Broadly speaking, ethics refers to the rules, standards, and norms that society establishes, and each person relies on them to adjust their behavior accordingly. Ethics is often discussed in three aspects: duty, conscience, and good and evil. Among these, duty refers to an individual's responsibility for the community's benefit; conscience is an individual's awareness of responsibility and self-evaluation of their conduct; good and evil are opposing terms used to measure an individual's ethics. On the other hand, "ecology" is a term used to refer to the living environment of human beings, or it can be understood as the natural environment, in which human beings and nature have a dialectical relationship. The ecological environment is formed on the basis of the material unity between nature, human beings, and society. It is the result of the evolution of the living environment and the development of human society.

Based on the analysis above, "ecological ethics" refers to the ethical standards, norms that society sets for human beings to behave towards the natural environment and the living environment around them. Ecological ethics includes the behavior of human beings that is regulated by specific rules, standards, norms that are formed from the requirements of nature for the existence and development of human beings. These are reflected in the way human beings interact with nature in their activities to exploit natural resources to meet increasingly higher human needs. These expressions reflect harmony, suitability in the interests of maintaining the natural environment's sustainable development and human and social development.

3.2. The Buddhist Perspective on Ecological Ethics and Ecological Moral Education

When discussing the nature of existence, Buddhism proposes the theory of Anicca (impermanence) and Anatta (non-self). According to this theory, "Human beings, plants, and animals are born, grow up, mature, and die. Human beings interact with other phenomena and with themselves..." [7]. Therefore, human life is impermanent and is subject to the constant changes of nature. Humans are not the center of the universe but only a component of it. Humans are not outside the cycle of all things, from "birth, aging, sickness, and death," "having birth, having death"... "According to Buddhist philosophy, what is called living

beings, individuals, or the self is only a synthesis of matter and the power or capacity of the spirit called the Five Aggregates" [6]. The material part of the Five Aggregates includes: form, consisting of bones, flesh, skin, and limited in space and time. The mental part includes: perception, thought, action, and consciousness, which are expressed through the six senses: sight, hearing, touch, taste, smell, and mind. The elements of the Five Aggregates are always changing, sometimes coming together, sometimes dispersing. The Lotus Sutra teaches, "Form is emptiness, emptiness is form. Perception, thought, action, and consciousness are also like this" [9]. Therefore, the nature of human beings is non-self; human beings are only a temporary aggregation.

Based on the theory of Emptiness and Non-self, Buddhism advocates the perspective of "respecting life" and the equality of all things. Whether it is a "sentient" being (with emotions and consciousness) or an "insentient" being (without consciousness such as grass, trees, flowers, leaves...), there is no differentiation, they all deserve to live and exist equally. Species exist on the basis of mutual dependence and interaction, only through which the ecosystem can be stable and sustainable. Therefore, the Dhammapada teaches: "All beings are seen but not seen; All beings live far away, not far away; All beings currently alive; All beings will be born; May all beings be free from harm; Live happily and peacefully" [8]. Therefore, in the five precepts, the first precept is to refrain from killing, which is the most important ethical standard for practitioners. Refraining from killing means that one should not kill oneself (including human and sentient beings) and even having the intention to kill is also a violation of the precept. According to the Buddha, refraining from killing also prevents others from killing, thus forming the tradition of "liberation" in Buddhism. This is also how compassion is cultivated. In the Dhammapada, the Buddha expresses: "May all who have life/ sentient beings/weak or strong/ not exclude anyone/ tall or short/ large or small/ seen or unseen/ living far away or near/ may all beings be happy and peaceful" [2]. According to this, the Buddha's compassion is limitless. "Tù" means loving-kindness for all beings, bringing peace and happiness. "Bi" means empathy for suffering, reducing the suffering of sentient beings. "Tù bi" is a very genuine and limitless love, without discrimination" [3]. All things in the universe have their own internal mechanisms, self-regulating, self-transforming, and self-elevating. Human beings or any species are all part of the ecosystem. Therefore, humans need to respect nature in order to achieve stability in the structure and function of the ecosystem. In order to exist and develop in this universe, human beings need to cultivate compassion for all sentient beings.

In addition to the theory of Impermanence and Non-self, Buddhism also has the theory of Dependent Origination. According to this theory, the Buddha believed that the whole world is a tightly unified entity, bound together by interdependent relationships that cannot be cut. In the *Ānguttara Nikāya*, the Buddha said, "Oh, Ānanda! It is by dependent origination that there is consciousness, by consciousness that there is mind and body, by mind and body that there are the six senses, by the six senses that there is contact, by contact that there is feeling, by feeling that there is craving, by craving that there is clinging, by clinging that there is becoming, by becoming that there is birth, by birth that there is aging and death, sorrow, lamentation, pain, grief, and despair. Such is the origin of this whole mass

of suffering" [10]. This means that everything in the world has a logical relationship with each other; this exists because of that, that develops based on this, this is destroyed by that, and so on. It can be said that everything is due to Dependent Origination, everything exists, develops or perishes because of it. Because of Dependent Origination, everything in the world is diverse and vibrant. This is the result of "multiple fortuitous connections" and "the key to unlocking the door of liberation is the principle of non-self, the principle of dependent origination" [11]. In that cyclic process, if something is lost, everything else changes accordingly. Also, the relationship between humans and nature is a symbiotic relationship, a dependent relationship, which is called "Dependent Origination.

Everything is born because of "Dependent Origination", and it has the essence of "Impermanence" and "Non-self," and it is subject to the ultimate law of karmic cause and effect. This is an absolute law of motion and operation in the universe. In the Pāli Canon, it says, "There is no place on the face of the earth, in the sea, or in any mountain crevice where one who has committed an immoral act can escape from the law of karmic cause and effect" [2]. Because of the power of karma, everything is constantly changing: arising, persisting, decaying, and ceasing; being born, existing, decaying, and dying. Dependent Origination is not accidental, but it is all caused by karma. Today is the result of yesterday's karma. Karmic effects can be direct or indirect, early or late, and they can occur not only in this life but also in future lives. Karmic cause and effect cover human life in a very subtle and transparent way. Accordingly, Buddhism affirms that the impact of human beings on nature will also follow the law of karmic cause and effect. If people behave appropriately towards nature, they will receive the benefits...

Thus, the theories of Buddhism all affirm the relationship between human beings, nature, and society. Ecological ethics from the Buddhist perspective is built upon these theories. In other words, humans must have principles of behavior and a peaceful way of life with all beings, which is an interdependent and mutually supportive relationship, relying on each other's existence because everything is caused by "dependent origination," all are "impermanent, selfless" and all have "karmic consequences". Good actions of humans towards nature are also the means of maintaining the living environment and existence of humans themselves. From the perspective of the equality of all sentient beings, Buddhism places humans as the subject in maintaining the balance of the ecosystem. At the same time, ecological ethics helps humans cultivate their body and mind to attain "renunciation," "compassion," "joy," and "equanimity."

3.3. The role of Buddhism in ecological ethics education today

3.3.1. Buddhism points out the relationship between humans and the ecological environment, in which humans are a part of the ecosystem and have the responsibility to balance it

Not only does Buddhism encourage people to pursue "goodness, kindness, and beauty," but it also advises them to abandon "greed, anger, and delusion" in order to reduce their greed and prevent the exploitation of nature in an excessive manner, forcing nature to obey humans. Once nature is destroyed and deteriorates, humans cannot exist either. The Consciousness-Only theory in Buddhism explains the relationship between human

consciousness and the physical world, such as rivers, land, mountains, and forests, where the physical world affects all forms of life on Earth, including humans. The theory of "dependent origination" also explains the relationship between humans and the environment. The Impermanence theory proves the independent existence of all species in the ecosystem, and the theory of "karma" clarifies the consequences that humans have to pay if they act against morality and the norm.

With its theories, Buddhism affirms the position of humans in nature as both independent and bound by the ecological environment. Humans are a part of nature and have a position and role as a part of the ecosystem. Humanity has an organized way of survival and maintaining existence different from other species. In that ecosystem, humans are not alone but always bound to and evaluated on nature. Humans live by nature, and nature humans humans. That's why the image of Buddha from birth, through renunciation, enlightenment, preaching, and entering Nirvana, is always associated with a tree. Likewise, for his disciples, they practice under the tree during the day and use the tree as a place to sleep at night. It is a clear, vivid message that Buddha wants to convey to everyone: Live in harmony with nature.

Therefore, humans are a part of nature and have a responsibility to balance the ecosystem. Destroying nature means that humans are destroying their own lives. According to the theory of "karma," the ecological crises currently present are what humans have to suffer when they disturb the ecological balance.

3.3.2. The viewpoints of Buddhism help change human perception, attitude, and behavior towards nature

By highlighting the position and role of human beings in the ecosystem, Buddhist teachings encourage people to adopt a lifestyle of "moderation and wisdom", meaning to desire less and understand what is enough. Therefore, people should not indulge in the excessive enjoyment of resources and energy for their present lives but rather conserve, use just enough, and avoid wastefulness. In addition, people should actively protect the ecosystem and not harm living things and the environment. However, this does not mean that the quality of human life will decrease. Buddhism believes that quality of life is "inner peace and happiness" rather than greed and anxiety, protecting nature rather than killing and destroying it, cooperation for the benefit of all humanity rather than seeking personal gain, and harmonizing with nature rather than separating from it.

Parallel to this, Buddhism condemns the three poisons: greed, anger, and ignorance of human beings and believes that these are the sources of all suffering. These desires of human beings are the source of damage to all living things in nature and to human beings themselves as entities of nature. Therefore, Buddhism always emphasizes the need to control personal desires, with the highest level being the eradication of sexual desire and greed.

From perception to attitude and action, these are the changes that Buddhism brings to its followers and society as a whole in educating ecological ethics. When people recognize their role, position, and responsibility towards nature, and the consequences of destructive

actions, their attitude towards living things around them will change, resulting in actions to protect the environment such as not littering, planting trees, conserving electricity, etc. From the perspective of Buddhism, a good society cannot exist if people constantly harbor too much greed, anger, and ignorance - the root of unwholesome behavior. The living philosophy of Buddhism has helped people gain deeper insight and understanding of their responsibility towards the environment.

3.3.3. Buddhism education of believers and practicing a simple lifestyle in harmony with nature and actively contributing to protecting the ecological environment

Buddhism goes beyond doctrine, turning the process of understanding the position and responsibility of humans towards the environment into action. In temples, there are usually three months of "rain retreat" coinciding with the rainy season of ancient India. During this time, the monks and Buddhists in the temple limit their movement to avoid accidentally killing insects, worms, and plants. The Buddha once instructed his disciples: "Buddhists should not kill themselves, order others to kill, use killing tools, praise killing, see killing and indulge in it, and even use spells to kill. All sentient beings with life should not be intentionally killed" [13]. Or: "People often generate thoughts of killing, which increases their karma of suffering and keeps them in the cycle of life and death, with no way out" [13].

The most practical aspect is that Buddhist meditation centers are often built on the "meditation forest" model, with lush greenery, clean lakes, and cool air. Even many meditation centers and temples are built next to forests with the purpose of protecting the forest and preserving wildlife. In Buddhist festivals, monks, Buddhists are also mobilized to participate in the "blessed tree planting" and "virtuous tree planting" movements. The practice of "vegetarianism" by believers and monks is also an action to protect the environment, avoiding the risk of extinction for many species. Thanks to the Buddhist teachings on ecological morality, humans can be aware, change their attitudes, and behave well to maintain and develop life, balancing the existence of the ecosystem-environment for human beings.

Buddhism always educates its followers and practitioners to lead a simple and frugal lifestyle, to reduce pressure on the environment, to harmonize material prosperity with the protection of natural resources and all living beings. The Buddha taught his disciples about clothing: "only to prevent cold, prevent heat, prevent the bites of mosquitoes, wind, the heat of the sun and various reptiles ... to use simple food only to ensure the body can live long, to maintain it, to prevent harm to the body, and to support spiritual practice ... to use medicine only to prevent the arising of painful feelings and to achieve complete liberation from suffering..." [4]. Accordingly, the Buddha did not deny economic life, but economic development must go hand in hand with spiritual development, expanding awareness, including awareness of the environment and environmental protection as a moral standard. In general, "Buddhism encourages us to accept a middle path between two extremes: a) extreme poverty that lacks the means to live, where poverty is a painful condition for families in this world, and poverty and debt are sad matters in this world; b) seeking material wealth for oneself" [5].

4. Conclusion

With a spirit of defiance and non-conformity, Buddhism regards ecological ethics as a problem that needs to be addressed through the actions of each practitioner or any Buddhist, believer, or human being. Maintaining ecological balance, protecting the environment, and respecting the lives of all species is not only a responsibility but also a factor in maintaining the very environment that sustains human life. From the concept of Dependent Origination to the doctrines of "Emptiness" or "Non-Self," Consciousness, karmic retribution, and the Four Immeasurables... All the teachings of Buddhism educate people on ecological ethics with the spirit of respect, equality, and compassion towards all species. Accordingly, "the highest and most universal ideal of Buddhism is to continuously strive to permanently end suffering for all sentient beings, not just humans" [1]. It can be said that this is an important function of Buddhism. Through practical ethical education methods that are realistically applicable, Buddhism has "listened to the cries of the Earth and awakened the collective consciousness" [11], thereby calling on humans to take positive action in addressing ecological balance issues. Buddhism calls on Buddhists and people to act from their inherent good nature. Therefore, it can further enhance the efforts of humans in the collective fight against climate change and the protection of the ecological environment.

INTERNATIONAL DESIGNS OF MULTI - TIER PENSION SYSTEM AND THE ORIENTATION OF DEVELOPING VIETNAM MULTI - TIER PENSION SYSTEM

MSc. Dang Thi Minh Thuy

thuydm@neu.edu.vn

Dr. Phan Anh Tuan

phananhtuan@neu.edu.vn

Faculty of Insurance, National Economics University, Ha Noi, Vietnam

Abstract

The article identifies the challenges faced by Vietnam's social insurance system; especially, when Vietnam pension fund is at risk of deficit which threaten workers' rights and national social security system. Hence, it proposes solutions to develop a sustainable pension fund. The article analyzes the designs of ILO and OECD multi - tier pension system to suggest recommendations for Vietnam design.

Keywords: *Multi - tier pension system, challenges, designs, sustainability*

1. Introduction

Although Vietnam is a developing economy, it confronts the problem of rapidly aging population. In 2020, Vietnam life expectancy reaches 75.38 years and this number is expected to increase to 78 years in 2030 (The World bank, 2020). According to General Statistics Office of Vietnamese, in 2020, Vietnam has 11.41 million elderly people (comprising 12% of the population) while there are approximately 2 million people aged 80 years or older. By the end of 2020, Vietnam has more than 16 million employees (accounting for 32.5% of total workforce) participating in social insurance system (Vietnam Social Insurance); relatively 40% of pensioners received pensions and social allowances (Ministry of Labor, Invalids and Social Affairs).

Currently, there are about 3.8 million elderly people who have not yet received pension social benefits as prescribed by law (Vietnam Social Insurance). Thus, reforming pension insurance and social allowance policies is extremely essential for Vietnam.

Vietnam government always attaches great significance to the formulation and implementation of social security policies to ensure social justice and sustainable socio - economic development. Resolution No. 28-NQ/TW the Party Central Committee stated that Vietnam's social insurance policies still have many limitations and shortcomings. Therefore, as the main pillar of national social security system, Vietnam social insurance policies need to be flexible, innovative diversified, multi - tier and international integration. This improvement and innovation aim to maximize social resources to ensure risk sharing and payment of pension benefits for all workers sustainably. Resolution No. 28-NQ/TW also

emphasized that the above issues are related to create a multi-tier social insurance system, social pension allowances, basic social insurance, supplemental pension insurance, etc. Simultaneously, the key issue is expanding social insurance coverage (The Central Committee of the Communist Party of Vietnam, 2018).

Accordingly, it is necessary to study practical experiences in the international context in order to find appropriate design for Vietnam multi - tier pension insurance system.

2. Method

The article used the method of synthesis and statistical analysis. Data sources on revenue and expenditure of pension social insurance system are taken from the Vietnam Social Security, Department of Social Insurance and ILO reports for summarizing and analysis. The article studies typical international experiences to suggest recommendations for Vietnam case

3. Results

3.1. Challenges to Vietnam pension scheme

Vietnam pension scheme consists of two tiers: the first tier is those who have paid social insurance contributions for 20 years or more are entitled to pension benefit when they reach retirement age; the second tier is a small percentage of the elderly (80 years old or older) receive monthly social allowances. The design of pension system has a distinction between age groups. People aged 60 to 79 is classified into 3 types: some better-off are entitled to social insurance pension (higher income); a few people from poor households receiving social allowances; and the majority is not covered (no social insurance pension, nor social allowance), as figure 2 indicates. However, if people aged 80 years or older do not receive pension, they will be entitled to elderly allowances. Hence, theoretically all adults aged 80 years over are covered.

Figure 1. The current design of Vietnam’s old age pension system

Source: ILO

Given the aging population and inadequacies in the implementation of social insurance policies over the past time, the sustainability of Vietnam pension system recognizes a number of major challenges as follows:

Swift aging population

Vietnam experiences demographic trend, transitioning from young population stage to aging population . It will take Vietnam just 20 years which is much faster than other countries to reach “aged stage” (GSO, 2016). While France needs 115 years, the US needs 69 years, Japan and China need 26 years. The ratio of working age population (aged 15-59) to the elderly (aged 60 and over) is 6.6 in 2015, and this rate is estimated to decreased to 2.1 in 2025. This issue urgently requires significant adjustments of pension system.

The design of social insurance system is incomprehensive

Basically, Vietnam social insurance system is state system, operating under Pay-As-You-go defined benefit (PAYG DB) mechanism, retirees’ main income are retirement allowances of social insurance system. However, coverage is relative low. Currently, social insurance coverage only accounts for about 80% of compulsory participants and 20% of workforce. This situation is caused by a large number of informal workers , and small enterprises’ evasion of social insurance payment. In recent years, since Vietnam economy faces many difficulties, the trend of labor transition from formal sector informal sector has become popular, leading to delayed expansion of social insurance coverage .

Figure 2. Vietnam social insurance coverage (%)

Source: VSS

Nonetheless, other concern is also low coverage of the elderly. Presently, only 34% of people aged 65 and over enjoy pension or old-age allowances. Coverage for people aged 80 years and over is 60%, though the cover is theoretically universal for this age group. Furthermore, pension system is biased in terms of beneficiary gender: 39% of men aged 65 and over are entitled to pension/allowances while this rate for women is 30%.

Moreover, voluntary pension scheme perform ineffectively. Voluntary system aims to attract workers who are not required to participate, but it has only reached about 533,000 people in 2019 (0,96% of labor force) (VSS,2019).

Another matter in of system design is that the statutory retirement age is relatively low, leading to short duration of social insurance contribution. On average, men contribute 28 years, women contribute 23 years while enjoyment period might last 22.6 years for men and 27 years for women (Social Insurance Department).

Long life expectancy and high net replacement rate

Viet nam retirement age for Women is 55 years 8 months and 60 years and 6 months, for mem while life expectancy is 73.5 years in 2021 (GSO ,2021) and reach 80.9 years in 2060 (UNDP). Longer life expectancy leads to longer period of retirement enjoyment (or higher working age in case of good health conditions). Additionally, declining rate of contributors and rising number of beneficiaries pose financial challenge for the system. The current net replacement rates are too high to ensure system’s financial sustainability. The maximum net replacement rate is 75% of reference salary after 35 years of contribution. Vietnamese normally contribute for people 20 to 35 years. This means the net replacement rate in Vietnam is currently too high.

The number of lump – sum withdrawal increases

The increase in number of people withdrawing lump - sum social insurance leads to a negative impact on the expansion of social insurance coverage. Those who postpone contributing for at least one year and have not reached 20 years of contribution are allowed to receive lump sum withdrawal. However, this withdrawal will affect income security in old age. The number of participants choose one -time benefit reaches roughly 500,000 per year which is high compared to the number of pensioners. Moreover, the cases of one-time payment focusing on young workers who might fail to ensure old-age income security.

Figure 3. The number of lump – sum withdrawals and new contributors (case)

Source: VSS

3.2 International designs of multi - tier pension system

Many countries have approached strategies of expanding coverage based on multi-tier pension system. Besides, this system design also are studied by many individuals and organizations

ILO design of multi - tier pension system

The first tier usually is sponsored by tax – based sources to ensure basic old-age security for all citizens. The 2nd tier is defined benefit mechanism (DB) that financed by participants' contributions. Finally, Tier 3 is an additional and fixed contribution (DC) which allow people to enjoy higher retirement rates.

Tier 1: Non-contributing pension is derived from tax sources

Tier 1 aims to ensure everyone has a minimum income in retirement through pension derived from tax sources. This is fully consistent with the ILO Social Protection Floor Recommendations. There are two models to be considered: universal pension scheme based on a common rate for all people who reach the qualifying age; or social pension scheme based on pension verification for all persons who reach the age of eligibility but are not entitled to social pension or other public pension system.

Tier 2: Compulsory public social insurance

This tier functions as insuring and distributing income tool in old-age income security programs. Although basic income is guaranteed, tax subsidies are difficult to finance sufficiently compared to previous earnings. Tax-funded programs are geared toward poverty reduction and redistribution of pension system, but lack the function of income regulation. Compulsory public pension schemes sourcing from contributions are the key to ensuring adequate benefits for a large segment of workers, including middle - income class. According to ILO standards, this tier must be designed in the form of defined benefit (DB) managed by the state. The Social Security (Minimum Standards) Convention, 1952 (No. 102) stipulates a minimum replacement rate of 40% of pre - retirement income (after 30 years of contribution). C128 - Invalidity, Old-Age and Survivors' Benefits Convention, 1967 (No. 128) set higher standards, requiring a replacement rate of at least 45% of pre - retirement income.

Tier 3: Additional Private Pension Insurance

Occupational pension or other voluntary private pensions has a limited role in Asian countries as only a small number of participants. These individual retirement plans provide additional benefits to mandatory public pension for those who demand a higher replacement.

OECD design of multi - tier pension system

Tier 1: Compulsory mechanism, government fund ensures appropriate income for all retirees. Each country can choose policy design based on the following three models: (1) Basic pension, (2) Social pension based on income verification or (3) Minimum pension.

Tier 2: Compulsory mechanism, participants' contributions to save for old age. This might be provided by the government or private insurers. If provided by the government,

there are 3 models which are (1) Defined benefit, (2) Accumulate points or (3) Personal account. If it is provided by private sector, there are two models that are (1) defined benefit or (2) defined contribution rate.

Tier 3: Voluntary mechanism, participants' contributions to save for old age, it is provided by private sectors, there are 2 models that are (1) defined benefit or (2) defined contribution rate.

4. Discussion and conclusion

The trend of swift population aging combined with changes in socio-economic aspects and workforce are posing challenges in terms of adequacy and especially sustainability for pension system in most nations. Retirement is not a recent social issue but has not received sufficient attention from the Government and public until recently since recent financial crises affected negatively retirement assets. If timely reforms are not implemented, pension system's challenges will not only be a matter of financial security but also can lead to the risk of socio-economic instability.

Recognizing these problems, many countries have implemented pension system reforms with the aim of building a more stable and sustainable pension system in long term. Although reform policies have been carried out diversifiedly, depending on specific socio-economic situation of each country, policy implementation still has many similarities. According to statistics, there are currently 80 countries around the world that introduce supplementary pension plans, including ASEAN and APEC countries such as: Thailand, Philippines, Indonesia..., but except from Vietnam (IOPS - International Organisation of Pension Supervisors, 2022).

There is a growing recognition that multi-tier pension systems address different risks associated with aging population (diversifying pension sources for employees; reducing pressure on basic pensions plan, etc.) is better than single-tier pension system. International experiences proved that: basic pension has never been considered as the only source of retirement income. Global trend is that basic pension income will decrease gradually whilst additional retirement income will continuously rise as the economy develops.

Most nations introduce supplemental pension insurance when the population structure is golden. This scheme initially voluntary and then becomes compulsory. when the nation reach golden population, labor force is abundant and stable for several decades, simultaneous high economic growth. The implementation of additional pension plan at this time will ensure stable income at relatively high level which attract employees participating in the system. When the supplementary pension scheme becomes popular and the population switch to aging stag, this scheme will turn to mandatory. Vietnam just entered golden population phase, this is the driving force and leverage to introduce supplementary pension insurance. However, Vietnam golden population does not last long, so the government needs to urgently issue implement supplementary retirement plan.

According to international practice, supplementary pension policy is a form of social insurance, so it is involved in a tripartite relationship including employees, employers and

the government. Nonetheless, the government plays a protective role in the basic pension programs; while in the supplementary pension insurance policy, initially, the government must have incentive policies via developing a legal framework; tax incentives; strictly manage investment portfolios to protect the interests of participants.

There are preferential tax policies such as corporate and personal contributions are tax deductible, taxed only for lump – sum withdrawal. Vietnam Law on Social Insurance indicates that basic compulsory retirement income is exempt from tax. However the supplementary pension also directed towards social security goals, ensuring life stability, reducing the burden of retiree on their family and society. Therefore, in order to encourage employees and employers to save for the future, it is necessary to have tax incentives for contributions to supplementary pension fund as well as income from this fund.

The government needs to regulate maximum contribution level to avoid tax evasion from businesses and employees since they pay high contributions. Additionally, this regulation aims to limit future payment for retirees, ensure fund safety, and reduce income gap of retirees.

Furthermore, it is also necessary to stipulate a minimum level of contribution to ensure efficiency. The pension benefits should be equitable to ensure retirees' living and social security purposes.

Vietnam must clearly and specifically regulate the participating conditions of supplementary pension plans such as: age, duration of contribution, monthly benefit, lump – sum benefit. Strict regulation of beneficiary conditions will help manage the fund sustainably, avoiding fraud. However, if employees can prove a legitimate need to withdraw, they should also be approved.

In order to be financially transparent and attract employees, the Government needs effective fund management and investment tools. The fund management agency regularly reports publicly on revenue and expenditure, fund balance or investment portfolio as well as investment interest rate. Before the fiscal year, the Fund Management Authority should develop an investment strategies and publicly announce.

DEVELOPING HUMAN RESOURCES TO MEET THE CURRENT REQUIREMENTS OF BUILDING A DIGITAL ECONOMY IN VIETNAM

Dr. Bui Thi Phuong Thuy
thuybuivientriet@gmail.com

Institute of Philosophy, Ho Chi Minh National Academy of Politics, Hanoi, Vietnam

Abstract

Along with the development of the Fourth Industrial Revolution, in recent years, the trend of digital transformation is taking place strongly in most countries worldwide, including Vietnam. The digital economy brings great development opportunities and requires workers to change their qualifications appropriately to meet the requirements. The paper clarifies the comprehension of the digital economy, analyzes the current situation of digital human resources in the digital economy in Vietnam, and proposes some solutions to develop digital human resources to meet the requirements of building a digital economy in Vietnam.

Keywords: *Human resources, digital human resources, digital economy, Vietnam.*

1. Introduction

The digital economy is a new economic model that most countries are moving towards. In Vietnam, developing the digital economy is one of the major orientations for the socio-economic development strategy for the 2021 - 2030 period. To form the digital economy, besides the environment, institutions, and policies, developing human resources is considered a prerequisite factor. The digital economy requires correspondingly developed human resources to deploy, implement, and operate the economy effectively. However, how the workforce responds and adapts to digital transformation is challenging. There has been much concern that digital transformation could create fluctuations in the labor market, especially in countries with low labor productivity and mainly based on outsourcing and assembly, like Vietnam. Therefore, it is essential to understand the current situation of human resources to prepare the best ones for the development of the digital economy in Vietnam.

2. Method

The study used basic methods such as secondary data research, primary and secondary data collection, and analytical methods.

3. Results

3.1. Digital economy and requirements for human resources in our country

Nowadays, one of the prominent features is that the Fourth Industrial Revolution and globalization are taking place firmly worldwide. The Fourth Industrial Revolution is the continuation and development of the Third Industrial Revolution based on integrating new achievements in many scientific fields, such as: physics, chemistry, and biology... This is

the outstanding development of many technologies, creating many new technologies, such as: nanotechnology, new material technology, new energy technology, biotechnology, 3D printing technology, and especially digital technology. Digital technology is a higher level of information technology with the development of artificial intelligence, the Internet of Things, cloud computing, big data, and blockchain. All information and data are converted into electronic data, digitized, stored, transmitted in a larger capacity, and processed faster. However, each of these technologies mainly affects a specific area, e.g., new material technology in the material sector, energy technology in the energy sector, 3D printing technology in the manufacturing sector, and biotechnology in the field of biology. Meanwhile, digital technology greatly influences almost industries and creates the foundation for other technologies to be implemented. Digital technology acts like the human brain and nervous system. It develops strongly, creates breakthroughs in many fields, especially in the economic field. The digital economy is growing very fast and becoming a new development trend on a global scale. In line with the development trend of countries around the world, Vietnam is promoting the development of the digital economy, considering this "breakthrough" step in the context of the Fourth Industrial Revolution.

The digital economy can be approached from many angles with different aspects. However, in the most general sense, the digital economy is understood as an economy that operates mainly by applying digital technology. Building a digital economy is a revolution that transforms a resource-based economy (traditional economy) into a knowledge-based economy with the pillars of science, technology, the internet, and digital. Economic activities are performed in the internet space, using telecommunications services and information technology, helping save time as well as human resources, increasing labor productivity, and creating tremendous value for the economy.

After 35 years of renovation, the economy has been improved in many aspects, and the people's material and spiritual life has been markedly raised: "Our country has never had the opportunity, potential, position, and international prestige as it is now." However, the economic growth rate is still not commensurate with the potential and advantages, lacks sustainability, and has been unable to close the gap and catch up with developed countries. The economy's productivity, quality, and competitiveness are not high and are not really based on science, technology, and innovation. The macroeconomic foundation and the economic resilience have not been firm yet. In the coming years, Vietnam will integrate more deeply into the international economy and will have to fully and effectively fulfill its commitments when participating in new-generation free trade agreements. However, the economy that has not developed sustainably has many weaknesses and faces many challenges. To overcome that difficulty, one of the urgent tasks is to "renew growth thinking, change the way of working and living, boost institutional reform, application of scientific and technological advances, and innovation, drastically implement a digital transformation, and build a digital economy and a digital society."¹ This shows that building and developing

¹ The Communist Party of Vietnam (2021), *Documents of the 13th National Congress*, Volume I, Truth National Political Publishing House, Hanoi, p.213.

the digital economy in Vietnam is both an objective trend and an urgent requirement. The Party and State identify developing the digital economy as one of the key tasks that must be successfully performed for Vietnam to “catch up and develop together” with other countries in the region and the world. This is one of the most significant growth drivers to turn Vietnam into a developed country by 2045: “Strongly promoting national digital transformation and developing digital economy and digital society to create breakthroughs in productivity, quality, efficiency, and competitiveness of the economy.”² Along with that, the Government has also actively researched and developed many guidelines and policies, especially promptly issued a series of legal documents such as decrees and circulars to create a legal corridor, managing and regulating various segments of the digital economy in Vietnam. Dated June 3, 2020, the Prime Minister issued Decision No. 749/QĐ-TTg approving the “National Digital Transformation Program to 2025, orientations by 2030” with the goal of striving that Vietnam is in the group of 50 leading countries in e-government, related to the development of the digital economy, improving the competitiveness of the economy; the target that by 2025, the digital economy will account for 20% of GDP; the proportion of the digital economy in each industry or field shall reach at least 10%; by 2030, the digital economy will account for 30% of GDP; The proportion of the digital economy in each industry or field shall be at least 20%.³ Besides, the Government of Vietnam has been taking necessary steps to facilitate the development of the digital economy, such as: Implementing institutional reforms to attract investment in digital technologies; Building e-government, digital government, reforming the administrative In addition system towards digitization and improving the quality of human resources; Building legal frameworks on network safety and security; Promoting innovation and digital ecosystem... Thanks to the decisive battle of the whole political system, Vietnam is becoming one of the strong attraction places for digital economic investment in Southeast Asia.

Vietnam is one of the countries with the fastest-growing digital economy in Southeast Asia, with the growth rate of 28% in 2022. Forecast to 2025, Vietnam's digital economy can reach 52 billion USD, making Vietnam the second largest digital economy in Southeast Asia. Thanks to the digital economy, businesses in Vietnam have become more active, from ecommerce, online advertising on social networking sites (Facebook, instagram), entertainment (Netflix, Pinterest), transportation (Uber, Grab, GoViet) to distribution, wholesale and retail (Lazada, Shopee),... The digital economy promises to be a factor that brings many opportunities for implementation of the process. develop industrialization and modernization towards modernity in the coming time.

Each economy requires a correspondingly capable production force, especially human resources. Therefore, digital human resources are required to deploy, organize, and operate to correspond to the digital economy. Digital human resources are the workforce in the digital economy, a pivotal force to deploy and realize the digital economy. They decide

² The Communist Party of Vietnam (2021), *Documents of the 13th National Congress*, Volume I, Truth National Political Publishing House, Hanoi, p.46.

³ Decision No. 749/QĐ-TTg of the Prime Minister: Approving the “National Digital Transformation Program to 2025, orientations by 2030”.

the existence of the digital economy, can master digital technology devices, and operate them in production, business, and other activities. Therefore, parallel with the economic transformation is the process of labor restructuring. Accordingly, digital human resources are increasingly developing and leading the social labor force. Therefore, the development of digital human resources is indispensable in the process of labor restructuring in Vietnam.

The essence of the digital economy is based on applying digital technologies and knowledge, and knowledge is considered a resource for developing the economy. Thus, digital human resources must be well-trained, professional, ethical, capable of mastering technology, creative, and able to quickly adapt to technological changes. The characteristics of digital human resources can be seen in the following aspects: Being capable of mastering digital technology devices in the interactive process of economic activities; Having the ability to quickly adapt to the working environment and new scientific and technological advances; Being disciplined and ethical at work; Having breakthrough thinking at work, also known as creativity. This is considered a sufficient condition and a criterion of digital human resources. To satisfy the above aspects, digital human resources must be properly trained and constantly be supplemented, but this task is not easy and fast. In the context of Vietnam, forming digital human resources to meet the requirements of developing the digital economy still has many problems that need to be clarified and dealt with by appropriate solutions.

3.2. The current situation of digital human resources in the digital economy in Vietnam

In the context of global economic competition, all countries consider human resources the most important tool to improve national competitiveness. Currently, Vietnam's human resources are increasing in quantity and advancing in quality. According to the General Statistics Office of Vietnam, as of July 31, 2022, Vietnam's population was about 99 million, of which the working-age labor force was 51.9 million. The number of workers who were trained and had degrees and certificates was estimated at 13.4 million, accounting for 26.2%.⁴ Vietnam's Human Development Index (HDI) in the fairly developed group ranked 115 out of 191 countries (according to the report dated September 9, 2022, of the United Nations Development Program). This is one of the favorable conditions for Vietnam's labor force to be able to transform and apply digital technology to build a digital economy in the 4.0 Industry.

Although the quality of human resources has improved, Vietnam's human resources faces many challenges. Digital human resources are lacking and weak in quality. Vietnam is lacking in technology engineers with high qualifications and management capacity to meet the development needs of technology enterprises now and in the future. According to the online job service company VietnamWorks, Vietnam lacks about 78,000 IT employees annually and about 500,000 by 2020, which means that the current staff only meets 22% of market demand.⁵

⁴ <https://www.gso.gov.vn/du-lieu-va-so-lieu-thong-ke/2022/07/thong-cao-bao-chi-tinh-hinh-lao-dong-viec-lam-quy-ii-va-6-thang-dau-nam-2022/>

⁵ <https://www.vietnamworks.com/hrinsider/nganh-cong-nghe-thong-tin-viet-nam-thieu-hut-so-luong-nhan-su-khong-lo.html>

To adapt to the digital economy, workers must have the knowledge and technical expertise to use and exploit modern tools to lift labor productivity. Currently, the level of knowledge, ability to master science and technology, and skills in the production process of Vietnamese workers have not met the demands. According to the Ministry of Industry and Trade, the rate of FDI projects using high technology in Vietnam is still low, with only 5% of high-tech from the US and Europe being operated. 80% is medium technology, and 15% is outdated technology.⁶ The reason for the slow technology transfer is that workers have not met the demands of mastering science and technology in production. According to the report of the Central Institute for Economic Management, Vietnam’s labor market has a surplus, but the quality of labor is still low. There is a lack of connection between training and practice, and labor skills are poor. According to the assessment of international organizations, most of Vietnam’s human resource indicators are low. The report of the World Economic Forum in 2018 assessed that Vietnam’s human resources were not ready for the 4IR and ranked 70 out of 100 countries. Due to low skills and the nature of labor, they are vulnerable to technological breakthroughs, lose their jobs, and are replaced by automation, robots, and artificial intelligence. We also ranked 90 out of 100 countries regarding technology and innovation. Highly qualified staff is also in the last group, ranking 81 out of 100 countries (view table). In particular, labor productivity was very low, equal to 7% of Singapore’s labor productivity.⁷ Vocational training quality ranks 80 out of 100 countries, just above Cambodia (ranking 92 out of 100 countries).⁸ Compared with ASEAN countries, most of Vietnam’s indexes only exceed Cambodia’s. Thus, the level of the Vietnamese workforce is only close to that of Indonesia but lower than most other countries, leading to a series of other weaknesses such as poor application of science and technology, low labor productivity, and high product costs, making the competitiveness of our country’s economy low, and causing great difficulties for the development of digital economy in the future.

Table 1. Ranking of factors “Dynamics of production” of Vietnam and Asean countries

	Singapore	Malaysia	Thailand	Philippines	Vietnam	Indonesia	Cambodia
Technology and bright	6	23	41	59	90	61	83
Human resources	2	21	53	66	70	55	86
Highly skilled labor	1	45	78	50	81	83	87

Source: WEF Readiness for Future of Production Report 2018

The majority of Vietnamese workers are unskilled and untrained, which leads to a risk of labor redundancy and poses a problem in retraining this workforce. Research published recently by the ILO indicates that in the next two decades, about 56% of workers

⁶ <https://baochinhphu.vn/them-bo-tieu-chi-loc-nhung-du-an-fdi-kem-chat-luong-102221116175843599.htm>.

⁸ <https://vietnamnet.vn/loi-giai-bai-toan-nguon-nhan-luc-nhan-taitrong-thoi-dai-40-713560.html>.

in 5 Southeast Asian countries, including Vietnam, are at risk of losing their jobs because of robots, especially in the clothing industry. Or according to the Asian Development Bank's report, the growth of the digital economy will lead to the loss of a large number of jobs. For example, a third of the workforce in agricultural processing and 26% of the workforce in the logistics industry in Vietnam will be replaced. Workers will lose their jobs if they lack the necessary skills to do new jobs and do not have an adequate and timely investment in skills development. At that time, Vietnam may be under big pressure on job creation and face an increase in unemployment or underemployment in the future.

In addition, the issue of labor consciousness, labor discipline, technology discipline, professional ethics, soft skills, and ability to work in a multicultural environment are considered weaknesses of Vietnamese workers. Labor discipline has not yet met the high requirements of modern industrial production. Employees are not equipped with the knowledge and skills to work in groups. Their ability to synthesize and share work experience and creativity is limited.

The above limitations are caused by the following main reasons.

- Perceptions and conceptions of many ministries, relevant agencies, society, and people about developing digital human resources to meet the direct requirements of the digital economy are not comprehensive and accurate. In recent years, all ministries and relevant agencies have paid much attention to the role, importance, opportunities, and challenges of the digital economy. However, advancing digital human resources to meet the needs in developing the digital economy is still slow compared to reality and requirements, from people's awareness to the participation of education and training institutions and state management agencies. Providing information and career guidance for people in choosing and deciding to participate in vocational training to meet the needs and demands of the labor market in the context of the digital economy is not good.

- Human resource training is renewed and updated slowly. Most training institutions for digital human resources have not caught up with the trend of the digital economy and have not trained enough digital human resources that meet quality standards for the labor market.

- Promulgating and implementing some mechanisms and policies related to developing digital resources are not consistent and synchronous. There is a lack of an information system that updates human resource supply and demand for the digital economy.

3.3. Some solutions to develop digital human resources to meet the requirements of building a digital economy in Vietnam

Recognizing the importance of digital human resources, the Party and State have had many policies and correct orientations on developing digital human resources. In which, we must mention Decision No. 146/QĐ-TTg of the Prime Minister, dated January 28, 2022, approving the Project "Raising awareness, popularizing skills, and developing human resources for national digital transformation by 2025, with orientation to 2030," and Decision No. 411/QĐ-TTg of the Prime Minister, dated March 31, 2022, approving the National Strategy on Development of the Digital Economy and Digital Society to 2025, with orientation to 2030. To develop digital human resources, the following solutions need to be implemented:

Firstly, promoting propaganda to raise awareness about digital transformation and the development of the digital economy. The attention of governments at all levels in raising people's awareness of digital transformation plays a role. The State must have programs and plans to foster and spread knowledge about the digital economy so that managers and implementers understand it. Digital transformation is relevant and affects every individual in society in many aspects, from tasks and work arrangements to the way of working, and way of life, and protects the interests, security, safety, and secrets of each person. Ignorance, lack of preparation, and unpreparedness of members and social organizations will hinder digital transformation and economic development. Therefore, raising awareness and understanding about digital technology and digital transformation for each person to prepare the psychology, conditions, and skills to participate in and adapt to digital transformation actively is the first and vital requirement to complete the digital transformation and develop the national digital economy. If people gain knowledge, they will change their minds and develop a digital economy well.

- Secondly, our Party and State need to perfect institutions and legal documents to create favorable conditions for building the digital economy. The rapid development of science and technology, the digital economy, and new and unprecedented business methods and innovative ideas have confused state agencies in managing digital economic activities. Vietnam has issued a national strategy for developing the digital economy and digital society, so it is necessary to accelerate the implementation of the national digital transformation program, especially solutions for skills training, digital human resource development, digital transformation of enterprises, and development of the domestic digital market. The content of the digital economy needs to be legislated to ensure a solid and unified corridor and legal basis for fulfilling the digital economy agenda. In which, a core digital workforce, sufficient in quantity and satisfying in quality, must be built to serve the requirement of digitizing all areas, from agriculture to industry and services.

- Thirdly, boosting the construction of digital businesses, thereby promoting the transformation of digital human resources. Digital transformation in the industry to build smart manufacturing is considered an essential driving force of digital economic development. According to a survey by the Ministry of Industry and Trade on the readiness to apply Industry 4.0 in industrial enterprises' production and business activities, up to 82% of enterprises are new entrants. In which 61% are still on the sidelines, and 21% of enterprises have started to have initial preparation. This requires businesses to boldly transform their operations to match the general development orientation of the economy. The digital transformation of businesses will put new requirements on employees and force them to change their working methods, actively study, improve their qualifications, advance their skills, and apply science and technology instead of relying on the training of enterprises as before. It is crucial to develop incentive mechanisms (financial and non-financial) to develop digital technology enterprises and Vietnamese enterprises in the field of digital business, especially small and medium-sized enterprises, because most Vietnamese enterprises are SMEs. The digital enterprises with the digital technology solution "Make in Vietnam" will be a principal driving force for successfully building the digital economy. Encouraging the

improvement of soft skills for employees and creating initiatives to build essential core skills for people to meet the demands of technological advances is an urgent task.

- *Fourthly, building education and training strategies to serve the development of the digital economy.* Education and training play a decisive role in the quality of human resources. It is necessary to associate the education and training development strategy with the human resource development strategy and the socio-economic development strategy on both macro and micro aspects. Thus, a new integration between supply and demand for digital human resources can be created in terms of education level, professional and technical level, human structure, capacity, and quality. With the characteristics of digital human resources, training human resources needs to innovate the model, structure, and thinking from just learning once to work for life to learning for life to be able to work for life. The structure of vocational training is adjusted and changed according to the requirements of the digital economy, with a focus on training the IT labor force. The IT HR training program should accelerate IT education's socialization. It is needful to update curricula in association with new technology trends such as the Internet of Things, AI, robotics technology, etc., helping learners approach this field early and promoting training and practice linkages between schools and the business sector applying IT. Educational programs need to be reviewed to update and educate children about the Internet from high school. In addition, it is necessary to study and change training contents and methods to build human resources capable of receiving new production technology trends, focus on promoting training in science, technology, engineering, and mathematics (STEM), foreign languages, and informatics, develop training programs, re-train professional knowledge, and provide the ability to self-study flexibly, suitable for each organization and individual. It is important to create close links between businesses, schools, and learners to enhance exchange and coordination to increase efficiency in training digital human resources to serve digital businesses. Enterprises support funding and order personnel. The schools provide in-depth knowledge training for learners in the fields that companies need to recruit workers. Learners should be aware of the requirements of the enterprises and based on their own capacity to choose a career and train their capacity appropriately. Furthermore, it is paramount to advance the internal resources of domestic universities in combination with large research institutes, universities, and research centers in the world on technology and digital to build a smart university system and gradually form leading research centers on science, technology and digital in the region and in the world. The Ministry of Education and Training needs to coordinate with ministries, relevant agencies, enterprises, universities, and research institutes to forecast labor demand and demand for products of science and technology of each industry and field to set training targets and invest in big research projects. Developing programs, training and retraining digital skills for the tech workforce, as well as training basic digital skills for people to adapt to the trend of digital transformation and development of the digital economy is an urgent task.

- *Lastly, building a working culture for digital human resources.* Industry 4.0 helps each person receive information quickly, but not all information is accurate and useful. Much

harmful information, ideas aimed against the Party and State, and false information cause disorientation in the actions of each individual. Therefore, building and consolidating political stances and ideas and creating the ideal of life for employees is significant. For creating a cultural working environment and bringing conditions and opportunities for human resources to help them develop, leaders must be exemplary in words and deeds. Human resource development strategy must be implemented in a fair, disciplined, and ethical environment. Following the law is considered the standard for creating a cultural environment, leading to the development of human resources.

4. Discussion and Conclusion

In summary, Vietnam has favorable conditions for developing digital human resources, but that development is not commensurate with its potential. Therefore, all forces participating in developing digital human resources must actively promote their roles, which can bring high efficiency. The Party and State play the role of orienting, directing, and building a favorable mechanism for the digital transformation process. Organizations and businesses need to be proactive and flexible in transforming operating models and methods based on digital technology. Finally, each person must actively learn, improve professional qualifications, master science and technology, and apply them to production to promote the growth of Vietnam's economy in the current period.

HUMAN RESOURCE DEVELOPMENT STRATEGIES FOR LECTURERS AT HUE UNIVERSITY ADAPTATION TO UNSTABLE WORLD

MA. Nguyen Minh Hung

n Nhung2325@gmail.com

Vietnam Graduate Academy of Social Sciences, Hanoi, Vietnam

Abstract

The world today is going through multiple accelerating and complicated changes. Under the impact of globalization, international integration and the fourth industrial revolution, when digital technology is becoming more and more powerful and widespread, accordingly, higher education institutions need to build up development strategies to adapt to those changes. Human beings are both a product of circumstances and a subject of circumstances – history. Therefore, human beings play a leading role in fast and sustainable development in a changing world. In such an unstable world, building smart university is an indispensable requirement for Hue University. Development of lecturer resource is considered a decisive factor for building smart university

In its development strategy for the period of 2021-2030, with a vision to 2045, Hue University always emphasizes the strategy of human resource development, especially the strategic development of lecturer resource that can actively adapt to the world full of changes. Lecturers are the most important human resource for Hue University to flexibly adapt to the changing world. In order to develop a resource of qualified lecturers meeting the requirements of building smart university which is compatible with the digital economy and digital society, Hue University needs to implement a number of synchronous solutions.

Keywords: *a changing world, international economic integration, lecturer resource, fourth industrial revolution.*

1. Introduction

The world is constantly changing because movement is its inherent property. Specifically, globalization, international integration, economic competition and the fourth industrial revolution, especially digital technology, are taking place powerfully and widely; creating huge and abrupt changes, causing unprecedented complexity globally. To cope with this unpredictable world, higher education institutions need to establish adaptive strategies to overcome challenges and take advantage of opportunities for rapid and sustainable development. For higher education institutions, the foremost adaptation strategy is flexibly and effectively combining development resources with the increasingly unstable circumstances.

Human beings are the center, the subject, the main resource and the goal of development. Consequently, investment in human resources is considered as an investment in one of the most special resources. This kind of investment is considered as a basic one

because it enhances the reproduction of labor force for the future. Therefore, in the development strategy for the period 2021-2030, with a vision to 2045, Hue University always emphasizes the strategic importance of lecturer resource development. Higher education plays an important role in the national education system, in which lecturer resource not only plays a decisive role in improving the quality of education and training, but also determines the adaptability of the whole university, its ability of response and its resilience to challenges in an unstable world.

The article focuses on analyzing and clarifying the human resource development strategy of Hue University's lecturers in adaptation with the changing world. To accomplish this purpose, the article analyzes and clarifies the following: Adaptation strategies in new contexts and human resource problems; Problems of developing Hue University's lecturer resource to adapt to the changing world; Solutions to develop lecturer resource at Hue University to adapt to the changing world.

2. Method

The article applies specific methods such as analysis, aggregation and systematization of documents, Research works related to the situation in Vietnam and globally as well as faculty resources in educational institutions. Moreover, Survey methods are also used to collect and process data for in-depth analysis of Hue University's faculty resource development strategies to adapt to the changing world. From here, the article points out: developing high quality human resources is a core issue of adaptation strategies in a changing world; the requirements necessary for the development of Hue University faculty resources to adapt to the changing world; Hue University resource solution lecturers to adapt to the changing world.

3. Results

3.1 Adaptation strategies in new contexts and human resource problems

The world nowadays is a world full of change. "The world is going through great changes which is happening very quickly, complicatedly and unpredictably. Economic competition, trade wars, competition for markets, resources, technologies and high-qualified human resources. Attracting foreign investment among countries is drastically increasing which strongly affects the global production and distribution chain. The fourth industrial revolution has given way for the fast growing of digital technology, creating breakthroughs in many fields, at the same time, creating opportunities and challenges for all nations and peoples." (Communist Party of Vietnam, 2021, pp.105-106). The adaptation and development of each institution, enterprise and higher education institution under the impact of the COVID-19 pandemic in the digital era, globalization and international integration is a matter of urgent and long-lasting survival. Therefore, it is necessary to have a holistic thinking and approach that is suitable for the new developing context and requirements; concurrently, it is necessary to have a mindset and approach in which human beings are both the center and the subject. Human beings are the goal and driving force of social development in general and organizations, businesses, and higher education institutions in particular.

Strategies must go along with the situation. The current world situation is becoming more uncertain. People need to have more adaptive and flexible vision and action. The more uncertain the world is, the harder it is to predict. The more complicated the world is, the harder it is to analyze. Therefore, in order to actively adapt to the changing world, people need to boost the development of human resources, science, technology, innovation and digital transformation to improve adaptability, quality, efficiency and competitiveness of agencies, organizations, enterprises in general and higher education institutions in particular. The world today is a world of great change. Accordingly, an adaptation strategy is a necessity.

Adaptation strategy is a development strategy that is suitable for changing circumstances, in order to create a reasonable combination of opportunities and risks of the environment and the capabilities and resources of the subject (organization, enterprises, higher education institution). The resources for social and economic development in the volatile world are all assets, resources, power is ready to put into use or reserve to serve that development). Kneel according to the division basis, one can divide resources into natural and non-natural resources; resources are divided into material resources and immaterial resources; resources are divided into domestic resources (internal resources) and foreign resources (external resources).

In the context of the fourth industrial revolution and international economic integration; Human resources are considered part of non-natural resources and play a leading role in development resources. Because: the use of natural resources is economical, effective, sustainably and adapting to a world of turmoil or irregularity belonging to human resources; a country rich in natural resources, modern machinery but without high quality human resources, it is difficult to adapt quickly to the unpredictable transformation of circumstances; opposite, a country with a poor natural resources but a high quality of human resources is able to adapt quickly to challenges in a volatile world; management institutions, science and technology, literary values, development aspirations are all of unnatural resources and, to the end, are all created by human resources. "The treasure within itself is bigger than any treasure in the ground"

In the dialectical relationship between resources are divided into material resources and immaterial resources; in this way, human resources are part of a material resource, so it plays a leading role. In the dialectical relationship between internal and external forces, internal force plays a decisive role. The main pillar of internal force is the human – human resources.

As such, the resources for the world's socio-economic development are very volatile despite being divided into natural and non-natural resources, between resources are divided into material resources and immaterial resource, or internal and external forces; but human resources play a fundamental and decisive role. Therefore, the adaptation strategy in a volatile world should prioritize the development of human resources, especially high-quality human resources.

Human beings exist and develop in a certain situation. That is called the natural condition and the social condition which have an indispensable relationship to human life.

Therefore, people have to accept and adapt to the situation. Human beings are the product of natural history and social history. Human beings are a product of the natural environment - Human beings are a biological entity and a part of nature; in other words, the natural world is the inorganic body of man. Therefore, human beings must rely on the natural world, stick with it, adapt to nature, harmonize with the natural world, and depend on nature to survive and develop. Human beings are also a product of the social environment - the human beings are a social entity with social activities, the most important of which is labor and production; The social environment includes economic, political, cultural, educational, historical issues which encircle human beings and they take that as a source of their life and their goal. Therefore, people must adapt to the situation in order to survive and develop.

As a product of history, human beings are not passively changed by historical activities, but they are also the subject of history. Human beings not only have to accept and adapt to the situation, but at the same time, they change the situation to adapt and transform themselves. Through the above analysis, the requirements for an adaptation strategy in today's changing circumstances include properly addressing the relationship between opportunities and risks of the environment and the capabilities and resources of the subjects, especially human resource. In higher education institutions, lecturer resource is the most important resource for rapid and sustainable development in the world full of changes and challenges. The fourth industrial revolution, international economic integration is taking place strongly on a global scale, Strong impact on all areas of social life, including higher education. In this context, the development of lecturer resource has become the focus of strategic competition among higher education institutions.

3.2. Problems of developing Hue University's lecturer resource to adapt to the changing world

To adapt to the changing world in the digital era, Hue University has determined that one of the important strategic tasks is the effective application of information technology, digital transformation in all activities to build Hue University into a model of smart university with entrepreneurship and innovation. The outstanding development of science and technology, especially digital technology, has created many unprecedented changes and strong impact on the whole system of education and training. The traditional university model has proved to be inadequate in response to the requirements of socio-economic development in the digital era. The traditional university model must be changed by a smart university model, in other words, a digital university. Consequently, it is requirable to build a smart university suitable for the digital economy, digital society and digital citizen and to make higher education institutions in general and Hue University in particular flexibly adapt to the fourth industrial revolution, globalization and international integration that are taking place more and more strongly.

Developing higher education institutions in the direction of smart universities is a trend and a vital issue of Vietnamese higher education, especially national and regional universities. Hue University is an example of regional university. According to article number 4 of the Law on Higher Education, it is clearly stated: "Educational institutions have

legal status, including universities, colleges and higher education institutions with other names in accordance with the provisions of law. National and regional universities are universities that perform national strategic tasks and regional development tasks of the country” (National Assembly of the Socialist Republic of Vietnam, 2019, p.14). As a regional university, Hue University has made active contributions to the training of human resources, especially high-quality human resources to serve the cause of industrialization and modernization of the country.

In today world of changes, the tendency of transforming colleges into universities and making connection among universities is strongly increasing. This tendency is being encouraged by the nation which turns small universities into universities of larger scale, broadly understood as centers for undergraduate and postgraduate training and scientific research, a place for highly-qualified multi-disciplinary and multi-field technology transfer which makes Vietnam a famous country in education and training in the area, catching up with the advanced level of the world.

For its nearly 66 years of establishment and development, Hue University (1957 – 2023), is a higher education institution that plays a leading role in providing high-quality human resources training in Thua Thien Hue province, in the Central and Central Highlands of Vietnam as well as in the whole country. Hue University ranks the top 350 universities in Asia and among the top ranking of higher education institutions in Vietnam. “Currently, Hue University has 09 member units including University of Education, University of Sciences, University of Medicine and Pharmacy, University of Agriculture and Forestry, University of Arts, University of Economics, University of Foreign Languages, University of Laws, Institute of Biotechnology; 01 affiliated school which is the University of Tourism and Hospitality; 03 affiliated faculties including the Faculty of Physical Education, International School, and School of Engineering and Technology; Quang Tri Campus; functional departments, Centers, Research and Training Institutes and a Publishing House. Hue University is always proud of its tradition, position and role of a national educational institution, bringing with it the unique and elite features of education and training. The multi-disciplinary nature of Hue University is clearly demonstrated with a full range of disciplines and groups of training disciplines” (Hue University, 2021, p.6). In order to affirm its position, brand and reputation while trying to meet the new requirements of socio-economic development, science and technology and to adapt to the fourth industrial revolution, globalization and international integration, Hue University has to transform itself following a smart university model.

For Hue University to become a smart university - a digital university, it is necessary to have resources. Resources have a close relationship with each other, in which human resource, especially lecturer resource, plays a decisive role in building a smart university. The role of lecturer resource originates from the role of human beings. Human beings are the subjects of history because labor and creation are the supreme social nature of humans. The productive forces are the material and technical foundations of socio-economic formations. Human beings are the decisive factors in the productive force, because human

beings are the subjects of creation when using means of work and tools of work. Under the strong impact of the fourth industrial revolution and international economic integration, then both the natural ecosystem and the human society are immeasurable. Accordingly, lecturer resource is the foundation of all transformations in higher education institutions. As a result, the focus of the adaptation strategy to a changing world is the development of lecturer resource. A development higher education institution must always put lecturer resources at the center of its development programs and plans

Building Hue University following the smart university model is the vision and strategic goal of Hue University in the new context. One of the strengths of Hue University when building a smart university is that: “Hue University's staff and employees are highly qualified, capable of undertaking many high-quality training programs and new programs of interdisciplinary and transdisciplinary nature” (Hue University, 2021, p.33). Hue University's staff and employees are highly-qualified and capable of implementing many high-quality training programs as well as numerous new interdisciplinary and transdisciplinary programs” (Hue University, 2021, p.33). According to statistics, until August 1st, 2021, Hue University has 3.679 officers, officers on a temporary assignment and employees (2.431 officers, 11 officers on a temporary assignment, 1,237 contracted employees). Among the total number of staff, there are 1.939 lecturers and 19 professors, 196 associate professors, 717 lecturers with doctor degree, 10 senior specialists, 1.125 lecturers with master degree, 03 junior specialists and 84 lecturers with bachelor degree. Regarding professional titles, there are 215 senior lecturers, 411 main lecturers and 1.313 lecturers. In comparison with the beginning period when the 2016-2020 Hue University's Strategic Plan for Development was implemented, the ratio of lecturers with doctor degrees among the total number of lecturers has reached 37.64 per cent” (Hue University, 2021, p.9).

The Industrial Revolution 4.0 has led to a smart economy or a digital economy, a digital society and accordingly, a smart university - a digital university. This is a major upward change in the history of human development. The smart university model was inevitably born to replace the old university model - the traditional university model. The core of building a smart university in the current context of the fourth industrial revolution and deep international integration is digital transformation. Digital transformation in higher education is based on the advancement of new technologies to innovate models and modes of operation to flexibly adapt to the changing world in the digital era.

The new context creates conditions and at the same time, sets requirements for the development of Hue University's lecturer resource. Over the years, the lecturer resource of Hue has undergone many positive changes in all aspects of quantity, quality and structure. However, compared with the requirements of building a smart university, whose core is digital transformation to adapt to a changing world, there are certain shortcomings:

Firstly, the quantitative development of university lecturers depends on the training scale and the adaptation strategy to an unstable world. According to statistics, the training scale of Hue University as of June 2021 will reach nearly 40,000 undergraduate students and 4,500 postgraduate students. According to higher education regulations, in order to have a

basis for analyzing and evaluating the development of lecturer resource in terms of quantity, the number of all learners needs to be converted to one level of bachelor and the number of all teachers (or lecturers) needs to be converted to one level of master. To become a research university, the student/lecturer ratio should not exceed 20. However, currently in Hue University, this ratio is around 24. Therefore, the student/lecturer ratio needs to be adjusted reasonably to promote digital transformation towards building Hue University following the smart university model.

Secondly, the internal structure of the lecturer resource is a complete and unified body with synchronous requirements - which contributes to the synergy of human resources. The synchronicity of the lecturer resource structure is the basis to ensure that Hue University's activities can adapt actively and flexibly to the changing world. The structure of lecturer resource is evaluated according to the following criteria: age structure, gender structure, qualification, title and specialization. According to statistics, “by June 2021, Hue University has 147 undergraduate majors, 104 master majors and 55 doctoral training majors; 63 training specialties for senior and junior specialists; 12 branches of training resident doctors” (Hue University, 2021, p.10).

The demands of digital transformation and building smart universities are requiring Hue University to restructure its lecturer resource towards meeting the requirements of economic reconstruction and increasing training majors with potential and competitive advantages as well as high technology content and high added value to adapt to the changing world. The fact shows that there are a number of training majors of undergraduate and graduate levels at Hue University have not yet satisfied the requirements of socio-economic including artificial intelligence, data science, big data, cloud computing, Internet of things, virtual/augmented reality, blockchain, 3D printing, digital technology, digital transformation, digital economy and digital society.

Thirdly, the quality of human resource is an overall factor of intellectual, physical and mental strength. To adapt actively and flexibly to an unstable world, intelligence is the most important. Human beings are the subjects of history but they cannot create history according to their subjective will. Human beings must obey the law, which means they have to be aware of the rules and their actions have to follow the rules.

Under the impact of the fourth industrial revolution, globalization and international economic integration will promote the formation and development of the digital economy. Digital economy operates on the basis of combining many new technologies, the core of which is digital technology, to create new business models and bring surplus value for the economy. The digital economy is considered as a breakthrough to form and develop a digital society, towards the formation and development of a smart economy, a smart society and a smart university. In the digital economy, the most important development resources are the knowledge and digital resources. Those resources participate in the global value chain production network, giving businesses and higher education institutions many new development opportunities which never happens before.

The intelligence of lecturer resource is demonstrated through the following criteria: professional qualifications, information technology application capacity, foreign language proficiency, pedagogical skills and scientific research capacity. Owing to the requirements of new period and according to Hue University's assessment, "the number of employees with doctoral degrees is still low, many officers and lecturers have not been timely under training plans of political theory and expertise; It is also difficult to attract highly-qualified employees in teaching and research at Hue University's training institutions, while the number of highly qualified people leaving Hue University tends to increase due to low income compared to the same level in larger provinces and larger training institutions. Some lecturers who went to overseas for training and retraining did not return to serve the institution or decided to quit jobs at Hue University" (Hue University, 2021, p.20). In conclusion, the demands for Hue University is actively developing lecturer resource; especially improving intellectually to adapt to the changing world. Lecturers are the most advanced part of human resources because they are the "role model" of high-quality human resource.

3.3. Solutions to develop lecturer resource at Hue University to adapt to the changing world

The first, solution is changing thinking and action. In order to flexibly adapt to the changing world, first of all, Hue University must start from the flexibility of thinking. The institution must renew thinking and actions to promote digital transformation towards building a smart university, overcome the separation between education and training development as well as science and technology development and application; overcome the separation of higher education institutions with the new and transformed context. Higher education institutions in general and Hue University in particular can only implement adaptation strategies to a changing world when it really innovates its thinking and actions. Building a smart university is an opportunity for Hue University to develop breakthroughs in quality, efficiency, competitiveness and adaptability to the new context.

Developing lecturer resource is the focus of Hue University's strategy to adapt to the changing world. Developing lecturer resource is the basis for creating a reasonable combination between opportunities and risks of the environment, circumstances and capabilities and resources of Hue University. Developing human resources for lecturers is the key to open the door for Hue University to firmly step into the digital era. The more uncertain the world is, the harder it is to predict. The more complicated the world is, the harder it is to analyze. Therefore, improving the quality of lecturer resource is both an urgent and long-term requirement for Hue University to develop quickly and sustainably. Developing human resources faculty is a very urgent strategic math problem; thereby, improving flexible adaptability, create the best conditions for Hue University to grow fast and sustainably

The second, solution is improving the quality of training, fostering lecturer resource to meet the requirements of digital transformation and a smart university. Improving the quality of training and fostering lecturer resource needs to comply with the criteria of adapting to the new context. The powerful development of digital technologies has created

tremendous and rapid changes to the economy and society. The digital era is demanding that lecturers improve their technology capabilities, first of all, new skills related to digital transformation and building smart universities. Determining the necessary skills and appropriate qualifications for each subject of the training is a basis. Prioritize training and fostering digital knowledge and skills for lecturers through digital platforms and online training. Digital transformation and building great intelligence are always associated with innovation. Therefore, it is necessary to improve the capacity of Hue University's innovation system, form a digital ecosystem and promote digital transformation in all activities of Hue University. Innovation is the creation of knowledge in a creative way which is associated with the acceptance of the market. Therefore, "the nation encourages individuals, organizations and enterprises to invest in research, development, transfer and application of scientific and technological advances to the fields under their responsibility" (Communist Party of Vietnam 2021, p.141). Implement a close relationship among schools, scientists and businesses in education and training of human resources.

The third, solution is increasing the degree of integration of Hue University into the world higher education system to advance with the period. Smart university has the mission of creating knowledge, providing high-quality human resources, becoming an innovation factor and a focal point for international integration. Therefore, in order to adapt to the rapid changes of the current socio-economic situation, Hue University implements: "Diversify international cooperation in order to quickly develop high-quality human resources, especially lecturers. Develop and implement a project to improve foreign language proficiency for lecturers and researchers of Hue University; a project to establish a team of experts and scientists according to task groups, field groups, competency frameworks and title standards, in line with the criteria of research universities in terms of size, structure and academic levels, in which a number of research groups reaching international levels" (Hue University, 2021, p.38).

The fourth, solution is developing teaching, doing research environment and conditions for lecturers. The fourth industrial revolution created a real world combination with the virtual world. Therefore, higher education will take place both in real and digital environments; through that, encourage and facilitate the construction of smart universities. Good teaching and researching environment and conditions will motivate lecturers and enhance self-study, research and practice activities in order to reach the values of truth - goodness - beauty, and consequently, they can adapt quickly to changes in the world. Cultural, human is the endogenous power for Hue University to adapt and develop in the context of the fourth industrial revolution and international economic integration strong. "Promote the development of digital platforms; create, update, store and share, use digital data; ensure network information safety; educate, fostering, developing digital human resources, digital skills, population citizens, digital culture" (Prime Minister 2022, p.26). Thereby, Hue University can create favorable conditions for lecturers to promote their initiative, positivity and self-discipline; improve their research, teaching, technological and creative capacity.

The fifth, solution is developing mechanisms and policies for the development of lecturer resource to adapt to the new context. “Develop a policy of attracting, bringing together Vietnamese intellectuals at home and abroad to actively participate in livelihoods, training cooperation, scientific research, transfer of new technology” (Tran Thi Van Hoa (2023), p.59) As an institution for managing and employing of lecturer resource, Hue University needs to develop and implement mechanisms and policies to flexibly adapt to the changing world. The synchronous implementation of mechanisms and policies on attracting, recruiting, using, evaluating, training, fostering, treating and honoring lecturers should follow the orientation of the nation, of Thua Thien Hue province and of Hue University in order to adapt to the actual situation of the new period, promoting the strength of the lecturer resource in successfully implementing the Hue University development strategy for the period of 2021 - 2030, with a vision to 2045.

4. Discussion and Conclusion

In higher education institutions, the adaptation strategy is the flexible and effective coordination of development resources with specific circumstances. The main pillar of internal resources is lecturer resource. Lecturers are the most important resource for Hue University to flexibly adapt to the changing world. The Industrial Revolution 4.0 will lead to a smart economy - a digital economy, a digital society and accordingly a smart university - a digital university. The core of building a smart university in the context of the fourth industrial revolution and current deep international integration is digital transformation. Therefore, in an adaptation strategy in a changing world, it is necessary to prioritize the development of human resources for lecturers. In other words, Hue University's adaptation strategy to the new context is also the strategy for developing human resources for lecturers in changing world.

There have been many positive changes in the lecturers of Hue University. However, compared with the requirements of building a smart university, whose core is digital transformation to adapt to a changing world, there are certain shortcomings. Compared to higher education institutions in advanced countries in the region and around the world, Hue University's staffing of human resources is still low, not meeting the digital and digital economic development requirements. So, to develop lecturer resource adapted to the new context and requirements of the fourth industrial revolution and international economic integration, Hue University needs to implement the above solutions synchronously.

BUDDHISM AND ECO-ENVIRONMENT ISSUES

Nguyen Thi Toan

ngthitoann@gmail.com

Hung Yen University of Technology and Education, Hung Yen, Viet Nam

Abstract

Today, ecological and environmental issues attract the attention of all nations and peoples. Aspiration for a healthy green living environment is the dream of all sentient beings. Before the problem of environmental pollution, experts, scientists and politicians have found many ways to solve it. However, the results can be quite limited. From that practice, the article tries to give an explanation of today's ecological pollution problem from a religious perspective. That is Buddhism. Thereby also concretize environmental protection solutions according to Buddhist theory. From this research will help orient people to live a better life. People are more aware of their responsibility to protect the environment. Building good behaviors that contribute to sustainable socio-economic development.

Keywords: *Environment, pollution, Buddhism and the environment*

1. Introduction

Humanity is currently entering the post-industrial stage, also known as intellectual civilization and knowledge economy. Besides the very developed economic life with a huge amount of material wealth brought about by scientific and technological progress. people in modern society are facing new tribulations such as gap between rich and poor, competition and conflict, environmental pollution, moral corruption, lifestyle... That's the reality. In particular, environmental pollution is a hot issue of all mankind. The risk of depletion of natural resources and environmental pollution destroys human life. Humans are getting more and more diseases. Buddhism with its human value in human liberation seems to have met the spiritual needs, gaps and frustrations in people's hearts. By its ability to regulate inner balance, Buddhism can help people live harmoniously in this world.

In today's modern society, people fall into a lifestyle of enjoyment, for economic profit, but constantly increase their impact on the living environment to exploit minerals and natural resources. Therefore, people also have to face consequences such as climate change, environmental pollution, floods, droughts, epidemics. Experts, scientists and politicians are trying to clarify the causes and find solutions to the current ecological imbalance problem. However, there is still no perfect solution to this problem. Meanwhile, the issue of living in harmony with nature, environmental protection and sustainable development has been mentioned by Buddhism since the 6th century BC. This is one of the sustainable solutions to current ecological and environmental problems that scientists and politicians are still paying little attention to and have hardly been mentioned. Therefore, it is very important to study and clarify the Buddhist view of the environment. From there, contribute to find out

the values in the teachings of the Buddha, change the perception and behavior of each person in order to contribute to environmental protection and sustainable development in Vietnam as well as in the world today.

The theoretical basis of the article is the principles of Marxism - Leninism, Ho Chi Minh's thought and the line of the Communist Party of Vietnam on religion. Historical documents of Indian Buddhism and Vietnamese Buddhism. Analytical documents on the current status of ecological pollution in Vietnam and the world.

The study clarifies the views of Buddhist doctrine on the causes of current ecological and environmental problems. From there, clarifying the solutions of Buddhism in solving ecological environmental problems. This study has theoretical and practical implications for religious policy making. On the other hand, research also contributes to solving ethical and environmental issues, especially in Buddhist communities.

2. Method

In this study, the author used qualitative research method. The author has researched, analyzed and synthesized theoretical views of Buddhism related to ecological environment issues. Besides, the author uses the historical - logical method to deploy and clarify the research problem.

3. Results

3.1. Current status of ecological and environmental problems and their causes from a Buddhist perspective.

Current status of ecological problems today

A hot and pressing issue in today's society is ecological pollution. Caused by production activities and human activities. This problem is increasingly serious and directly threatens sustainable socio-economic development. It threatens the existence and development of present and future generations. Solving the problem of environmental pollution in the current period is not only an urgent requirement for all levels of management and businesses, but also the responsibility of the whole political system and of the whole society.

Today's environmental problem is a global problem. In fact, the earth and the atmosphere are warming. Melting ice at the poles threatens natural life. Rising seas engulf lowlands. Air, soil and water are all polluted. Desertification is common. Plastic waste fills the oceans... The polluted natural environment is no longer a problem of any country or ethnic group. All humanity is involved and must share responsibility for the consequences. The problem of ecological pollution today is threatening the survival of mankind. Man cannot exist independently if separated from the natural world.

We are no stranger to the image of giant whales dying from ingesting too much plastic waste. Sea turtles were also unjustly killed by swallowing a plastic bag they mistook for a jellyfish. Scientists and environmental protection organizations have surveyed and estimated the volume of plastic, rubber, and inorganic waste in the oceans equal to the area of France and rapidly increasing. Scientists and environmentalists urgently call on the United Nations

to soon come up with laws and measures to save the ocean. Environmental organizations also work hard to protect and save the green planet.

It is not until this time that environmental issues are raised as an urgent requirement of all mankind. The consequences of environmental destruction are bringing human life closer to the danger of extinction. It is no coincidence that floods, earthquakes, tsunamis, and tornadoes continuously occur in every corner of the earth, leaving unpredictable consequences, claiming the lives of thousands of people.

From the above situations, people have to change their awareness and views on environmental issues. Countries, organizations and the whole society are making efforts to clarify the causes and find appropriate solutions to solve current environmental problems. The cause of environmental problems is none other than humans. The industrial boom, population pressure, rapid urbanization, exhausting resource exploitation, and waste discharge into the environment... lead to problems of climate change and ecological imbalance. Humans have directly or indirectly caused the agents to change their own lives. Therefore, solving environmental problems must also start with people.

In today's civilized and modern society, people have reached a high level of science and technology, which allows to explain many natural phenomena that were previously inexplicable. It also makes people think that they have mastered nature, forcing nature to obey. Humans also do many things that are contrary to nature. They exploit nature excessively, affecting the natural environment and affecting their own lives. Indeed, the threat to the ecosystem has been put on a red alert by the world, because of the increasing harm of toxic substances on human health and life, on all living things, for the land, the air, the sea, the trees, even the life of the earth is being seriously threatened. It was humans who caused this terrible situation

The actions of destroying mountains, forests, rivers, and destructive exploitation of resources by humans today have destroyed the lives of other species, eventually leading to the bad consequences of destroying the environment and destroying the environment own life.

Causes of environmental pollution from a Buddhist perspective

Buddhism is a major religion in the world. Today, we cannot help but be surprised to see that mankind, especially Western countries, is turning towards Asia, towards Buddhism. This can be partly explained from the humanistic values of Buddhist ethics. Moreover, Buddhism has really entered the world in all areas of life, even economic activities, business, environmental pollution... Buddhism does not teach people to give up their lives to become gods. Buddhism aims to improve society, improve the world with morality, and make humanity more progressive and humane.

In recent decades, facing the problem of polluted environment and the danger of depletion of natural resources, mankind has alarmed about human responsibility and the relationship between man and nature. However, with clear wisdom, 26 centuries ago, the Buddha attached great importance to the relationship between man and nature. It is a reciprocal, reciprocal relationship. In it, humans are only a part of the living world. Human

life and existence will be inseparable from the natural world. The Buddha explained the existence of all things and phenomena in the natural environment by the theory of Dependent Origination. Many scriptures explain that causality is the cause of all existence and non-existence as the core philosophy of this doctrine. All existence and non-existence cannot occur independently but are caused by causes and conditions because they always support each other. It means “Since this exists, that exists. Because this is born, the other is born. Since one is not present, the other is absent. Because one ceases, the other ceases” (Translated by Thich Minh Chau (1991), *Kinh Tuong Ung*, p. 55-56). The theory of Dependent Origination has clarified the starting point of the relationship between humans and ecological and environmental issues today.

Based on the theory of Dependent Origination, the relationship between humans and the polluted natural environment today is caused by human behavior and consciousness. Human life is developing more and more, resources from the natural environment are increasingly lost because people have taken advantage of high technology to exploit. The abuse of excessive exploitation of resources is the cause; Climate change is its result. Another, the use of fossil fuels and industrial and agricultural activities have created the greenhouse effect. In the process of producing goods, businesses also create waste and emissions. Then, waste continues to be generated when consumers use the products sold by the business.

Another phenomenon caused by human impact on the natural environment is desertification. Part of the reason is that people use scientific and technical means to affect agriculture. Thus, the phenomenon of desertification and climate change are the consequences of human direct intervention in the natural environment, making the natural ecosystem disturbed. This means that, for the sake of life, for personal gain, man has lost his own nature and changed the nature of nature.

It can be affirmed that everything that harms the ecological environment and destroys the earth comes from the greedy mind, the profiteering mind, the selfish mind, and the delusional mind of people. Ready to kill, cause war, spread poverty and disease, destroy human life, species and environment are also increasingly destroyed. Or to make huge profits, along with indiscriminate exploitation of resources, they also release toxic substances into the ground, into rivers, into the air, polluting the environment, harming health and causing pain. sick many people. Thus, the problem of ecological imbalance and environmental pollution are the causes of diseases in humans. Environmental pollution is caused by humans. This proves that man cannot exist without the existence of nature and man must deal with nature in a harmonious way.

The Buddha pointed out that all those actions are rooted in the three poisons: greed, hatred, and delusion of every human being. In fact, individuals or groups because of boundless greed have turned them blind and cruel. They are ready to kill, cause war, spread poverty, disease, destroy human life, animals and the environment, thereby harming them even more. Or to get immediate benefits, along with indiscriminate exploitation of resources, they also release toxic substances into the ground, into rivers, into the air, polluting the environment, harming health and causing harm to health and sick many people.

According to the Theory of Dependent Origination, environmental pollution will gradually make people physically degraded, mentally emaciated, lagged behind in life, and economic crisis according to the principle “This gives birth to another”. “If this does not exist, the other does not exist, because when this ceases, the other ceases” (Translated by Thich Minh Chau (1991), *Kinh Tuong Ung*, p. 55-56). Human will not be able to exist because the human entity consisting of body and sentient beings (natural world) is within oneself. According to the theory of Dependent Origination, the unbalanced natural environment is inherently caused by ignorance and craving. Humans themselves must understand and take responsibility for all their actions that directly or negatively affect the natural environment. Therefore, the Buddhist view is to explain environmental pollution as a consequence of lack of awareness and over-exploitation of natural resources. According to cause and effect, this operation is consistent with the traditional model: greed - hatred - delusion exist and “suffering” will also exist according to co-existence in the natural environment.

In short, according to the theory of Dependent Origination, the natural environment is a resource that humans must rely on to survive. If the environment is disturbed and destroyed, people will gradually lose their support and confidence in the future of present and future generations. The Theory of Dependent Origination proves that we cannot exist without relying on nature and that this relationship is an equal one. People need to put aside Greed - Hatred - delusion and live in harmony with nature to protect the natural environment and lead a peaceful and happy life.

3.2. Some solutions to environmental problems according to the Buddhist approach.

Some solutions from Buddhist theory

For Buddhism, the path to enlightenment and becoming a Buddha has to go through many challenges. One of the prerequisites of a Buddhist is compassion for all sentient beings. With the concept that all species are born with life, Buddhism believes that all species are equal and should be respected and protected. The Buddha taught his disciples about the five precepts, in which the issue of prohibiting killing is given the top priority.

The content of the teachings of Buddhism carries humanistic thought, respecting the life of all species. The precept against killing in Buddhism contributes to solving environmental problems because Killing to serve human needs will lead to ecological imbalance. That action has a direct impact on human life. Those who live by exploiting forest and marine resources, those who cultivate and produce agriculture, if they only exploit nature by completely exploiting them without letting those resources have time to regenerate, they will deplete them. In addition, the exploitation of hard-to-renew resources such as coal, oil, etc make environmental problems more and more serious.

With the wisdom of the enlightened, the Buddha pointed out the truth of life. That is all living things on this earth have an organic and close relationship with each other. The existence of one species is a condition for the existence of the other. Conversely, when the

life of one species ends, the extinction of other species is followed. When there is this, there is another, when this arises, that arises, when this ceases, that is destroyed. Thus, with the wise view of Buddhism based on the theorem of Dependent Origination, it helps people to see that humans and nature have an indistinguishable relationship. This reciprocal relationship creates sustainable development to survive. The destruction of nature affects human life. Therefore, we must not harm any animal, even the smallest species in this world. The Buddha also advised people not to waste, but to appreciate resources. The Buddha taught those who have the heart to walk with him on the path of liberation and enlightenment to practice compassion, whereby not only not killing but also respecting the lives of people, animals and even plants.

That truth of the Buddha is completely consistent with the natural law of existence. In that natural chain, one species is the lifeblood of the other, and so, if a link in that chain is broken, it will upset, change and lead to extinction. Proposing the precept forbidding killing, the Buddha is teaching his disciples to practice the teachings of compassion but also to return to the laws of nature, limiting interference with nature to satisfy their own ends. It is also an effective way to protect the environment and protect human life.

According to the Buddha's teaching, Buddhists are not greedy and do not do things that harm all sentient beings. Minimalist, contented lifestyle. It is a way of living with understanding and nobility. From there, limit selfishness. Each individual does not for his own benefit but harms others, to other living things. Humans should not destroy the environment, do not exploit natural resources in a destructive way so that generations of descendants will suffer terrible disasters. Instead, Humans live in harmony with nature.

Buddhism teaches that the cause of suffering is greed, hatred, delusion and ignorance. Therefore, if people want to be free from suffering, they need to eliminate it. Applying to today's environmental problems, we see the Buddha teaching his disciples to apply the teachings of Buddhism to the present life. People should live in harmony with nature, do not destroy the environment, do not indiscriminately exploit natural resources, only exploit what is essential and in moderation so that nature has time to regenerate. So that our next generations can continue to exploit and benefit from nature.

Affirming the Buddha's teaching of living in harmony with nature, today Buddhist monasteries are often built on hills, or in forests. The monasteries with shady trees, fresh air and a quiet and peaceful lifestyle are becoming an attraction for monks, nuns, devotees as well as tourists from all over the world. It becomes a great place to practice to find serenity for the mind and health for the body.

Buddhist vegetarianism is also a useful solution to the environmental problem. Besides the proven effects on human health, the practice of vegetarianism also brings practical effects on the environment, helping to improve and balance the living environment. Limiting and not using animal products will help some species avoid extinction, permanently no longer exist in the world. The vegetarianism policy is a testament to the charitable spirit

that Buddhism has, and at the same time it is a positive action to show the love of nature and the responsible attitude to the environment of each Buddhist.

In short, the Buddhist view of ecology is the harmonious coexistence between man and nature. Man must always love nature and his living environment. Because the existence of nature is the existence of man. The extremely close relationship, interdependence and coexistence not only between humans and humans but also with other species and with the ecological environment is very important. With such awareness, protecting the ecological environment on earth will become easy and effective.

Vietnamese Buddhism and the issue of environmental protection

Vietnam is a developing country. With the policy of opening up, integrating and attracting investment, Vietnam's economy has achieved many achievements in recent years. However, besides the development of material civilization, Vietnam also faces the problem of environmental pollution and resource depletion. With the rapid explosion of industrial parks, export processing zones, craft villages and production facilities, environmental problems in Vietnam have become increasingly serious. Air, water and soil pollution are directly affecting the lives of Vietnamese people in both rural and urban areas. The epidemic in Vietnam is getting younger and younger. The number of cancer patients in Vietnam ranks first in the world. Therefore, in Vietnam today, it is very necessary for all organizations and individuals to speak up and take practical measures to protect the environment.

Buddhism was introduced to Vietnam very early and has a history of development of nearly 2000 years. Buddhism blended with the indigenous culture of the Vietnamese people to become the national religion. Vietnamese Buddhism has accompanied the ups and downs of Vietnamese history for thousands of years. Today, Buddhism is still actively participating in all areas of Vietnam's social activities. In which the environment and environmental protection are also issues of concern and focus. With its methods and approaches, Vietnamese Buddhism is daily mobilizing and propagating monks, nuns and Buddhists to be aware of environmental issues and actively protect the environment like protecting their own lives.

The solution of Vietnamese Buddhism is to encourage followers to live close to the environment, in harmony with nature, and to minimize direct impacts on the environment. Recently, many meditation practices have attracted a lot of attention not only from Buddhists but also from all walks of life, from all walks of life, not only the elderly but also the elderly. The youth classes, teenagers and children are also very excited about the practice.

Completely in harmony with nature, staying away from modern civilized life not only makes practitioners feel peaceful and light, but also contributes to minimizing the impact on the environment due to noisy and rushed life. It also reduces the use of devices of modern life such as cars, phones, etc. That will contribute to a cleaner environment. People who come to this meditation are also encouraged to live slowly, meditate in all daily activities,

be closer to nature by spending time taking care of and protecting trees and birds, and limiting killing animals. Limit Use of digital technologies. Practicing vegetarianism as an effective measure to protect health and the environment.

Buddhist ashrams also regularly organize retreats for Buddhists. The content of humanistic education in these retreats is rich and varied. In particular, the issue of environmental protection was also taught by dignitaries and propagated to believers and Buddhists as an important content. Coming to these retreats, believers and Buddhists will gain knowledge about environmental protection from the Buddhist point of view. From there, they can practice right in their daily lives and encourage everyone to join hands to act for the environment.

In modern life, the fast pace of life also leads to the result that young people in society receive and integrate too quickly with the Western lifestyle, which is not suitable with the fine customs and traditions of the Vietnamese people. It has given rise to many negative phenomena in Vietnamese society. More than ever, young people need a healthy living environment both physically and mentally. Meeting the practical needs of society, every year, pagodas in Vietnam organize summer retreats to help a part of Vietnamese youth stay away from temptations, personal and selfish pleasures. Thereby, they aim to live a life of altruism, love and sharing.

In summary, it can be affirmed that the ethical values of Buddhism are making an important contribution to the awareness of environmental protection in Vietnam. The actions of Buddhists are leading, orienting and creating a truly beneficial living environment for the people and country of Vietnam today. Buddhism has been joining hands with society in activities to protect nature and ecological environment. Vietnamese Buddhism has been making every effort to build a peaceful society, a community enjoying peace, prosperity and happiness, building a real realm of bliss in the world.

4. Discussion and Conclusion

The responsibility to protect the ecological environment does not belong to any individual or organization but needs the cooperation of all mankind. Buddhism with the motto “Buddha Dharma in the world, not separated from the world” has always accompanied mankind in all matters of life. Buddhism with the policy of living in harmony with nature has a profound meaning in explaining ecological issues and protecting the living environment of people and things.

The truth of life is nothing but cause and effect. Everything in life has a cause and effect. What we need to do now is to sow more good deeds, avoid sowing evil. Start with your own actions. Start with the little things in your life. People should not do anything bad that harms the environment and society no matter how small. Humans need to wake up to the incalculable harms of acts that destroy the living and ecological environment. Then spread and encourage family members, groups, organizations, factories, schools, etc. also act well. Thus, our living environment will be better and better and the world will be more peaceful. Our lives become more peaceful and happier.

TRAINING AND FOSTERING TALENTS IN VIETNAM ACCORDING TO HO CHI MINH THOUGHT

Hoang Thi Giang

hoanggiangllct@gmail.com

Hung Yen University of Technology and Education, Hung Yen, Vietnam

Abstract

To build and develop a prosperous and happy country, it is necessary to gather and maximize all resources, including high-quality human resources - talents. To have a talented team, it is necessary to have the right training and fostering policies. In this article, the author has clarified the views of President Ho Chi Minh about the necessity of training and fostering talents and methods of training and fostering talents. On that basis, the author initially clarified the perception of the Communist Party of Vietnam on training and fostering talents in the doi moi period from 1986 up to now.

Keywords: *training, fostering, talents, Ho Chi Minh, Communist Party of Vietnam*

1. Introduction

A country that wants to survive and develop sustainably needs to make good use of human resources. People are endogenous and never-ending resources. Mastering that issue, Ho Chi Minh always considered people the center of every revolutionary period. Inheriting traditional national values, derived from revolutionary practice, Ho Chi Minh soon realized the need to train and foster talents for the country. Since then, Ho Chi Minh has proposed training and fostering talents. It is Ho Chi Minh who is an example of training and fostering talents. In the process of leading the Vietnamese revolution, Ho Chi Minh has both directly participated in training and fostering talents and sent talents to train abroad. Therefore, Ho Chi Minh has built a team of outstanding associates, contributing to the victories of the Vietnamese revolution in the twentieth century. Currently, our country is entering a period of accelerating industrialization and modernization with intertwined opportunities and challenges. The issue of high-quality resources is increasingly concerned and becomes an urgent issue. Acquiring and creatively applying Ho Chi Minh's point of view, over the years, the Communist Party of Vietnam has had the right views and policies on the issue of training and fostering talents and considers this a solution. Strategy towards building a prosperous and happy Vietnam. Studying Ho Chi Minh's views on training and fostering talents and the views and policies of the Communist Party of Vietnam on training and fostering talents in Vietnam today have profound theoretical and practical significance sharp.

2. Method

In this study, the author used qualitative research method. The author has researched, analyzed and synthesized the views of President Ho Chi Minh in 15 volumes of Ho Chi Minh Complete Collection. Research, synthesize and analyze the views of the Communist Party of Vietnam in documents of the Party Congress.

3. Results

3.1. Ho Chi Minh's perspective on training and fostering talents

From a very early age, Ho Chi Minh was interested in training and fostering talents for the country. Ho Chi Minh's point of view on training and fostering talents includes many contents. Within the framework of this article, the author focuses on clarifying on two aspects: the necessity of training and fostering talents and methods of training and fostering talents.

3.1.1. Ho Chi Minh's point of view on the necessity of training and fostering talents

President Ho Chi Minh once said that in order to build socialism, there must be socialist people. For Ho Chi Minh, the human factor is always the most important factor in every revolutionary period, so Ho Chi Minh attaches great importance to talent. In Ho Chi Minh's thought, talent plays a great role and is a driving force for the development of the country.

President Ho Chi Minh conceived of a talented person as a person who is both talented and virtuous, because talented people "can do things that benefit the country and the people" (Ho Chi Minh, 2011, Vol 4, p.504). According to Ho Chi Minh, talented people are "those who are the most enthusiastic, the smartest, the most patriotic, the most determined, the bravest" (Ho Chi Minh, 2011, Vol 5, p.302). In the relationship between virtue and talent, Ho Chi Minh emphasized the role of morality, considering morality as the root, the foundation. Thus, talented people in Ho Chi Minh's concept are talented and virtuous people who wholeheartedly serve the country and the people. In two articles "Talent and National Construction" published on National Salvation Newspaper, on November 14, 1945 and "Finding talented people" on November 20, 1946, Ho Chi Minh affirmed the important role of talents. in the cause of national construction and defense. Ho Chi Minh clearly defined: "Construction requires talent" (Ho Chi Minh, 2011, Vol 4, p.114). This point of view clearly affirms that talent is an important factor to build and develop the country. Stemming from the role, position and importance of talents, Ho Chi Minh soon saw the need to train and foster talents for the country.

President Ho Chi Minh determined that fostering, training and using talents is the top issue, the foundation, determining the success or failure of the revolution. Since preparing for the establishment of the Party, in 1927, in the work "Revolutionary Road", President Ho Chi Minh affirmed: "It is necessary to cultivate talents to bring into the Communist Party" (Ho Chi Minh, 2011, Vol 2, p.322). Thus, very early on, Ho Chi Minh clearly saw the relationship between talent and the Party, in other words, towards the goal of bringing talented people into the Party to serve the Fatherland and the people. Chi Minh made clear his point of view on the need to cultivate talents so that talented people can solve important problems on behalf of the people on behalf of the country.

It is important to understand that not all talents are cadres and not all cadres are talented. The fact of our nation's history for thousands of years has proven that: there are many talented people who have become generals and mandarins with great influence on the country and nation such as: Ly Thuong Kiet, Tran Hung Dao, Nguyen Trai... The feudal dynasties of Vietnam adopted the form of an examination to select talented people to serve

as mandarins to help the king and help the country. Ho Chi Minh clearly understood the nation's history and the role of talents for the country. Ho Chi Minh wishes that talented people will contribute their efforts to the process of national construction resistance. Thus, talent becomes an cadre is inevitable. At that time, talented people bring all their talents to contribute to the country. Ho Chi Minh determined that for the country to develop quickly and sustainably, it is necessary to have many cadres and party members who are both talented and virtuous and to realize the aspiration for a prosperous and happy Vietnam. Because according to Ho Chi Minh: "The cadre is the root of all work" (Ho Chi Minh, 2011, Vol 5, p.509), "The success or failure of the work is due to good or bad cadres" (Ho Chi Minh, 2011, Vol 5, p.313). In fact, all policies and guidelines of the Party and Government are researched and proposed by officials, as well as by officials to organize and guide the people. The Party's line is right or wrong, the organization's success or failure all depends on the cadres. In every stage of the revolution, the masses are the driving force and the cadres are the leadership nucleus. Therefore, Ho Chi Minh emphasized the Party's responsibility for the training, fostering and training of talents and cadres: taking care of and raising cadres is an important job that must be very meticulous and thoughtful. Careful, meticulous, just like a gardener who takes care of and cultivates precious trees, diligent and dedicated will have fragrant flowers and sweet fruits. Therefore, the Party needs to know how to respect and preserve old cadres, and actively train and foster new cadres, respect talents, and respect cadres.

After the victory of the August Revolution in 1945, the country entered the period of both resistance war and national construction, human resources in Vietnam, especially professional talents, were seriously lacking: "We are both resistant to war and at the same time, there is a serious shortage of human resources in Vietnam. Therefore, the most specialized talents, especially those in the medical field, will only be lacking but not in abundance" (Ho Chi Minh, 2011, Vol 5, p.487). Therefore, we need to know how to detect, train and foster them. Natural talent is a rare thing, so the role of the organization and the leader is to gather them together for training and fostering. Through the process of training and fostering, professional talents will be formed. Talented people will apply to each industry, each specific field. Thereby contributing to the construction and development of the homeland. Ho Chi Minh pointed out that they had to make every effort to gather them together: "Who are the young men and women who went to war, where are the professional talents and technical staff participating in economic and financial activities, culture. Employing all kinds of people as above means concentrating human resources" (Ho Chi Minh, 2011, Vol 4, p.531). After gathering, it is necessary to organize training and foster them. With that, talents will bloom like spring flowers.

3.1.2. Ho Chi Minh's point of view on the method of training and fostering talents

When he saw the role of talent and the need to train and foster talents, Ho Chi Minh came up with a system of methods for training and fostering talents. Methods of training and fostering talents focus on such contents as: the role of education and training; on the construction of education and training institutions; on method innovation; responsibilities of

the organization and its leader; on mechanisms and policies in the implementation, training and fostering of talents.

Firstly, Ho Chi Minh's view on the role of education and training in training and fostering talents. From a very early age, Ho Chi Minh attached great importance to education and training in general and training and fostering talents in particular. Ho Chi Minh once said: "For the sake of ten years, one must plant trees, for the benefit of a hundred years, one must plant people" (Ho Chi Minh, 2011, Vol 11, p.528). Cultivating people is concerned with training people who are both virtuous and talented to serve the country and the people. Ho Chi Minh once affirmed the role of education and training in order to: "train good citizens and good cadres for the country" (Ho Chi Minh, 2011, Vol 11, p.528).

Second, about building training facilities. In the process of leaving to find a way to save the country and directly lead the revolution, President Ho Chi Minh found that talents who matured from self-training are available but very rare. Therefore, in order to build a large force for the country, it is necessary to promote the process of training and fostering talents. To practice training and fostering talents according to Ho Chi Minh, it is necessary to open schools and open classes. In the "Viet Minh Program" in 1941, President Ho Chi Minh made a request: "Set up specialized schools for political, military and technical training to train talented classes" (Ho Chi Minh, 2011, Vol 3, p.630). Later, in his appeal to compatriots nationwide on the occasion of the second anniversary of the National Day of the Democratic Republic of Vietnam, Ho Chi Minh requested: "Build a new high school and university, train talents " (Ho Chi Minh, 2011, Vol 5, p.233). Thus, President Ho Chi Minh attaches great importance to building a system of schools and classes for education and training to improve people's knowledge in general and training and fostering talents in particular.

Third, on innovation of training methods and fostering talents. Besides opening schools and opening classes, President Ho Chi Minh advised the need to innovate methods associated with revolutionary practice. Ho Chi Minh once wrote: "We must modify the way of teaching to suit the training of talents for the resistance war and national construction" (Ho Chi Minh, 2011, Vol 5, p.575). Ho Chi Minh advised: the process of training and fostering talents must meet the needs of reality. Theory is related to reality. Learning with practice. Overcoming the fatal weakness in our education is heavy on teaching letters, light on teaching people; Heavy on theory, light on practice. Training and fostering talents, officials need: "Practical core is much more thoughtful than greed" (Ho Chi Minh, 2011, Vol 6, p.357).

In order to innovate methods to bring high efficiency, according to Ho Chi Minh, it is necessary to clearly define the goals of education and talent training. According to Ho Chi Minh, the training goal for talented people is: "Learn to work, be a person, be an officer. Learn to serve the Union, to serve the class and people, to serve the Fatherland and humanity. In order to achieve the goal, one must be thrifty, thrifty, incorruptible, righteous, just, and impartial" (Ho Chi Minh, 2011, Vol 6, p.208). Thus, Ho Chi Minh clearly specified the job of studying to be a human being before studying to be an official. Learning to be a person is put first, only being a good person will become a good cadre. Ho Chi Minh specified the objectives, training and training of cadres: first to study to improve their qualifications, then

to correct their ideology and finally to be loyal to the revolutionary cause. According to Ho Chi Minh: "If the right thought is right, the action will not be wrong and only the revolutionary task will be fulfilled" (Ho Chi Minh, 2011, Vol 6, p.360). In which, first of all is learning to cultivate morality: need, thrift, integrity, righteousness, righteousness, and impartiality. Learn to believe in the union, believe in the people, believe in the nation's future.

Fourth, about the responsibility of the organization and the leader in training and fostering talents. In the process of training and fostering talents, leaders and leaders have an important role. The role of the first leader is to spot talent. Early on, Ho Chi Minh assigned "localities must immediately investigate where there are talented people who can do things for the benefit of the country and the people, they must immediately report it to the Government" (Ho Chi Minh, 2011, Vol 4, p.504). For talents outside the Party, leaders need: "We must not abandon them, distance them from them. We must honestly unite with them, support them. Must be close to them, close to them, bring their talents to help in the resistance war to save the country. We must get rid of the diseases of pride, of narrow-mindedness, of excuses" (Ho Chi Minh, 2011, Vol 5, p.316). In order for the training and fostering of talents to be really effective, leaders and Party organizations need to change their leadership style: "To avoid the waste of talents, we need to correct the way we lead. religion" (Ho Chi Minh, 2011, Vol 5, p.281). Leaders need to eliminate rafting and winging because: "It makes the Party less talented" (Ho Chi Minh, 2011, Vol 5, p.297). Besides training and fostering talents, it also needs to be checked because: "Every time a talent is reviewed, on the one hand, new talents are found, on the other hand, corrupt people also emerge" (Ho Chi Minh, 2011, Vol 5, p.314).

Fifth, on mechanisms and policies in training and fostering talents. Ho Chi Minh pointed out: "Agencies need to pay close attention to staff training. The personnel responsible for such training must be selected very carefully. Leaders need to be involved in teaching. Do not be stingy about expenses for training" (Ho Chi Minh, 2011, Vol 5, p.313). Ho Chi Minh also pointed out that the work of training and fostering talents should be given to talented people. In the Training article, President Ho Chi Minh pointed out: "The nature of training is based on the fact that it is necessary to consider and assign responsibility to talented people to train" (Ho Chi Minh, 2011, Vol 3, p.456). Thus, the mechanisms and policies on training and fostering talents focus on two issues: the person performing the training and retraining must be talented people and need to have appropriate financial mechanisms and policies.

With a consistent system of views on training and fostering talents, during the process of leading the Vietnamese revolution, President Ho Chi Minh has built a team of outstanding leaders. Talented people are people who know how to use talented people. The team of outstanding leaders in the Ho Chi Minh era together with President Ho Chi Minh created the resounding victories of the Vietnamese revolution in the twentieth century. Currently, President Ho Chi Minh has gone far, but his thoughts and views are still valid for our Party and State. Applying and creatively developing Ho Chi Minh's views on talent training and fostering is an urgent issue for the Communist Party of Vietnam in the current period.

3.2. The Communist Party of Vietnam applies Ho Chi Minh's point of view on training and fostering talents

When the country enters the renewal period with intertwined opportunities and challenges, it is required that the Communist Party of Vietnam make full use of and maximize resources, including high-quality human resources. Inheriting and creatively developing Ho Chi Minh's thought on talent, over the years, the Communist Party of Vietnam has set forth many viewpoints and policies on training and fostering talents. Therefore, within the framework of this article, the author focuses on researching and clarifying the viewpoints and policies on training and fostering talents of the Communist Party of Vietnam from 1986 to present and on two contents: As follows:

3.2.1. The view of the Communist Party of Vietnam on the necessity of training and fostering talents

The Vietnamese people with a history of thousands of years of building and defending the country, each era has a lot of heroes. Stemming from ethnic characteristics and historical context, in 1986, at the 6th National Congress of Deputies, the Communist Party of Vietnam affirmed the need to train and foster talents for the country: "Many talents are not spontaneous products but must be discovered and nurtured meticulously" (Communist Party of Vietnam, 1986, p.75). Thus, at the VI Congress, the Communist Party of Vietnam was well aware of the need to train and foster talents for the country.

On the basis of the new perceptions of the VI Congress, at the 9th Plenum of the 10th Central Committee, the Communist Party of Vietnam continued to affirm the role of talents and the need to train and foster talents. Therefore, it is necessary to have: "mechanisms and policies to develop mechanisms for detecting, training, fostering and employing virtuous and talented people and a mechanism for cadre nomination; create a fundamental change in the discovery, training, fostering and use of talents and a contingent of excellent scientists and experts; develop a national strategy on talent; consider it a very important solution in the implementation of the cadre strategy" (Communist Party of Vietnam, 2006, p.115). Thus, at the 9th Central Conference, the Communist Party of Vietnam was well aware of the role of talent in the development of the country. The breakthrough point of this Conference is that the issue of talent training and fostering is considered an important solution in the staff strategy. Training and fostering talents is the basis to provide the country with talented and virtuous cadres who can shoulder the job. The 10th Congress, the Communist Party of Vietnam also affirmed: "Fast development of high-quality human resources. Focus on discovering, fostering, and appreciating talents" (Communist Party of Vietnam, 2006, p.96).

In the Economic Development Strategy for the period 2011-2020, the Communist Party of Vietnam affirms the role and importance of talents in the development of the country: "Especially considered in the leadership and management team. excellent staff, a team of experts, good corporate governance, skilled workers and leading scientific and technological staff" (Communist Party of Vietnam, 2011, p.130). When clearly seeing the

importance of talent to the country, the 11th Party Congress continued to affirm the necessity of talent training: "In order to create a strong collective, each child must be built individually. people, paying attention to discovering and fostering talents" (Communist Party of Vietnam, 2011, p.49). Since then, the XI Congress also pointed out: "Focus on discovering, fostering and promoting talents; training human resources for the development of the knowledge economy" (Communist Party of Vietnam, 2011, p.49).

At the 13th National Congress, the Communist Party of Vietnam became more aware of the role of human resources in the development of the country: "Really attaching importance to and effectively promoting the dynamic role of people and culture. , of education and training, science and technology in national development" (Communist Party of Vietnam, 2021, Vol I, p.29). When clearly defining the role of human resources in the country's development, the 13th Congress of the Communist Party of Vietnam affirmed the necessity of training and fostering talents: "Developing human resources, especially high-quality human resources, prioritizing human resources for leadership, management and key areas on the basis of improvement, creating a fundamental, strong and comprehensive shift in education quality, training associated with the mechanism of recruitment, use and treatment of talented people" (Communist Party of Vietnam, 2021, Vol I, p.54).

After 37 years of renovation, the Communist Party of Vietnam has become more and more aware of the role and position of talents in the country. Since then, the Communist Party of Vietnam has set forth policy positions on promoting talent training and fostering activities. Consider this as the most important solution for the development of the nation and nation.

3.2.2. The view of the Communist Party of Vietnam on methods of training and fostering talents

Once well aware of the need to train and foster talents, the Communist Party of Vietnam has set forth views and policies to promote talent training and fostering activities.

Firstly, the role of education and training in training and fostering talents. From the very beginning, the Communist Party of Vietnam was well aware of the importance of education and training in general and education and training for talents in particular. In the political report of the 7th Party Central Committee at the 8th National Congress of Deputies, the Communist Party of Vietnam affirmed: "Along with science and technology, education and training is a national priority. aimed at raising people's knowledge, training human resources and fostering talents" (Communist Party of Vietnam, 1996, p.87). Thus, in this view, the Communist Party of Vietnam has affirmed the important role of education and training in fostering talents. At the 12th Congress, the Communist Party of Vietnam continued to affirm the important role of education: "Education is the leading national policy. To develop education and training in order to raise people's intellectual level, train human resources and foster talents" (Communist Party of Vietnam, 2016, p.114).

Second, on building a system of education and training institutions. The 8th National Party Congress determined each specific step as follows: "Building a system of specialized

schools, key schools, and high-quality centers at all educational levels" (Communist Party of Vietnam, 1996, p.106). At the 10th Congress, the Communist Party of Vietnam continued to affirm the important role of education in talent training. In order to train and foster talents for the country, the document of the X Congress clearly defines: "Promoting the construction of a number of Vietnamese universities to reach world-class standards, training talents for the country" (Communist Party of Vietnam, 2006, p.207). Education and training in Vietnam needs a system of overall solutions, which focuses on building and improving the quality of educational institutions. The policy of bringing educational institutions in Vietnam to international standards. This is a novelty in the education and training policy towards training and fostering talents.

Third, on innovation of training methods and fostering talents. In the political report of the IX Central Committee at the Xth Congress, the Communist Party of Vietnam has determined: "Innovation of the education system undergraduate and graduate degrees, linking training with employment, directly serving the transformation of labor structure, rapidly developing high-quality human resources, especially leading experts. Focus on discovering, fostering, and appreciating talents; quickly build a reasonable human resource structure in terms of professions, training levels, ethnicities and regions" (Communist Party of Vietnam, 2006, p.97). This point of view of the Party has shown the need to renovate the higher and postgraduate education system, promoting the connection between training institutions and the practical needs of the country's human resources.

Fourth, the role of the Party and the leader in training and fostering talents. Talent training and retraining is a matter of concern for the whole political system, in which the Communist Party of Vietnam, the State and the head, the leader play an important role. The Communist Party of Vietnam is the leading organization of the country. The leadership role of the Communist Party of Vietnam in training and fostering talents is to set out the right viewpoints and policies for the development of education and training. Besides the role of the Party, the heads and leaders of agencies and units also have a very important role. Because they are the ones who have direct contact with the talents. At the 12th Congress, the Communist Party of Vietnam pointed out: "Innovating financial policies and mechanisms, mobilizing the participation and contributions of the whole society; improve the efficiency of investment to develop education and training" (Communist Party of Vietnam, 2016, p.117). In Resolution No. 26, dated May 19, 2018, the Communist Party of Vietnam specifies the responsibilities of leaders in training and fostering talents: "Stipulating the responsibilities of leaders and members at all levels in the nomination of virtuous and talented people; the head has the responsibility to train, retrain and nominate his replacement" (Resolution No. 26, 2018).

Fifth, on mechanisms and policies for training and fostering talents. In order for education to truly become a leading national policy, and to do that, the VIII National Congress also pointed out: "Sufficient state budget is spent to send talented and well-qualified people for training and retraining. training in key occupations and fields in

countries with developed science and technology” (Communist Party of Vietnam, 1996, p.106). Thus, the Communist Party of Vietnam advocates combining domestic training and fostering with overseas training and retraining in order to create a talented and virtuous team of talents to meet the requirements of the industrialization cause. modernize the country. The 13th Congress of the Communist Party of Vietnam clearly stated: "Building synchronously, institutions and policies to effectively implement the policy of education and training with science and technology as the top national policy, is the key driving force for the development of the country” (Communist Party of Vietnam, 2021, Vol I, p.136). In order to do well in the training and fostering of talents, Resolution No. 26 also clearly states: “Improving the mechanism, promoting the attraction and creation of cadres from excellent graduates, young scientists with high qualifications. prospects and pay special attention to training, fostering and training the next class of cadres. Actively grasp, select, train, foster and train excellent and excellent graduates at home and abroad” (Resolution No. 26, 2018).

At the 13th National Congress, the Communist Party of Vietnam reaffirmed its policy: “Focus on training high-quality human resources, discovering and fostering talents; have outstanding policies to attract and utilize talents and experts both at home and abroad” (Communist Party of Vietnam, 2021, Vol I, p.220). Thus, once again the Communist Party of Vietnam affirmed the need for appropriate mechanisms and policies in training and fostering talents.

Over the years, the Communist Party of Vietnam's awareness of the need to train and foster talents as well as methods for training and fostering talents has gradually been clarified. These correct views and policies are the basis for practical application. Thereby contributing to building high-quality human resources for the country. Well implementing the views and policies of the Communist Party of Vietnam on training and fostering talents is one of the important orientations, contributing to the development of a powerful and prosperous country as Ho Chi Minh always desired.

4. Conclusion

In the entire content of the article, the author has presented the contents of Ho Chi Minh's thought on training and fostering talents and the application of the Communist Party of Vietnam in the current period. President Ho Chi Minh has gone far, but the lessons on training and fostering talents that Ho Chi Minh left us are still valid today. Currently, our country is entering the stage of accelerating industrialization and modernization, striving "by 2045, turning our country into a developed and high-income country"(Communist Party of Vietnam, 2021, Vol I, p.36) asked the Party and State to make the most of high-quality human resources - talents. Inheriting and creatively developing Ho Chi Minh's thought, over the years, the Communist Party of Vietnam has set forth many correct policies on training and fostering talents, suitable for the development of the country. The achievements in national construction and development are the clearest evidence for the Party's human policy in general and the policy of training and fostering talents in particular.

THE ROLE OF POLITICAL THEORY SUBJECTS IN DEVELOPING PERSONALITY, MORALITY, AND LIFESTYLE FOR STUDENTS AT UNIVERSITIES AND COLLEGES IN VIETNAM TODAY

MA. Ta Van Sang

tvansang@agu.edu.vn

Faculty of Law and Political Science, An Giang University, Vietnam

National University Ho Chi Minh City, Vietnam

Abstract

Political theory subjects play a significant role in forming and developing personality, morality, and lifestyle for students. Therefore, improving the quality of teaching Political theory subjects at universities and colleges is inevitable. Many researchers approach the issue of promoting the role of Political theory subjects from many different perspectives. In this article, the author explains the role of Political theory subjects in universities and colleges and proposes solutions to improve the quality of teaching Political theory subjects, contributing to student personality building and development, morality, and lifestyle.

Keywords: *Political theory subjects, Personality, Lifestyle, Students*

1. Introduction

Political theory subjects (Marxist-Leninist Philosophy, Marxist-Leninist Political Economy, Scientific Socialism, History of the Communist Party of Vietnam, Ho Chi Minh ideology) are integral to higher education programs, accounting for about 10% of total credits in training programs. Political theory subjects provide progressive, revolutionary theoretical knowledge and play a significant role in building and developing personality, morality, and lifestyle for students.

Through the knowledge provided by Political theory subjects, students will gradually establish a worldview, human perspective, and scientific methodology. This is the basis for comprehensive human development and a step to prepare the next generation of cadres who are good in professionalism and political bravery in the future. However, the study of Political theory has yet to achieve the desired effect because many people are not fully aware of the role of these sciences. There is still a section that thinks that anyone can teach Political Theory; those who do not study Political theory subjects still graduate from school and can work well with their professional expertise. Instead of studying Political theory subjects, they should focus on specialized subjects. Some students have the mentality of "hesitating" to learn" these subjects. They consider these subjects dry, abstract, difficult to understand, and impossible to apply. With this misperception, it will be an opportunity for hostile forces to attack the student force and, step by step, eliminate our weapon of theory. Therefore, improving the quality of teaching and learning in Political theory has become an urgent issue both theoretically and practically, not only contributing to fostering and developing students' personalities but also protecting the ideological foundation of our Party in the current period.

2. Method

The article is based on the theory of Marxism-Leninism, Ho Chi Minh ideology, and the Communist Party of Vietnam on political theory education.

At the same time, the article also uses other methods, such as:

Combined historical and logic: used to study the process of formation, development and find out the essence of the studied problem;

Documentary research method: used to analyze documents such as documents of the Communist Party of Vietnam and published scientific works on improving the quality of teaching Political theory. From there, take note and summarize scientific judgments from sources to serve as a basis for comparison, comparison, and development of theoretical research framework;

Analysis and synthesis method: used to analyze and synthesize knowledge gained from collecting views from sources to give explanations, comments, and suggestions on ideas and solutions to build personality, ethics, and lifestyle for students through Political theory subjects.

3. Results

3.1. The Role of Political theory subjects in Universities and Colleges

3.1.1. Fostering materialistic worldview, communist human perspective, and scientific methodology for students

Political Theory Subjects, primarily Marxist-Leninist philosophy, play an essential role in fostering materialist worldview and dialectical methodology for students. Worldview is the views and conceptions of people about the world around them, about themselves and people's lives, and about the position of people in that world. At the same time, the methodology is the reasoning about methods, the system of views, and principles that guide people to explore, develop, select, and apply methods in perception and practice.

Forming a materialist worldview and scientific methodology will "provide students with a scientific perspective on objective reality and affirm the role and position of human beings in perceiving and improving the world" (Hoang Anh, 2012, p.106). In particular, Political Theory subjects help students to absorb other science subjects well because today's sciences are always closely related and penetrating each other, and every science must have theoretical thinking. Equipping materialist worldviews and dialectical methodologies will help students have a correct view when analyzing and evaluating problems that other sciences pose. In the training program, each science subject provides professional knowledge and forms students' personalities. Political theory subjects are no exception, but it also plays a fundamental role in creating political bravery, a sense of self-reliance, and self-reliance aspirations to develop a prosperous and happy country.

Studying Political theory subjects helps students to be adequately aware of the process of formation and development of natural, social, and thinking circles. For example:

- Marxist-Leninist Philosophy helps students understand the most general laws and gives people the correct scientific worldview and methodology to perceive and reform the world;

- Marxist-Leninist Political Economy studies the relations between people in the production process. With the capitalist mode of production, Marxist-Leninist Political Economy indicates the essence, the main economic laws that shape, develop, and bring capitalism to its demise. With the communist mode of production, Marxist-Leninist Political Economy studies the development laws of new production relations, the way to build a society free from oppression and injustice, for freedom, prosperity, and happiness for everyone. The first stage of the communist mode of production was socialism; Scientific socialism studies the laws of transition from capitalism to socialism and the direction of building a new society. Scientific socialism has proven that the socialization of labor in capitalism created the primary material basis for the inevitable birth of socialism. The social force that carried out that transformation is the working class and the working people. From providing such basic knowledge, students will form scientific awareness and adequately explain the historical development of human society through socioeconomic forms. From there, they give students confidence in the future society, as well as the upward path of the country. At the same time, step by step, students will establish the right and scientific attitude toward reality and be able to identify and analyze existing problems in the spirit of Marxism-Leninism, Ho Chi Minh Thought, and the Communist Party of Vietnam.

The knowledge of Political theory subjects, when imparted scientifically and artistically, plus the active learning of students, will gradually absorb to help students have sharp cognitive tools to orient in professional and professional improvement, improve political bravery and working methods to become "both morality and professional competence."

Political theory courses also form in students the communist view of life, building for them perspectives on how to see life, how to see people, and how to determine the purpose of life. Political theory courses will foster communist ideals and help students have the energy to overcome difficulties and challenges to achieve goals for people and the cause of human liberation, bringing people freedom and happiness. Political theory courses form for students' perspectives on class, ethnicity, and humankind to help them comprehensively view social issues. Since then, students will be more sensitive to reality, rise on their own in their study, productive labor, living, and behavior, and have a firm belief in the path of socialism, contributing to raising political consciousness and perfecting personality.

According to scientists, the human personality is expressed in intellect and morality. Intellectually it is socialization capacity: representing the ability to acquire knowledge, from that accumulated knowledge capital as the basis for the creation of personality bearers in practical activities, expressed in adaptability, mobility, and flexibility in social life; Subjectivization competence: speaking the ability to communicate the "ego" bravery and the unique mark of the individual in social relations; Capacity for action: demonstrating the ability to act on purpose, having the spirit of initiative, positivity, creativity with the highest productivity, quality, and efficiency, is to show the social positivity of the personality bearer; ability to socialize and communicate. Morals are expressed in social qualities: including

worldview, stance, socio-political attitude, and labor attitude. The high development of these qualities makes the individual always have the correct and reasonable perceptions and actions in different practical circumstances and conditions. Only by establishing a worldview can each person assert their personality in life; Personal moral qualities: reflection and affirmation of social existence of the interests and activities of individuals. In their cognitive and practical exercises, individuals implement social ethics as systems of social experience, ideals, and standards formed in the history of the community, turning social experience into personal expertise, and quality of will, discipline, criticality, and manners are essential qualities of a person of character; The development of aesthetic consciousness: With a high sense of aesthetics, the individual will have a high, joyful spiritual life, arouse creative potential and always consciously reach for beauty in each person.

3.1.2. Raising revolutionary feelings and morals for students

Political theory subjects play a significant role in contributing to raising revolutionary sentiment and will. Building revolutionary emotional will become a platform to motivate action, helping students have faith in the scientific theory they are studying. From there, they are determined to learn and follow, and especially they will self-answer about the intense vitality of Marxism-Leninism and the significant progress that no other doctrine has been able to surpass so far.

Along with building revolutionary sentiment, Political theory subject courses also develop and enhance revolutionary ethics for students. One of the paradoxes of today's society is that when science and technology are growing, people's morality and lifestyle are more and more degraded, leading to a selfish, narrow-minded, and insensitive lifestyle. These things happen daily, every hour, impacting the personality, morality, and lifestyle of young people and students. Therefore, arousing the right sentiments and high revolutionary ethics will be the driving force for the development of society. Ho Chi Minh once affirmed: "Like rivers have sources, there is water; without sources, rivers are shallow. The plant must have a root; without one, the plant wilts. The revolutionary must have morality; without morality, no matter how clever, they will not be able to lead the people. Because to liberate the nation, the liberation of humanity is a great task, but the revolutionary without morality do foundation, corrupted and evil by itself, what can be done?" (Ho Chi Minh, 2011c, p.292-293). Ho Chi Minh's view shows that Ho Chi Minh always considered morality as the root of the revolutionary. According to Ho Chi Minh, revolutionaries must have revolutionary ethics to carry heavy work, go far, and lead the people. Because the revolutionary cause is long and arduous, it is necessary to sacrifice, so revolutionaries must have revolutionary ethics.

The study and study of Political theory subjects help learners have conditions to understand and practice revolutionary ethics, anti-individualism, and the enemy "in every man" to establish themselves, establish a career, live beneficial for society, love and do good things, hate and avoid evil, evil; raise pride in the country, the socialist political regime, Ho Chi Minh, and the Communist Party of Vietnam.

The political theory also improves political bravery, maintains stances, and fulfills civic responsibilities. Regularly cultivating and training ideas, ethics, working styles, and methods associated with acquiring revolutionary sentiments will make practical and influential contributions to the country's revolutionary cause, firmly walking on the revolutionary path chosen by Ho Chi Minh and the Vietnamese people.

3.1.3. Develop theoretical thinking capacity and improve the quality of human resources

The Communist Party of Vietnam affirms: Marxism-Leninism and Ho Chi Minh's ideology as the ideological foundation and guideline for the Party's actions. Therefore, seriously studying Marxism-Leninism and Ho Chi Minh's ideology is an objective necessity. Through that learning, students' ability to think reasonably is also enhanced. The power of each person to think the reasoning is essential to help solve the requirements set by life. Students' capacity is formed and developed from many sources, going through many stages of life, but the scene at university is critical; it is associated with the creative youth of people. Moreover, students' knowledge and skills formed and developed through the study of Political theory subjects will contribute to guiding actions for students to become productive citizens of society.

In the process of growing up of each person, in addition to equipping ourselves with professional knowledge, building intense political bravery is very necessary because if we lack political courage, we will be easily exploited by enemies and quickly lose our ideals, the belief and become traitors to the harm of the interests of the nation. Ho Chi Minh once said: "Everyone has the right to study a doctrine. I have studied Marxism." (Ho Chi Minh, 2011b, p.315) because, according to Ho Chi Minh, Marxism-Leninism is the most genuine, surest, most revolutionary. Marxism-Leninism helps us to have dialectical working methods and allows us to live together more loyally.

Learning and understanding political theory is essential for a future cadre to be able to plan courses and guide people in exercising their rights and obligations. Therefore, to become a good officer in the future, students need to work hard to learn theory. The theory is a summation of practice. Political theory subjects are also constantly updated with new, scientific, advanced, and vivid practical knowledge, contributing to the formation of students of unique qualities to meet the requirements. Our Party affirmed: "To build people and generations who are earnestly attached to the ideals of national independence and socialism, have pure morals, and have a strong will to build and defend the socialist Vietnam fatherland." (Communist Party of Vietnam, 1996). In particular, in the Resolution of the 8th plenum of the XI session on fundamental and comprehensive reform of education and training, our Party affirmed: "Create fundamental and strong changes in the quality and effectiveness of education and training; better meet the construction and defense of the Fatherland and the people's learning needs. Educating Vietnamese people to develop comprehensively and bring into full play the potential and creativity of each individual; love family, love the Fatherland, love fellow citizens; Live well and be productive." (Communist Party of Vietnam, 2013).

3.1.4. Protection and promotion of traditional values of the nation

Political Theory courses help learners be fully aware of the nation's traditional values and a systematic awareness of the correct and scientific leadership and rule of the Communist Party of Vietnam towards the class and nation. On that basis, students realize their responsibility to preserve and protect the nation's traditional values and the leadership of the Communist Party of Vietnam against the onslaught of hostile forces.

In the current period, when some young people and students show signs of devotion, hybridity, and turning away from traditional national values, Political Theory subjects will foster the spirit of patriotism, compassion, obligation, honesty, solidarity, diligence, creativity, etc. The will to self-reliance, self-reliance and national self-respect for students helps students understand the nation's traditional values and that traditional values developed to the peak during the period of the Communist Party of Vietnam's leadership. This is an essential basis for building a noble lifestyle for students.

From being adequately aware of the role of Political Theory subjects, students will be more active and active in fighting critically against wrong views to protect the purity of Marxism-Leninism, Ho Chi Minh ideology, guidelines, and policies of the Party and State. At the same time, they are improving the fighting power of young people against negativity, backwardness, and corruption, contributing to preventing and repelling the deterioration of political thought, morality, lifestyle, and manifestations of "self-evolution" and "self-transformation" in the Party and current society.

3.2. Improve the teaching quality of Political Theory subjects, contributing to building and developing personality, morality, and lifestyle for students

3.2.1. Raising awareness of training institutions, lecturers, and students toward subjects and renovating how to organize teaching and learning Political theory subjects.

Our Party advocates fundamental and comprehensive education and training reform, meeting the requirements of industrialization and modernization in the conditions of a socialist-oriented market economy and international integration to create high-quality human resources for the cause of building and defending the socialist Fatherland. The fundamental and comprehensive renewal of education and training is the renewal of major, core, and urgent issues, from viewpoints and guiding ideas to objectives, contents, methods, mechanisms, policies, and conditions to ensure implementation; innovation from the leadership of the Party, the management of the State to the governance of education and training institutions and the involvement of families, communities, society, and learners themselves; innovation at all levels and disciplines.

About theoretical education, in Conclusion, No. 94-KL/TW of the Politburo dated 28/3/2014, emphasized: "Renovating the learning of Political Theory in the national education system to create a new, fruitful and higher quality progress, contributing to Marxism-Leninism, Ho Chi Minh's ideas and the Party's guidelines and views play a leading role in social life; ensure that the young generation of Vietnam is always loyal to the goals and ideals of the Party and our regime." At the same time, the conclusion also affirmed:

"Strengthen the management and direction of the study of political theory in the national education system. Clearly define Political Theory as a compulsory main subject, with serious and rigorous examinations and examinations." Therefore, training departments must seriously observe Politburo's guiding views in Conclusion No. 94-KL/TW. This is the basis for raising awareness of training institutions, lecturers, and students towards teaching and learning Political Theory.

From a management perspective, training institutions must constantly build qualified political theory lecturers. Build their motivation to strive, self-study, research, improve their professional and professional qualifications, innovate, and be creative in teaching methods for service. At the same time, training institutions must strengthen quality management by developing standards for evaluating teaching effectiveness in Political theory.

Training institutions must also firmly say no to unspecialization teaching, pressure learning, shortened learning time, and organizing classes beyond the prescribed number. This is one of the critical issues in improving the quality of teaching Political theory subjects. Because the placement of lecturers outside the training major to teach will lead to the inability to deepen reasoning and make reasoning dry, losing its attractiveness because it is impossible to exploit the characteristics of specialized science. The pressure of learning shortened learning time and organizing classes beyond the prescribed number will make it difficult for lecturers to deploy active teaching methods focusing mainly on one-way presentations. From there, learners are not interested in Political theory subjects, and bad academic psychology spreads from one course to another. This situation should put an end to it. At the same time, training institutions need to create conditions for lecturers to innovate the form of teaching Political Theory subjects such as reducing theoretical learning time, increasing discussion time, self-study and scientific research, and Combining classroom learning with visiting monuments, red addresses, and museums. Through practical teaching, theoretical teaching forms combined with field visits create excitement for students. Or you can develop a plan to organize the Olympiad of Marxist-Leninist science subjects to create a healthy playground for students to participate, contributing to raising awareness and belief for students. At the same time, it is necessary to promote coordination with units outside the school to build and foster student personality, morality, and lifestyle.

Enhance facilities, equipment, and learning materials to serve research and teaching. Teaching facilities and equipment are essential components of the teaching process. The strengthening of modern teaching facilities and equipment will improve the quality of training in general, and the quality of teaching Political Theory subjects in particular. In addition, the building of a rich system of learning materials such as textbooks, lectures, thematic documents, scientific research results, specialized journals, theses, dissertations, dissertations, proceedings of scientific conferences, internship reports, practical is essential for lecturers and students to access for teaching and learning easier. Develop open learning resources, and build shared and inter-library libraries that allow students to exploit and use learning materials in a convenient way to research, discover and create new knowledge.

3.2.2. *On the lecturers*

It is necessary to master professional knowledge and related scientific subjects systematically. Getting specialized knowledge and associated scientific issues will help lecturers have the ability to concretize the nature, content, and value of ideas and views, capable of stringing problems logical "axes of thought" to help learners easily remember, easy to understand, and not infringe on other sciences. This task is difficult for teachers because it is a gradual process of accumulating knowledge. It requires teachers to be persistent, continuous, flexible, sensitive, creative, and especially contemplative to summarize values in the research and teaching process. At the same time, in the teaching process, teachers need to master the module objectives to teach in a focused way. In addition to the general theoretical contents, lecturers need to deeply apply reasoning in practice to each specific training profession to change the perception and actions of students of each discipline. Ho Chi Minh once said: "Education must serve the political line of the Party and the Government, associated with production and people's lives. Learning must go hand in hand with practice, and reasoning must be related to reality" (Ho Chi Minh, 2011d, p.467). To do that, we must carry out Lenin's teachings well: "We must carefully study the question of what we must teach and how young people must learn if they want to appear worthy of the title of communist youth truly and how we must prepare them to build up to the end and thoroughly accomplish the cause we have begun" (V.I.Lenin, 2005, p.357). First, this responsibility belongs to the teaching staff of political theory in universities and colleges.

Combine teaching with scientific research. Teaching and scientific research are two critical factors for assessing faculty competence. Teachers of Political Theory need to be acutely aware of this task. In some schools, scientific research does not bring us monetary value but gives us scientific knowledge and prestige. To do this job well, teachers must explore, learn, research, think independently, apply the accumulated knowledge, and develop it to new heights. Only then can lecturers thoroughly understand the problem to guide students to perform their research and study tasks well.

It must be an excellent example of personality, morality, and lifestyle for students to follow. Ho Chi Minh affirmed: "A good teacher – a teacher who deserves to be a teacher – is the most glorious person. Although their names are not published in newspapers, they are not awarded medals, but good teachers are unsung heroes. This is a very glorious thing. If there are no teachers to teach people's children, how can socialism be built" (Ho Chi Minh, 2011e, p.402-403). This proves that teachers must be ethical and professionally knowledgeable. Building a teacher role model in students' eyes is an important job to implement the personality method to educate personality. At the time, Ho Chi Minh also reminded: "A living example is worth more than a hundred propaganda speeches" (Ho Chi Minh, 2011a, p.284). Therefore, each teacher must strive for self-cultivation to become an excellent example of morality and lifestyle for students.

To become a teach Political theorist loved and valued by students, a lecturer must have enthusiasm, love for the profession, and professional knowledge. At the same time, the teacher also knows how to master himself and lives meaningfully, lovingly, calmly, gently,

cheerfully, sincerely, simply, and politely in learners' eyes. Building a beautiful image of the teacher's personality in students is a great success in teaching. Because of that good example, it has had a significant impact on shaping the character of students.

3.2.3. On the learner

Must raise awareness and interest in learning the subject for students. With the critical role of Political theory subjects in building and developing personality, morality, and lifestyle for students, as mentioned above, in the educational process, it is necessary to raise awareness for students about the importance of studying Political Theory subjects as sciences, is a doctrine of Vietnam's sustainable development, not merely a module that needs enough points to pass and accumulate points according to regulations.

Students must also improve their ability to self-study, self-research, and develop study plans. In learning, students themselves must take self-study as the core. Learning is a need of every person and must be lifelong learning. Therefore, students must be self-disciplined in complying with school rules and regulations; honest in studying, testing, and examinations; and have the spirit of solidarity and mutual support in study and life. Adhering to and training one's sense of organization and discipline at school is the foundation for learners' professional success in the future. Students must develop a plan, set out implementation measures, and be determined to act.

3.2.4. About teaching methods

Combining traditional and modern teaching methods is necessary to promote learners' creativity. Teaching methods are the teacher's tools to transmit knowledge to learners; what content is that method? The method helps learners form scientific awareness, cultivate theoretical thinking capacity, and train political thought, moral qualities, and personality. Education is methodological education. Suitable methods will promote learners' creative ability, help learners acquire knowledge on their own, and use theoretical knowledge to master knowledge. The correct method will be the thrust to develop knowledge and wisdom. The method is the transmission, suggestion, and stimulation of independent thinking to solve the problem best.

Currently, there are different opinions on the use of teaching methods. However, each method has disadvantages since no technique is a multimeter. Therefore, we need to harmoniously combine traditional and modern methods according to each suitable subject to create high efficiency in teaching, especially when the current classes have many students. Therefore, the problem is to be diverse and flexible in using methods to help learners actively acquire and teach knowledge. In teaching Political Theory subjects, in addition to using traditional teaching methods such as presentation methods, raising problems, debating questions, and self-study with textbooks and reference books. Teachers can apply project-based teaching, flipped classes, organize seminars and competitions or apply constructivist theories to education.

In the teaching process, it is necessary to apply information technology in teaching. Information technology is considered an effective support tool for the teaching process. A good lecture usually combines elements: Teacher, learner, and teaching conditions and

means. Most universities and colleges have modern facilities and equipment to meet teaching and learning needs. The application of information technology in teaching has created practical effects to help teachers visually, concisely, succinctly, and systematically express lectures with diagrams, tables, and movies to create excitement in learning. The application of information technology is also an essential requirement in innovating the method of teaching modules. In applying information technology in teaching, we can choose and use software to design lectures, such as Microsoft PowerPoint, MAKER, and iMindMap ... or combine software to make lessons lively and easy to understand, reducing the "dry, abstract" mentality of the lecture.

The application of information technology will increase the persuasiveness of lectures with diagrams, tables, good movies, beautiful photos, and meaningful songs. Teachers who know how to select and use the right resources at the right time will create interest in students' learning, and vice versa will be counterproductive in teaching. Of course, we must also prepare the necessary tools to easily interact with students in education.

Regarding testing, examinations also need innovation, forcing students to enhance their ability to self-study and self-research by strengthening tests and exams in the form of multiple choice, combining short essays and open-ended questions. Make it a habit for students to learn to understand, not memorize. That dramatically affects students in promoting creativity, passion for discovery, free thought, and a more holistic and deeper view of current Political theory subjects.

4. Discussion and conclusion

The above research results clarified the role of Political theory subjects in building and developing students' personalities, morality, and lifestyle. Political Theory subjects contribute to fostering the communist worldview, human perspective, and scientific methodology for students; raising revolutionary sentiments and ethics for students; improving theoretical thinking capacity and developing quality human resources; protecting and promoting the nation's traditional values. Along with that, to promote the role of Political Theory subjects, it is necessary to synchronously and flexibly implement solutions from awareness to organizational form, content, methods, teachers, learners, and material conditions in an excellent way to improve the quality of teaching Political theory subjects, contributing significantly to the improvement of personality, conduct, lifestyle for students.

Specifying the role of Political theory subjects in building and developing personality, ethics, and lifestyle for universities and colleges today will raise awareness of training institutions, staff, lecturers, and students towards Political theory. This is a significant factor because only with proper perception can people act appropriately. Understanding the role of Political theory and proposed solutions will contribute effectively to the realization of "Strengthening the education of revolutionary ideals, morals, lifestyles and arousing aspirations to contribute to youth, adolescents, and children in the period 2021-2030".

This research also provides scientific bases and references for materials for study to improve the quality of teaching political theory subjects at specific universities and colleges today.

Abstract

Over the past decades, Vietnam's higher education has made remarkable achievements and developments, making an important contribution to the mission of raising the people's intellectual level, training human resources for the process of national construction, defense and development. Typically: People's learning needs are better met; the strategic goals of improving people's knowledge, training human resources and fostering talents have achieved some important results; the social policies on higher education have been implemented better and more effectively; the quality of higher education has made a good first step in both quality and quantity; strengthen conditions to ensure possible educational development.

Besides the great achievements mentioned above, higher education in our country still contains many weaknesses, shortcomings, and exists many issues that need to be concern. Specifically, the quality of majority education, especially at the university level is still low, educational methods are outdated and slow in innovation; conditions to ensure higher education development are still inadequate; poor families, low-income families and ethnic minorities still face difficulties in accessing higher education, especially for postgraduate studies; some negative cases in higher education are slowly solved, etc.

In order to resolve the above issues, this paper summarizes the achievements, difficulties and provides directions for building an education based on a solid theoretical foundation, focus on researching educational philosophy to suit the requirements of the era and integration.

Keywords: *higher education, current situation of education, educational achievements, challenges and integration.*

1. Introduction

The studies of educators and educational administrators have analyzed and synthesized scientifically on issues in the process of implementing innovation, proposed solutions to the renovation of education and training successfully. Initially, administrators and scientists assessed the overall situation, causes and remedies on education and training on the way of international integration; deep research into issues such as change in awareness and implementation policies; learn the deployment process from the flat world, study the barriers to adjusting explicit implementation methods, create unity, cooperation and high consensus of the whole education system and society. [1] & [16]

In the research process to find the optimal direction for education, initial research results obtained have positive changes at the macro level of the whole system, society to the micro level in people's awareness, teachers, learners about the needs, concrete and practical actions to be taken to innovate education. [2]

Firstly, we need to be deeply aware of the revolutionary and scientific nature of the educational reform process. These are not local, micro modifications and adjustments dogmatically; but this is a "fundamental and comprehensive" innovation process at the macro level of the nature of the education system, take the education system to a new level, a new position, more effectively, more quality. Those are the basic components that need to be objectively and explicitly researched on the theoretical basis, clarifying both scientific and practical basis as a basis for renovating education system. These are very important issues that have not been studied thoroughly and systematically, and there are still many critical, different and opposite opinions. [3] & [16]

However, the renovation process must be implemented consistently from higher levels to grassroots levels, synchronously, with steps and routes consistent with the identified priorities, on the basis of combining scientific research with experimentation, practical theory, with extensive implementation in practice, drawing experience and making supplementary and complete adjustments so as not to allow serious mistakes to occur which affects the whole system.

2. Results

2.1. Current situation of higher education in Vietnam

For any country, the implementation of human resource training must revolve around two basic issues: training and employment. There is no common voice and close relationship between training and labor market in practice. As a result, graduates are many, but their practice capacity is limited so they do not meet the labor market demand. [1], [2]

The reason is that the quality of higher education is still low, institutions are only interested in developing more quantity than quality; compared with the development requirements and needs of the country, there are still many unsatisfactory contents; education is not really a top national policy; the institutions still owe the country a promise for higher education quality as expected. Higher education has only achieved the goal of convey

knowledge, failing to meet the requirements for teaching to be human, career guidance and learning attitudes [16].

The role of education and training is directed to human development to meet the urgent needs of the developing economy; therefore, it is necessary to have a high-quality education. In training, priority should be given to personal development such as independence, sense of responsibility and the ability to work in groups; based on broad and firm basic training, allowing transfer between forms of training; towards the development of social-occupational capacities and close ties with the labor market; enhance adaptability and self-study [8] & [9].

State management of education still has many problems, which are the main causes of all other causes; education management mechanism is still subsidized, not untied; haven't promoted the activeness and responsibility of institutions; overlap and inconsistency in management; incomplete educational policies are still subjective, only willed, far from reality, lack of social consensus; there are still many embarrassments and perceptions at the macro level, especially in terms of market economy and international integration; have not met the expectations of the country [2]&[5].

Training at university level, the contents, programs and methods of education are still stagnant, outdated, slow in innovation, not fast in modernization, not closely associated with the social life and professional labor of the working world; not promote creative thinking and practical capacity of students. Learners has not placed in the right center of the educational trajectory [2].

Embarrassing, not clearly defining the guideline in building the direction of training links with foreign partners. The national education system is not suitable for development, lack of uniformity, not yet connected and lose the balance.

Figure 1. Relationship in teaching - learning

In both qualitative and quantitative terms, the quality of scientific research in higher education is still low in both quality and quantity and there are many shortcomings, although the number of scientific staff, especially the number of doctors, associate professors and professors in our country, is the highest in the region [18].

Educational thinking is psychologically heavy, the point of view has not been fully grasped, slow to innovate, the attitude of not fully and properly aware of education socialization; failing to catch up with the core requirements of education and training innovation with the goal to develop the country in the context of market economy development and international integration; technical pedagogical universities, technical pedagogical institutes or technical pedagogical faculties have not been given adequate attention, not returning in line with the trajectory of technical education but rather the responsibilities of technical pedagogical institutions[1].

The number of educational managers and lecturers is insufficient, weak and inadequate, ethics and capacity of a part is still low. The reality is that lecturers and educational administrators still have limitations that are reflected mainly in consultancy, forecasting, planning, working methods, financial management, foreign language and information technology skills, ability to collect and process information, etc.

The quality of higher education is lax, declining, especially moral education and lifestyle; weak on ideological education, national history, creative thinking, practical skills, life skills, lifestyle, ethics, etc.

The quality of majority education, especially at the university level is still low, educational methods are outdated and slow in innovation; conditions to ensure higher education development are still inadequate; poor families, low-income families and ethnic minorities still face difficulties in accessing higher education, especially for postgraduate studies; some negative cases in higher education are slowly solved.

The impact of the industrial revolution 4.0 on education is enormous, need a change of mindset, goals, content, programs, methods, means, forms of teaching in higher education to meet the era 4.0; must adapt to lifelong learning, which equips new skills for each occupation; education 4.0 requires creative, innovative, and problem solving skills, critical thinking, creativity, human resource management, teamwork, etc.

Objectively assess the current situation of education, put education ahead of the country's demands in a new phase, approach to the next research items.

2.2. Achievements, opportunities and challenges of higher education in Vietnam

From the overall perspective, apart from the reality of being subjective and objective, we can see the positive aspects exist, higher education is not quite a dark color because it has many commendable achievements that are undeniable.

2.2.1. Achievements of higher education in Vietnam

Our country's education and training have achieved important achievements which contributes greatly to the process of national construction and protection.

Typical as: The system of higher education institutions and sizes rapidly develops, the learning needs for the people are better met and increasing, implement a universal education to meet the needs of the people and improve the qualifications and vocational skills of learners.

The strategic goals of raising people's intellectual level, training human resources and fostering talents have achieved important results, contributing to meeting the human resource requirements for socio-economic development of the country. The possible development path towards gradual shift from the goal of higher education is to enhance knowledge to develop learners' qualities and competencies. The quality of higher education, at a certain perspective, is evaluated to be close to the standards of the world.

The social policies on higher education have been implemented better and more effectively. Socializing education and international cooperation have been promoted, achieving many important results. The quality of higher education was improved, there were good initial changes in both quality and quantity; strengthening conditions to ensure successful educational development.

The management of higher education has a positive move. Teachers and administrators of higher education increased rapidly in terms of quantity, training level was raised, gradually meeting the requirements of higher education development of the times.

The facilities of the higher education system are developed and step by step modernized, creating the most favorable teaching environment for teachers and learners when investment in higher education is strengthened. At the same time, there is an approach to teaching methods and assessment based on competence, prioritizing the development of skills and skillful in real life based on the serious attitude of the learners. In training, priority should be given to personal development such as independence, sense of responsibility and the ability to work in groups; relying on broad and firm basic training, allowing transfer between training forms; towards the development of social-occupational capacities and close ties with the labor market; enhance adaptability and self-study ability [2], [3].

Social justice in higher education has made a lot of progress, especially for poor families, low-income families, ethnic minorities, rural laborers, social policy beneficiaries, people with meritorious services and people in difficult circumstances and gender equality are guaranteed; create favorable conditions for everyone to study at the right age and with their own qualifications.

About the worldview and human outlook, parents, educators, educational institutions and the world of work have made positive changes at the macro level of the entire social system in recognition of the progress in management and administration, to micro level in the awareness of everybody, lecturers and learners about the need and specific actions to be taken to innovate education.

A possible, dynamic, effective and quality education is one that meets the country's development needs in the new phase and is in line with the trends of the times and represents the optimal education.

2.2.2. Opportunities and challenges of Vietnamese higher education

The current industrial revolution 4.0, Vietnam is not outside the common trajectory of the world, which is to participate and be directly affected, this creates opportunities,

difficulties and challenges for higher education in particular and for the process of industrialization and modernization of the country in general.

The Industrial Revolution 4.0 can disrupt the traditional labor structure by automating robots to replace manual labor in many industries and sectors of the economy. The impact of this revolution for the social labor structure will change in stages.

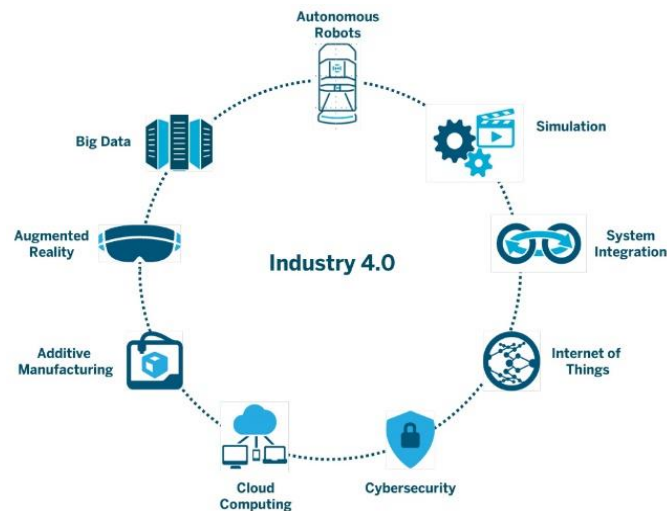

Figure 2. The 4th industrial revolution diagram

Due to the characteristics of Industry Revolution 4.0 is that it does not depend primarily on machines and equipment, but on the creative capacity, ability and intelligence of the people, so Vietnam can take advantage of a latecomer country with a golden population structure.

Another opportunity and challenge for higher education is that the world is entering the Fourth Industrial Revolution, Vietnam is still mainly in the second phase (the 2nd industrial revolution), that is the implementation of the processing and assembly lines.

Most Vietnamese workers are not well-trained, theoretical qualifications and skills are still limited. It is professional knowledge, foreign language ability for social interaction and work. This is a great opportunity and challenge for higher education when entering the industrial revolution 4.0 with human resources that have not been fully prepared, especially the high technology platform is limited, small production, unsynchronized, and missing links.

Changes in the way we communicate on the internet are also opportunities and challenges for people in the digital age, especially the dangers related to human health, financial security, cyber security, the protection of personal information is also imposed at a higher level.

The center of the innovation process in higher education training is high-quality university-level human resources to meet the requirements of the Industrial Revolution 4.0.

In the 4th industrial revolution, along with the rapid change of technology, requires education to give learners basic skills and knowledge, serious attitudes, creative thinking, the ability to adapt to challenges and the need for constant job changes to avoid the risk of

being left behind and eliminated. With many new requirements that are vital for higher education, accepting the law of going forward must be exclusion so traditional education methods will certainly not be able to adapt and be eliminated, because education in the 4.0 era requires critical thinking, innovation mind, cultural understanding and learning skills to start a business; intelligent agents use modern information; mobile technology, Smartphone and cloud computing.

In the context of many changes in the world, countries are looking for ways to develop education and have succeeded then education in our country has stood still and has not escaped from the outdated situation. The fact that the development of higher education in our country in recent years has created an imbalance in the scale between disciplines and study levels, has created a strong and local conflict between effectiveness, quality and training scale.

The public opinion criticized the teaching and learning methods in higher education is outdated, the model of educational and training organization is still stereotyped in the style of academic academy, heavy in theory, overlooking the practical part.

The fact shows that countries in the world not only rely on the advantages of capital, technology and mineral resources of the country but also have to research, study, manage and administer, seek solutions to finding other advantages in creative capacity and exploitation of human intelligence through education. Vietnam's higher education needs to apply to eliminate the constraints that make it difficult for innovation.

On the other hand, compensate for the limitations and shortages, Vietnam has a lot of human resources, which is the golden population generation, quickly and appropriately adapt to information technology, education and training will be the key to opening up all the roles of science and technology. This is an opportunity but also a great challenge of the higher education today.

2.2.3. Solutions for higher education in Vietnam.

To overcome the above problems, higher education needs to urgently implement the following requirements: Researching and applying successfully renovating educational philosophy, educational cognitive thinking to suit the requirements of the times, innovating educational perspectives and goals, because these are issues that are oriented, paving the way for the process of renovating higher education. This innovation will be the premise of changes from the curriculums, textbooks, teachers and teaching methods. According to this new philosophy, the way of teaching and learning will change from learning to "remember" to "understand".

Equity in education is well implemented. Everyone has equal rights and obligations to education and equal opportunities. Education must respect individuals, develop personalities, create many paths and learners are given opportunities to develop their talents and become the country's talents. Personality education is an important element that needs special attention; promote creativity, self-study, self-research, self-responsibility and

participation in group activities, enhance higher-order thinking ability for students; inspire true passion for scientific research and practice self-reading habit, self-seeking information to enhance the understanding to apply academia in the flat world.

Basically and comprehensively changing the assessment to the competency-based assessment of both the input for understanding and acquiring creatively learned content and the output evaluates the ability to apply what learned, practice into the actual experience environments, etc. [2] & [6].

Promote innovation in higher education management, especially the management of training quality; curriculum development must have curriculum outcomes. Curriculum outcomes is written from the perspective of the learners, clearly announcing what the learners will do after completing the unit of study and curriculum outcomes must take the objective reality and requirements of the society as a scientific argument, meeting the diverse needs both in terms of category and quality.

Strongly renovate curriculum contents and teaching methods towards regional and international integration. The program content is built in an open direction and has a life cycle of 3 to 5 years; innovate teaching methods that are learner centered.

The learner-centered teaching method is the teaching method in which teachers no longer play the leading role and learners are no longer passive but become the center and subject of the teaching-learning activities. All are geared towards and for learners. Here, learners are no longer passive in acquiring, do not have to be placed before the existing knowledge of lectures, syllabuses or textbooks, but learners are put in front of practical problems and situations.

The power of teachers is no longer based on the passivity and darkness of learners but based on their ability, teachers must be instructors, mentors to study rather than just transmit dogmatic knowledge. From there, learners mobilize resources and experience to analyze, synthesize, quantify, evaluate, explicitly solve experience problems.

All training methods are centered on the teaching-learning process. However, in the traditional training method, teachers' role is respected. In contrast, in the new training method, the role of learners is especially important. The learner-centered approach is thorough from the program design stage, content compilation, script writing, goal writing to the use of teaching methods, etc.

The learner-centered teaching method is to put learners in the right direction of education, in accordance with the rules of educational process so that education is grounded and focused on learners. With implementation capacity, passion and personal conditions, learners will master their learning and research process [4] & [7].

There are comments that: The learner-centered teaching method has changed the traditional order in schools. At that place, the role of learners has surpassed responsibilities of teachers, creating a bad mentality for learners and teachers. However, the absolute assertion of many leading pedagogical educators on this is that the learner-centered teaching

method or the method of positive teaching of learners is the return to the inherent position of learners, for a long time, learners have accidentally lost.

It is necessary to renovate the orientation and strategy for higher education and training in the context of the Industrial Revolution 4.0 and the formation of a digital economy; development of higher education must be associated with the needs of socio-economic development; changing the educational process from provide academic knowledge primarily to developing comprehensive capacity and quality of learners, learning along with practice, reasoning associated with practice, learning through experience.

2.2.4. Vietnamese higher education on the road of integration and cooperation.

International integration in higher education has been directly and indirectly affecting Vietnam's higher education, this issue needs to be deeply and fully aware at the macro and micro level of higher education. Although our higher education is lagging many countries in the region and the world, but it is recognized as a service (WTO & GAST); based on this foundation, we are gradually opening the education service market and promoting international cooperation [2].

Vietnam's higher education access to changes in the function and mechanism of development of education, and of other fields. Since then, research, comprehension, perception and approach to world education are happening new trends with many important components for the success of higher education, including:

Firstly, the trend of popularization; it is suitable for all people in the world and serves the interests of all people in the world.

Secondly, development of distance learning, online training; diversify methods and types of education; change the model and function of educational institutions.

Thirdly, regionalization, globalization, cooperation and integration together with international competition on education. Standardize educational programs and content towards streamlining, modern, suitable for ages, qualifications, trades, towards the direction is to attach importance to the development of learners' qualities and competencies.

Fourthly, education and training, science and technology together with economic and social development are increasingly dialectical and effective. Strongly transforming higher education mainly from equipping knowledge to comprehensively developing the capacity and quality of learners, learning along with practice, reasoning is tied to reality.

Fifthly, the general development mechanism of education, market and socio-economic is increasingly compatible and correlated; ways to implement social welfare increasingly and effectively; characteristics, features, nature of service and service provision are on the rise.

Sixthly, forming a philosophy of the need for lifelong learning, strongly promoting socialization, combining the state and the people in the development of higher education. Completing the higher education system towards open education and building a learning society.

Seventh, accreditation the quality of higher education becomes a matter of the whole society, one of the necessary and enough conditions to expand international cooperation.

The important elements mentioned above are the prerequisites necessarily for renovating and modernizing the educational system. For education and pedagogy to be successful, Vietnam's higher education development strategy cannot be outside these characteristics.

When Vietnam's higher education is renovated under the conditions, the criteria have been experimentally planned to give some optimal characteristics of higher education, namely:

- High quality and effective education;
- Unique educational method;
- Low cost, appropriate tuition;
- Proper investment in educational facilities;
- Internship opportunities and attractive jobs.

These characteristics are necessary and enough conditions for Vietnam education to integrate and cooperate fully with other advanced educations in the world, including Asian higher education.

3. Conclusion

Bill Gates, CEO of Microsoft Corporation, affirmed: *"One of the most amazing things over the past 20 years has been the advent of the Internet. It was the Internet that made the world so small, the geographical distance was flattened ... Another great thing is that more and more universities around the world are giving lectures on the Internet. You can be anywhere in the world to choose lectures, topics ..., even reputable professors to study without paying. This will be a root change in the education system in the future"*.

Building smart schools and applying information technology based on industrial revolution 4.0 is necessary, it becomes an obvious goal; thanks to IT, the world is brought together, the exchange of science fields is more and more convenient and much more benefit.

Besides the systematic inadequacies such as the quality of education, educational methods, ... Vietnam's higher education has asserted itself in the revival; new arguments, scientific arguments and the application of the 4.0 industrial revolution are placed in the right frame of education to be a lever to develop education; to educate for education, education for humanity.

In short, with the realities, achievements, challenges, opportunities and solutions that have brought higher education to a new height, developing rapidly and achieving remarkable achievements, firmly stepping on the path of comprehensive cooperation and international integration.

A STUDY ON VIETNAMESE COOKING TERMS

Dr. Nguyen Ngoc Binh

ngngbinhvn@gmail.com

*Faculty of Linguistics, VNU - University of Social Sciences
and Humanities, Hanoi, Vietnam*

Abstract

Vietnam has a long and developed wet rice agriculture, forming an extremely rich and diverse culture in cuisine. Vietnamese cooking terms have reflected this typical culture in daily life. This article collected and analyzed 20 Vietnamese cooking terms in order to study the characteristics of its structures and semantics. Furthermore, this study also provides and discusses the meanings of cooking terms in respect of language and culture.

Keywords: *cooking terms, cuisine, Vietnamese*

1. Introduction

1.1. Rationale

Vietnam is a country with a long tradition of wet rice cultivation. There are many kinds' plants like potatoes (potatoes, sweet potato); pumpkin (pumpkin, squash), maize (corn sticky, glutinous corn), watermelon, green beans, black beans, soybeans... and animals (buffalo, cow, pigs, chicken, shrimp, fish...), and others... have contributed to the cooking process.

“In Vietnamese culture, eating and drinking is an art, it is not only to meet the basic requirements of people but also has a close relationship with the lifestyle, national traditions, which is very clearly shown through the tools used in the meal, how to behave with people while eating. Therefore, eating and drinking also proves the history and formation of the culture of Vietnam. The dishes through each period speak about the life and people of that period and the land - where each dish was born” (Nguyen Thi Dieu Thao, 2007).

Besides, “Language as one facet of human behaviors actually relates to other facets, and these all facets are comprised to be human culture” (extracted from Supapas Kumtanode, 2006) and “Words connect indirectly to objects in the world via human’s mind. Hence, they express some attitudes of the speakers towards the world they see and the way they interpret words in their culture” (extracted from Supapas Kumtanode, 2006). Thus, “To reveal a language as a part of culture, it is easier to discuss on the relationship between vocabularies and other facets than between grammars” (extracted from Supapas Kumtanode, 2006).

A study on Vietnamese cooking terms will show the "quintessence" of how to prepare food, which is an important part of Vietnamese culinary art since semantic studies are basically due to human’s thought and worldview expressing via the vocabularies.

1.2. Vietnamese

Vietnamese is in the Austroasiatic language family and is the national language of Vietnam (Vietnam's Constitution 2013).

1.2.1. The Vietnamese consonants are expressed as below:

Manner of articulation		Point of articulation								
			Bilabial	Labio-Dental	Dental	Alveolar	Retroflex	Palatal	Velar	Glottal
Stop	Aspirate				/h/		/ɣ/			
	Unaspirate	Voiceless			//			//	//	//
		Voiced	//			//				
	Nasal		//			//		//	//	
Fricative	Voiceless		//	//		/ʂ/		//	//	
	Voiced		//	//		/ʐ/		//		
	Lateral			//						
Semi-vowel			//					//		

1.2.2. And the Vietnamese vowels are as below

	Front	Central	Back
High			
Mid		,	
Low		,	

Three main diphthongs: /ie/, /uɤ/, and /uo/

1.2.3. There are 6 tones included

- High tone, represented by the number “1”
- Low tone, represented by the number “2”
- High falling – rising tone, represented by the number “3”
- Low falling – rising tone, represented by the number “4”
- High rising tone, represented by the number “5”
- Low rising tone, represented by the number “6”

(Adapted from Đoàn Thiện Thuật, 2004)

1.3. Theory perspectives

1.3.1. Theory of Cooking

According to Arora (1977), the first cook was a primitive man lighting to warm himself and put the piece of meat close to fire. Then he recognized that the meat heated had a good flavor and was tasty. From that ancient time on, the cooking method has been evolved and improved to more sophisticated methods up to the present. Thus, the theory of cooking concerns the transference of heat to food. In any cuisine of the world, it has to pass through the cooking method of using heat (Supapas Kumtanode, 2006).

All methods cooking depend on one or more of the following principles:

* **Radiation:** The process of radiation is that heat passes from its source in direct rays until it falls on an object in its path, e.g. grilling.

* **Conduction:** This is the transferring of heat through a solid object by contact. Some materials, e.g. metal used for pans, transfer heat more quickly than other things such as wood as used for spoons. Conduction normally involves using solid electric hot plates.

* **Convection:** The particles of gases or liquids are heated until they move. Then, it is expanded and become less dense and rise. The colder particles sink to take their place, thus causing convection currents, which distribute heat. This principle is used in heating a gas oven and in the heating of liquids like boiling (Wayne, 2003).

1.3.2. Lyon's Basic Principles

The Lyon's basic principles of the theory of semantic fields in terms of sense relations were cited in "Cooking Vocabularies and the Culinary Triangle of Levi-Strauss" by Adrienne Lehrer in 1972. The principles used for paradigmatic relations are:

- *Incompatibility:* This is about the lexemes which are incompatibility. It means that if any lexeme asserts to be one in a set, e.g. red, blue, yellow, etc., it denies being the others. To state that X is red implies X is not blue, yellow, etc.

- *Complementarity:* This is a kind of incompatibility; but there are only two lexemes involved in the notion of comparison. For example, if X is single, it implies that X is not married.

- *Antonymy:* This principle involves the notion of comparison, such as tall-short, fat-thin, and so on. To say that X is taller than Y implies that Y is shorter than X.

- *Converseness:* It deals with certain systematic sentence transformation, such as a pair of words buy and sell. If X bought a pen from Y, it implies that Y sold a pen to X.

- *Hyponymy:* Lehrer claimed that this is one of the most important semantic relationship. Hyponymy is class inclusion which its more general term is the superordinate term. For example, rose is a hyponym of flower, and flower reveals as the superordinate of rose, tulip, lotus and so forth.

- *Synonymy:* Synonyms mean the lexeme that is the same as another word. If X and Y are synonyms, it means that both of them are implied by each other.

1.3.3. Componential Analysis

Componential analysis is dealt with semantic features which are the significant characteristics of lexemes to facilitate distinguishing one from the others. Nida (1975) proposed the six steps of procedure to analyze diagnostic components as follows:

- Select the related series of lexemes, such as whisper, babble, murmur, sing and hum.

- Examine all the possible referents of these lexeme. For example, for the word "whisper", there is a degree of loudness as the designate of this word.

- Examine the various lexemes as reflected in the nature of the referents and determine which characteristics are true of one or more lexemes. However, there is not any referent being true to all lexemes.

- List the distinctive features of all each lexemes.
- Test the analysis or cross checking all the lexemes in the first step.
- Describe and arrange the features diagnosed in the form of tree, diagram or matrix.

One of the studies about cooking terms using this approach is “Semantic Cuisine” which Lehrer exposed in 1969. Lehrer divided the lexical field of “cook” into 4 main categories, i.e. boil, fry, broil and bake. Each category contains an almost closed set which is incompatible with one another. “Boil” has the most complex subset of terms consisting of simmer, boil (marked), poach, stew, braise, parboil, steam, and reduce, as follows:

Table 1. The categorization of “boil” (Lehrer, 1969)

boil (unmarked)					
simmer			boil (marked)		
poach	stew	parboil	steam	reduce	
	braise				

In the above figure, “stew” and “braise” is a partial hyponym not synonym. Because of having food passed the first process of “braise” in browning in a little fat and taking to be cooked in a little liquid over a low heat in a covered pan, this method reveals the semantic overlap of “stew” and itself.

In the second category, “fry”, there is some partial synonym between “pan-fry” and “sauté” in the necessity of using fat. Besides “deep-fry” and “French-fry” are synonymous in the sense of the amount of fat they gain in large amount.

The third group, “broil”, “grill” seems to be a partial hyponym of fire because of the using of the utensil, griddle that is used as in the “fry” category.

The last group, “bake”, Lehrer commented that “roast” was difficult in classification because of its true sense as cooking by direct heat in front of an open fire and the modern method that cook food in a closed oven. Thus, Lehrer decided to arrange this lexeme as a partial hyponym of “bake”. The four categories can be shown as follow:

Table 2. The figure of cooking terms (Lehrer, 1969)

cook									
boil		fry		broil			bake		
simmer	(full) boil	sauté pan-fry	french-fry deep-fry	grill	barbecue charcoal	plank	roast	shirr	scallop
see	above								
figure									

1.4. Related previous studies

1.4.1. Nguyễn Thị Dung (2009), *Culinary words and how to translate them into English, Ph.D. dissertation, University of Social Sciences and Humanities, Hanoi.*

The dissertation analyzed the origins, structure and semantic characteristics, provide specific look in Vietnamese culinary. The author points out there are two ways of processing of Vietnamese food: processed through fire (boiled, steamed (map), fried (fried), fried, gravy, roasted, baked warehouse, cellar, braised, burst, frequency) and not processed through fire (raw, cooked with fermented foods).

1.4.2. Supapas Kumtanode (2006), *Thai regional cooking terms - An ethno-semantic study, M.A. thesis, Mahidol University.*

In this thesis the authors have shown 102 cooking terms, as follows: Central Thai has 31cooking terms, Northern Thai has 29 cooking terms, Northeastern Thai has 21 cooking terms, and 23 cooking terms in Southern Thai. The analysis is based on cooking terms semantic elements and parameters, specifically pointed out the similarities and differences of food processing among proposed parts in Thailand.

1.4.3. Prasitrathsint (2001), *A componential analysis of kinship terms in Thai, In Essay in Tai language, Kalaya Tingsabadh and Arthur S. Abramson edited.*

She presented a componential analysis of the basic and non-basic kinship terms in Thai, included 17 basic and 32 non-basic kinship terms. This study reveals that each dimensions of contrast play important roles in signifying the reflection of Thai culture through the kinship system, especially for this study of the Standard Thai.

2. Method

2.1. Data preparation

Hanoi is the capital of Vietnam, the place to show the "quintessence" of Vietnamese cuisine. Gone through thousands of years and filtered the most sophisticated and unique features of nature in the North of Vietnam, Hanoi's cuisine has become a special culture that attracts any persons once they first come to Hanoi. Data collected in Hanoi from May 2018 to January 2020.

2.2. Informants

The criteria for the informants are set to be as follows:

- 40 informants aged from 30 to 70 years old, must live in the studied areas and never migrate to other areas more than one year.

- There will be equal numbers of 20 males and 20 females selected as informants.

- 10 chefs in Northern Vietnam to test the data and the way the food is prepared.

2.3. Research Instruments

Questionnaire

The questionnaire used in this research is merely the instrument to gain the personal data of each informant according to the criterion above. This will help the researcher to get some basic data of the informants.

Recorder

Recorder will be used for in-depth interviews to ensure details of significant data acquired from each informant.

2.4. Data Analysis

- The recorded data are transformed into the lists of words and meaning of each informant. Each word will be transcribed according to Đoàn Thiện Thuật (2004).

- The data lists are summarized to get the core meaning of each word.

- The source of heat which is the main factor concerning the cooking method is brought to help the classification of the cooking words.

- Based on the information from 2.4.3, the meaning of words in each group will be considered in detail with their common and distinctive features.

- The researcher will arrange the cooking words in the structure that can reveal and explain their relation in hyponymy, synonymy, and incompatible and so on.

- The result shown in the structure charts will be concluded.

3. Results

3.1. Vietnamese cooking terms and their meanings

From the Vietnamese dictionary (2003) and the field work, there are 20 cooking terms and its meanings as follows:

3.1.1. /luok6/ - luộc: Make foods cooked in boiled water

3.1.2. /lam1/ - lam: Cook (rice) by putting it in some kinds of bamboo tubes (nứa and vầu) (not using a pot, a way of cooking rice in some ethnic minority areas)

3.1.3. /do2/ - đồ: Cook in a pot (chõ) until it's cooked by the heat of steam

3.1.4. /h p5/ - hấp: Make the foods cooked by the heat of steam

3.1.5. /saw5/ - xào: Cook meat with plenty of water and separated vegetables and spices

3.1.6. /h m2/ - hầm: Cook, bake in the oven, in a covered pot, until cooked

3.1.7. /ʔom1/ - om: Cook on low heat for a long time so that the food is thoroughly absorbed with salt and spices

3.1.8. /xɔ1/ - kho: Thoroughly cook salty foods

3.1.9. /t n2/ - tần: Steamed in a water bath until cooked

3.1.10. /cuɲ1/ - chung: Heat to evaporate and thicken (talking about liquid food)

3.1.11. /niɲ1/ - ninh: Cook solid, chewy food by simmering and simmering for a long time

3.1.12. /nuɲɲ5/ - nướng: Cooked by placing directly over burning coals or fire

3.1.13. /quãj1/ - quay: Cook the whole meat until golden brown by turning it over the heat or frying it in a covered fat pan

3.1.14. /saw2/ - xào: Cook food by stirring with oil and salt on the stove

- 3.1.15. /zan5/ - rán: Cooked in boiling grease
- 3.1.16. /zan1/ - rang: Cook by stirring in a hot pan, do not add water
- 3.1.17. /zim1/ - rim: Simmer for food to absorb salt or sugar and solidify
- 3.1.18. /bak5/ - bác: Cook savory food by simmering and stirring until it becomes thick
- 3.1.19. /c n2/ - chân: Dip in boiling water until cooked or clean
- 3.1.20. /n w5 / - nấu: Cook or boil by boiling in a pot

3.2. Classification of the Vietnamese cooking terms

According to the theory of cooking, methods depend much on the types of heat used in cooking. Therefore, in this section, the cooking terms listed in II will primarily be classified according to three heat methods, i.e. the Moist heat, the Dry heat and the Dry heat using fat methods.

3.2.1. *Moist heat method included* /luok6/ - luộc; /lam1/ - lam; /do2/ - đồ; /h p5/ - hấp; /saw5/ - xào; /h m2/ - hầm; /ʔom1/ - om; /xɔ1/ - kho; /t n2/ - tằm; /cuɿ1/ - chung; /nɿp1/ - ninh; /bak5/ - bác; /c n2/ - chân; /n w5 / - nấu

3.2.2. *Dry heat method included* /nuɿŋ5/ - nướng; /quǎj1/ - quay; /zan1/ - rang

3.2.3. *Dry heat method using fat included* /saw2/ - xào; /zan5/ - rán; /zim1/ - rim

3.2.4. *Meaning components of the Vietnamese cooking terms*

- The three heat methods are categorized based on three dimensions of contrast: The use of non-fat liquid, the use of fat, and a direct and indirect exposure of heat to food. The use and non-use of non-fat liquid are used as the criteria to distinguish the Moist Heat method among the three heat methods. The direct and indirect exposure of heat reveals the distinction between the direct heat and non-direct heat to the food in Dry heat method.

- However, these three dimensions of contrast are not enough to express the native's worldview and knowledge concealed. Therefore, more elaborated considerations are needed in finding the semantic components of these terms.

- After using the componential analysis, there are 8 components and 4 relevant parameters resulted concerning the Vietnamese cooking terms as follows:

* Use of non-fat liquid: [+liquid] vs. [-liquid]: The non-fat liquid is some water or water-based liquid such as coconut cream, soup...Cooking terms that use these kinds of substance in their processes have [+liquid] as their semantic component to distinguish it from others that do not use any of this matter (Lehrer, 1969). 14 lexemes in the Moist heat method group have this component as their common component. Thus, the other terms can be explained by [-liquid].

* Use of fat: [+fat] vs. [-fat]: This is the semantic component of 3 cooking terms in the Dry heat method using fat. According to the redundancy rule, [+fat] implies [-liquid] and [-fat] implies [+liquid] (Lehrer, 1969).

* State of heat exposure: [+direct] vs. [-direct]: The component [+direct] concerns the radiated heat to the food directly such as the food cooked by the method /nuuxŋ5/, /quǎj1/. As for [-direct], it is the component involved in terms of the same group of /nuuxŋ5, quǎj1/ but they are different in the exposure of heat to the food: /zɑŋ1/

* Vigorous and gentle action of heat: [+vigorous] vs. [-vigorous]: For the Moist heat method, the water-based substance used for /luok6/, /h m2/, /t n2/ needs the vigorous action of heat to make it reach its boiling point whereas /cuŋ1/, /h p5/ requires the gentle action of heat to make the food tender. In addition, /χɔ1/, /bak5/ also use the gentle action of heat to avoid food burning.

/zɑŋ1/ in the dry heat method need the gentle action of heat to cook the food, but /nuuxŋ5/, /quǎj1/ use the vigorous action of heat to make the food done.

The component is not relevant for those cooking terms that use inconsistent degree of heat in cooking. For example, the component of action of heat is not relevant for /n w5 /, which needs vigorous action of heat at the beginning and gentle action of heat in a later process of cooking to avoid rice from burning.

* Duration of cooking: [+long cooking time] vs. [-long cooking time]: Most cooking spends around 10-20 minutes meanwhile the duration of cooking concerns some methods such as /h m2/, /χɔ1/, /t n2/, /cuŋ1/, /nij1/ have long cooking time to make the food tender. Other methods normally are done in the average time mentioned above, except /c n2/, which spends a short time to cook. Therefore, the vital semantic component of /c n2/ is [-long cooking time].

* Amount of special substance: [+large amount of substance] vs. [-large amount of substance]: Special substance means the substance used in the cooking processes to convey heat to the food. There are two types of special substance, i.e. water-based liquid used in the moist heat method and fat that is used in the dry heat using fat method.

The water-based substance is generally used in an appropriate amount for the food cooked. However, /ʔəm1/ is the processes in which the amount of special substance needs to be controlled. Therefore, /ʔəm1/ have [-large amount of substance] as their important component, showing a small amount of the substance.

A large amount of fat or oil is used in the process of /zan5/ but /saw2/, /zim1/ needs less amount of fat than /zan5/ in different degree. This means /zan5/ has [+large amount of substance] as its distinguished component, and [-large amount of substance] is the distinguished component of the others.

* Food submergence: [+submergence] vs. [-submergence]: The feature [-submergence] is the semantic component for the processes of cooking: /h p5/, /do2/ because the food is cooked by hot steam on a rack.

* Food proportion: [+big proportion] vs. [-big proportion]: Food proportion is another kind of semantic component, /nuɤŋ5/, /quǎj1/ are marked as [+big proportion] and /zɑŋ1/ is marked as [-big proportion] because the process of /nuɤŋ5/, /quǎj1/ is used for bigger size of meat than that of /zɑŋ1/

* Special kinds of utensils: [+rack] vs. [-rack]: Different utensils are used for different purposes. The rack [+rack] is used in many process such as /do2/, /h p5/. For /do2/, /h p5/, a rack helps the food not to be submerged in the substance used for cooking. For /nuɤŋ5/, /quǎj1/, the food is put on a rack to be closely exposed to the heat. A spit is used for /quǎj1/ for the convenience in turning the food on a rack.

A pan is used in the /zɑŋ1/ process, while a bamboo section is used in /lam1/. The processes of /h m2/ and /ʔəm1/ has a lid on to keep the heat in the pot in order to help tenderize the food.

* Special ingredients added: [+special ingredient] vs. [-special ingredient]: Some ingredients are specially added for some cooking processes. /lam1/ needs coconut cream, sesame, ginger as their special ingredients, while /t n2/ require some herbals and garlic, pepper... are important ingredients for /χɔ1/.

* Specific purposes: [+specific purpose] vs. [-specific purpose]: All processes which use the water-based substance such as /do2/, /cuŋ1/ may different in their purposes. The process of /do2/, has the purpose of making food glutinous while /cuŋ1/ has the purpose of making food condensed.

/nuɤŋ5/ and /quǎj1/ are similar in their processes, except their purposes. /quǎj1/ needs an amount of oil/fat covered the surface of the food while /nuɤŋ5/ does not require it.

* Special actions: [+special action] vs. [-special action]: To accomplish the desired purposes of processes, some specific actions are needed. For instance, in /saw2/, /zɑŋ1/, one has to stir the food while it is being cooked. In /saw2/, the ingredients are cooked with fat, or vegetable oil, with fish sauce, salt (moderately), stir on the fire thoroughly while the food cooked by /zɑŋ1/ needs to be stirred continuously.

/nuɤŋ5/ may use a thin film of oil and the food has to be turned on both sides until done.

3.2.5. Structure of Vietnamese cooking terms

To organize these cooking terms of processing food into a structure, it is necessary to describe them in the hierarchical from to show the semantic relations among them. Thus, all these 20 cooking terms mentioned earlier will not come under any super ordinate term but will be grouped as terms in the same lexical field.

- Processing food by moist heat method

Figure 3. Vietnamese cooking terms concerning Moist heat method

/nuɤŋ5/	/hɣp5/	/luok6/					/bak5/	/c n2/	/n w5/
/lam1/	/do2/	/tɣn2/	/saw5/	/χɔ1/	/ʔəm1/	/h m2/, /niŋ1/			

* In the above figure, /lam1/ is considered a partial hyponym of /nuɤŋ5/ since it shares a common feature with /nuɤŋ5/ since the bamboo tube is put next to the fire to get the heat.

* /hɤm1/, /niŋ1/ are complete synonyms, which processed in small heat source and in a long time.

* /do2/, /hɤp5/, /tɤn2/ are methods of processing foods that do not contact with the heat directly and cooked by water steam. However, /do2/ often used for glutinous rice, /hɤp5/ usually used for root vegetables (potatoes, cassava...), and /tɤn2/ used for meat.

* /luok6/, /saw5/, /ɤɔ1/, /ʔom1/ are methods of processing foods use vigorous action of heat to boiling water.

- *Processing food by dry heat method*

Table 4. Vietnamese cooking terms concerning Dry heat method

/nuɤŋ5/	/quǎj1/	/zɑŋ1/
/lam1/		

In the above figure, /lam1/ is a partial hyponym of both /quǎj1/ which is in the Dry heat method group, and /nuɤŋ5/, which belongs to the Moist heat method group.

- *Processing food by dry heat method using fat:*

Table 5. Vietnamese cooking terms concerning Dry heat using fat method

/saw2/	/zɑn5/	/zim1/
/quǎj1/		

In the above figure, /quǎj1/ is a partial hyponym of both /saw2/ which is in the Dry heat using fat method group, and /nuɤŋ5/, which belongs to the Dry heat method group.

4. Discussion and Conclusion

The case of the word /lam1/ is quite interesting because it could be a loanword from the Tai-Kadai (Nguyễn Tài Căn, 1995). From the data that we have confirmed that this cooking term does not belong to the Kinh (the majority group in Vietnam today and hardly having "nomadic lifestyle"/ shifting cultivation (agricultural system in which land is cultivated temporarily then abandoned to revert to their natural vegetation).

Actually, with the current document conditions, what we want to further this study is to build a panorama of regional cooking terms in Vietnam (possible an Ethno-semantic study) in order to discuss the similarities and differences between specific regions and localities.

If the data allows, we would like to study the cooking terms among Southeast Asian countries. The case of /luak3/ in Thai may provide us interesting insights and the similarities, differences in culture between two ethnic groups who do not share the same territory.

Since the Tai (Thái in Vietnamese) people in Vietnam are said to be the owner of wet rice cultivation (Phan Ngoc and Pham Duc Duong, 1983) so we believe that, in the

vocabulary of wet rice agriculture in general and cooking terms in particular, has a certain interference and is a "gold mine" for historical linguistics researching.

IMPLEMENTING THE NEW GENERAL EDUCATION PROGRAMME (2018) IN HO CHI MINH CITY UNDER THE INFLUENCE OF DIGITALISATION

Le Thi Ha

halthi@hcmue.edu.vn

Ho Chi Minh City University of Education, Ho Chi Minh City, Vietnam

Abstract

Hồ Chí Minh City is one of Việt Nam's economic, financial, cultural, and educational hubs. Being the leading economy, the city has contributed around 30 percent of the total national income. With over 1,7 million students, Hồ Chí Minh City's ambitious plan on applying The New General Education programme (2018) was and has had significant achievements. The influence of the 4th Industrial Revolution on all sectors, including education and training, has provided Hồ Chí Minh City with broad opportunities to successfully apply The New General Education programme via digitalisation.

Keywords: *Hồ Chí Minh, digitalisation, education*

1. Introduction

With the crucial role of education and training and the current situation, human resources is one of the determining factors in national development. Having researched on the undertakings of basic and multifaceted educational change of Việt Nam Social Republic, the author analyses the current situation in executing The New General Education programme (2018) in Hồ Chí Minh City. The analysis includes the effects of digitalisation on the city's educational programmes, through which provide suggestions on applying achievements of the Fourth Industrial Revolution to digitising the city's education, contributing to the general educational changes.

The broad influence of the Fourth Industrial Revolution has provided great opportunities for countries and territories, the 13th National Congress of the Party noted, "The rapid evolution of science, technology, innovations, and the Fourth Industrial Revolution has placed a multi-dimensional impact on a global scale. Science - technology and innovation are determiners for the competitiveness of each country. Digital technology will promote the development of the digital economy and digital society, change the governmental management method, production and business models, consumption and cultural and social life" (Communist Party of Vietnam, 2021). The Party's view on digital transformation is institutionalised by the Government by Decision No. 749/QĐ - TTg dated June 3, 2020, approving the National Digital Transformation programme to 2025, with orientation to 2030 in which identified the basic goal of the programme: "The dual goal is to develop the digital government, digital economy, and digital society, and to form Vietnamese digital technology enterprises capable of going global.. ." (Prime Minister, 2020).

As one of the country's largest economic hubs, as well as a major cultural and educational centre in the southern region, the city has been implementing the Party's policy and the Government's project on national digital transformation and building a digital economy, digital government, promoting the experiences gained in the period (2016 - 2020) when implementing the programme of information technology application in the management and construction of e-government. Resolution of the 11th Party Congress of Hồ Chí Minh City for the term (2020 - 2025) when determining the overall development goal of the city by 2030 with a vision to 2045 in which the digital economy and digital government are important motivation noted, "... mobilising all resources, taking advantage of the opportunity of the fourth industrial revolution; improve the effectiveness and efficiency of state management..." (Hồ Chí Minh City Party Committee, 2020). To accomplish the set goals, the City Party Committee identified the task of building the Party Committee and the City government, emphasising the need for "fast and sustainable economic development on the basis of strong application of science - technology, innovation... developing the digital economy and circular economy... promoting digitalisation, and constructing digital government..." (Hồ Chí Minh City Party Committee, 2020).

It is clear that digitalisation and building digital government are one of the important goals and key tasks identified by the City Party Committee in order to promote the city's socio-economic development in the direction of sustainable development based on innovation and creativity.

Implementing the national digital transformation programme and the policy of the City Party Committee, on July 3, 2020 issued the decision No. 2393/QĐ-UBND approving the digital transformation programme of Hồ Chí Minh City with a vision to 2030, "Hồ Chí Minh City will become a smart city with fundamental and comprehensive innovation in the operation of the digital government, digital businesses, and the prosperity and civilisation of digital society" (Hồ Chí Minh People's Committee, 2020). With a defined 10-year vision, based on existing resources, experiences and achievements in building e-government in the period (2016 - 2020), the City identifies specific goals for digital transformation and builds digital government by 2025 as a basis to promote the digital transformation process at all ministries, departments, and units of the City. In order to improve the efficiency of digital transformation and speed up the process, the City has issued the Digital Transformation Evaluation Index of Ho Chi Minh City including 6 main indicators, with 32 sub-indices (1. Received). digital literacy, 2. Digital institutions, 3. Digital infrastructure, 4. Digital human resources, 5. Cyber Information security, 6. Digital transformation activities) (Hồ Chí Minh City People's Committee, 2023). This is an important basis for ministries, departments, and units to build their own digital transformation plan.

2. Method

To carry out his research, the author uses historical methods and logical methods mainly to analyse the digital transformation guidelines and policies of the Việt Nam Communist Party and the National Digital Transformation programme of the Government as a theoretical basis for the implementation of digital transformation in Hồ Chí

Minh City. The method is used by the author in analysing digital transformation policies and measures of the Hồ Chí Minh City Party Committee, the city's digital transformation project and digital transformation criteria as the basis for ministries, departments, and units to implement and promote their digital transformation activities. Using the analysis method, the author clarifies the actual status of the implementation of the New General Education programme (2018) in Hồ Chí Minh City to identify the results and arising problems, thereby making recommendations for the implementation of the programme in terms of digital transformation.

3. Results

The implementation of the New General Education programme (2018) under the ongoing digital transformation in Ho Chi Minh City has gained many achievements contributing to its socio-economic development. The Party Congress of Hồ Chí Minh City (term of 2020 - 2025) oriented, "To build and develop high-quality human resources, and perfect the education system towards open education, lifelong learning and building a standardised, modern and internationally integrated society" (Hồ Chí Minh City Party Committee, 2020). With such orientations, it is clear that the determination of the City Party Committee in renovating general education meets practical requirements, especially in the context of digital transformation.

Implementing the programme of the City Party Committee, the City People's Committee directs its education sector to implement "quality improving of comprehensive education; implementing synchronously and effectively according to the 2018 General Education programme plan, new textbooks; enhancing training and retraining to prepare for the coming years" (Hồ Chí Minh City People's Committee, 2020, Directive). The city's education has proactively carried out step-by-step the plan to comprehensively renew its general education in terms of great human resources, facilities, teaching equipment and materials to implement the 2018 General Education programme, and continued to increase the number of teachers and educational administrators with high quality and reasonable management.

The Department of Education and Training has directed to properly implement the education curriculum and teaching plans, conforming to the knowledge and standards and the orientation to develop students' ability, and to adjust education-focused content based on the current general education programme in a reasonable and simple way, aiming to fully meet the requirements of the 2018 general education programme as well as be suitable for the students.

Promoting the application of information technology and utilising the achievements of the Fourth Industrial Revolution, the city's education sector has initiated new methods in teaching and pedagogical organising, eyeing to become modern, active, and to promote students' ability; it also been applying different teaching methods, such as differentiated instructions, individual teaching, project-based teaching, outdoor teaching, extra-curricular activities, practical experiences, application of information technology. Educational institutions continue to actively implement the general education programme in the direction of the 2018 general education programme-oriented approach; regularly and effectively implement active teaching methods, forms and techniques; improve the quality of

examination - evaluation, especially the National High-school exam; actively renovate the contents and methods of vocational education and training in general in association with the city's economy. With the efforts in implementing the plan of comprehensive general education renovation, the city has been achieving important results.

Hồ Chí Minh City's education scale has grown in both quantity and quality, meeting the learning requirements of its students. The city is also able to maintain and develop its educational activities, increasing the numbers of teachers and educational staff, improving education quality to gradually meet the requirements of the reformation of educational programmes and methods. According to statistics in the Final Report of the 2021-2022 school year of the city's Department of Education and Training, the city has 286 secondary schools with 9,993 classrooms and 11,046 classes, 17,293 teachers and 447,940 students; 204 highschools with 6,548 classrooms, 5,915 classes, 12,005 teachers and 232,350 students (Hồ Chí Minh City Department of Education and Training, Secondary Education Department, 2022).

Besides the achieved results, the process of implementing the New General Education programme (2018) in the city has a number of issues raised:

The innovation of teaching methods and techniques, testing and evaluation towards developing the quality and capacity of learners is also facing many challenges. The application of technological achievements to the examination and evaluation of the new general education programme has not been shown in a synchronous and effective manner.

Contrary to the majority of teachers in the city who have well implemented the process of reforming teaching forms and teaching methods and promoting the positivity and initiative of students, there is still a part of teachers who have not kept up with the change. A large number of teachers have not met the requirements of using technology in teaching.

There is a shortage of teachers, especially teachers of integrated subjects at secondary level such as natural science, history - geography, computer training, foreign languages and art subjects.

Despite the improvements of educational infrastructure, it is still unable to meet the actual needs. The lack of schools and facilities in some districts, especially in the periphery areas with rapid increase in population, leads to classes having an overwhelming number of students. Moreover, the lack of day-long classes causes certain difficulties in improving the quality of teaching and learning conforming to the programmer's goal.

4. Discussion and Conclusion

In order to improve the effectiveness of the implementation of the New General Education programme in the context of digital transformation in Hồ Chí Minh City, it is necessary to pay attention to the following issues:

Firstly, raising awareness about digital transformation in the education sector among officials, teachers and students about the impact of digital transformation on education. In addition to propaganda activities, the education sector needs to promote training in digital knowledge and digital skills for education administrators, teachers and students.

Secondly, synchronously build a shared digital data source in the city's educational system. Building and synchronising a shared digital data system in the education sector will

contribute to improving the efficiency and effectiveness of educational management, saving time, effort, and monetary resources. Building a unified education data system throughout the city, including electronic lectures, electronic libraries, etc. will make an important contribution to overcoming the disparity in educational enjoyment conditions between areas of the city.

Thirdly, facilitate investment in educational infrastructure, especially technology, thus promoting creativity and innovation among teachers, promoting innovative teaching and assessment according to the requirements of the New General Education programme (2018). It is also necessary to have a solution to share digital teaching resources between educational institutions in each district to effectively utilise shared resources.

Fourthly, promote the application of technology in education to training and retraining of teachers, with the aim to promote self-study and self-research in teachers under the support and control of technology while requiring minimum resources.

Fifthly, facing the problem of new subjects such as integrated subjects and art subjects, it is recommended to open free online courses on digital resources to create favourable conditions for schools to use and apply those lessons.

Hồ Chí Minh City's education has been seeing new opportunities in the context of digital transformation. With the dynamism and creativity in education, digital transformation is one of the important solutions contributing to overcoming the limitations of the implementation of the New General Education programme (2018) in the city.

A WEB-BASED SOLUTION TO THE UNSOLVED SOCIAL-ECONOMIC PROBLEM: CARING FOR STROKE PATIENTS AT HOME IN VIETNAM

Bui Duc Khoi

duckhoi2812@gmail.com

Ha Noi Amsterdam High School, Hanoi, Vietnam

Abstract

With the large number of stroke patients in Vietnam and the difficulty to provide special care to them when they return home from hospital, a web-based solution can effectively connect family members of stroke patients with healthcare professionals specializing in caring for stroke patients. This allows family members to find a suitable healthcare professional faster, cheaper, and more reliably. This web-based also includes a database of healthcare professionals.

Key words: *Stroke, Web-base, Caring*

1. Introduction

According to the World Health Organization (WHO), approximately 17 million people suffer from a stroke each year. Of these, 5 million die, and another 5 million are left with permanent disabilities, resulting in an increased economic burden on families and communities.

In the United States alone, nearly 800,000 people suffer from a stroke each year, with 82%-92% being caused by coronary artery disease. Stroke is one of the top five causes of death and disability among adults and costs over \$72 billion annually (Mozaffarian, 2015).

In Vietnam, the stroke rate has increased from 200/100,000 people/year in 1990 to 250/100,000 people/year in 2010. Each year, Vietnam records approximately 200,000 new cases of stroke and 11,000 deaths due to it.¹

While strokes often occur in the elderly due to cerebral ischemia and bleeding in the brain, there has been an increase in young stroke patients. This is largely due to hypertension – the leading cause of stroke – among young people.

Factors such as elevated work pressure, lack of exercise, obesity, high protein diets, and alcohol consumption can all contribute to an increased risk of blood fat and hypertension over time. These factors increase the likelihood of high blood pressure which makes stroke more likely.

After having a stroke, patients often experience sequelae of movement disorders such as paralysis, cognitive disorders, and difficulty in eating and drinking. They may also suffer from psychological and emotional disorders, Kleindorfer (2021).

¹ <https://dotquy.kcb.vn/hieu-dung-ve-dot-quy/tu-vong-do-dot-quy-o-nguoi-tre-tuoi-ngay-cang-gia-tang.html>

Recovery methods for stroke patients must be diverse and multimodal due to the variety of forms of disability that a stroke patient may suffer. These methods may include drugs, surgical interventions, rehabilitation interventions using machines, and hands-on exercises at various stages, Churojana (2019).

The WHO divides the rehabilitation process for stroke patients into four stages:

1. The patients enter the early recovery phase after the first 48 hours of life-saving priority.
2. The second phase, which takes place after 48 hours to three months, is the "golden" phase.
3. The third phase takes place three to six months after the stroke, also a good but slower recovery period.
4. After six months, the patient enters the chronic stage.

Therefore, stroke patients need to begin rehabilitation as soon as possible after treatment to increase their chances of recovery.

It is estimated that more than 30 million people are in need of rehabilitation services in Vietnam. However, according to a survey conducted by The Ministry of Health in 2020, only about 40% of people have access to rehabilitation services.

Meanwhile, due to limitations in Vietnam's medical care system and high hospital costs, many stroke patients are discharged before they are fully recovered and must be cared for at home.

Stroke patients need special care, especially in the early stages. Their family members often struggle to provide adequate care due to a lack of professional skills and time. Not only that, finding qualified caregivers for stroke patients can be difficult as there is no established market or platform for these services in Vietnam. Most connections are made through word-of-mouth referrals which can be narrow and unreliable.

On the other hand, technicians and nurses with expertise in stroke care also have difficulty finding suitable patients for their services; they are willing to provide home care for stroke patients. Interviewing with 24 technicians, nurses with expertise in stroke care shows that they utilize one-third of their free time to care for stroke patients on average.

Without proper and timely care from a qualified healthcare professional, stroke patients can suffer from lifelong complications or even death. Those who experience complications after a stroke may not only lose their ability to work but may also require lifelong care. This can have negative social and economic impacts on both the individual's family and society as a whole.

2. Method

To assess the needs and content of information necessary for the connection between family members of stroke patients and qualified healthcare professionals, interviews were conducted.

Interview with Stroke Patients' family members

- Size: 36 people

- Subgroup: Severe patients requiring intensive care (12 people); mild patients still in need of care (12 people); moderate patients (12 people).

Information about the patient's family was accessed through the Stroke Department of Bach Mai Hospital, Hospital of Hanoi Medical University, 103 Hospital, and Central Acupuncture Hospital.

- Interview content:

○ Assessing the need for information technology application in the connection between family members of stroke patients and healthcare professionals.

○ Identifying information that family members of stroke patients need to decide on home care service for their patient

Interview with Professionals caring for stroke patients

- Size: 24 people

- Subgroup: Referred by the family of severe patients (8 people); Referred by the family of mild patients (8 people); Referred by the family of moderate patients (8 people).

- Interview content:

○ Assess the willingness to provide information to connect with the patient's family.

○ Assess the extent to which information is allowed to be disclosed.

○ Evaluating the necessity of information technology applications in connection.

Interview results

- About the need to apply information technology to connect

Both the patient's family and healthcare professionals specializing in caring for stroke patients highly appreciate the need for connectivity through an information technology application.

A quote from a patient's family member: "Very necessary. If there was an application to connect soon, I would not have struggled to find someone to take care of my wife. The good thing is that I will have more information to choose the right person."

A quote from a healthcare professional specializing in caring for stroke patients: "I regret that there was no early application of information technology to connect us and patients. Such an application is essential. There are cases where I believe, if I had had acupuncture earlier, they would have recovered. Unfortunately, I'm late because we don't know each other."

- About the current connection difficulties

Both the patient's family and healthcare professionals specializing in caring for stroke patients confirmed that their connection was through word-of-mouth. Therefore, their range of options is very limited and it is possible that they may not find the right person.

- About the information needed when connecting

The following information is needed when a patient's family wants to learn about a healthcare professional specializing in caring for stroke patients:

1. Full name
2. Gender
3. Age
4. Hometown
5. Contact phone number
6. Professional qualifications
7. Work experience
8. Working time
9. Price for service
10. Personality
11. Assess the satisfaction and reputation of those who have rented before

The following information is needed by healthcare professionals specializing in caring for stroke patients:

1. Patient's condition
2. Address to take care of
3. Willingness to pay
4. The timetable for caring

- About the readiness to provide information for the connection

All healthcare professionals specializing in caring for stroke patients are willing to provide information upon request to better connect them with the patient's family. Some suggest not publishing their personal information on a connected application while it is still in the beta stage. After the application is completed, the majority of interviewees agreed to make their personal information public, while others suggested keeping it hidden.

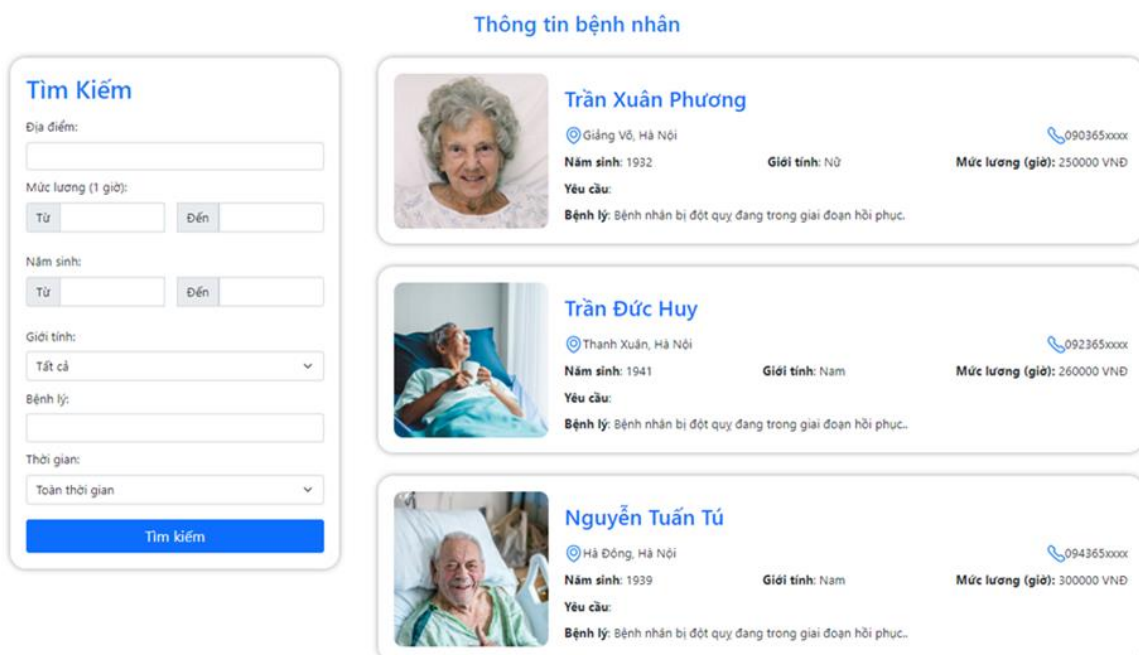

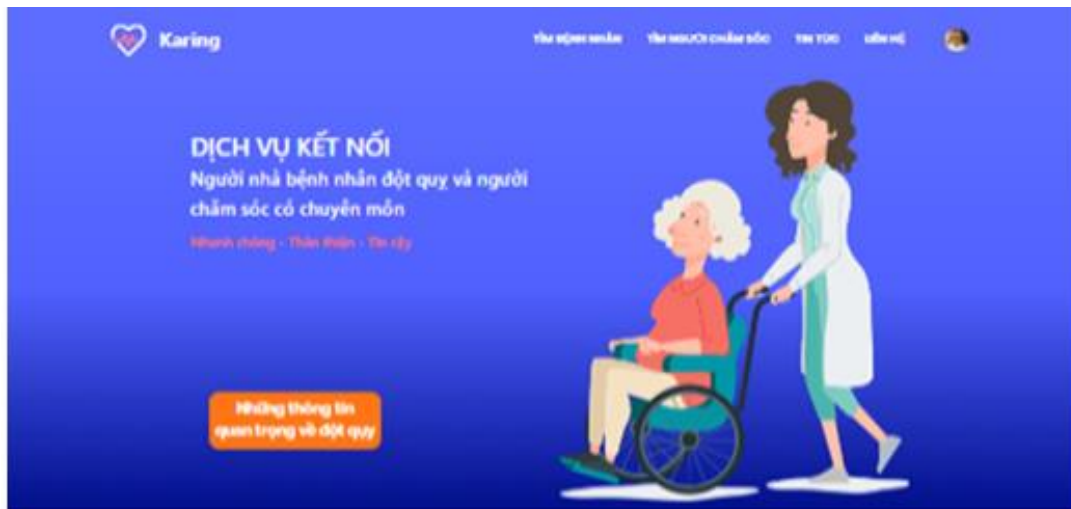

3. Web-Based Design and Setting Requirements

Based on the characteristics, requirements, and features of information technology application models in supply-demand connection (such as websites and web apps), and considering the necessary features for an effective connection between family members of stroke patients and healthcare professionals specializing in caring for stroke patients, a web-based application is suitable and applicable. An app application will be developed in the next stage when the database is large enough.

The main features and requirements of the website include:

- Open database of the patients and persons with expertise in caring for the stroke patient. The information must be verified before publishing on the Website.
- Search engine based on different criteria for finding a suitable person from the database.

Following is the initiate development of website to connect family members of stroke patients with healthcare professionals specializing in caring for stroke patients.

4. Conclusion

With the help of information technology, a web-based solution can effectively connect family members of stroke patients with healthcare professionals specializing in caring for stroke patients. This allows family members to find a suitable healthcare professional faster, cheaper, and more reliably.

This web-based solution supports fast and reliable connections between stroke patient families and professional caregivers. It also improves the effectiveness of home stroke treatment, thereby reducing mortality and complications, and helping patients better recover their health by quickly and conveniently connecting suitable caregivers. As a result, they can soon return to normal life and continue to participate in work. This helps to reduce the social and economic burden on the family of the stroke patient.

SUSTAINABLE DEVELOPMENT**

FACTORS AFFECTING GREEN CONSUMPTION BEHAVIOR OF CITIZENS IN HANOI CITY, VIETNAM

Dr. Nguyen Thi Oanh

oanhnt0305@gmail.com

Thuy Loi University, Hanoi, Vietnam

MA. Nguyen Thu Huong

nguyenthuhuongnut@gmail.com

Thai Nguyen University of Technology, Thai Nguyen, Vietnam

Abstract

The aim of this study is to determine factors influencing green consumption behaviors of consumers in Hanoi City, Vietnam. Based on thoroughly researched secondary data, this conceptual paper suggests a framework integrating the so far incoherent frameworks as proposed by previous authors. A sample of 260 respondents was collected via both online and offline surveys and data were analyzed by multiple regression model. The research findings indicated that 04 factors affecting green consumer behavior including (1) environmental concern, (2) social trend, (3) product price (4) social influence, (5) product availability and (6) perceived consumer effectiveness. From these, some suggestions are proposed to promotion of green consumption of citizens in Vietnam, to enhance the sustainable development of the nation.

Key words: *Green consumption, green consumer behavior, green purchasing, green consumer decision.*

1. Introduction

Public concern for environmental issues has gradually but steadily increased over the past three decades since the inception of Earth Day (Kim and Choi, 2005) appealing to preserve nature and biodiversity. Marketers have reacted to consumers' growing environmental consciousness by developing 'environmental-friendly' products (Kaufmann, H. R et al., 2012).

Green products are defined as products that are environmentally friendly, have little impact on the natural environment and have a green life cycle (Kumar & Ghodeswar, 2015). In other words, at every stage of the product's life cycle, from design and decision on raw materials to production, storage, transportation, use and post-use, the product must have minimal impact to the environment. According to Tandon and Sethi (2017), green products are classified into two main categories: consumer products, technical products and household appliances.

Green purchasing behavior can be translated to the act of consuming products that are conservable, beneficial for the environment, and responding to environmental concern

(Lee, 2009) Responding to environmental concern, one of the way related to waste management system is by doing the 3R (Reduce, Reuse, and Recycle). ‘Green consumption’ on the other hand, is normally related to environmentally responsible consumption where consumers consider the environmental impact of purchasing, using, and disposing of various products, or using various green services (Moisander, 2007).

Green purchase indicates customers' environmentally responsible buying behaviors for eco-friendly products/services in order to reduce the harm to the environment (Joshi & Rahman, 2015)

It is notable that pro-environmental behaviors differ from general purchase-related consumer behaviors. General purchase behavior is driven by an assessment of its benefits and costs that are of immediate relevance solely to the individual consumer performing the behavior. By contrast, environmentally conscious behavior is unlikely to deliver instant personal gain or gratification, but rather a future-oriented outcome (e.g. cleaner environment) that often benefits society as a whole (Mc Carty and Shrum, 2001; Kim and Choi, 2005)

Environmentally responsible purchasing is vital as unplanned purchasing of goods can severely damage the environment. Grunert (1995) reported that consumer household purchases were responsible for 40% of the environmental damage. Consumers possess the capability to prevent or decrease environmental damage by purchasing green products.

2. Literature Review

Green purchasing refers to the purchase of environmentally friendly products and avoiding products that harm the environment (Chan, 2001). Green purchasing is most often measured as green purchase intention and behavior. Green purchase intention refers to consumers’ willingness to purchase green products. Intentions capture the motivational factors that influence green purchase behavior of consumers (Ramayah, Lee, and Mohamad, 2010). Green purchase behavior represents a complex form of ethical decision-making behaviour and is considered a type of socially responsible behavior. As a socially responsible consumer, the green consumer “takes into account the public consequences of his or her private consumption and attempts to use his or her purchasing power to bring about social change” (Moisander, 2007). A green product is one which satisfies consumers’ needs without damaging the environment and contributes towards a more sustainable world. These products are environmentally superior and have low environmental impact. Green products use material safer to the environment, are recyclable and require less packaging (Chen and Chai, 2010). Some examples of green products are organic products, energy efficient light-bulbs, herbal products, eco-friendly washing machine, etc.

Certain studies adopted TPB as the underpinning theory and other studies included some of the components of TPB as a part of the research constructs (Elhoushy and Jang, 2020; Wang et al., 2020b). However, most of these studies often gave inconclusive or even controversial outcomes (Wang et al., 2019, 2020c). As TPB is a behavioral theory based on a causal process, it ignores other essential factors (Ulker-Demirel and Ciftci, 2020), such as impulse factors, feelings, private standards (Sniehotta et al., 2014); unconscious motives

and spontaneous choices (Yuzhanin and Fisher, 2016); and personal decision criteria (Ulker-Demirel and Ciftci, 2020). This leads to the identification of the attitude- intention/behavior gap by some researchers who argue that factors influencing the magnitude of this gap have not been systematically investigated (Jacobs et al., 2018).

Value-attitude-behavior (VAB) model is a classical model in the literature of social psychology, which investigates the relationship between value and behavior through attitude (Jan et al., 2019). Specifically, the VAB model summarizes specific extant literature on natural food consumption and leads to the development of corresponding hypotheses (Jacobs et al., 2018). Since then, researchers have employed the VAB model in different contexts, such as local food consumption (Zhang et al., 2020), green customer loyalty (Hur et al., 2013), green hotel patronage (Rahman and Reynolds, 2019), and pro-environmental behavior (Tamar et al., 2020).

Various theories exist which assert that attitude alone does not affect behaviour; there are other factors that not only influence behaviour, but also the strength of the attitude-behaviour relationship. Guagnano et al. (1995) introduced Attitude-Behaviour-Context (ABC) model to better understand human behavior. According to this model, consumer green behavior is not only determined by attitude, but also by contextual factors. Favorable contextual factors strengthen whereas unfavorable contextual factors diminish the strength of the attitude-behaviour relationship. Olander and Thøgersen (1995) introduced Motivation- Ability-Opportunity (MAO) model for understanding consumer behaviour. MAO model used two constructs - ability and opportunity, as indispensable pre-requisites to green consumer behavior. The ability construct incorporates both habit and task knowledge, whereas the opportunity construct incorporates facilitating conditions or 'opportunity' to perform the behaviour. According to this model, consumers' positive attitude will lead to desired behaviour only if they have the ability and the opportunity to carry out the expected behaviour. For example, green purchase will not happen without easy availability of green products. Recently, Phipps et al. (2013) introduced reciprocal deterministic theory to understand sustainable consumer behavior. This model emphasized the importance of past behavior and considered it as an indicator of future sustainable behaviour. The model suggests that personal factors such as attitude, along with past sustainable behaviors and sociocultural environments, affect future sustainable behavior. It is thus clear from the above discussion that consumer behavior is not only affected by attitude, but also by various other personal and situational factors. Further, these factors can either strengthen or weaken the strength of attitude-behavior relationship.

Major environmental problems and depletion of natural resources forced human civilization to focus on environmentally responsible consumption. More and more organizations are producing environmentally friendly products today and consumers are also showing increased willingness to purchase such products. The authors conducted an extensive review of 53 empirical articles on consumer green purchase behaviour and identified major factors influencing consumer green purchase decisions. Further, the authors offer probable explanations for the observed inconsistency in green purchase attitude-

behaviour. Additionally, the variables that have received most attention in literature and those that have largely been overlooked were identified.

In addition, Ahmad and Juhdi (2008) notified that perception towards organic food, awareness on government action and support, beliefs about product safety for use, belief about product friendliness to environment, availability of product and product information are the most influential factors that affect consumers' pro-environmental behavior. Partially confirming the view of Ahmad and Juhdi, Panni (2006) as well as Ismail and Panni (2008) notified that availability of information on green products as well as the availability of such products significantly influences consumers' pro-environmental behavior.

To date, social influence has been found as the most important factors that affect green purchasing behavior of adolescents, however there are several more factors which are: Environmental attitude, Environmental concern, Perceived seriousness of environmental problems, Perceived environmental responsibility, Perceived effectiveness of environmental behavior, and concern of self-image in environmental protection. (Lee, 2008).

Hughner (2007) found that while many consumers showed a positive attitude towards purchases of organic food products (67%), only a small number of consumers (4%) actually purchased those products.

Environmental Concern and Social Trend

Dunlap and Jones (2002) defined environment conscious as the extent to which individuals are aware of environmental issues and show support to solve them or signify the readiness to contribute personally to their solution.

Beckford et al. (2010) and Cornelissen et al. (2008) also found in their studies that environmental attitude has a significant impact on consumer environmental/green purchasing behavior. Mostafa (2009) found that environmental knowledge has a significant impact on the consumers' intention to buy green products. So from the above discussion the first hypothesis for a correlated set of consumer behavior variables can be developed:

H1: Environmental concern has a positive influence on the consumers' green purchasing behavior.

H2: Social Trend has a positive influence on the consumers' green purchasing behavior.

Product Price

It has been reported in some studies that higher price outweighed ethical considerations and widened the attitude behaviour gap in case of purchase of green products (Connell, 2010; Gleim et al., 2013; Vermeir and Verbeke, 2006). However, low price sensitivity of consumers was found to positively affect green purchase behaviour (Aertsens et al., 2011; Eze and Ndubisi, 2013; Lea and Worsley, 2008). Conversely, high price sensitivity negatively affected (Ma et al., 2013) green purchase behaviour of consumers.

Besides, customers tend to compare the price of green products with the benefits that green products bring to the environment (Kumar & Ghodeswar, 2015).

H3: Product Price has a positive influence on the consumers' green purchasing behavior.

Social Influence

Many studies found subjective or social norms and reference groups to have a positive correlation with purchase intention and actual purchase of green products (Eze et al., 2013; Liu et al., 2012; Welsch et al., 2009) while studies found that societal norm had a negative relationship with purchase intention and actual purchase behaviour (Connell, 2010; Lee, 2011). Subjective norm was also found to have an indirect influence on consumer green purchase behaviour as it influenced green attitudes that further affected green purchase behaviour (Gadenne et al., 2013; Smith et al., 2010; Welsch et al., 2009; Salazar, Oerlemans, and van StroeBiezen, 2013). Findings further reveal that social and reference groups, especially peers and other individuals with close proximity to consumers have a stronger influence on consumers' green purchase decision-making process (Lee, 2010; Salazar et al., 2013; Tsarenko et al., 2013). To summarize, it can be said that subjective or social norm and reference groups have a positive relationship with consumer green purchase behaviour.

H4: Social influences have a positive influence with green purchasing behavior

Product availability

Some studies reported that limited availability of a product had a negative influence on consumer green purchase intention and behavior (Young et al., 2010); Most studies showed that limited availability and difficulties in accessing green products were major barriers to purchasing environmentally sustainable products (Padel and Foster, 2005; Young et al., 2010). On the other hand, easy availability of the green product positively affected green purchase behaviour (Tarkiainen and Sundqvist, 2005; Vermeir and Verbeke, 2008). Consumers generally don't like to spend a lot of time searching for green products; they prefer products that are easily accessible (Tanner and Kast, 2003; Young et al., 2010). Further, consumers generally look for convenience in purchasing (Fotopoulos et al., 2002; Padel and Foster, 2005). Thus, it can be said that limited availability and inconvenience in procuring products act as barriers and increase the gap between consumer positive attitude and actual behaviour towards purchasing green products.

H5: Product availability have a positive influence with green purchasing behavior

Perceived consumer effectiveness

Some studies found a positive correlation between perceived consumer effectiveness and purchase intention/adoption of green products (Gleim et al., 2013; Gupta and Ogden, 2009). Perceived consumer effectiveness was also found to indirectly influence consumer purchase intention since it significantly affected consumer attitudes, subjective norms and perceived behavioural control which further determined consumer purchase intention (Kang et al., 2013). Hence, it can be said that there exists a positive correlation between perceived consumer effectiveness and green purchase intention and behaviour.

Kim and Choi (2005) argued, that individuals with a strong belief that their environmentally conscious behavior will result in a positive outcome, are more likely to

engage in such behaviors in support of their concerns for the environment. Hence, self-efficacy beliefs may influence the likelihood of performing green purchase behavior. From the above discussion the sixth hypothesis for a correlated set of consumer behavior variables can be developed:

H6: Perceived Consumer Effectiveness (PE) has a positive association with consumers' green purchasing behavior.

3. Method

The target population for this research is the Hanoi dwellers who serve as respondents.

Inheriting previous research results, from the perspective of students' perception of school culture issues, the authors proposes a research model with 6 independent factors affecting Green Consumer Behavior, including: (1) environmental concern, (2) social trend, (3) products' prices (4) social influence, (5) products' availability and (6) perceived consumer effectiveness.

Proposed hypotheses are:

H1: Environmental Concern (EC) has a positive effect on University Culture

H2: Social Trend (ST) has a positive effect on Green Consumer Behavior

H3: Product Price (PP) has a positive effect on Green Consumer Behavior

H4: Product Availability (PA) has a positive effect on Green Consumer Behavior

H5: Social Influence (SI) has a positive effect on Green Consumer Behavior

H6: Perceived consumer effectiveness (PE) has a positive effect on Green Consumer Behavior

Table 1. Scales of the study

No	Variables	Contents	Sources
Environmental Concern			
1	EC1	I am very concerned about the environment.	Pickett-Baker (2008), Ozaki [10], Tseng et al (2013)
2	EC2	I would be willing to reduce my consumption to help protect the environment.	Zhao, Q., Wu, Y., and Zhu, X. (2014)
3	EC3	Major political-social change is necessary to protect the natural environment.	Paul, J., Modi, A., & Patel, J. (2016).
4	EC4	Anti-pollution laws should be enforced more strongly	
5	EC5	Environmental pollution can only be improved when we act to protect it.	Zhao, Q., Wu, Y., and Zhu, X. (2014)
6	EC6	Positive attitude towards green consumption has important implications for personal benefits and environmental protection	

No	Variables	Contents	Sources
7	EC7	I know how to choose products and packaging to reduce waste to the environment	Le Phan Hoa (2022)
Social Trend			
8	ST1	Green lifestyle is getting more and more attention	
9	ST2	The government has many measures to raise people's awareness about green lifestyle	
10	ST3	The government now encourages consumers to buy green products	Aijen, I. (2002)
11	ST4	Information and images of green products for environmental protection are widely communicated to citizens	
12	ST5	I believe in government efforts to enforce standards of environmentally friendly products	Scheneider et al. (2009)
Product Price			
13	PP1	The price of green products is usually higher than regular products	Saleki, Z. S., & Seyedsaleki, S. M. (2012).
14	PP2	The price of green products is suitable with product quality	
15	PP3	I feel pleased when I pay more for green products	Moser (2015), Yadav và Pathak (2016)
16	PP4	The quality of the product is worth the money I spent.	
17	PP5	High price of green products limit consumption	
Product Availability			
18	PA1	Green products are now being sold in many places	Moser (2015)
19	PA2	There are likely to be plenty of opportunities for me to purchase green products	
20	PA3	Manufacturers and distributors pay great attention to make it easy for consumers to recognize green products	
21	PA4	There are shops and supermarkets sold green products more and more	

No	Variables	Contents	Sources
Social Influence			
22	SI1	Most people who are important to me think I should purchase green products when going for purchasing.	Kumar và Ghodeswar
23	SI2	Many people around me use green products	
24	SE3	Most people who are important to me would want me to purchase green products when going for purchasing.	
25	SE4	People whose opinions I value would prefer that I purchase green products.	
26	SE5	Propaganda activities/green lifestyles of people around me affect me	Aijen, I. (2002)
27	SE6	Most people who use green food are guilty of active living	
Perceived consumer effectiveness			
28	PE1	Green lifestyle helps me to be more relaxed and pleased	
29	PE2	My family and I are healthier when using green products.	Shaharudin, M. R., et al (2010)
30	PE3	I feel like a person with a high social responsibility	
31	PE4	Buying green products is a good behavior	Le Phan Hoa (2022)
32	PE5	Green consumption behavior brings benefits to individuals and communities	Fishbein và Ajzen
Green Consumer Behavior			
33	GCB1	Going green brings many benefits to me	
34	GCB2	In future I will use green products more	
35	GCB3	I plan to spend more on environmental-friendly product rather than conventional product.	
36	GCB4	I will recommend green lifestyle to relatives, friends and colleagues.	
37	GCB5	I believe green consumption is becoming more and more popular and has a positive influence	
38	GCB6	Using green products is my right decision	

To answer the research questions, survey data were collected from some districts in Hanoi City, Vietnam. The questionnaire which was sent via both online and offline approaches. The respondents were asked to state how they agree by using a 5-point Likert scale (1 = highly disagree, 5 = highly agree) with agreement with components of culture in their university. From 2022 December to 2023 March, 260 responses in total were received and all were qualified and all valid samples.

In this study, a questionnaire comprising 29 determinants was designed to measure university culture. The Statistical Package for Social Science (SPSS 26.0) is used for data analysis.

4. Results

Of the 260 valid samples, there were 26.5% of the respondents were male compared to 73.5% of the total students who were female; 72.3% in the age from 35 to 55, 18.5% above 55 years old and 9.2% under 35 years old.

In order to test the reliability of each factor, Cronbach's alpha of each factor was computed as below:

Table 2. Cronbach's alpha scores

Factor	Observed variables	Mean	Std. Deviation	Cronbach's Alpha
Environmental Concern (EC)	EC1	3.59	.683	.792
	EC2	4.08	.736	.766
	EC3	3.93	.742	.774
	EC4	3.88	.764	.784
	EC5	3.91	.750	.761
	EC6	3.76	.713	.775
	EC7	3.79	.763	.775
Cronbach's alpha of EC factor: 0.801				
Social Trend (ST)	ST1	3.85	.740	.774
	ST2	3.73	.724	.740
	ST3	3.80	.734	.723
	ST4	3.88	.717	.708
	ST5	3.73	.712	.755
Cronbach's alpha of ST factor: 0.781				
Product Price (PP)	PP1	3.83	.728	.807
	PP2	3.78	.686	.777
	PP3	3.75	.712	.780
	PP4	3.73	.699	.771
	PP5	3.74	.720	.762
Cronbach's alpha of PP factor: 0.816				

Factor	Observed variables	Mean	Std. Deviation	Cronbach's Alpha
Product Availability (PA)	PA1	3.93	.732	.815
	PA2	3.95	.718	.782
	PA3	4.00	.758	.811
	PA4	4.07	.748	.815
	Cronbach's alpha of PA factor: 0.847			
Social influence (SI)	SI1	4.11	.764	.759
	SI2	3.92	.742	.743
	SI3	3.75	.748	.721
	SI4	3.86	.724	.708
	SI5	3.80	.711	.721
	SI6	3.79	.754	.743
Cronbach's alpha of SI factor: 0.767				
Perceived consumer effectiveness (PE)	PE1	3.94	.766	.669
	PE2	3.80	.733	.665
	PE3	3.79	.718	.697
	PE4	3.96	.696	.683
	PE5	3.83	.726	.685
Cronbach's alpha of PE factor: 0.727				
Green consumer behavior (GCB)	GCB1	3.83	.728	.731
	GCB2	3.78	.696	.723
	GCB3	3.75	.712	.713
	GCB4	3.59	.683	.750
	GCB5	4.08	.736	.723
	GCB6	3.93	.742	.725
Cronbach's alpha of GCB factor: 0.763				

The table indicates that Cronbach's alpha scores of 5 factors ranged from 0.727 to 0.816. Since 0.50 is the minimum value for accepting the reliability test (Nunnally, 1967), the results of factor analysis in this study are considered reliable.

Exploratory Factor Analysis (EFA)

The exploratory factor analysis (EFA) was conducted to test the validity of the measurement of six independent variables that met the requirements of Cronbach's Alpha reliability testing. By using SPSS ver 26.0, the exploratory factor analysis produced the results as presented in table 2 below. The results of EFA satisfied four elements: (1) Sig value. Bartlett's test = 0.000 <0.05; (2) 0.5 <KMO coefficient = 0.914 <1; Fraction of deductible = 60,754% > 50%.

Prior to multiple regression analysis, the 32 determinants were factor analyzed using principal component analyses with varimax rotation in order to identify the structure of determinants related to university culture. After 3 times to exclude variables EC1, EC4, EC6, PE4, ST1, SI4; SI3; and PE3, EC7.

The EFA analysis verified the four factors as predetermined in the questionnaire development as the table below:

Table 3. Factor rotation matrix result of independent variables

	Component			
	1	2	3	4
ST5	.763			
PP3	.686			
PE2	.645			
PP4	.639			
SI5	.634			
PP2	.630			
PP5	.609			
PP1	.579			
PE1	.547			
PA3		.808		
PE5		.795		
PA4		.774		
SI1		.761		
PA2		.757		
PA1		.689		
EC3			.733	
EC2			.663	
SI2			.629	
EC5			.563	
ST2				.824
SI6				.819
ST3				.583
ST4				.512

The number of factors was determined by retaining only the factors with an eigenvalue of 1 or higher. After removing 9 determinants, the first factor, Product Price (PP), comprised nine items: PP1, PP2, PP3, PP4, PP5, ST5, PE1, PE2 and SI5. The second factor, Product Availability (PA), consisted of six items: PA1, PA2, PA3, PA4, PE5, and SI1. The

third factor, Environmental Concern (EC) consisted of four items: EC2, EC3, EC5 and SI2. The fourth factor was related to Social Trend (ST), including ST2, ST3, ST4 and SI6.

With dependent variable, KMO = .812, Chi-square = 319.810 và the only one component extracted, accounted for 45.846% of the variation.

In order to investigate whether the independent variables (four factors) had significant impacts on the dependent variables (GPB), Pearson correlation and regression analyses were conducted.

Table 4. Pearson Correlation analysis

		GCB	PP	PA	EC	ST
GCB	Pearson Correlation	1	.849**	.538**	.837**	.586**
	Sig. (2-tailed)		.000	.000	.000	.000
	N	260	260	260	260	260
PP	Pearson Correlation	.849**	1	.521**	.645**	.619**
	Sig. (2-tailed)	.000		.000	.000	.000
	N	260	260	260	260	260
PA	Pearson Correlation	.538**	.521**	1	.538**	.462**
	Sig. (2-tailed)	.000	.000		.000	.000
	N	260	260	260	260	260
EC	Pearson Correlation	.837**	.645**	.538**	1	.478**
	Sig. (2-tailed)	.000	.000	.000		.000
	N	260	260	260	260	260
ST	Pearson Correlation	.586**	.619**	.462**	.478**	1
	Sig. (2-tailed)	.000	.000	.000	.000	
	N	260	260	260	260	260

***.* Correlation is significant at the 0.01 level (2-tailed).

Based on the results of Pearson Correlation analysis in table 3, the Sig. of all factors (PP, PA, EC, ST) > 0.05; therefore, there are correlations between them and the dependent variable (GPB).

Multiple regression analysis

To determine the importance of each factor to online reservation intention, a multiple regression analysis was conducted. Online reservation intention was the dependent variable, while the four determinant factors were the independent variables. All variables were entered at the same time. Table 4 reports the results of the multiple regression analysis.

Table 5. Multiple regression analysis

	Std. β	Sig.	VIF
PP	.512	.000	2.240
PA	-.014	.631	1.568
EC	.497	.000	1.902
ST	.038	.211	1.704
R2 = 0.865			
Adjusted R2 = 0.863			
ANOVA (F = 408.787), Sig = 0.000b < 0.05			

The result showed an adjusted R2 of 0.863, suggesting that about 86.3% of the variation in overall satisfaction was explained by the regression equation, and there is no multi-collinear phenomenon because the VIF of all factors < 10.

Based on the coefficient of each independent variable, it is possible to assess the impact of each variable on the dependent variable. The findings reveal that Product Price (PP) was the most important factor in explaining Green Purchase Behavior (GPB). Environmental Concern (EC) followed in importance. Besides, (PA) and (ST) do not guarantee reliability to have impacts on the dependent variable (GPB).

5. Discussion and Conclusion

This article has significant managerial implications. It informs policy makers and managers about the key predictors of consumers' green purchase behaviour. The findings showed that green consumer behavior is basically influenced by two main factors, which are environmental concern and product price. Besides, other factors also need to be considered for the purpose of improving green purchasing behavior.

The Green Consumption Conference (Oslo, Norway 1994) has said that green consumption is a way to use products effectively, save resources, reduce toxic substances and environmental pollution, and do not affect next generation needs. That is, minimizing the use of natural resources and harmful substances as well as waste and pollutants. It is important to understand that green consumption is not about "consumption less" but knowing how to consume more efficiently, better and using less resources.

Green consumption is currently considered the consumption trend of the century when the environment becomes a major concern of many countries all over the world. During the past decade, efforts have been made to implement policies and programs to successfully transform the industrial structure, making production processes cleaner and more efficient. However, businesses can only reduce the environmental impacts associated with production, but not address the environmental impacts related to the selection, use and disposal of products by consumers. Therefore, consumption plays an increasingly important role in solving environmental problems; Collaboration between producers, consumers and other stakeholders can lead to more sustainable solutions in the production-consumption system. In that context, integrating the efforts of stakeholders is a key issue to promote green consumption in the world in general and in Vietnam in particular.

For manufacturers, they need to make changes to show social responsibility, to enhance the brand image in the eyes of customers, in their sayings and actions, to avoid a communication crisis.

Businesses should focus on investing in aspects such as materials, usages, durability and design of products, because these are the factors that consumers care about first when choosing green products. In addition, businesses should also supplement certificates of safety standards for health and environment friendliness, in order to increase consumers' peace of mind and confidence in their products.

Further, producers and marketers should not only introduce products with eco-labels, but also make efforts to develop consumer trust in the eco-label. To this end, marketers can run campaigns to promote public awareness of eco-labels, inform citizens about the meaning and availability of the eco-labels, and the benefits of using eco-labelled products. Government should also monitor the credibility of the messages carried by eco-labels to ensure that the trust of consumers is not breached.

Developing a green product distribution system: Invest in a distribution system to ensure convenience for consumers in accessing green products. Providing diversified and flexible distribution methods with green products, contributing to limiting obstacles for consumers in deciding to buy green products. Thus, retailers should ensure that their stores contain a variety of green products displayed at convenient and easy to view locations.

The present study has useful implications for public policy as well. Findings reveal that environmental concern is the prime factors that motivate a consumer to investigate green products. Policy makers should further nurture and develop this tendency through environmental education.

Raising people's awareness in environmental protection and green consumption; launch the green consumption movement through the media. Exploiting the effectiveness of the media in bringing green products and green consumption closer to consumers.

Encouraging people to use environmentally friendly products: increase the use of products labeled water saving, energy saving and efficient environmental labels, green food labels and food organic products, reducing the use of products with multiple packaging and single-use products.

Using financial policies: taxing on the use of environmental components; on users of cars and motorbikes that release toxic gases into the environment (usually taxed through fuel); on tobacco using; on the use of fertilizers and pesticides; also waste objects or wastewater into the environment.

Limitations and suggestions for future research

This research basically achieved the research objectives that stated above. However, the research still has certain limitations which are expected to be improved in the future research. First, due to the constraints of time, the sample is chosen by applying non-probability convenience method with a limited number of samples of respondents in some households in Hanoi City with only 260 citizens. Secondly, dwellers which are not separated in fields such as economics, technologies, and social sciences with own characteristics.

Abstract

This study aims to analyze and evaluate the factors affecting green agricultural products consumption behavior of consumers in Hanoi city. The article uses SEM model for analysis based on data collected from 305 consumers in Hanoi. The results of this study show that the factors "Attitude towards green agricultural products, Environmental awareness, Health awareness, and Green marketing activities" all have a positive impact on the green consumption intention of consumers. The study draws a new conclusion; no relationship between subjective norm and consumption intention. From there, the authors propose some recommendations for state agencies and businesses to promote the green agricultural product consumption behavior of consumers in Hanoi city.

Keywords: *Consumption intention, green agricultural products, green consumption, Hanoi*

1. Introduction

In recent years, green consumption has emerged as a trend with the purchase and use of friendly goods, protecting the environment and the consumers' health, including agricultural products. Among the current manufacturing industries in Vietnam, many industries are applying green standards to the production process and selling them to the

market. However, they have only reached the surface, and have not gone deep into its nature, including the agricultural product industry, one of the industries that account for an enormous proportion and directly affect the interests and lives of consumers. Although green consumption is constantly being popularized and propagated, clean food chain stores also steadily promote the brand and origin of fresh agricultural products to consumers but only gain the trust of loyal customers instead of the expectation and the top priority of all consumers in Hanoi. Therefore, the paper of the factors affecting the green agricultural product consumption behavior in Hanoi city to propose some solutions to encourage the green agricultural product consumption behavior of the consumer in Hanoi in particular and the whole country in general are extremely urgent, meaningful in both theory and practice.

2. Literature review

2.1. Green agricultural products

The concept of green agricultural products in the world has not been clearly defined by many studies, although in Vietnam this concept is still mentioned regularly. According to Yishu Liu and Xia Wang (2022), green agricultural products refer to those agricultural products that are

recognized by special agencies and allowed to use the green agricultural products logo, conform to the theory of sustainable development, and are produced in accordance with the standard environment, health, technology, and other conditions. Green agricultural products are a category covering three concepts: non-polluting agricultural products, organic food, and green food. The above three concepts are interconnected and complement each other's meanings. Other research by Ha et al. (2019) shows that organic food is different from conventional food in some aspects: no pesticides, care, and packaging procedures,... and ensures no harm to the human body and the environment in the entire industrial chain. The above concept is consistent with the definition of Yishu and Xia Wang (2022) when it is determined that organic agricultural products must be produced according to production requirements and standards of organic agriculture in the world. Green food, on the other hand, needs to be produced in a certain way, and its basic characteristics are non-polluting, non-polluting, green, and safe (Yishu Liu and Xia Wang, 2019). Thus, it can be concluded that the concept of green food and organic food is further developed and improved based on non-polluting agricultural products.

2.2. Research on green consumer behavior

Pagiaslis et al. (2004) research on green consumption behavior in biofuels has shown that environmental concerns directly and positively impact behavioral knowledge, beliefs, and intentions. In addition, demographics determine the level of concern and awareness of the environment. Emekci et al. (2019) studied and explained

the factors affecting green consumption behavior and the relationship between these factors. For this purpose, three key elements were added to Ajzen's theory of planned behavior (TPB) to develop a more comprehensive model, namely, concern, environmental knowledge, and consumer cognitive effectiveness (PCE). The results showed that PCE was the variable with the highest influence on attitudes toward green consumption intention and behavior in the proposed model. It can be said that the PCE variable added to the model is an important variable that has improved and strengthened the measurement model. Variables added to the model are also compatible with Ajzen's original model. Pham Thi Huyen et al. (2020) in the study "Factors promoting green consumption intentions and behaviors of Vietnamese Millennials" confirmed that individuals with knowledge of green products are the ones with the most green consumption trends. In addition, having a positive view of green agricultural products is an important factor in promoting green consumer intentions and behavior.

2.3. Research on organic food consumption behavior

Tarkiainen, A., & Sundqvist, S. (2005) focus in depth on the relationship between subjective norms (SN) and attitudes in green food buying behavior of people in Finland. Most previous research has refuted the role of subjective norms in behavioral research, but Tarkiainen points to a close relationship between subjective norms and attitudes. The study confirms that people with positive attitudes toward green consumer behavior influence the attitudes of other buyers. On the other hand, the authors point out that the perceived factor of how much green food affects health has no significant impact on organic food buying behavior. This is in contrast to research by Fotopoulos and Krystallis (2002) that suggests that the health effects of food play an important role in the decision to buy organic food. Using behavioral inference theory (BRT), Tandon et al. (2020) study the role of food safety concerns and green food consumption participation. In addition, Tandon et al. also confirmed that purchase intention is not affected by the refusal to buy green food, which shows that for Indian consumers, the sole reason for refusal may affect the purchase intention. Also on the issue of organic food consumption, Tandon and colleagues (2021) used the SOR model to study organic food buying behavior. The study results confirm that health preoccupation is a stimulus that has a positive effect on the supporting factors (natural content, nutritional content, and ecological well-being) as well as on the factors that inhibit use behavior (use barriers, risks, and values). The analysis also found that all three supporting factors and two hindering factors (value and risk barriers) were associated with consumer behavior. Another study by Nguyen Hoang Viet et al. (2019) indicates that price obstacles have a negative impact on the buying frequency of Vietnamese consumers. This can be explained by the context that Vietnam's per capita income is still at a low average compared to the world as well as the relatively high prices of organic commodities.

2.4. Hypotheses

2.4.1. Attitude towards green agricultural products

According to Ajzen (1991), attitude is an individual's assessment of the results obtained from taking an action. Attitude toward action has a positive influence on the intention to act, a relationship shown in several studies (Chan, 2001; Vermeir, & Verbeke, 2004). Attitude determines a person's purchasing preferences, and it is one of the most important predictors of behavioral intention. Consumers with a positive attitude towards organic food believe that buying organic food is important and a good choice (Magnusson M.K. et al., 2001). Other research also suggests that attitude is one of the important factors affecting behavioral intention and is the best indicator to predict behavior (Rana & Paul, 2017). Accordingly, the following hypothesis is proposed:

H1: Attitude towards purchasing green agricultural products positively affects the intention to consume green agricultural products.

2.4.2 Subjective norms

Ajzen (1991) defines subjective norms or social influence as the perception that influencers will think that they should or should not take action. Research conducted by Vu Anh Dung et al. (2012) found that social factors such as influence from family and society are important sources affecting Vietnamese people's interest in green products. In an investigation of young consumers' intention to buy organic food in India, Yadav and Pathak (2015) confirmed that the subjective norms of the consumers strongly influence the motive to buy organic food. Accordingly, the following hypothesis is proposed:

H2: Subjective norms positively affects the intention to consume green agricultural products.

2.4.3 Environmental awareness

Environmental awareness is defined as "Understanding the impact of human behavior on the environment". Panni (2006) found that the more aware consumers are of social and environmental issues, the more they engage in social and environmental behaviors. As environmental pollution and environmental consciousness increase, they significantly influence consumers' buying behavior of green products because they are less harmful to the environment than traditional products. Caring for the environment is one of the main drivers of buying organic products. Accordingly, the following hypothesis is proposed:

H3: Environmental awareness positively affects the intention to consume green agricultural products

2.4.4. Health Awareness

Health-conscious lifestyles are also considered to be the leading motivating factor for purchasing organic agricultural products (Mohamed et al., 2012). Bourn and Prescott (2002) found that organic foods have a competitive advantage over conventional foods due to their nutritional properties. Siti et al (2014) found that organic food consumption has increased

among Malaysian consumers due to their increasing health awareness. Accordingly, the following hypothesis is proposed:

H4: Health awareness positively affects the intention to consume green agricultural products

2.4.5. Green Marketing Activities

According to the Environmental Protection Agency (EPA), green marketing is the development and promotion of products and services that meet customer needs, including needs for quality, form, reasonable price, convenient to use without harming the environment. There are many opinions that green marketing is only concerned with marketing and advertising products using environmental features or symbols. However, in essence, green marketing is the combination of a series of activities including changing the production process, packaging, and advertising to create environmentally friendly products (Polonsky, 1994). It is widely acknowledged that green marketing practices significantly influence consumers' choice of environmentally friendly products (Maniatis P., 2016). A Malaysian study conducted by Mohd Suki (2018) showed that green marketing activities in some stores enhance consumers' perception of organic food quality and image. Accordingly, the following hypothesis is proposed:

H5: Green marketing activities positively affect the intention to consume green agricultural products

2.4.6. Intention to consume green agricultural products

Purchasing intention refers to the priority of a product category to consumers when they are in the purchase evaluation stage. Behavioral intention is the most important factor to predict consumption behavior Ajzen (1985), Venkatesh et al (2003). Several studies have shown that behavior can be determined from the intention with considerable accuracy (Ajzen 1991). Attitudes towards organically grown food products can positively and significantly influence purchasing behavior (Voon JP, 2011). Accordingly, the following hypothesis is proposed:

H6: Intention to consume green agricultural products positively affect green agricultural product consumption behavior

2.4.7. Price perception

Green agricultural products are more expensive than conventional products, so the price is one of the major barriers to the use of green products (Gadenne et al., 2011). Marketers find that even when consumers claim to be strongly pro-environmental, they are still extremely price-sensitive when it comes to green purchases (Mainieri et al., 1997). This can de-motivate and discourage customers from engaging in green buying behavior. However, Radman (2005) concluded that some consumers have a positive attitude toward organic food and are willing to pay higher prices. Meanwhile, Smith et al. (2009) found that price did not significantly affect the purchase of organic food. Inheriting results from other study, the following hypothesis is proposed:

H7: Price perception positively affects green agricultural product consumption behavior

2.5. Research model

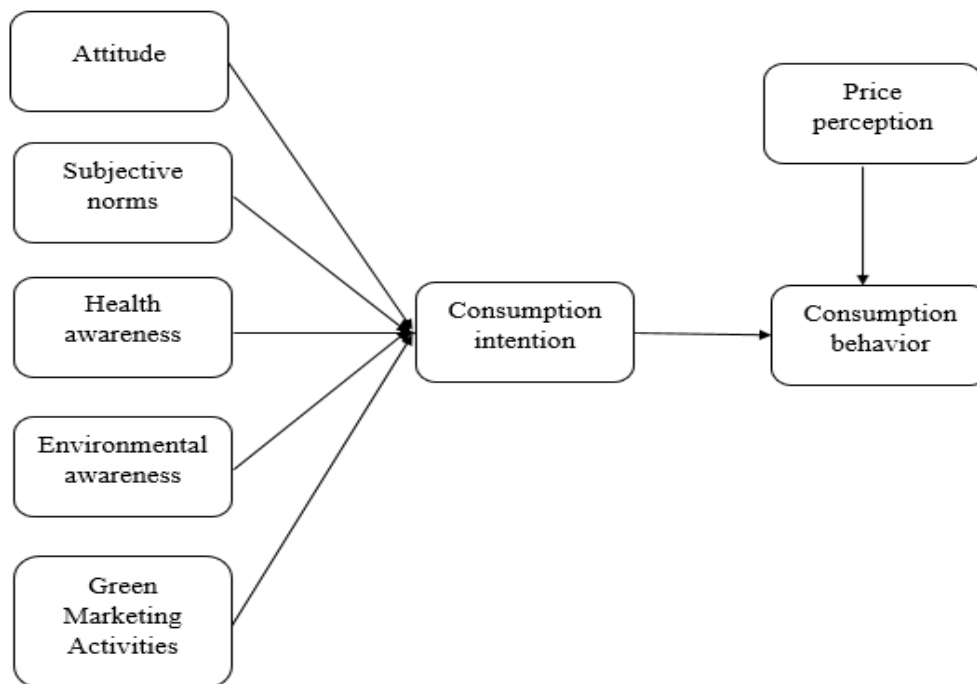

Figure 1. Research Model

3. Method

3.1. Qualitative research methods

With the qualitative research method, the authors use the form of in-depth interviews to exploit consumers' views on green agricultural product consumption behavior. The in-depth interview questions are designed to explore potential factors in consumer behavior and discuss the intelligibility of the preliminary questionnaire. On that basis, the authors propose a research model and a formal questionnaire. Survey subjects include people who are interested in or have purchased green agricultural products, including 3 target groups: students; a group of working people, and a group of middle-aged people. By interviewing 8 consumers in Hanoi, the authors draw qualitative research results as follows:

Firstly, the authors propose to remove the "Eco-label" scales from the observed variables of the factor: "Green Marketing activities". In Vietnam, green marketing activities are mainly based on mass media. Currently, there are quite a few products that are certified with eco-labels, and consumers also have little access to and interest in this issue. Therefore, the authors think that the factor: "Eco-label" is not suitable to be included in the questionnaire.

Secondly, the majority of consumers believe that price plays an important role in their decision to consume green agricultural products. In the context that the income source of Vietnamese people is still relatively low compared to the current price of green agricultural products, consumers are afraid to buy green agricultural products due to the price level despite being aware of the benefits that it brings.

3.2. Quantitative research methods

Research data was collected through questionnaires of consumers in Hanoi city. Out of 330 questionnaires collected, 305 questionnaires were suitable for data analysis. Research data were analyzed using SPSS 20.0 and AMOS 22.0 software. The scales are tested and evaluated by Cronbach's Alpha reliability coefficient and confirmatory factor analysis (CFA). Finally, the authors test the hypotheses using the SEM model.

4. Results

4.1. The frequency of consumption of green agricultural products in Hanoi

The result of descriptive statistics on the frequency of use of green agricultural products in Hanoi shows that the average value of the frequency of consumption of green agricultural products of people in Hanoi reached 4.06, representing the level of “Often”. The analysis results also show that 42.3% of the respondents answered that they always consume green agricultural products. In addition, 34.75% of the respondents confirmed that they regularly consume green agricultural products. Proportion levels “Sometimes”; “Rarely”, and “Never” reached 18.03%, 3.6%, and 1.31%, respectively.

Figure 2. The graph of how often people consume green agricultural products in Hanoi

Source: Authors' synthesis, 2023

4.2. Evaluation of scale reliability

The research data after calculation all meet the conditions of reliability of the scale according to Hair (2009). Calculation results in Table 1 confirm that the scales are reliable (all scales have Cronbach's Alpha coefficient greater than 0.7 and a total variable correlation coefficient greater than 0.3). Based on that result, the authors do not remove any observed variables and proceed to the next step of the analysis.

Table 1. Cronbach's Alpha's results

	Encode	Cronbach's Alpha	Correlation coefficient	The number of variables removed
Attitude towards green agricultural products	TD	0.876	0.672 - 0.781	0/4
Subjective Norms	CCQ	0.763	0.492 - 0.603	0/4
I. Health Awareness	SK	0.886	0.724 - 0.777	0/4
II. Environmental Awareness	MT	0.919	0.714 - 0.794	0/6
Green marketing activities	MAR	0.899	0.778 - 0.818	0/3
Price perception	GC	0.877	0.829 - 0.853	0/4
Intention to consume green agricultural products	YD	0.911	0.885 - 0.9	0/5
Behavior to consume green agricultural products	HV	0.898	0.763 - 0.82	0/4

Source: Authors' synthesis, 2023

4.3. Confirmatory factor analysis CFA

According to the test results described in Figure 1, the indicators showing the goodness of fit of the model include Chi-square/df = 2,106 < 3; GFI = 0.834 > 0.8; CFI=0.937 > 0.9; TLI=0.93 > 0.9; RMSEA=0.06 < 0.08. According to Hair (2009), the GFI index should be > 0.9 but some studies like Doll, Xia & Torkzadeh (1994) confirmed that GFI greater than 0.8 is still considered acceptable. Thus, the calculation results confirm that the model scale is appropriate for the actual data.

On the other hand, the normalized weights are greater than 0.5 and the non-standardized weights are statistically significant, so the concepts in the model achieve the conditions to ensure the convergence of the model. The critical scale has a correlation between the errors of some observed variables, so it does not achieve nomadism (uniqueness is achieved when the correlation coefficients between concepts on the overall scale are different from 1 and have statistical significance (P - Value is smaller than 0.05). The discriminant test results of some factors are not guaranteed because the correlation coefficient between some factors is greater than 0.9. However, to clarify the degree of correlation, the authors keep the factors unchanged and accurately evaluate the effects in the next analysis.

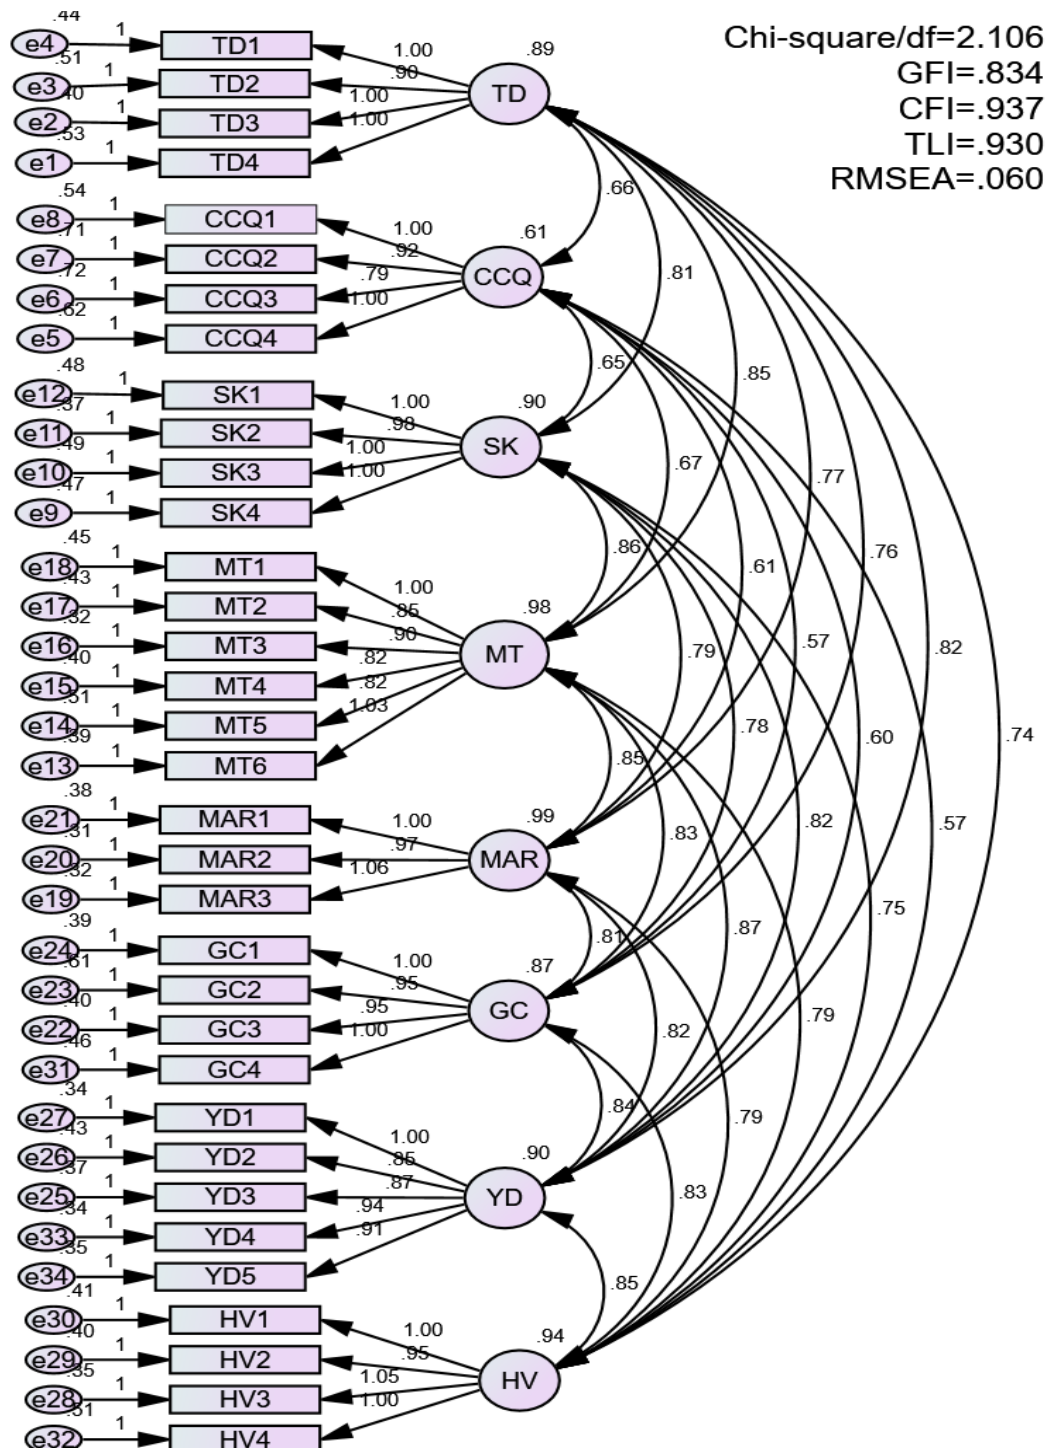

Figure 3. CFA model for scales

Source: Authors' synthesis, 2023

4.4. SEM model analysis

In the next step, the authors performed linear structural analysis SEM to evaluate the fit and accuracy of the model and achieved the following results: Chi-square/df=2.935 < 0.3; GFI = 0.802 > 0.8; TLI=0.877 > 0.8; CFI=0.887 > 0.8, RMSEA=0.08 ≤ 0.08. The relevancy indicators are all at acceptable levels, showing scales that are consistent with market data.

Figure 4. SEM model analysis

Source: Result from AMOS 22, 2023

With 95% confidence, the P-Value of the subjective standard factor (CCQ) for the degree of impact on the variable Consumer intention (YD) is $0.056 > 0.05$. Therefore, the subjective norm factor (CCQ) does not affect consumption intention (YD). The remaining factors all have P - Value < 0.05 , confirming that these effects are statistically significant (Table 2). To evaluate the impact of the factors in the model, the authors use the multiple-squared correlation coefficient and the standardized correlation coefficient.

The average multiple correlation coefficient of the factor “Consumption intention” and “Consumption behavior” are 90.2% and 77.9%, respectively. The results show that the factors in the model have a very large degree of coverage for the factors affecting the dependent variables, and confirm that the model has very few important variables missing.

Among the four factors affecting the intention to consume, the impact level of the variables in descending order is as follows: Attitude (TD); Environmental awareness (MT); Health awareness (SK); Green Marketing (MAR). Which, factor Attitude (TD) has the strongest impact on intention to consume (YD) with a standardized impact coefficient $\beta = 0.44$. Besides, the factors “Environmental awareness” and “Health awareness” also have a significant impact on consumer intention with coefficients of 0.293 and 0.271, respectively. The authors found that the impact level of the two factors above has a negligible difference, and the correlation coefficient between the two factors is relatively large (0.922). The results of the author's data set also show that the two factors have a relatively small degree of difference. This also explains the strong correlation between these two factors.

On the other hand, when considering the impact on consumer behavior, the factor of consumption intention has the largest impact on the actual behavior of consuming green agricultural products with a standardized impact coefficient $\beta = 0.715$. Price perception has a significant impact with a standardized impact coefficient of 0.517. This is consistent with the qualitative research results of the authors.

Table 2. Results of standardized correlation coefficient analysis

			Estimate
YD	←	TD	.440
YD	←	SK	.271
YD	←	MT	.293
YD	←	MAR	.228
HV	←	YD	.715
HV	←	GC	.517

Source: Authors's synthesis, 2023

5. Discussion and conclusion

5.1. Discussion

The results of SEM model analysis show that consumers' attitude towards green agricultural products has the strongest impact on the intention to consume green agricultural products with the level of impact reaching 43%. This result is consistent with the study of Tarkiainen, A. & Sundqvist, S. (2005) who found that attitude has a very significant impact on the intention to consume organic foods. Besides, the results of CFA analysis show that the factor "Attitude towards green agricultural products" containing the variable "TD3" has the highest weight of 0.834. It shows that consumers are aware that green agricultural product consumption is a good trend and should be widely promoted in the community, which will promote the intention to consume green agricultural products.

Research results show that "Health awareness" has a significant impact on the intention to consume green agricultural products with the coefficient $\beta = 0.271$. This conclusion of the authors is similar to the conclusion of Fotopoulos and Krystallis (2002) who found that the health effects of foods play an important role in the decision to buy green foods. Tandon et al. (2020) also show that being health conscious can increase the probability of considering organic food. The above results are very consistent in practice. Specifically, according to the actual observations of the research team, people are now increasingly aware of the importance of health in the context of food safety and hygiene conditions as well as living environment are not guaranteed. More and more agricultural products are using stimulants or pesticides to increase production. On the other hand, today almost people have to be exposed to many factors that are harmful to health. Therefore, awareness of the health benefits of consuming green agricultural products is an important factor in shaping the intention to consume green agricultural products.

The factor “Environmental awareness” has the second strongest positive impact on people's intention to consume green agricultural products with an impact coefficient of $\beta=0.293$, equivalent to “Environmental awareness” with an impact of 29.3%. This is consistent with the results of research by Pagialis et al. (2004) on green consumption behavior that the environment has a positive and direct impact on knowledge, beliefs and behavioral intentions. Research by Emekci et al. (2019) also confirms that environmental concerns and knowledge have an impact on green consumption intentions and behavior. The above results are also consistent with domestic studies by Pham Thi Huyen et al. (2020). Consumers are gradually becoming aware of the decline in environmental quality, which also affects the health of the community and individuals.

The factor “Green marketing activities” has a relatively remarkable impact on people's intention to consume green agricultural products with the impact coefficient $\beta = 0.228$. The above conclusion is also consistent with the study of Nguyen Hoang Viet et al. (2019) which shows the important role of green marketing activities and the role of distribution and retail units in people's organic food purchasing decisions. Thus, promoting the introduction, propaganda, and education campaigns about green agricultural products will have a very positive impact on the community's green agricultural product consumption behavior.

The impact of the factor “Price perception” on green agricultural product consumption behavior is very considerable with an impact coefficient of $\beta=0.517$, equivalent to an impact of 51.7%. Thus, it can be seen that "Price perception" has a great impact on the consumption behavior of green agricultural products of people in Hanoi. Specifically, consumers who think that the price of green agricultural products is suitable for their income will have a higher frequency of buying green agricultural products. Nguyen Hoang Viet et al. (2019) also show that price constraints have a negative impact on the frequency of organic food consumption, as Vietnam's per capita income is still low compared to the price of organic food.

5.2. Conclusion

5.2.1. On the government side

Firstly, the government needs to promote the introduction, propaganda, and education campaigns in the mass media about the benefits and importance of green agricultural products for the health of the consumers.

Secondly, the authority should have policies to strengthen the supervision of agricultural production activities to ensure that enterprises would comply with environmental regulations. In addition, it is necessary to investigate and penalize enterprises that produce and distribute unhealthy agricultural products.

Thirdly, it is crucial for the administration to issue supportive policies for businesses in the production and trading of green agricultural products, creating a strong network in the distribution and sale of green agricultural products to encourage start-ups in this field. Moreover, the government should send people to study science and technology in agricultural production processes in developed countries and apply to Vietnam to reduce

costs for enterprises, and at the same time can research and create new processes suitable to Vietnam's economic and development conditions.

5.2.2. On the enterprises side

Firstly, manufacturing enterprises need to comply well with regulations and seriously take their responsibilities for environmental protection as well as health safety. Enterprises can apply sustainable procedure not only to factors such as packaging, green labels, ... but also in the production process, including prioritizing the use of environment-friendly raw materials, practicing regenerative agriculture and converting advanced technology into production.

Secondly, businesses should promptly solve the cost problem. Specifically, businesses can reduce personnel costs, rental costs, make optimal use of existing resources to save money for green marketing activities, apply advance technology in production to increase sales volume, thereby, can offer more price support programs to stimulate consumer demand for green agricultural products.

Thirdly, businesses also need to promote commercial activities, green marketing activities, and pay more attention to distribution channels so that they are always available to consumers. For retail businesses, it is necessary to build a sustainable agricultural supply chain to link farmer households with the view to not only building large-scale specialized production to provide the market with clean food sources, but also creating a generation of advanced Vietnamese farmers and improving the value of Vietnamese agricultural products. Moreover, it is essential to coordinate with the local government to access information on financial support and technology transfer policies as well as guidelines for green and sustainable agriculture development.

SUSTAINABLE HUMAN RESOURCES MANAGEMENT, EMPLOYEE'S JOB PERFORMANCE: THE MEDIATING EFFECT OF PERCEIVED ORGANIZATIONAL SUPPORT

MA. Pham Van Thieu

thieupv.uls@gmail.com

*Faculty of Human Resource Management,
University of Labour and Social affairs, Hanoi, Vietnam*

Abstract

Businesses nowadays face intense competition and are forced to shift from traditional human resource management to sustainable human resource management to improve employee job performance. Based on a survey of 208 respondents, the author confirms that SHRM has a positive impact on employee job performance. Specifically, the study adds new insight by finding that POS plays a mediating role in the relationship between SHRM and employee job performance. Some solutions to improve employee job performance associated with SR-HRM and GHRM, POS have been proposed.

Keywords: *Sustainable human resource management, Employee's job performance, Perceived organizational support.*

1. Introduction

Amidst the intense competitive pressures of today, businesses are compelled to redesign their human resource management activities, including renewing and innovating their workforce, shifting from consumption to the development of sustainable human resources by integrating the concept of sustainability. Therefore, sustainable human resource management (SHRM) is viewed as a new approach to human resource management (Davidescu et al., 2020). Integrating sustainability into human resource management activities is still relatively new, therefore, the concept of sustainable human resource management still has many different perspectives. In general, sustainable human resource management can be understood as the application of human resource management strategies and practices that enable the achievement of financial, social, and ecological goals, with both internal and external impacts on the organization, over the long term, while controlling unintended negative impacts.” (Ehnert et al., 2016, p. 90).

Effective job performance of employees (JP) helps businesses achieve their planned goals and gain a competitive advantage (Sonnentag, S, 2003). Employee job performance is considered one of the most important factors influencing the success or failure of a business (Campbell, 1990). Therefore, this has been a topic that many scholars have researched over the years.

The textile and garment industry play an important role in Vietnam's economy. According to (Song Hà, 2022), the textile and garment industry contributed an export value

of \$40.4 billion in 2021, accounting for 5.2% of the global market share. In 2021, Vietnam ranked fourth among the top 10 exporting countries of textiles and garments (after China, the EU, and Bangladesh), providing employment for 2 million workers. Despite its significant contribution to the economy, the textile and garment industry is also a leading cause of environmental pollution.

Meanwhile, Vietnam's textile and garment import markets are becoming increasingly demanding in terms of products. Specifically, importers require companies to have a consciousness of environmental protection and to comply with social responsibility in the production process. To contribute to addressing the difficulties of the textile industry and practicing sustainable development, sustainable human resource management is one of the appropriate approaches. Many studies on the impact of sustainable human resource management on job performance have been conducted, but (1) no studies have examined the impact through the mediating role of Perceived organizational support (POS), and (2) the textile industry has not received corresponding attention.

For the reasons above, the author chose the textile industry to study the impact of sustainable human resource management on employee job performance, taking into account the mediating role of perceived organizational support. The study examines a typical case in a Vietnamese textile manufacturing company.

2. Literature review and Theoretical background

Blau (1964) explained the mechanism of reciprocal interaction between individuals in society through a theory called Social Exchange Theory. This theory suggests that social exchange involves a series of interactions that are interdependent and dependent on the actions of others. It also emphasizes that these interdependent interactions have the potential to create high-quality relationships, although we see this only in certain cases. Reciprocity is the foundation of social exchange, where parties in a relationship reciprocate to maximize their benefits (Phipps et al., 2013), and if employees receive what they perceive as fair treatment from their employer, they will respond by displaying more positive outcomes that benefit the organization (Y. W. Kim & Ko, 2014). In this study, the author argues that sustainable human resource management will bring many positive benefits to employees (fair treatment, recognition of value to the business, reward for environmental actions, etc.), and through perceiving positive organizational support, employees will try to reciprocate back to the organization. This reciprocation is reflected in the effort to improve work effectiveness.

2.1 Sustainable human resource management - SHRM

Sustainable human resource management is a relatively new concept, still in its early stages of research and reflects efforts to link sustainability with human resource management (Manzoor et al., 2019). It is a concept that many scholars support, stating that "sustainable human resource management involves applying human resource management strategies and practices that enable the achievement of financial, social, and ecological goals, with both internal and external impacts on the organization and over the long term, while controlling unwanted negative impacts" (Ehnert et al., 2016, p. 90).

Sustainable human resource management draws inspiration from the three-pillar model of sustainability, combining activities related to social responsibility and green human resource management (Ehnert et al., 2016). Socially responsible human resource management is the combination of a company's social responsibility and sustainable human resource management (Jie & John, 2016). According to Shen & Jiuhua Zhu (2011), socially responsible human resource management consists of three main components, including legal compliance human resource management (implying compliance with local laws and regulations related to human resource management, such as compliance with working hours, minimum wage, equal opportunities, etc.), employee-oriented human resource management (implying human resource management policies that satisfy both the needs of employees and their families), and green human resource management, which primarily involves influencing and encouraging green practices and actions among employees and contributing to the company's environmental certification through “greening” existing HR functions such as green recruitment, green training, and green rewards, ... (Renwick et al., 2013).

Sustainable HRM practices bring about innovation (progression or enhancement) (Salim et al., 2020). Sustainable HRM practices maximize profits for the organization while minimizing harmful negative impacts on employees, their families, and the community (Mariappanadar, 2003). Sustainable HRM practices lead to job involvement and therefore improve employee performance (Jeronimo et al., 2020, Manzoor et al., 2019).

Therefore, hypothesis 1 is:

H1: SHRM has a positive impact on employee job performance.

2.2. Perceived Organizational Support - POS

According to Rhoades & Eisenberger (2002), is an organizational perspective on employees. If the organization values the dedication and loyalty of employees as a form of commitment to the organization, employees in general also pay attention to how the organization commits to them. The authors also suggest three ways that are considered good and can enhance the organizational support that employees feel, including: 1) Fairness; 2) Supervisor support; and 3) Rewards from Organizational Benefits and Working Conditions.

The awareness of human resources leads to the extent to which organizations can appreciate the contributions made and pay attention to the welfare of human resources, known as POS (Rhoades & Eisenberger, 2002).

POS can be generated through various means, including the application of effective HRM practices (H.-H. Chiang et al., 2011) and when these practices are maintained by organizations, it sustains employees' positive perceptions of this support (Kim & Ko, 2014).

Sustainable HRM practices play an important role in establishing positive outcomes and ensuring that positive changes are reflected in employees' attitudes and reactions to their organization (Salim et al., 2020). For employees, sustainable HRM is a signal that the organization can act as a driving force to make their job more meaningful (Albrecht et al., 2015).

Therefore, hypothesis 2 is:

H2: SHRM has a positive impact on POS.

2.4. Job performance - JP

Employee job performance refers to the ability of employees to perform their job responsibilities in the most efficient and effective way possible to produce the best results (Anitha & Kumar, 2016). Currently, there are three common perspectives in research on employee job performance. The first perspective considers employee job performance as the entire individual output (represented by Şehitoğlu & Zehir's study), the second perspective considers it as the behavior (in the formal role) or completion of expected responsibilities in performing job tasks according to job descriptions (represented by Chan, Mak, Darsana), and the third perspective views employee job performance as behavior or effectiveness in both formal (job description) and informal roles, but with significant relevance to organizational job effectiveness (represented by Borman and Motowidlo's studies).

POS is one of the strengths that can influence employee behavior to improve employee performance (Ridwan et al., 2020). Many studies have also demonstrated that POS has a positive impact on employee job performance, such as those conducted by (Ragas et al., 2017; Ridwan et al., 2020).

Therefore, hypothesis 3 is:

H3: POS has a positive impact on JP.

In addition, based on social exchange theory by Blau (1964), when employees perceive support from the organization in the form of fair treatment and job recognition, it will lead to various positive outcomes such as increased commitment, loyalty, and job performance (DeConinck et al., 2018), this is because when employees perceive a certain level of support from the organization, they feel an obligation to reciprocate for the good treatment they have received by exhibiting more positively directed behavior (Kurtessis et al., 2017).

Therefore, hypothesis 4 is:

H4: POS plays a mediating role in the nexus between sustainable HRM and job performance.

Figure 1. Proposed research model by the authors

3. Method

The study was conducted using a quantitative method. Data was collected through a questionnaire using convenience sampling. The subjects were employees of a Vietnam-based limited liability company producing textile products. Data was collected in April 2023. A five-point Likert scale ranging from 1 (strongly disagree) to 5 (strongly agree) was used to measure all variables except for the demographic characteristics of the respondents. A total of 219 questionnaires were collected, of which 11 were invalid (respondents only chose one answer for all questions). According to Hair (2009), the minimum survey sample size can be obtained by multiplying the number of observed variables by 5. In this study, a total of 35 variables were used, so the minimum required sample size was 175 observations. Thus, a total of 208 valid questionnaires were collected. Among the 208 respondents, the proportion of male respondents was 13.94% and female respondents were 86.06%, while direct production workers accounted for 67.78% and indirect production workers accounted for 32.22%. The encoded data was analyzed using Smart PLS software version 4.0.8.5.

The scale of SHRM was adapted from Shen & Jiu-hua Zhu (2011), Sun et al., (2007) and Renwick et al., (2013). It is a multidimensional, second-order formative construct assessed via socially responsible HRM (SR-HRM) with three sub-constructs: perceived legal compliance HRM practices (five items); perceived employee-oriented HRM (five items); and perceived general CSR facilitation HRM (three items); green human resource management (GHRM) with three sub-constructs: green hiring, green training and involvement, and green performance management and compensation.

Job performance was measured using six items adapted from (C.-F. Chiang & Hsieh, 2012) and (Vu et al., 2022).

4. Results

4.1. Assessment of the measurement mode

The two-stage approach was used to process the second-order SHRM variable into first-order variables before analysis. According to Hair (2009), the overall reliability of the observed variables was evaluated using the composite reliability (CR) and the average variance extracted (AVE) of the variables. The reliability of the observed variables must have an outer loading coefficient greater than or equal to 0.708 to meet the reliability requirements (Hulland, 1999). The results are presented in Tables 1 and 2.

Table 1. Outer loadings SHRM

	EO	GF	GH	GPC	GT	LC
EO1	0.833					
EO2	0.686					
EO3	0.803					
EO4	0.763					

GF1	0.811
GF2	0.714
GF3	0.802
GH1	0.885
GH2	0.852
GPC1	0.802
GPC2	0.656
GPC3	0.738
GPC4	0.754
GPC5	0.794
GT1	0.786
GT2	0.728
GT3	0.72
GT4	0.777
LC1	0.677
LC2	0.846
LC3	0.801
LC4	0.742
LC5	0.779
LC6	0.769

The composite reliability coefficient should be greater than or equal to 0.5 to achieve overall reliability (Hulland, 1999).

Table 2. Composite reliability & Average variance extracted SHRM

	Cronbach's alpha	Composite reliability (rho_a)	Composite reliability (rho_c)	Average variance extracted (AVE)
EO	0.769	0.769	0.896	0.812
GF	0.699	0.7	0.869	0.769
GH	0.677	0.685	0.86	0.755
GPC	0.777	0.779	0.87	0.691
GT	0.64	0.642	0.847	0.735
LC	0.834	0.839	0.901	0.751

To assess the convergent validity of the measurement scale, Fornell và Larcker (1981) suggested that the average variance extracted (AVE) coefficient should be greater than or equal to 0.5. Table 2 demonstrates the appropriateness of the data.

After four rounds of data processing, the data has met the required standards. To assess discriminant validity, this study followed the approach proposed by Fornell and Larcker (1981). Table 3 revealed that the square root of AVE of each reflective construct is greater than its highest correlation with other constructs (Fornell & Larcker, 1981). Additionally, the HTMT values presented in Table 5 varied from 0.599 to 0.816, substantially below 0.85, demonstrating stronger support for discriminant validity (Henseler et al., 2009).

Stage 2 was processed similarly to Stage 1, and the measurement model's fit was assessed using the same criteria. The results are presented in Figure 2.

Figure 2. Measurement mode

4.2. Evaluating the measurement structural model and results of hypothesis testing

Testing for multicollinearity: When the VIF values are less than 5, there is no multicollinearity issue (Hair Jr et al., 2017). From Table 7, we can see that the model has no multicollinearity.

Table 7. Collinearity statistics VIF - Inner model

	JP	POS
JP		
POS	1.946	
SHRM	1.946	1

To test the hypotheses of the PLS structural model used in this study, three hypotheses with direct effects and one hypothesis with an indirect effect were proposed. A significance level of 5% was proposed as a basis for accepting or rejecting the hypotheses. Table 8 shows the direct effects, and we see that all hypotheses H1, H2, H3, and H4 are accepted.

Table 8. Path coefficients & Specific indirect effects

	Original sample (O)	Sample mean (M)	Standard deviation (STDEV)	T statistics ((O/STDEV))	P values
POS -> JP	0,184	0,175	0,058	3,192	0,001
SHRM -> JP	0,665	0,672	0,053	12,541	0,000
SHRM -> POS	0,697	0,701	0,041	16,838	0,000
SHRM -> POS -> JP	0,128	0,123	0,042	3,049	0,002

In summary, the path model results are presented in the diagram shown in Figure 3.

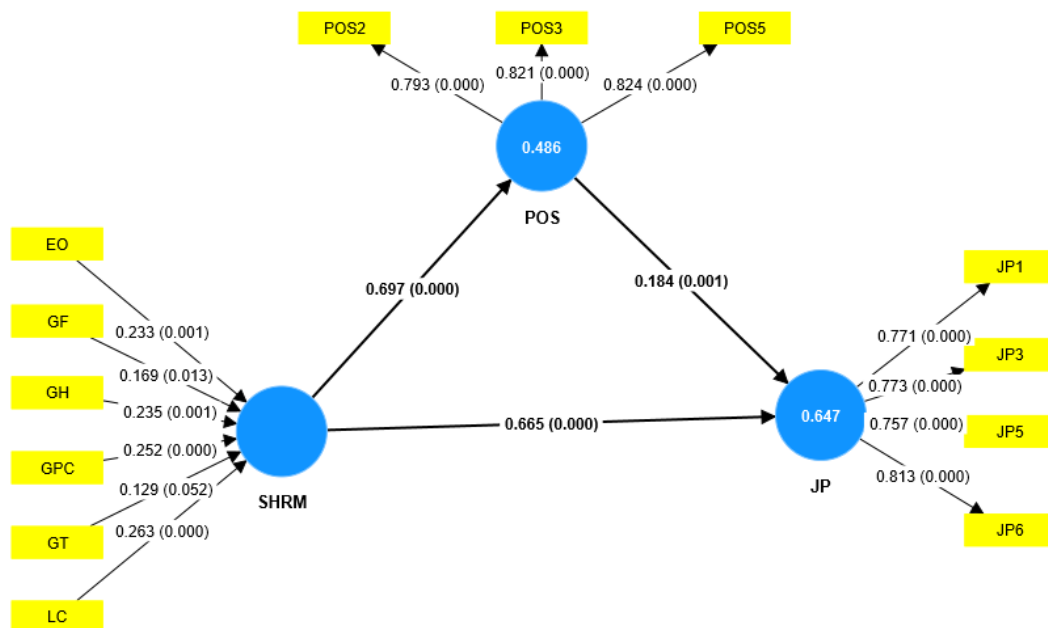

Figure 3. Research model results.

5. Discussion and conclusion

5.1. Discussion

The aim of this study was to analyze the impact of SHRM on employees' job performance, and to test the mediating role of POS, in the case of a Vietnamese garment manufacturing company. As there is no standardized measurement scale for SHRM (Manzoor et al., 2019), SHRM in this study is a second-order variable that combines SR-HRM and GHRM activities. The findings indicate that SHRM has a positive effect on employees' job performance, which is consistent with the results of Ragas et al. (2017), Manzoor et al. (2019), Almarzooqi et al. (2019); POS has a positive effect on job performance, which is consistent with (Muse & Stamper, 2007), (C.-F. Chiang & Hsieh, 2012), (Hafidhah & Martono, 2019). Particularly, this study contributes to the literature by revealing that SHRM has a positive effect on POS, and that POS mediates the relationship between SHRM and job performance.

The significance of the research results is that they support the call of Ehnert et al. (2016) for further research on the impact of sustainable human resource management. Additionally, the study also fills the research gap on sustainable human resource management in Vietnam in general, and the textile industry in particular. The findings of the study provide a scientific basis for textile companies to improve the effectiveness of employee work by integrating sustainability into their human resource management practices and enhancing the employee's POS.

5.2. Conclusion

This study investigated the impact of SHRM on JP, and the results confirmed that SHRM has a positive impact on both POS and JP, and POS is the mediator in the relationship between SHRM and JP. These findings reinforce the positive benefits of SHRM for businesses, provide a basis for improving JP, and offer a systematic approach for future research in this area. In particular, the study discovered the role of POS in the relationship between SHRM and JP.

Based on these findings, the author propose some recommendations that businesses can consider to improve JP, such as:

Firstly, strengthen the practice of SR-HRM through activities such as building and implementing flexible working hours to help employees achieve a balance between work and life. Continue to promote the positive role of trade unions in protecting the rights and legitimate interests of workers (policies should seek the opinions of trade union representatives, build and monitor the implementation of collective labor agreements, etc.).

Secondly, "greening" the functions of HRM. Integrate green criteria into job descriptions, use them as a basis for evaluating employee performance, and reward employees accordingly. To achieve this, organizations need to increase training on green awareness for their employees. The integration of green criteria into the performance evaluation and reward system for managers has a strong and effective impact, which is also

consistent with the practical role of managers who are responsible for the effectiveness of their department. Therefore, businesses need to research and implement "greening" in the evaluation of managerial performance.

Thirdly, actively listen to and care about employees' feedback. Recognize and appreciate employees' achievements, efforts, and loyalty to enhance their positive perception of the organization. To create a positive perception, businesses can focus on caring for employees' health; value and emphasize the goals and values of each employee; respect privacy and personal characteristics. When employees make mistakes, businesses should show empathy, share and forgive their mistakes.

Abstract

Sustainable development always has been the highest goal that all countries aim for. Particularly, in the context of increasing challenges such as natural resource depletion, environmental degradation, and climate change, moving towards sustainable development will also become more and more difficult. The circular economy (CE) model has been and is still being pursued by many countries, and is considered an effective solution to cope with these new challenges. However, the transition to a CE model requires breakthrough changes and fundamental innovation. These are the challenges for developing countries, including Vietnam, which is one of the most vulnerable and severely affected countries by climate change. The study examines the experiences of some countries preparing for the transition to CE model, compares them with the preparation process of Vietnam, thereby identifying the challenges of Vietnam on the way to the new model. The study also gives some suggestions to overcome and minimize barriers for Vietnam to soon transition to this new economic model.

Keywords: *circular economy (CE), circular business (CB), linear economy, sustainable development.*

1. Introduction

Circular economy is no longer a new term that has emerged from the ideas of material circulation in the agricultural industry in the 18th century (Schivelbusch W., 2015). However, it was not until 1990 that this model was fully defined and mentioned in the textbook of environmental and resource economics of Pearce and Turner (Ekins, P. et al., 2019). Pearce, D. and Turner, R.K. (1990) mentioned the contrast between the cyclical natural system and the linear economic system and introduced a new economic model based on the basic principle, that “Everything is an input into everything else”. This model is completely different from the view of the traditional economy. This new economic model, with the goal of connecting the end point (disposal/demolition of linear economy) with the starting point (exploitation of EC) to keep the material flow used as long as possible, to

restore and renewable products and materials at the end of each production or consumption cycle, helps to ensure the sustainable development of the global economy.

Reike, D. et al (2018) said that the model can be divided into three phases, which are: (i) period 1970-1990s: CE 1.0, focusing on waste treatment; (ii) 1990s-2010 period: CE 2.0, paying more attention on connecting inputs and outputs in strategies for ecological efficiency; and (iii) period from 2010: CE 3.0, maximizing value retention in the era of resource depletion.

Currently, CE has developed at many levels (micro, medium and macro) and at many different models. Many countries are continuously innovating, creating and taking actions/plans to develop this model thanks to its benefits. Although actions between countries are quite diverse, most of them focus on: (i) formulation of the Law/Strategy/Program/Plan for the development of CE; (ii) launching a campaign to educate the community's awareness, to change consumption behavior, especially starting from the government consumption behavior; (iii) focusing on effective waste management; and (iv) establishment of Funds to encourage the development of CE.

This study will focus on some key issues: (i) Definition of CE and its benefits; (ii) Preparation of some countries to switch to CE; (iii) Vietnam's challenges of transitioning to CE; (iv) Some recommendations for Vietnam; and (v) Conclusion.

2. Literature review

2.1. Some theories on CE model and challenges of countries when applying the CE model

2.1.1. Definitions of circular economy

CE is not an entirely new theory or a new tool. It has been developed from other already existing theories. Some scientists argued that the theoretical and empirical foundation of CE is mainly based on the theory of industrial ecology (such as Ghisellini et al., 2016; Preston, 2012; Ellen MacArthur Foundation, 2012; Chiu and Yong, 2004); some believed that CE is based on ecological economic theory (eg: Ghisellini et al., 2016; and Loiseau et al., 2016); or some stated that CE based on the theory of Cradle to Cradle (C2C) (eg: Sadhan, 2019); or even some scientists said that CE was in line with the main idea of a green economy (eg: Aurélien et al., 2018). Most scientists believe that CE is a tool for sustainable development. Emphasizing this idea, Bonciu, F. (2014) pointed out that sustainable development aims to solve emerging problems, not to go into the causes as CE is solving. In other words, sustainable development provides goals to be achieved in order to solve problems or consequences, while CE is a tool to solve some causes of problems.

It can be said that CE has recently developed into an independent academic field. The concept of CE is also interpreted quite differently among organizations and scientists. Below are some definitions of CE:

- Ellen MacArthur (2013): A CE is “an industrial system that is restorative or regenerative by intention and design. It replaces the ‘end-of-life’ concept with restoration,

shifts towards the use of renewable energy, eliminates the use of toxic chemicals, which impair reuse, and aims for the elimination of waste through the superior design of materials, products, systems, and, within this, business models”. In 2015, the Ellen MacArthur Foundation continued to give a new definition, which is “one that is restorative and regenerative by design and aims to keep products, components, and materials at their highest utility and value at all times, distinguishing between technical and biological cycles. This new economic model seeks to ultimately decouple global economic development from finite resource consumption. It enables key policy objectives such as generating economic growth, creating jobs, and reducing environmental impacts, including carbon emissions”.

- EC (2015): A CE is “an economy “where the value of products, materials and resources is maintained in the economy for as long as possible, and the generation of waste minimised”. The transition to a more circular economy would make “an essential contribution to the EU's efforts to develop a sustainable, low-carbon, resource-efficient and competitive economy”.

- UNIDO (2017): The CE is “a new way of creating value, and ultimately prosperity. It works by extending product lifespan through improved design and servicing, and relocating waste from the end of the supply chain to the beginning - in effect, using resources more efficiently by using them over and over, not only once”.

- Sadhan, K.G (2019) interpreted CE as “a systems-level approach to economic development and a paradigm shift from the traditional concept of linear economy model of extract-produce-consume-dispose-deplete to an elevated echelon of achieving zero waste by resource conservation through changed concept of design of production processes and materials selection for higher life cycle, conservation of all kinds of resources, material and/or energy recovery all through the processes, and at the end of the life cycle for a specific use of the product will be still fit to be utilised as the input materials to a new production process in the value chain with a close loop materials cycles that improves resource efficiency, resource productivity, benefit businesses and the society, creates employment opportunities and provides environmental sustainability”.

In sum, it is very difficult to determine which concept of CE would be the most perfect because most concepts fit very well in one way to another. However, over time, the concept of CE has gradually grown to be relatively broader and more complex than it was originally. In the early stages of the emergence of CE definition, the CE just stopped at the concept of pursuing the reduction and prevention of waste elimination. In recent years, the concept of CE is no longer only pursuing the reduction and prevention of waste elimination, but also finding new values of waste and discarded products to prolong the life cycle of waste and reuse of the product. Extending the life cycle and reuse of products can be accomplished through product design and/or education. Meanwhile, recycling can result in a huge loss of resources, energy and labor. CE concepts have recently inspired technological, organizational and social innovation across and within value chains (Venkatachalam Anbumozhi, 2016). In addition, the concepts of CE not only pay attention to environmental and economic aspects, but also focus more on social aspects, including creating jobs and protecting people's health.

2.1.2. The circular economy model

Studies on CE show that this is not a uniform model for the whole economy, but it includes different models. CE operates on the principle that “everything is an input to everything else”, meaning operating as a closed cycle. CE approach follows the principle of waste management, turning products/wastes at the end of the life cycle into resources/inputs for a new cycle or for others. With this philosophy, waste management models have been continuously expanded, from 3R, 4R, 5R, 6R, 9R, and in the future may be even more innovative and broad to more Rs. Such as:

The simplest model is the 3R model including: reduce, reuse and recycle. This model dates back to the 1970s when the US Congress passed the Resource Conservation and Recovery Act to strengthen recycling efforts as waste became an increasingly major issue in this country. The 4R model includes: reduce, reuse, recover and recycle. This model was introduced by the European Commission in November 2008 to improve the handling of rubber waste. The applied 5R model is quite diverse, which can include: (i) reduce, reuse, recycle, refuse and rethink; or (ii) refuse, reduce, reuse, repurpose and recycle; or (iii) refuse, reduce, reuse, recycle and repair. The 6R, 7R and 8R models offer a closed lifecycle system with more stages. For example, the 6R model created by the Food and Agriculture Organisation of the UN, including: refuse, redesign, reduce, reuse, recycle and recover. By 2017, the 9Rs model appeared.

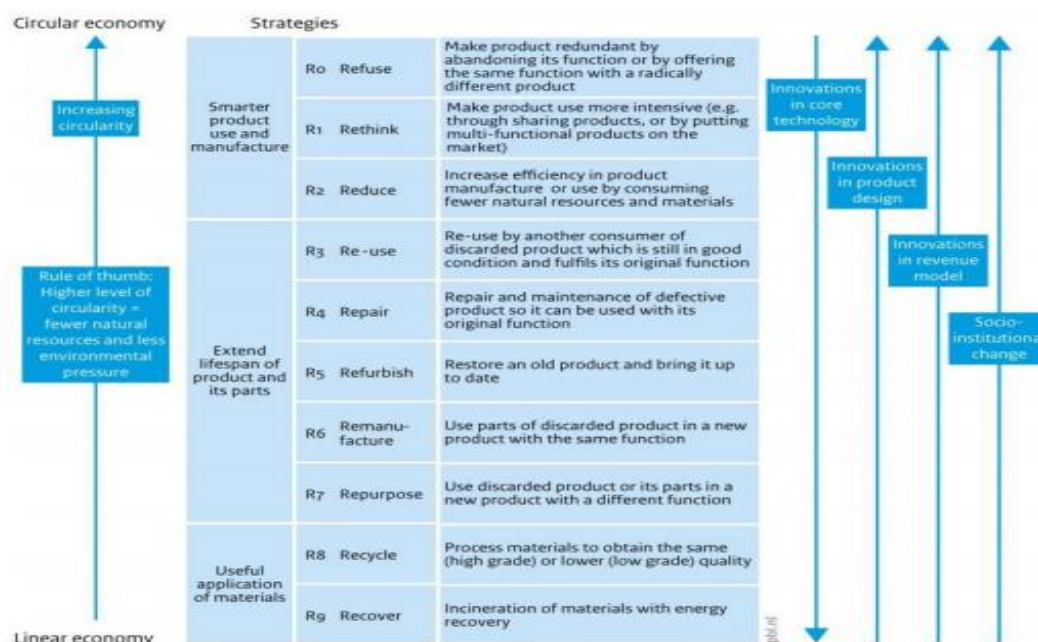

Figure 1. Model of CE in order of priority

Source: Potting et al. (2017), figure 1:5 (quoted from Ekins et al (2019))

Recently, Reike et al (2018) mentioned the 10R model, including: R0 (refuse); R1 (reduce); R2 (resell/reuse); R3 (repair); R4 (refurbish); R5 (remanufacturing); R6 (repurpose); R7 (recycle), R8 (recover); and R9 (Re-mine). According to Reike et al (2018),

R9 (re-mine) is the recovery of materials after the landfill or the extraction of valuable parts from discarded products. In developing countries, people try to make a living by collecting valuable materials and items from landfills. In developed countries, with a long history of controlled landfilling, entrepreneurs have recently begun to 're-exploit' valuable resources stored in old landfills and other waste plants, known as landfill mining or urban mining.

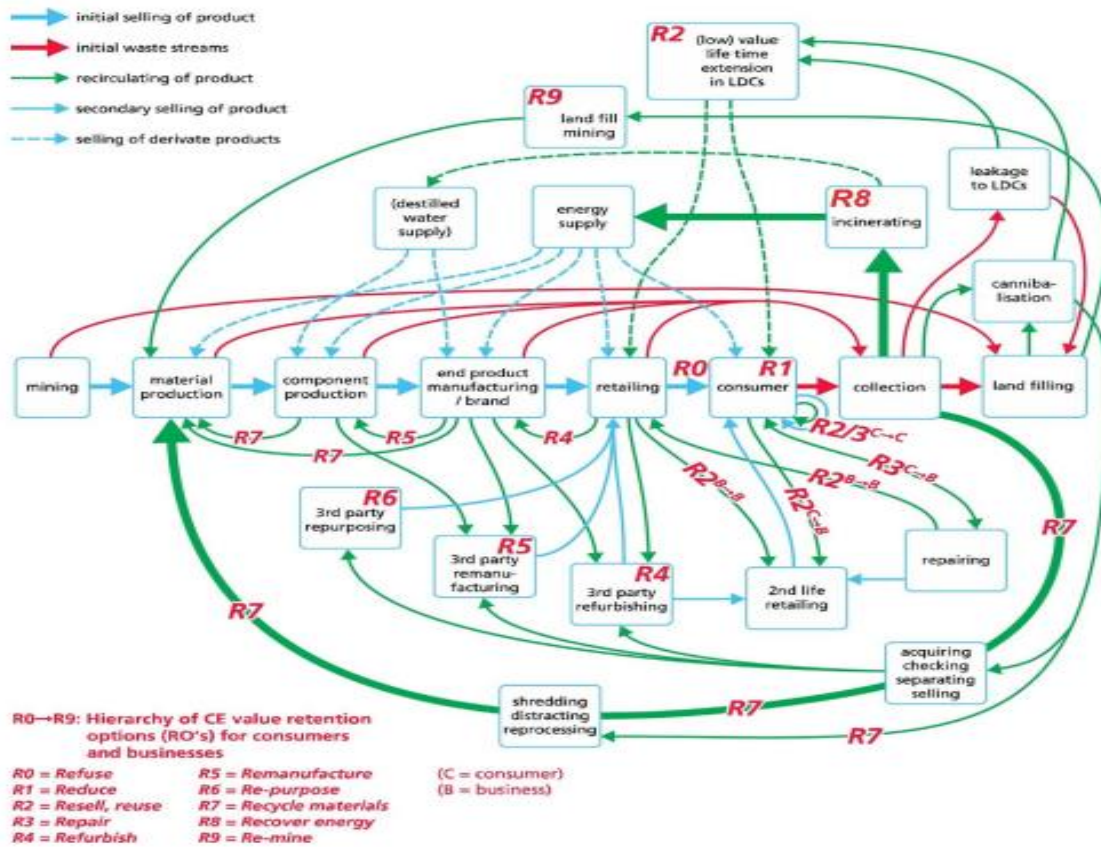

Figure 2. Mapping Circular Economy Retention

Source: Reike et al. (2018:13)

Overall, what connects these models together is the common goal of sustainable development, and in the long run eliminating waste from production and consumption. CE is based on the following basic principles: (i) maintenance and development of natural capital; (ii) optimizing the use of natural resources; and (iii) improving overall system performance. The maintenance and development of natural capital is ensured from the rational and efficient exploitation and use of natural resources, the regeneration of natural systems and the promotion of the use of renewable energy.

CE is still an inevitable trend that countries pursue in the context of increasingly degraded and depleted resources, polluted environment, and fierce climate change. Implementing CE model demonstrates the responsibility of countries in fulfilling their commitments on climate change, while improving the capacity and competitiveness of the economy as well as businesses and consumers.

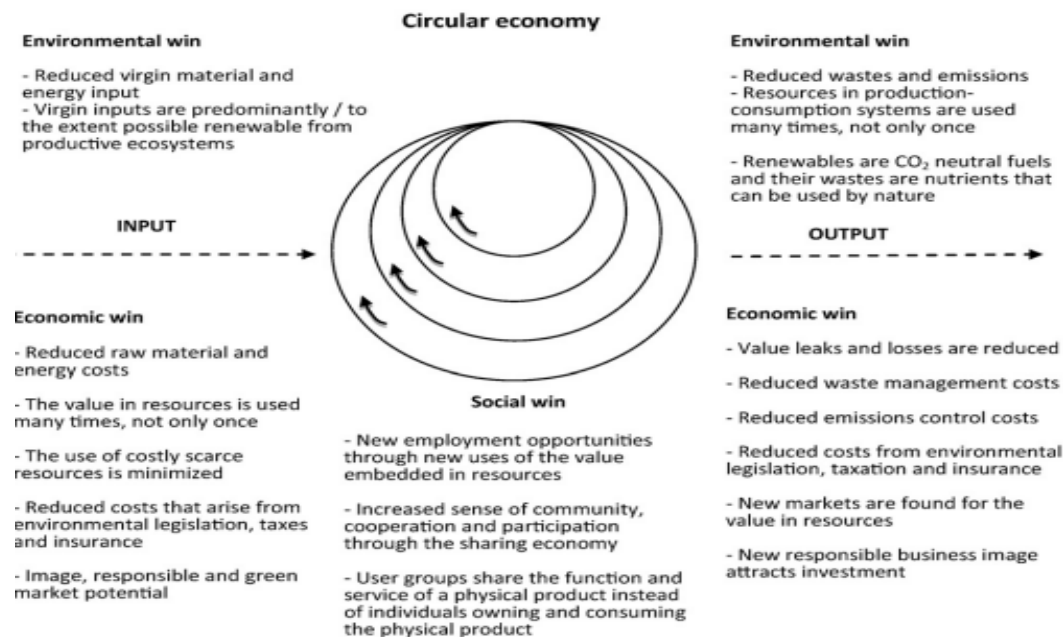

Figure 3. The win-win potential of circular economy

Source: Korhonen et al. (2018:40).

In addition to the benefits of CE models mentioned in Figure 3, the CE would reduce the social costs of managing environmental protection and responding to climate change, help to create new job opportunities and especially improve people's health. For businesses, the implementation of CE models also brings a lot of benefits, including reducing risks of resource scarcity crisis, creating motivation for investment, technological innovation, reducing production costs and increasing supply chain. Especially, today, countries are increasingly participating in joining global Agreements on environment, climate change, sustainable development and joining new generation free trade agreements. These Agreements have set out many regulations on waste and emission standards, on facilitation of circular goods and services and so on. For example, in order to support businesses to apply the CE model, the ASEAN Economic Community discussed and developed a CE framework, in which one of the strategic goals is to create an attractive ecosystem for circular goods and services through trade open and trade facilitation for circular goods and services.

2.1.3. The challenges of countries when applying circular economy model

In many countries, the implementation of CE model in practice has encountered a lot of barriers because CE requires breakthrough changes and fundamental innovations in management, production and consumption. Such as:

- Laura (2018) has identified three main barriers hindering the implementation of CE model in China, which are: (i) lack of educating customers about using recycled products. Some manufacturers have provided used clothing collection services for their recycling purposes, but customer response is very low due to the lack of information about the classification, recycling and reuse service; (ii) higher costs for recycle, especially polyester recycling; while the majority of customers are not ready to pay more for a recycled product with similar features; and (iii) lack of government support.

- Adding to Laura's study, Xue et al. (2010) also mentioned the China's difficulty, that is, although this is the country that provides the legal regulations to implement CE very early, the perception of staffs in the public agencies about CE is still different from their action. The awareness of the people and the community about CE is much more limited than that of officials. The survey in Tianjin (China) shows that, while the government sets ambitious goals in promoting CE, there is still limited public awareness of this model. The public does not have basic information about their role in the implementation of the government's policy on CE promotion.

- Mayer et al. (2019) argue that a CE is an economy that promotes the fundamental linkages between resource use, waste and emissions, and contributes to the integration of environmental policies (output-related) and economic (input-related). However, achieving environmental sustainability and transitioning from a linear economy to a CE is highly dependent on effective waste management and how waste is treated as a potential resources in the future. However, according to Elisabetta et al (2021), at present, the waste management towards CE is facing many barriers, which are: (i) inadequacies in the collection and processing of used materials due to high cost for collection and processing. Besides this, the amount of collected material may not be large enough; the price of material collection may fluctuate; and the raw material market may under-developed; (ii) businesses lack data and information to assess the benefits of circular business (CB) model; and (iii) businesses worry a lot about the fact that regulations between countries are quite different and can hinder work towards CE. Along with a lack of knowledge about CE, the administrative burdens of monitoring waste classification and recycling are also challenges. Finally, socio-cultural barriers, including the fact that organizations/enterprises participating in a closed cycle do not act equally towards CE; or there are cultural differences between organizations/enterprises, thus leading to lack of cooperation also hindering the development of CE. In addition, Cooper, T. (2013) shows that consumption in developed countries is often characterized by shorter use/ownership of product due to the influence of "discard" CE. To achieve the goal of CE, Cooper argues that it is necessary to reverse the consumption habits in these countries.

Recently, OECD research (2020) has identified 13 main barriers for countries to transition to CE model, in which the order of barriers is as follows: lack of financial resources (73% rated as large and very large); inadequate legal regulations (73%), financial risks (69%) and cultural and vision barriers (67%). These are the factors that have a great impact on the implementation of the transition to a CE that governments should pay attention to. In addition, inadequate awareness (63%), lack of human resources (61%), limited investment for CE (59%), incomplete information and inconsistent regulations (55%), lack of private sector participation (43%), lack of political will, and lack of technological solutions (39%) also have a significant impact on the adoption of CE model.

2.1.4. Preparation of some countries to transit to circular economy

Firstly, the development of CE is a process of continuous improvement in terms of mechanisms and policies. To ensure institutional adequacy at different levels (from product, business, consumer to industrial zones or more broadly, cities, regions, countries), many

countries have made great efforts in continuously promulgating and amending legal documents, especially ratifying Law on CE with regulations on technical standards, on encouragement of smart consumption, on promotion of appropriate technology transfer, knowledge transfer, etc. Recently, the British Standards Institute has issued “BS 8001: 2017 framework for implementing the principles of the CE in organizations” which is applied to businesses of all sectors and all scales that want to move to CE model (BSI, 2017).

Secondly, one of the key pillars of the CE is effective waste management. Therefore, many countries have paid great attention to this issue from the very beginning. For example, Germany has enacted a Law on Closed Cycle Management and Waste to provide a framework for implementing closed cycle waste management. England has introduced a Waste Prevention Programme, one of its key provisions is the introduction of an increasing annual landfill tax. The Netherlands has presented the Lansink scale for stratification in waste management methods. Japan has also enacted the Small Waste Electrical and Electronic Equipment Recycling Law; Singapore ratified the Zero Waste Master Plan; and so on. For waste management, in addition to promulgating regulations to encourage recycling (not only for producers but also for consumers), countries also promulgate regulations on strict penalties for violations in waste management. Most countries set a waste treatment fee on the principle of “the more you discharge, the more money you will have to pay”. The higher the fee for waste treatment, the higher the rate of landfilling will be reduced, and will help change the consumption habits and waste treatment of the whole society.

Thirdly, in many countries, in order to develop CE model in a synchronous and systematic way, in addition to amending, supplementing and perfecting the legal framework on environmental protection as well as encouraging more economical and sustainable production and consumption, countries have also developed their own Programs for development of CE. For instance, the Netherlands has adopted “A CE in the Netherlands by 2050”, or Germany has issued the “CE Initiative Deutschland”, or China has incorporated the CE model into the National Strategy and three consecutive periods of China's Five-Year Plan. The contents of these Programs are quite comprehensive, showing the vision, roadmap and focus on developing a number of priority sectors applying circular production in those countries. In addition, the roles and responsibilities of each relevant stakeholders are clearly divided, including: manufacturers, law enforcement agencies, local authorities, consumers and the community. Thus, the CE Programs have demonstrated the clear commitment of the Governments in implementing CE model.

Fourthly, Government itself is not only in the role of policy-making but also directly collaborates with other actors in the process of development of CE. For example, in 2014, the UK Government initiated the Public Procurement Programme, which revised the purchasing standards at the government level and introduced new regulations aimed at reusing furniture, purchasing items refurbished or easily reused, thereby acting as leverage for the development of CB models. The UK government has also established a “swap shop” to facilitate the reuse and exchange of items between government units. Similarly, in June 2016, the Government of Sweden released a National Procurement Strategy, which includes

rules for public procurement that are linked to the environment protection and how it works to ensure social sustainability (Sweden, 2017). Or, the Governments of some countries (such as the UK, Singapore,...) also play the role of a partner to connect stakeholders (leading experts, business representatives, associations, creative Funds,.....) together to discuss and find appropriate production methods and technologies to help business develop sustainably.

Fifthly, one of the major obstacles for businesses to switch to a CB model is financial issue. Understanding this issue, many countries have provided grants from the state budget for projects that have an impact on promoting CB model. For example, Germany has provided grants for collaborative projects during the period 2019-2022, focusing on innovative product design, or the UK launched the Waste Prevention Innovation Fund in 2013 to support waste prevention projects implemented in local communities. Hence, it is indispensable financial support policies from the Government to promote CB model, and these policies are mainly concentrated on creative design projects, recycling industry projects and waste prevention projects.

Finally, the role of business has always been considered as the key actor in promoting CE development. However, the role of consumers is equally important because production efficiency needs to go hand in hand with consumption efficiency. To achieve the goal of CE, it is necessary to reverse the habits of wasteful consumption. In Taiwan, right after the promulgation of the Waste Disposal Act, the Government launched a campaign to educate people about waste, whereby the campaign's message was “*people must cherish what they have in hand*”, helping people appreciate what they are using, thereby helping people to fundamentally change their consumption behavior. Sustainable consumption is also the driving force of sustainable production.

In sum, the steps to prepare for a CE in many countries are quite diverse and at many levels, with different outcomes. However, countries often approach the CE into two directions, which are: (i) widespread application of the CE with an important role of the state, forming the legal basis for CE development, and (ii) applying CE from bottom-up, practical activities, applicable to each product and business (Kalmykova, Y. et al., 2018).

3. Research methods and data sources

3.1. Research methods

To clarify the practical problems and challenges of CE, the study uses several qualitative methods. The study uses the desk-study method to systematize the research related to the topic. This study inherits some theories related to CE model; and uses descriptive statistics to understand the current situation towards the CE model in Vietnam; as well as using statistical and synthesis methods. In addition, the study uses comparative and contrasting analysis methods to highlight Vietnam's challenges on the way towards a CE model.

3.2. Data sources

The data in this study is secondary data collected from reliable researches and surveys. For example, using the CIEM (2020) survey conducted in 2022, with the scale of

interviews using a questionnaire of 508 enterprises operating mainly in the field of processing and manufacturing; and in-depth interviews with 40 businesses, experts, and leaders of relevant state agencies in Dong Nai, Hanoi, Nghe An, Thanh Hoa and Ho Chi Minh City. The purpose of CIEM's survey is to assess the level of understanding of Vietnamese enterprises about CB model; as well as the adequacy of legislation and government support for CB in Vietnam

3.3. Scope of Research

This study examines the current situation of Vietnam on the road towards a CE model at all three levels, namely the micro level (households, enterprises), the medium level (inter-enterprises, industrial parks) and the macro level (with the participation of the whole society, including production and consumption). The study mainly assesses the Vietnamese situation in the recent 05 years, and suggests solutions towards CE model in Vietnam in the next 5 years.

4. Results

4.1. Real situation towards circular economy model in Vietnam

After more than 35 years of Đổi Mới, Vietnam has risen to become a bright spot of growth with remarkable achievements in the region and in the world. However, Vietnam is facing many challenges in terms of resource depletion, pollution, environmental degradation and climate change. In Vietnam, the amount of plastic waste generated is about 1.83 million tons/year; the volume of daily-life solid waste generated is about more than 61,000 tons/day, of which up to 71% of the total waste volume (equivalent to 43 thousand tons/day) is treated by burial method. Many natural resources are currently severely depleted, typically coal. Vietnam has had to import coal since 2015, and it is forecasted that it may have to import up to 100 million tons of coal per year by 2030. In particular, Vietnam is among the most vulnerable countries to climate change. It is forecasted that climate change and natural disasters can cause losses up to 11% of Vietnam's GDP by 2030. Therefore, in order to implement the sustainable development goals and international commitments that Vietnam has signed, the country has implemented a number of approaches to CE, such as:

- At the enterprise and household level (micro level): the CE model is shown through activities of collecting and recycling metal, paper, plastic, etc., then moving to craft villages for recycling; or “garden - pond - barn - biogas” model (in delta provinces), “garden - pond - lake” (in central provinces) or “garden - forest - pond - barn” (mountainous provinces), gas collection from waste livestock production, cleaner production models in small and medium-scale industrial production (for example: food processing industry, steel production,...), or closed farm models. In general, these models have also initially approached to CB principal. However, at present, even corporations and enterprises, most of them just stop at applying the model of "reuse and recycle waste" (the approach towards “making full use of waste” is mainly). CIEM (2022) found that only 21% - 33% of surveyed entrepreneurs said they knew well or very well about one of the popular CB models, of which the "refurbish and reuse” had the highest rate of knowing, with a response rate of 33%. The proportion of enterprises that have never applied any form of CB model is 37.6%. The application from product design

to waste design (with the goal that when the product is discarded, it can be easily transferred to another purpose, or used in other production processes) in enterprises is still limited.

- At the inter-enterprise level, eco-industrial parks (medium level): In recent years, when awareness of environmental protection and climate change response has increased, Vietnam has formed new models towards CE and established wider CE networks, such as: “cleaner production” model; “production of by-products from aquaculture” model; Vietnam Packaging Recycling Alliance; Vietnam's global plastic Partner, or a pilot model of converting traditional industrial parks (IP) into ecological industrial ones in some localities (such as: Khanh Phu IP located in Ninh Binh Province, Khanh Hoa IP in Da Nang city, and Tra Noc 1&2 IP in Can Tho city. These models have been contributing to promoting the development of CE in Vietnam. Currently, only 06 IPs in Vietnam have been piloted for transition. This is a very modest number because at present, there are nearly 400 IPs established, of which nearly 300 parks have been put into operation with the occupancy rate reaching about 70% (Nguyen Hoa, 2021). The conversion to eco-industrial park model is still very limited and there are many obstacles in regulations on criteria of eco-industrial parks.

- At the social level (macro level): the model is still quite primitive and implemented under a number of Programs or Initiatives (such as: “Vietnam recycles” Program and “No Discharge to Nature” Initiative). The “Vietnam Recycles” is a program that collects and recycles obsolete or used electronic products free of charge for the purpose of ensuring a safe and eco-friendly e-waste recycling. This program was started in January 2015 by electronic manufacturers and is operating 10 free collection points, of which in Hanoi (05 points) and Ho Chi Minh City (05 points). In addition, “Vietnam Recycles” also organizes free home collection of e-waste.

Although many businesses have been implementing a part of the circular principal, so far, it seems that Vietnam still does not have a complete CE model. Compared to the CE model in the agricultural sector, the CE model in the industrial sector has only reached at the level of partial circularity in a production process or part of a product.

4.2. Vietnam's challenges of transitioning to circular economy

The road to CE model in many countries around the world has encountered many obstacles at different levels and at different times. Like many countries, the transition from a linear economy to CE in Vietnam also has faced many challenges, including huge barriers that need to be noted:

Firstly, the awareness of leaders, officials, civil servants, individual businesses and people about the characteristics and outstanding benefits of CE model is not always accurate and complete. In particular, in order to implement CE, right from the very beginning, people's awareness of sorting and cleaning waste before discarding or before putting it into reuse and recycling is still limited. People's consumption of some plastic products (plastic bags, plastic bottles, plastic packaging,...) has not been controlled. It is likely that sustainable consumption habits, in which using durable value products instead of one-time products only appear in a very small part of society. Meanwhile, the propaganda to enhance the

understanding of CE has not been focused. In addition, the awareness and consumption habits of Vietnamese people towards environmentally friendly products and services, "green" and "organic" products or products manufactured under CE model remain limited.

Secondly, the institutional framework for the development of CE is not yet complete and there is a lack of policies to encourage businesses to transit to CE model. The evidence is that, according to enterprises' assessment of the adequacy of the CE policy (conducted by CIEM, 2022), about 80% believe that Vietnam already has guidelines, policies and legal regulations on CE under varying degrees of completeness. However, only 9% - 10% think that the guidelines, policies on CE/CB are adequate; 18% - 20% think that there are no guidelines, policies on CE/CB; and 36% - 43% of surveyed enterprises think that guidelines, policies on CE/CB are still lacking. In addition, the proportion of enterprises receiving one of the forms of support from the Government, such as: credit, interest rate, science and technology, training, market information, production premises is quite low, accounting for only 2% to 15% depending on the form of support. Support for "production and business premises for the production line applying the BA model" is the group with the lowest rate of support (only 2%), while the support group on "training" has the highest (accounting for 15%).

Thirdly, the development of CE requires investment resources and continuous technological innovation. Meanwhile, Vietnam is a developing country, and most of the technology is only average level and even backward, and the production scale is small. Due to difficulties in investment resources and technology, the waste recycling industry has not yet fully formed. Currently, there is no suitable technology to turn solid waste into resources and input materials for other products, such as: generating energy, creating organic fertilizers, creating new functional materials, etc. Therefore, although Vietnam has a very large amount of domestic solid waste, generating about 25.5 million tons/year, of which urban is generated about 38 thousand tons/day and rural area is about 32 thousand tons/day. The volume of daily-life solid waste in urban areas across the country increases by an average of 10-16%/year (Ha An, 2019), but the ability to collect and reuse is not sufficient, especially that Vietnam has not yet implemented waste classification from source.

With a small production scale, it will be difficult for an enterprise to fully operate a large closed production process on its own, or to fully operate CB model. The cooperation between many small and medium-sized enterprises (SMEs) would bring competitive advantages to each enterprise and form an effective CE model. However, in Vietnam, the cooperation between SMEs is still very weak, even in many cases, enterprises compete unfairly with each other.

Fourthly, high-quality human resources are still lacking. The CE model requires scientific and technological innovation, creative ideas, and access to advanced technology. This means that it is necessary to have a large number of experts, a good and dynamic research team, who clearly grasp the production characteristics from the beginning to the end of production process. Meanwhile, human resources for science and technology are considered as one of the major challenges in Vietnam. According to statistics in 2021, the

percentage of trained workers remain low, reaches 66%, of which the percentage of trained workers with degrees and certificates is only reached 26.1% (Hong Minh, 2022). The low rate of trained workers with degrees and certificates also affects the application of high science and technology to production activities. In addition, state agencies at central and local levels have been implementing solutions mentioned in national strategies (National Strategy on Responding to Climate Change, Vietnam Sustainable Development Strategy, Green Growth Strategy, etc) and in many cases, the implementation of solutions with both technical and financial support from international organizations, or NGOs. Therefore, the fact that the implementation of solutions towards sustainable development and CE has not yet come from the endogenous capacity of state agencies. CE also requires public managers and officials with technical and information technology knowledge and innovative ideas.

5. Discussion and Conclusion

5.1. Some recommendations for Vietnam

Firstly, it is very necessary to further promote the propaganda about the benefits of CE to people's health and quality of life to leaders, civil servants, managers, workers and people to build a general consensus of the whole society. If policy makers are unknowledgeable about CE, there would be no well-designed policy on CE. If the citizen does not understand the long-term benefits of CE, it would be able to change sustainable consumption behaviour, as well as create pressure and motivation for businesses to change production behaviour. Finally, if businesses do not understand the trend of CE development, they will also be gradually excluded from the game due to increasing consumer demand and increasing technical standards towards CE. Hence, from the very beginning, all stakeholders need to be involved right from the design of CE policy to the implementation in each sector of the economy.

Secondly, the transition from a linear economy to a CE is considered an inevitable path in the context of achieving the goals of sustainable development and climate change response in Vietnam. In order to develop CE, Vietnam needs to soon formulate a Law on CE to avoid the common phenomenon that policies on the same issue are regulated in many separate legal documents. Law on CE is being applied by many countries (such as Germany, Netherlands, Japan, China,...). This Law helps to grasp the regulations on CE systematically and synchronously, including regulations related to many important stages of CE model, that is: design, production, consumption, waste management and turning waste into a resource, etc.

So far, Vietnam has not paid more attention to assessing the development level of CB models that are being encouraged to be implemented in practice, so it has not yet issued specific action plans or solutions to expand successful CB models. Meanwhile, Vietnam has come up with many Strategies with objectives and orientations for each Strategy; and in many cases there has been an overlap and even conflict of objectives between the Strategies. This also causes confusion when implementing those Strategies. Therefore, Vietnam needs to speed up the progress of formulating a comprehensive national action Plan for CE model for the next 10 or 20 years, which includes strong incentive for enterprises to proactively and confidently transit into a CB model.

Thirdly, people are always considered as a center to implement CE. Therefore, each individual skills and knowledge will be the key factors in the process of implementing the CE model. Therefore, it is necessary to develop training programs and courses on new economic models (CE, digital economy, sharing economy, etc). Subjects on ecological economics, green growth, cleaner production, clean technology, sustainable development, environmental industry, protection of ecosystems and biodiversity,... need to be included into all levels of national education system. The provision of basic knowledge about CE should be included in the curriculum even at the primary school. Besides, Vietnam also needs to invest more in science and technology.

Fourthly, to have a more comprehensive and broader policy on CE, it is also necessary to have a more comprehensive concept of CE from the very beginning. Currently, the concept of CE has been officially mentioned in Article 142 of the Law on Environmental Protection 2020. Accordingly, CE is “*an economic model in which the design, production, consumption and service activities aim to reduce the exploitation of raw materials, prolong the product life cycle, limit waste generation and minimize the negative impact on the environment*”. However, this definition has not yet fully expressed the requirements of sustainable development. Because: (i) this definition only refers to 04 activities of the CE model (including: design, production, consumption and service activities) which is incomplete; (ii) this definition only emphasizes on reducing the exploitation of raw materials, prolonging the life cycle of products, but does not cover some very basic features of CE, which are: improve the use of energy in a sustainable way through saving energy, using renewable energy to replace fossil energy; or change consumption behavior towards a more sustainable way through minimizing demand for goods, increasing shared consumption, eliminating the consumption of non-environmentally friendly products, toxic chemicals; or focus on sustainable exploitation and use of all resources. The fact shows that it is very difficult to achieve sustainable production without going hand in hand with sustainable consumption; and (iii) this definition emphasizes the benefits of CE from an environmental perspective, while economic and social benefits have not yet been mentioned. Both theory and practice show that the CE model brings not only the benefits of “reducing waste generation and minimizing adverse impacts on the environment”, but also benefits for businesses and society through creating job, improving productivity and income for workers. Thus, it is possible to consider adjusting the definition of CE, whereby in the next period the CE in Vietnam can be defined as follows: “*is an economic model that promotes innovation, optimization of close production through resource extraction and conservation, design, maintenance, repair, reuse, remanufacturing, restoration and refurbishment, recycling and prolonging the product life cycle. CE creates a society that develops in balance with nature by: maximizing the values of production inputs, minimizing waste, increasing efficiency and efficient use of resources, creating durable products, recycling, reusing products*”.

5.2. Conclusion

In Vietnam, sustainable development has long been considered a national priority. Vietnam is currently ranked as one of the five countries most vulnerable to climate change. There is a lot of evidence that climate change has caused great economic damage to Vietnam.

For example, climate change and natural disasters have caused a loss of 5% of Vietnam's GDP (in 2010), and this number could reach 11% by 2030 if Vietnam does not have effective solutions to solve the problem (DARA, 2012). Similarly, the World Bank has made a forecast that climate change could affect 1.5% of Vietnam's GDP from now to 2050. Therefore, encouraging the development of CE is one of the priority and urgent tasks that Vietnam chooses to develop the country's socio-economic in the next 10 years.

RESEARCH OF FACTORS AFFECTING EMPLOYER BRAND IN SMALL AND MEDIUM ENTERPRISES IN DONG THAP PROVINCE

Dr. Nguyen Giac Tri

ngtri@dthu.edu.vn

Faculty of Economics, Dong Thap University, Vietnam

Abstract

The study aims to examine the impact of factors affecting employer brand in small and medium enterprises in Dong Thap province. Research results show that: 5 factors have a positive impact on employer brand; in which the compensation policy has the greatest impact, followed by the co-worker relationship, the interestingness of the job and the opportunity to apply knowledge, and finally, the opportunity for career development.

Keywords: *small and medium enterprises, employer brand, Dong Thap province.*

1. Introduction

Recruiting and retaining talent has become one of the solutions to create competitive advantages of enterprises. To attract employees, employers have used some principles of brand management applied in the field of human resource management. The use of the principle of brand management in human resource management has formed the term employer branding. More and more businesses are using their resources to invest in employer brand development campaigns because of the benefits it brings. Employer branding has become a prominent topic of interest in the field of human resource management.

Dong Thap province has great potential for development in the fields of industry, commerce, services, agriculture and fisheries. Those advantages have created favorable conditions for small and medium enterprises to form and develop. According to the Dong Thap Statistics Department, by the end of 2022, Dong Thap province has nearly 3,000 small and medium enterprises, accounting for about 97% of the total number of businesses operating in the province. The small and medium-sized enterprise sector contributes to the province's GDP on average about 70% per year and handles 51.0% of the labor force in the enterprise sector in general. In recent years, small and medium enterprises in the province are tending to develop well. However, that development is not really commensurate with the role of the province. In general, small and medium-sized enterprises still have difficulties that small and medium-sized enterprises face in human resource management because of their sizes, financial ability and the attractiveness of the brand, etc., especially for businesses doing business in the field of services and retail trade.

Therefore, in this study, the author chooses to study the factors affecting the employer brand of small and medium-sized enterprises in Dong Thap province with the aim of identifying and measuring the level of influence on the employer brand. The influence of these factors serves as the basis for businesses in the field of services and retail trade in Dong Thap province to have appropriate solutions to build employer brands in the future.

2. Literature review and Theoretical basic

2.1. Literature review

Around the world, a lot of research has been done regarding the employer brand of the business. Research by Reis, G & Braga, B.M (2016) said that there are 5 factors affecting employer brand including: interestingness at work; relationships with colleagues; remuneration policy; career development opportunities; opportunity to apply knowledge. According to Hillebrandt and Ivens (2018), there are 12 factors affecting employer brand, including: culture and communication; teamwork spirit; assigned tasks; international environment and career opportunities; remuneration policy; business reputation; work-life balance; training and developing; diversity of work; client; autonomy; corporate social responsibility. Research by Berthon et al (2005) considers employer brand as the benefits from the employer that a candidate gets if they work for the business. With this definition, the authors considered employer branding in favor of benefits. This study also shows that there are 25 observed variables corresponding to 5 factors affecting employer brand including: interestingness at work; relationships with colleagues; remuneration policy; career development opportunities; opportunity to apply knowledge. In addition, the study of Schlager et al (2011) divides employer brand into employer brand perceived by employees in the enterprise and employer brand expectation towards potential candidates. Employer branding includes both internal and external branding, which is an organic integration of internal and external brands. External branding means establishing brand awareness among prospective employees and building a good image of the business to encourage and attract candidates (future employees). In return, internal branding is the image established by the business, which, according to current employees, is closely related to retaining and stimulating potential employees. Enterprises as employers need to develop value systems, company policies, and activities to attract, motivate, and retain current and future employees (Dell et al. Ainspan, 2011).

In Vietnam, the research situation related to the topic of employer brand of enterprises. Research by Nguyen Thi Anh (2016) identifies factors affecting employer brand, determines the level of impact on each factor to the employer brand at information technology enterprises in the Ho Chi Minh City. This study has shown that there are 5 factors affecting employer brand here, including: interestingness at work; relationships with colleagues; remuneration policy; career development opportunities; opportunity to apply knowledge. In addition, in the study of Truong Ngoc Tien (2018), the influence of employer brand experience on employees' intention to quit through the emotional commitment factor - the case of Joint Stock Commercial Banks in Ho Chi Minh City. This study aims to examine the relationship between employees' employer brand experience and emotional commitment, between emotional commitment and employees' intention to quit.

In the study, the author has built a research model from 01 employer experience factor including 3 components, 1 factor of intention to leave and 01 factor of emotional commitment. The research results show that the employer brand experience factor has a direct positive impact on employees' emotional commitment: the higher the employer brand experience and

the employee's emotional commitment, the higher the employee's emotional commitment. the lower the employee's intention to leave. Besides, the emotional commitment of employees to the employer brand has a direct negative impact on the employee's intention to quit. Research by Nguyen Minh Nhut (2016), a study on the influence of employer brand on employees' intention to choose a workplace: a case study at e-commerce enterprises in Ho Chi Minh City. The study aims to examine the impact of the components in the model and the impact of qualitative variables on the intention to choose a workplace of employees.

The results show that 3 factors: reputation, attractive salary and social responsibility are the main factors affecting the intention to choose a workplace of employees; The other two factors, working environment and training and development, have little influence in this study. The study makes recommendations to help businesses increase their attractiveness to employees. Research by Le Tan Dat (2016), research on the topic of improving employer brand image of Ba Sau Nam Group. Based on Lievens & Highhouse (2003)'s conceptual - symbolic framework model, the factors affecting employer brand image are divided into two groups of functional attributes and symbolic attributes. combined with a number of theories and previous research related to building employer brand image. The results of the study show that in order to successfully build an employer brand image, the company needs to improve the factors of salary, bonus, travel, and reputation.

2.2. Theoretical basic

2.2.1. Overview of employer brand

Brand - as defined by the World Intellectual Property Organization (WIPO): is one or a set of signs (tangible and intangible) to identify and distinguish a product, a business or it is an image of a product or business in the minds of customers and the public. Employer Branding is the image of a business from the perspective of a “workplace” in the eyes of current and future employees (Schlager et al. (2011). Employer branding is not what the business advertises itself, but the image perceived by its target audience (both employees and external talent). A “healthy” employer brand is a employer brand that is positively perceived by both internal employees and external target talent. In this study, employer brand is understood from the point of view of Schlager et al. (2011) and the study also focuses on analysis and evaluation. about employer brand from the perception of employees who are working in the business (not studied from the perspective of potential candidates).

2.2.2. Factors affecting employer brand

Relationships with colleagues: reflected in the fun, happy working environment, good co-worker relationships and teamwork atmosphere (Berthon et al., 2005; Hillebrandt and Ivens (Berthon et al., 2005; Hillebrandt and Ivens). 2011)). Potential candidates can perceive the degree of co-worker relationship in an enterprise through the recruitment process (Backhaus and Tikoo, 2004). Colleague relationships refer to the work environment and relationships with other employees (Sivertzen et al., 2013). Relationships with colleagues including relationships between an employee with other colleagues and with superiors; relationships among employees in the enterprise in general (Berthon et al., 2005).

Interest in work: includes diverse, rich and wide-ranging work; transformative work; creativity and enjoyment in products and services (Hillebrandt and Ivens (2011). Nguyen Thi Anh (2016) also pointed out that the interesting things at work include: interesting working environment, opportunities to access new technology, the company promotes the creativity of employees, professional staff. Karma.

Remuneration policy: reflected in salary, bonuses, job security and promotion opportunities (Berthon et al., 2005). Remuneration policy is related to economic benefits (Sivertzen et al., 2013). Remuneration policy is a factor mentioned in most of the studies including both quantitative and qualitative factors affecting employer brand.

Opportunities for knowledge application: Candidates will feel happy when their knowledge and skills have the opportunity to be communicated, shared with others and widely accepted. According to Berthon et al., 2005), the requirements of employees about having opportunities to apply what they have learned in their work and opportunities to impart and share their knowledge with others. others.

Opportunities for career development: is the factor that an individual is attracted to by an employer that provides recognition, recognition of contributions, dedication and creates opportunities for future career development. Research by Berthon et al (2005) said that candidates expect the company to bring attractive future income or have a salary that is highly competitive compared to other companies in the same field.

2.3. Research models

In this study, the proposed research model is inherited by the author based on the research of Berthon et al (2005); Hillebrandt and Ivens (2011) and some other research models on the factors affecting employer brand of small and medium enterprises, the author proposes a research model as presented in (Figure).

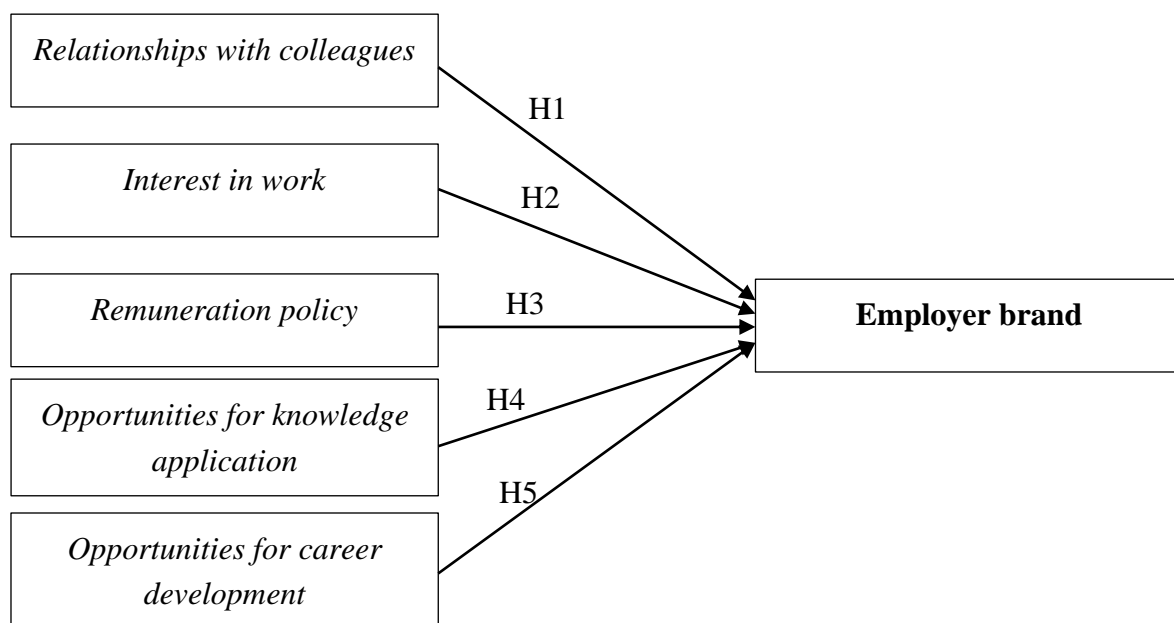

Figure 1. Proposed research model

The general function of the model has form: $Y = f(X_1, X_2, X_3, X_4, X_5, X_6)$

In there:

X1: *Relationships with colleagues* (QH)

X2: *Interest in work* (TV)

X3: *Remuneration policy* (ĐN)

X4: *Opportunities for knowledge application* (KT)

X5: *Opportunities for career development* (NN)

Y: *Employer brand of small and medium enterprises*

Research hypothesis:

- H1: Colleague relationship has a positive impact on employer brand.
- H2: Interest in work has a positive impact on employer brand.
- H3: Remuneration policy has a positive impact on employer brand.
- H4: Opportunity to apply knowledge has a positive impact on employer brand.
- H5: Career development opportunities have a positive impact on employer brand.

3. Method

3.1. Scale development

In this study, the scale for concepts in the research model is based on inheritance and correction from previous studies. Specifically, factor (1) Relationship with colleagues has 5 observed variables; factor (2) Interest in work has 5 observed variables; Factor (3) Remuneration policy has 5 observed variables; factor (4) Opportunity to apply knowledge has 5 observed variables. Factor (5) Opportunity for career development has 5 observed variables; (6) Employer brand has 4 observed variables. All observed variables measuring research concepts are assessed using a 5-point Likert scale ranging from 1 (Strongly disagree) to 5 (Strongly agree).

3.2. Research stages

3.2.1. Qualitative research

At the stage of qualitative research to determine the factors affecting the employer brand of small and medium enterprises in Dong Thap province. In which, qualitative research is carried out with the use of interview method to adjust influencing factors and measuring scale for influencing factors to suit the research context in small and medium enterprises in Dong Thap province. The author uses the target group discussion technique. Specifically: the author uses convenient sampling method, selects 07 new employees recruited in the last 5 years and 05 heads of human resources of 05 businesses in the retail sector in the area of Dong Thap Province. This research phase aims to adjust the terms used

in the scale and add observed variables to the scale for the concepts in the research model and verify the theoretical bases in the model before official researching.

3.2.2. Quantitative research

Quantitative research through survey questionnaires via google.doc and emailed to respondents. Samples were selected by convenience sampling method. The main subjects of the survey are newly recruited workers in the last 5 years from small and medium enterprises in the service and retail trade in Dong Thap province. The survey period is from October 2022 to December 2022, the sample size is expected to be 425.

3.3. Data processing method

(1) Descriptive statistics method to analyze the current state of recruitment brand of small and medium enterprises in the survey sample, as well as general information about enterprises.

(2) Testing the scale: Using Cronbach's Alpha coefficient to evaluate the quality of the construction scale. The scale is evaluated as good quality when: (1) Cronbach's Alpha coefficient of the population is greater than 0.6; and (2) The correlation coefficient - the sum of the observed variables is greater than 0.3 (Corrected Item - Total Corelation) (Nunnally & Bernstein, 1994).

(3) Exploratory factor analysis (EFA): Helps to extract factors for further analysis. Factor loading coefficients are the criterion to ensure the practical significance of EFA. This coefficient greater than 0.3 is considered the minimum level, greater than 0.4 is considered important, greater than 0.5 is considered to be of practical significance (Hair et al., 1998). In this study, in order to improve the practicality and reliability of the research results, the author only selects the factors with the transfer coefficient greater than 0.5, the Kaiser-Mayer-Olkin (KMO) has a high value. large value (between 0.5 and 1) and the total variance extracted is greater than 0.5 to ensure the explanatory content of the factors obtained from the results of EFA analysis.

(4) Logistic regression model analysis method to analyze the factors affecting recruitment brand of small and medium enterprises.

4. Results

4.1. Research sample information

After conducting the interviews and evaluating the quality of the questionnaires, the results showed that 375 votes were entered into SPSS 22 software, using SPSS tools such as checking the validity of the data, checking the validity of the data. check empty data to clean the data. After data cleaning, 50 invalid answer sheets were eliminated. Thus, the data of 325 enterprises' answer sheets will be used in the next analysis. Specifically, information about the research sample (n = 325) is presented in Table 1.

Table 2. Research sample information (n = 325)

Characteristic		Frequency	Percentage
Size	Small enterprise	198	51%
	Medium enterprise	192	49%
Field	Retails trade	135	34%
	Service	255	66%
Working time	From 1 year to under 2 year	25	6%
	From 2 year to under 3 year	28	7%
	From 3 year to under 4 year		
	From 4 year to 5 year	337	87%
Sex	male	250	65%
	female	140	35%
Age	Under 25 years old		
	Under 35 years old		
	36 - 45 years old		
	From 46 years old		

Source: The author's data collection and analysis results

4.2. Testing the scale through Cronbach's Alpha coefficient

The results of the reliability analysis show that the Cronbach's Alpha coefficients of all the scales have values above 0.70. The lowest is the Scale of Career Development Opportunities ($\alpha=0.71$), the highest is the Employer Brand Scale ($\alpha=0.85$), the standard scale when the alpha reliability is 0.70 or higher ($\alpha \geq 0.7$). The analysis results of the correlation coefficients - total correlation (itemtotal correlation) less than 0.3 will be rejected, quite closely between the observed variables. After testing Cronbach's Alpha coefficient, the remaining 27 observed variables, the unqualified and excluded variables are KT04 and KT05 (Table 2).

Table 2. Preliminary assessment results of the reliability of the scales

Scale	Encode	Cronbach's's Alpha
<i>1. Relationships with colleagues</i>	QH	0,78
<i>2. Interest in work</i>	TV	0,83
<i>3. Remuneration policy</i>	DN	0,80
<i>4. Opportunities for knowledge application</i>	KT	0,84
<i>5. Opportunities for career development</i>	NN	0,71
<i>6. Employer brand of small and medium enterprises</i>	TH	0,85

Source: The author' data processing result

4.3. EFA analysis

EFA analysis for 5 groups of factors affecting employer brand of small and medium enterprises includes 27 observed variables, after removing the variable KT02 does not meet Cronbach's Alpha reliability. The results of the first factor analysis showed that the variables were extracted into 5 groups, with the total variance extracted was 61.15% > 50%, the scale was accepted. KMO coefficient = 0.783 is in the range of $0.5 \leq KMO \leq 1$, factor analysis is appropriate. Bartlett test with Sig. = .000, representing a high level of significance. All Factor loading values of each group are greater than 0.5; except that the observed variable KT03 = 0.40 is less than 0.5 and appears in two factors (factors 1 and 5), so this variable will be excluded.

For better factor analysis results, the author conducts the second factor analysis after removing the variable KT03. The results of the second factor analysis showed that the variables were extracted into 5 groups, with the total variance extracted = 64.25% > 50%, the scale was accepted. KMO coefficient = 0.86 is in the range of $0.5 \leq KMO \leq 1$, factor analysis is appropriate. Bartlett test with Sig.= 000, showing high significance. All the Factor loading values of the observed variables are greater than 0.5; weight difference $\lambda_iA - \lambda_iB$ are all greater than 0.3, so they are accepted (Nguyen Dinh Tho, 2011). Therefore, the results of this factor analysis are accepted for inclusion in the official survey.

4.4. Logistic regression model analysis results of factors affecting business performance of small and medium enterprises

Regression results (Table 3) show that, R value = 0.754, which means that the relationship between the variables in the model is quite close. The value $R^2 = 0.570$ shows the fit of the model, the adjusted R^2 coefficient is 0.579 (which explains 5 factors that have an impact on 57.9% of the employer brand of small and medium-sized enterprises) and tests F with an F value of 69,615 at the Sig level of significance. very small = .000. The results of the evaluation of the above R^2 value show that the built linear regression model is appropriate. However, to be able to infer this model into a model of the population, we need to conduct an F-test through analysis of variance.

Table 3. Summary of regression coefficients

Model	R	R^2	R^2 adjusted	Standard deviation of the estimate	Change analysis					Durbin-Watson
					R^2 change	F change	df1	df2	Level of significance F change	
1	0,754	0,570	0,579	0,66319991	0,570	46.577	6	367	0,000	2.145

Source: Results from the author's survey data processing

According to the results of analysis of variance (ANOVA) in Table 4, Sig.= 0.000 < 0.01. Thus, the model of factors affecting employer brand of small and medium enterprises is consistent with actual research data. In other words, the independent variables are linearly related to the dependent variables with a 99% confidence level.

Table 4. Analysis of Variance (ANOVA)

	Model	Sum of squares	df	Mean square	F	Sig.
1	Regression	145.480	6	19.925	46.576	.000a
	Residual	108.518	247	.439		
	Sum	367.000	366			

Source: Results from the author's survey data processing

The results of the regression analysis of factors affecting the employer brand of small and medium enterprises are presented in Table 5.

Table 5. Table of regression coefficients

Model	Unnormalized coefficients		Normalized coefficients Beta	t value	Level of significance Sig	Multiple statistics	
	Regression weights	Standard deviations				Acceptance coefficients	Variance Magnification coefficients VIF
Constant	1,50	0,041					
X1	0,381	0,040	0,381	9.235	0,000	0,712	1.400
X2	0,277	0,040	0,277	6.723	0,000	0,478	2.081
X3	0,386	0,040	0,386	9.364	0,000	0,606	1.643
X4	0,232	0,040	0,232	5.641	0,000	0,818	1.217
X5	0,137	0,040	0,137	3.354	0,001	0,612	1.626

Source: Results from the author's survey data processing

The results of testing the assumptions of the regression model drawn from the Enter method also show that the assumptions are not violated and there is no multicollinearity because the VIF is less than 3. The results from Table 5 show that, 5 independent variables of the model are statistically significant because they have Sig value < 0.01 (at 99% confidence level), moreover these regression coefficients are > 0, meaning, They all have a positive impact on the employer brand of small and medium enterprises to different degrees.

The regression has the following form:

$$Y = 0.381X1 + 0.277X2 + 0.386X3 + 0.232X4 + 0.137X5$$

With the results of regression analysis from Table 5, it is possible to arrange the factors according to the degree of impact on the employer brand of small and medium enterprises from high to low as in Table 6.

Table 6. Impact of factors on business performance of small and medium enterprises

Variable	Name	Impact level (hệ số Beta)
X3	<i>Remuneration policy (ĐN)</i>	0,386
X1	<i>Relationships with colleagues (QH)</i>	0,381
X2	<i>Interest in work (TV)</i>	0,277
X4	<i>Opportunities for knowledge application (KT)</i>	0,232
X5	<i>Opportunities for career development (NN)</i>	0,137

Source: Results from the author's survey data processing

The regression model to evaluate the impact of factors on the business performance of small and medium enterprises is rewritten as follows:

$$\text{Employer brand} = 0.386DN + 0.381QH + 0.277TV + 0.232KT + 0.137NN$$

5. Discussion and Conclusion

The research results show that the remuneration policy factor has the greatest impact on employer brand with a β coefficient of 0.386. This result is similar to the study of Alniacik, E. and Alniacik, U. (2012) and Cheng, P., Phoebe, M. C., Lim, A. G., and Sze, D. A. (2015). This is completely appropriate because for many employees “benefits are the glue that binds employees to the business”. However, for small and medium enterprises, especially those operating in the fields of service and retail trade, in order to have a good remuneration policy, it is necessary to consider appropriate calculations. These enterprises can harmoniously combine financial and non-financial compensation policies. Combination of salary, bonus, allowance, welfare with other spiritual treatment policies. In which, financial compensation is the basic and important foundation. It is necessary to link remuneration with the work performed by employees, with the capacity of employees, with their achievements as well as their commitment and loyalty. It is also possible to consider grouping employees (for example, according to the criteria of scarcity, importance to business lines, etc.) to allocate appropriate budgets to ensure that the company's remuneration policies are guaranteed. ensure fairness, suitability to pay while ensuring competitiveness, attracting qualified candidates in the labor market.

The second group of factors that have a relatively large impact on the employer brand is the relationship between colleagues; interestingness of the job and the opportunity to apply knowledge with coefficients β of 0.381, respectively; 0.277 and 0.232. This result is similar to the study of Sivertzen et al., 2013. Regarding co-worker relationships, along with financial compensation policies, small and medium enterprises should have clear policies in improving the working environment, have clear job descriptions, and assign and decentralize expenses. Detailed and complete lay the foundation for maintaining and developing working relationships. Because when the job is diverse, rich, and complicated, if it is not clearly defined in terms of job descriptions and decentralization, it is easy for employees to fall into a difficult situation when performing jobs, overlapping, the relationship between employees is not good, conflicts between employees and employees, between leaders and employees in performing work. This is a very common fact for small and medium sized businesses.

At the same time, clearly specifying job descriptions, assignment and delegation of powers, along with giving employees a certain scope of authority (self-determination) in the process of job performance will help employees have have the opportunity to apply knowledge to work, the opportunity to share what has been learned with others, etc., thereby accumulating knowledge to apply what is learned through the process of working at the enterprise for the company. later work.

For small and medium-sized enterprises, the number of employees is not much, so in human resource management, it is necessary to pay attention to job design to create diverse,

rich and wide jobs. The very diversity of jobs will also help create jobs with good pay, rich jobs. This is the basis for employees to receive good remuneration policies from enterprises. At the same time, small and medium enterprises should also maintain the trend of changing the way of working in a positive direction. Because small businesses, it is easier to change and be flexible in work than large-scale enterprises.

The last factor that also has a positive impact on employer brand is career development opportunities with a β coefficient of 0.137. This result is similar to the study of Schlager, T., Bodderas, M., Maas, P. and Cachelin, J. L. (2011), when arguing that career development opportunities are one of the main reasons for applying candidate for a particular job. In fact, employees always want to have the opportunity to develop their career. They always want to be recognized and properly evaluated for their ability to get promotion at work. In addition, employees not only want to have opportunities for career development in the current enterprise but also in the future when they no longer continue to work at that enterprise. Employees want to stay or work at businesses that offer them wide career opportunities. Therefore, small and medium enterprises need to outline for employees a clear career path with open opportunities./.

*Faculty of Environmental, Climate Change and Urban Studies,
National Economics University, Vietnam*

Abstract

Ports and maritime transportation are significant since they account for 90% of global trade and national economic growth. However, it has a detrimental impact on both the environment and human health. Sustainable development is emphasized in recent port literature. According to some reports, cold ironing can be used to regulate air, water, and noise pollution in ports. There are still many challenges to solve before this technology may be used in real-world applications. The goal of this study is to pinpoint the elements influencing the adoption of cold ironing at Vietnamese ports as a component of the government's Green Port Development Project. The usage of ports for cold ironing is influenced by five main factors, according to research findings. National and international rules are regarded as one of the most important aspects in this. The discussion section of this paper goes into considerable detail about its findings and implications.

Keywords: *Cold Ironing, Green Ports, Drivers, Regulations, Sustainability.*

1. Introduction

Maritime shipping, which is recognized as the most fuel-efficient mode of transportation in terms of ton-miles, is used to move around 90% of the world's trade (UNCTAD, 2018). It has substantial challenges, nevertheless, including a dependency on fossil fuels, an increase in greenhouse gas (GHG) emissions, and certain technological challenges (Zis, 2019; AAPA, 2007). The third GHG study (IMO, 2014) estimates that shipping produces 2.2% of the world's anthropogenic CO₂ emissions, a 0.5% decrease from the estimates from the second GHG study (IMO, 2009). According to studies by Corbett et al. (2007), Eyring et al. (2005), and Zis (2019), ships operating near beaches and ports contribute 15% of the world's NO_x emissions and 5% to 8% of its SO_x emissions, respectively. This industry is also to blame for respiratory illnesses that have been linked to PM pollution deaths.

Among the adverse medical conditions brought on by air pollution are asthma, lung cancer, heart attacks, chest infections, and other serious respiratory diseases (Quaranta et al., 2012; Kumar et al., 2019; Tian et al., 2013). According to Kumar et al. (2019), the shipping

sector significantly contributes to air pollution, which causes long-term disease and mortality from asthma and other chronic illnesses, killing 40,000 people yearly in the UK alone. As a result, steps must be done to stop air pollution and protect a safe environment for people, particularly in harbors. The green ship, green port, and zero-emission port ideas may potentially introduce using renewable, sustainable, and energy-efficient solutions both onboard and onshore (Bailey & Solomon, 2004; Kumar et al., 2019; Pavlic et al., 2014; Sulligoi et al., 2015; Zhao et al., 2020). Many people consider cold ironing to be a way to make maritime transportation cleaner and more environmentally friendly (Cullinane and Cullinane, 2019; Pettit et al., 2018; Spengler & Tovar, 2021). Cold ironing is one way to reduce such emissions from ships at ports. Several earlier studies have demonstrated the significant impact of cold ironing on the economic, environmental, and social aspects of ports (AAPA, 2007; Ballini & Bozzo, 2015; Chatzinikolaou et al., 2015; Colarossi & Principi, 2020; ExternE, 2005; Friedrich and Bickel, 2001; Innes & Monios, 2018; Nunes et al., 2019; Tseng & Pilcher, 2015; Vaishnav et al., 2015).

In order to access the port and the adjacent markets, port officials eventually enacted restrictions requiring all visiting vessels to be outfitted with and then operate contemporary technology. Despite the fact that "cold ironing" legislation have been extremely effective in significant ports like Los Angeles, Seattle, and Rotterdam, Asian nations, like Vietnam, have been slow to implement the technology and regulations (Monacelli, 2017). Developing nations like Vietnam, which have limited resources, struggle to allocate resources to multiple ends including economic growth and environmental protection. Many countries have prioritized economic goals over environmental concerns. Although other studies (Arduino et al., 2011; Diógenes et al., 2020; Innes & Monios, 2018; Radwan, et al., 2019) have identified a number of implementation barriers for cold ironing, little is known about the factors that motivate it. This study aims to pinpoint factors that influence cold ironing adoption, notably in Vietnam. Additionally, this study is the first to examine the influences on the adoption of cold ironing using a quantitative methodology. This will serve as a critical starting point for the government and port authorities as they create regulations to promote the application of sustainability standards for the port.

2. Literature review

2.1. Cold ironing

Vessels can apply for cold iron, also known as an onshore power supply (OPS) or shore-side electricity (SSE), by connecting to shore-side electricity instead of utilizing their auxiliary generators to produce power for hoteling. While the ship is loading or unloading cargo, this procedure enables the continued electrical powering of other equipment, such as emergency equipment, refrigeration, cooling, heating, and lighting (Innes & Monios, 2018).

It has been shown to be effective in reducing emissions that contribute to air pollution and climate change in countries where renewable energy generation accounts for a large portion of energy production. The concept of "Green ports" calls for the use of cold ironing, which has been implemented at a number of ports worldwide. However, according to the WPCI (2017),

only 28 ports have cold ironing installed globally, showing the scant uptake of this technology so far (Innes & Monios, 2018). The use of cold ironing, a relatively recent method that supplies energy for large seagoing boats, may be considered a technical advancement. However, more study is required due to the dearth of information on this concept.

2.2. Cold ironing as a sustainable strategy in ports

According to Rajabi et al. (2022) sustainable development fosters social advancement, environmental resource protection, as well as short- and long-term economic growth and stability. The core of sustainable development is the control of the conflict between meeting human needs and preserving the integrity of the ecosystem. A measurement, or set of measures, that gives information on a particular element is referred to as a sustainability indicator (Ugwu and Haupt, 2007). The triple-bottom-line approach, which requires a minimum level of performance in the environmental, economic, and social dimensions, must be taken into consideration in order to achieve operational sustainability (Heravi et al., 2015).

Previous studies, which have been published for the ports of Los Angeles (US), Oslo (Norway), Aberdeen (Scotland), Copenhagen (Denmark), and Kaohsiung (Taiwan), corroborate the advantages of cold ironing from an environmental and economic perspective (AAPA, 2007; Ballini & Bozzo, 2015; Colarossi & Principi, 2020; Innes & Monios, 2018; Tseng & Pilcher, 2015). The primary advantages of cold ironing technology for the environment are the decrease of local and global pollutants as well as noise (Kotrikla et al., 2017; Sciberras et al., 2014; Winkel et al., 2016). Zis et al. (2014) showed that cold ironing has the ability to reduce CO₂, SO₂, NO_x, and BC emissions by 48-70%, 3-60%, 40-60%, and 57-70%, respectively. For the ports of Gothenburg, Long Beach, Osaka, and Sydney, Styhre et al. (2017) determined that the emissions were 150.000, 240.000, 97.000, and 95.000 tonnes of CO₂ emissions, respectively. According to Adamo et al. (2014), cold ironing at the port of Taranto, Italy, might cut emissions of NO_x and CO₂ by 1.097 tons per year and 25.686 tons annually, respectively.

Cold ironing can assist ports in making money through reduced CO₂ emission trade, according to research by Dai et al. (2019). The research also provides a framework for the

economic feasibility of cold ironing investment. Additionally, Zis (2019) examined three different fuel price scenarios for two roundtrips of the Ro-Ro ship between ports A and B in Sweden and Belgium. The results show that investing in cold ironing benefits the ship economically at medium and high fuel costs, but that at extremely low fuel prices, the energy cost savings are not enough to make up for the investment throughout the anticipated lifetime.

According to studies by Kumar et al., 2019; Tian et al., 2013; Quaranta et al. (2012), cold ironing is one useful strategy for reducing environmental pollution in society. This, in turn, reduces the number of individuals who pass away from diseases like asthma, lung cancer, heart attacks, and chest pain that are linked to air pollution. The main benefit of cold ironing is that it reduces the social expenses of treating diseases caused by the air pollution from ships. Several studies have estimated the cost of ship emissions (Ballini & Bozzo, 2015; Chatzinikolaou et al., 2015; ExternE, 2005; Friedrich and Bickel, 2001; Nunes et al., 2019; Vaishnav et al., 2015). Cold ironing provides several benefits when seen as a method to reduce the external expenses to society in general and to port cities in particular. For instance, Chatzinikolaou et al. (2015) estimated the total external health cost to be roughly 25.3 million euros in the Greek port of Piraeus, of which more than half (61%) was attributed to particulate matter. According to ExternE (2005), the external cost of air pollution from ships at the Venice port is 24 million euros. As a result of airborne pollutants from container ships traveling various routes, Friedrich and Bickel (2001) calculated the external cost of inland shipping for the Netherlands and determined that it was 321 million euros, as well as the cost per 100 kilometers: On the routes Felixstowe-Rotterdam (1200 €/vkm), Rotterdam-Felixstowe (1050 €/vkm), Piraeus (9300 €/vkm), Iraklion (900 €/vkm), Aegean Sea (1000 €/vkm), and Felixstowe-Rotterdam (1050 €/vkm). The CAFE project series (2005) calculated a 45 billion euro external cost of air pollution from maritime transport for the European Seas. According to Innes & Monios (2018), air pollution may cost the UK £54 billion annually. Air pollution-related health problems have a significant financial impact on both society and business. Each year, the UK spends more than £20 billion on medical costs (Royal College of Physicians, 2016). Additionally, cold ironing technology keeps the workplace quiet and free of air pollution, which is good for the health and productivity of the workers.

Table 1. Sustainability dimensions of cold ironing

No	Dimension	Authors

2.3. The context of Vietnam

In terms of growth, Vietnam is on course to succeed significantly. The so-called Doi Moi rehabilitation program is made up of several important political and economic measures that are meant to improve the economic climate, which had been negatively impacted by the post-war difficulties. Vietnam will become a new Asian Tiger after pursuing economic reforms for thirty years (Barker & Üngör, 2019). According to several international organizations, Vietnam will see the highest economic growth in the Asia-Pacific region in 2022. Vietnam's GDP growth is predicted by the World Bank (WB) to be 7.2% in 2022 and 6.7% in 2023. In the meantime, the IMF increased its 2022 growth prediction for Vietnam to 7% (News 1, 2022). Of the main economies in Asia, only Vietnam has seen a considerable increase in its GDP (Trinh et al., 2021).

However, one of the areas most severely impacted by climate change is the Mekong River Delta region of Vietnam. According to OXFAM's predictions, 90% of the region will be under water by 2100 and 45% of it will be covered in saline-sodic soil by 2030 (Nguyen et al., 2022). Because of this, the Vietnamese government is actively converting to a circular economy and reducing greenhouse gas emissions. Vietnam declared its intention to implement a circular economy in 2022. According to the plan, the advancement of the circular economy is intended to spur innovation, raise worker productivity, support green growth linked to economic restructuring, and update the growth model in line with efficiency improvement. The UNFCCC's 26th summit conference (COP26) in Glasgow (UK) in 2021 will once again call for a 45% reduction in CO₂ emissions by 2030 (compared to 2010) and a reduction of all greenhouse gas emissions (N₂O, CH₄, CFC, etc.) to zero by the middle of the century (Nguyen, et al., 2022). With the ultimate goal of avoiding global warming, Viet Nam is one of the participants in this agreement on reducing GHG emissions as well as in accords on energy, lands, etc. Additionally, the harbor has a program in place to reduce emissions. The Ministry of Transport gave their blessing to the green port expansion project in 2021. Since environmental protection is essential to investment in seaport construction, business, and exploitation, it is necessary to build Vietnam's seaport system in a sustainable manner.

2.4. The main drivers and barriers of cold ironing

2.4.1. Regulation drivers

According to Innes & Monios (2018), all nations are required to adhere to the fundamental legal standards specified by the IMO. The International Convention on the Prevention of Pollution from Ships, often known as the MARPOL Convention, was established by the IMO and has a long history of preventing ship pollution (Cullinane & Cullinane, 2019). However, stricter rules could be implemented. The European Union (EU) has important ecological aims for its maritime policy. By Directive 2005/33/EC, which was published in 2005, the English Channel, North Sea, and Baltic Sea emission control regions were established. The 1.5% sulfur cap imposed in these areas required ships moored or parked in EU ports to use gasoline with a sulfur concentration of 0.1% or less. In 2014, the European Union issued Directive 2014/94/EU, which addressed the development of

infrastructure for alternative fuels. This states that "Member States shall ensure that the need for shore-side electricity supply for inland waterway vessels and seagoing ships in maritime and inland ports is assessed in their national policy frameworks." Unless there is no demand and the costs are disproportionate to the advantages, including environmental benefits, such shore-side electrical supply must be deployed as a priority in ports of the TEN-T Core Network and in additional ports by December 31, 2025 (European Commission, 2014). Additionally, it encourages the use of alternative fuels and authorizes government support for the adoption of technology that reduces emissions.

Vietnam has been a member of the International Maritime Organization since June 12, 1984, making it the organization's 126th member. As of right now, Vietnam has ratified 24 important IMO Conventions and Protocols and is a signatory to 24 of them. To protect the maritime environment, Vietnam has also developed a variety of rules and regulations. For instance, the 2015 Vietnam marine Law stipulates that marine activities must abide by its provisions as well as those of other Vietnamese laws and any international agreements to which Vietnam is a party. It makes it unlawful for people and businesses to take part in actions that harm the marine environment. Additionally, Vietnam will begin construction on a green port there on October 27, 2020. Ports will thus begin legally implementing the Green port requirements by 2030 and on a voluntary basis in 2025. Vietnam's Green Port Plan will be created based on six main areas of criteria, including managing environmental quality, resource use, IT applications, decreasing emissions, and tackling climate change and sea level rise (News 2, 2020). At this time, a lot of ports in Vietnam were actively researching and using the Green Ports criterion as one of their long-term plans. Particularly large ports are frequently at the forefront of implementing governmental policies. As a result, the author argues that:

Hypothesis 1: Regulation drivers have a positive effect on the process of cold ironing adoption.

2.4.2. Incentives drivers

The extensive usage of cold ironing hasn't always been supported by culture and morals (Arduino, et al., 2013). In order to encourage cold ironing and decrease externalities by fostering cost integration, incentives are essential for port authorities. However, these incentives may be developed in various ways and put into practice by parties at various levels, including the government and global legislative bodies like the IMO (Tzannatos, 2010). By reducing taxes, the price of power, and the interest rate on loans, for example, the government may incentivize ports to use cold ironing. For instance, Williamsson et al. (2022) offered evidence that the difference between fuel prices and the cost of using electricity (Seediek, 2016) is the key economic element driving the employment of cold ironing. Some ports, reportedly including the port of Gothenburg, have reportedly switched to more alluring cold ironing by providing free power. A key factor in enticing potential ports to cold ironing is a decrease in fuel costs (Innes & Monios, 2018). Cold ironing is more alluring in countries like Norway that have inexpensive, clean power since local energy costs have a considerable impact on this (Hall, 2010). However, high local power costs, like those in Southern Europe, effectively act as a localized impediment to adoption (Piccoli et al.,

2021). Renewable energy source projects may be created more rapidly and become economically viable when financial incentives are applied efficiently (Diógenes et al., 2020; Ming et al., 2014; Simsek & Simsek, 2013).

The high cost of the investments that will likely be necessary in various forms of hardware is a significant barrier to the adoption of cold ironing (Radwan, et al., 2019). A cold ironing system would cost ports between \$2 and \$6 million, which is more than they have available. Many ports need a loan with a fair interest rate because they lack the initial investment cash. Low-interest rate government policies will influence port authorities to use cold ironing. As a result, the author argues that the government will employ financial incentives, tariffs, and regulatory procedures to encourage ports to use cold ironing technology for environmental preservation.

Hypothesis 2: Incentive drivers have a positive effect on the process of cold ironing adoption.

2.4.3. Environmental drivers

Findings demonstrate that environmental issues, in addition to the port's financial capability, influence the decision to implement technologies like cold ironing (Williamsson et al., 2022). Studies by the International Marine Organization show that emissions of carbon dioxide (CO₂), nitrogen oxides (NO_x), and sulfur oxides (SO_x) are produced by the marine sector in the globe at rates of 2.2%, 15%, and 5-8%, respectively (Wang et al., 2021). It is evident that reducing these emissions would have a significant impact on air pollution mitigation given that more than 90% of global trade happens over water (Monacelli, 2017).

Air pollution affects everyone who works at the port and those who live nearby. The shipping industry makes a substantial contribution to air pollution, which results in diseases like asthma and other chronic conditions that claim 40,000 lives annually in the UK alone (Kumar et al., 2019). Additionally, the noise and vibration of diesel-powered machinery causes headaches and hearing issues in long-term port workers. In order to eliminate health risks to workers' wellbeing and establish a secure workplace, port management works to enhance technology. The greatest solution for these problems is cold ironing. The pollution produced by contemporary ports is reduced by 95-98% with the use of cold ironing technology. This reduces emissions of all sorts, including carbon dioxide, nitrogen oxides, sulfur oxides, and particulates (Monacelli, 2017). As an example, the cold ironing program in Rotterdam was well established in 2014 when the poll was carried out. The port's cold ironing program significantly reduced sulfur oxide emissions because ships are no longer burning sulfurous bunkers while in port. One of the largest ports in the world, Rotterdam, may still be proud of having virtually totally reduced its sulfur oxide emissions (Monacelli, 2017). According to the author, the environmental benefits of cold ironing and the port's negative impacts on human health and the environment will promote the use of this method.

Hypothesis 3: Environmental drivers have a positive effect on the process of cold ironing adoption.

2.4.4. Initial capital barriers

The facility's related costs before, during, and after the implementation process are all considered financial hurdles. It includes investment expenditures, operating and maintenance costs, and power costs. The whole investment cost is made up of berthing, infrastructure, and ship-side refit expenditures (Radwan et al., 2019).

The cost of implementing a cold ironing system has been shown in several research. For instance, it was projected that investment expenses at the ports of Aberdeen and Copenhagen would total £6.6 million and €37 million, respectively (Ballini and Bozzo, 2015; Innes and Monios, 2018). According to the World Ports Climate Initiative (WPCI), annual operations and maintenance expenditures represent 5% of the project's total investment costs. The cost of powering the berthed ships varies greatly depending on the electricity policies of the various nations.

The shortage of electricity in some cities or areas may also be a barrier. Local grids frequently cannot handle high-voltage cold ironing systems. Smaller cities are where this is especially true. In order to support investments in cold ironing systems in such areas, further multi-million dollars expenditures in new electrical networks and transformation substations are required (Kraemer & Czermanski, 2020). For ports, especially those in underdeveloped countries, installing cold ironing systems will be quite challenging since it requires a substantial initial financial expenditure. Therefore, the author argues that:

Hypothesis 4: Initial capital barriers have a negative effect on the process of cold ironing implementation.

2.4.5. Standardization barriers

Another barrier is posed by various technical issues relating to a lack of standardization (Arduino et al., 2011; Kraemer & Czermanski, 2020; Kumar et al., 2019; Radwan et al., 2019). The fundamental challenge in creating port networks is matching ship power to the voltage and frequency of shore energy. This refers to the interoperability of electrical characteristics since different international shipyards have different voltage and frequency requirements. Some ships use 220 volts at 50 hertz (Hz), some at 60 hertz (Hz), while yet others use 110 hertz (Hz). A shoreside power transformer must meet the High Voltage Shore Connection (HVSC) standard voltage in order to be used, but it also has to have a low no-load loss since it is still in use even when a ship is not plugged into shore power (Paul, Peterson, & Chavdarian, 2014). To match the frequencies of the onshore and onboard power systems, a frequency converter is required to transmit energy to ships operating at 60 Hz on board in harbors with 50 Hz power sources and vice versa. A frequency converter must be constructed in a modular way to fulfill the various power requirements since it is one of the most expensive pieces of harbor grid equipment, even if it may not be sized to a standard (Ericsson & Fazlagic, 2008). Besides, the main distribution voltage ranges from 440 volts to 11 kilovolts. For vehicle carriers, the needed load is a few hundred kW, whereas, for passenger ships or reefer ships, it might be a dozen or more MW. Furthermore, there is currently no universal standard for connections and cables (Arduino et

al., 2011). A lack of technological standardization will lead to an increase in the number of converters and the cost of cold ironing. This impedes the practice of cold ironing at ports inadvertently.

Hypothesis 5: Standardization barriers have a negative effect on the process of cold ironing implementation.

3. Discussion and Conclusion

3.1. Discussion

It is generally acknowledged that the rise of port infrastructure and the associated activities significantly contribute to the expansion of marine transportation, the economic development of coastal nations, and the generation of both direct and indirect jobs in the region. However, it faces significant obstacles like a reliance on fossil fuels, an increase in greenhouse gas emissions, and some technological challenges. According to the most recent IMO study, additional types of international shipping pollutants, such as carbon monoxide (CO), nitrogen oxides (NO_x), sulfur oxide (SO_x), volatile organic compounds (VOC), ozone (O₃), and particulate matter (PM), contribute to air pollution in harbor areas. Cold ironing, which is also anticipated to play a significant role in a larger drive for the electrification of maritime transportation, is one of the best options for reducing local emissions among the various technologies that assist the growth of a more sustainable shipping industry (Wan et al., 2018; Williamsson et al., 2022; Zis, 2019). Although earlier research, which was published for the ports of Los Angeles (US), Oslo (Norway), Aberdeen (Scotland), Copenhagen (Denmark), and Kaohsiung (Taiwan), confirms the advantages of cold ironing from an economic and environmental perspective, the use of this technology in developing countries is very limited (AAPA, 2007; Ballini & Bozzo, 2015; Colarossi & Principi, 2020; Monacelli, 2017; Innes & Monios, 2018; Tseng & Pilcher, 2015).

By identifying the variables that affect the cold ironing process, this work significantly advances the field. First, according to our findings and previous studies (Cullinane & Cullinane, 2019; Innes & Monios, 2018), regulation drivers have a favorable effect on the adoption of cold ironing. Through an examination of both the function of international law and the results of national regulation, this study added to the body of knowledge already available on cold ironing. In particular, national regulation complements international law well to encourage ports to use cold ironing. In the past, insufficient national rules on concerns like air pollution have been blamed for the lack of adoption of cold ironing in numerous countries (Tseng & Pilcher, 2015). More detailed regulation is needed to target certain shipping industries, taking into account factors like time spent in ports and pollution impact.

Additionally, the results support earlier qualitative research by showing that incentive drivers have a favorable impact on the adoption of cold ironing (Diógenes et al., 2020; Ming et al., 2014; Tzannatos, 2010; Simsek & Simsek, 2013; Williamsson et al., 2022). Projects, particularly those with significant initial investment costs like cold ironing, can grow more quickly and be economically viable when financial incentives are employed as efficiently as possible. The challenges in putting in place financial incentives for cold ironing are primarily

brought on by the protracted processes required to collect the necessary paperwork in contrast to the short application deadlines, as well as the time required to assess the requests and release the incentives.

Third, the choice to create cold ironing in ports was influenced by environmental reasons. This characteristic demonstrates the level of knowledge about how the port affects the environment and public health. The lack of knowledge in Vietnam that addresses the aforementioned issues might be used to justify this. People in developing countries frequently concentrate on how to grow quickly and reap bigger economic rewards rather than the environment. However, a novel strategy is proposed that implements the idea of sustainability and guarantees both environmental protection and economic growth.

Fourth, study results show that initial financial barriers have a negative influence on the adoption of cold ironing (Kraemer & Czermanski, 2020; Radwan, et al., 2019; Williamsson, et al., 2022). Williamsson et al. (2022) said that because expensive expenditures are probably necessary for many different kinds of gear, they represent a considerable obstacle to the adoption of cold ironing. For instance, it was projected that investment costs would come to £6.6 million and €37 million, respectively, in the ports of Aberdeen and Copenhagen (Ballini and Bozzo, 2015; Innes and Monios, 2018). This study broadens our understanding of the difficulties that cold ironing presents. It helps to be proactive in creating a source of funding if port authorities want to go in a sustainable way. Our findings may be put to use by the government to encourage ports to adopt sustainable standards. It is essential to find strategies to reduce investments or link investments to values in order to make the business model more alluring (Williamsson et al., 2022).

The study's findings also concur with other studies' findings that the expansion of cold ironing at today's ports is being constrained by standardization (Arduino et al., 2011; Kraemer & Czermanski, 2020; Kumar et al., 2019; Radwan et al., 2019). The lack of standards for connecting shore to ship was recognized early on as a barrier to the growth of cold ironing, and it was suggested that a large coalition of parties, including shipbuilders and port officials, would promote the development of workable, affordable solutions (Khersonsky et al., 2007). In accordance with our study, raising the level of electrical uniformity between shore and ship would promote the cold ironing-encouraged decrease of local pollutants at ports. The standardization of wires and connectors should also be taken into consideration. More standardization will lessen the complexity, cost, and difficulty of implementing cold ironing toward sustainability (Williamsson et al., 2022).

3.2. Managerial and practical implications

Humans are significantly impacted by the consequences of climate change, which is a result of human economic activity. Action plans are actively developed by nations to lessen their adverse environmental consequences and build sustainable economies. A Green port model has been developed by nations with sustainable requirements for the maritime sector, including reducing noise, air pollution, and water pollution; using alternative energy sources; and raising environmental awareness. One important strategy for reducing regional

emissions at the port is cold ironing. The study's conclusions have a few managerial and useful applications. First off, regulation shows how effective both domestic and foreign laws are when it comes to running ports that follow sustainable development concepts. Management organizations must support the creation and application of specific regulations in order to encourage ports to change their ports in a greener direction. Lack of a clear regulatory framework hinders the growth of cold ironing. There are three different kinds of policy initiatives that have been used to encourage the expansion of cold ironing. First, command-and-control, usually referred to as direct regulation, might be employed by, for example, laying forth guidelines for equipment or processes. Second, politicians may create economic incentives—soft rules in this paradigm—by establishing markets, taxes, or direct subsidies, for example. Third, a more complex and difficult way to design policy is to use a hybrid approach, which defines some emission-related criteria while allowing players select and pursue the most alluring possibilities as solutions. Second, foreign investment has a significant positive impact on port infrastructure development. To give this change a powerful push, the government should seek out how to sustainably attract foreign investment into the construction of seaports. Additionally, maintaining a stable macroeconomic climate helps the seaport system expand, particularly in terms of sustainability. Additionally, port authorities are aware of the critical elements influencing the deployment of cold ironing, which enables them to be proactive in their plans.

VALUING INDIRECT USE VALUE OF MANGROVES IN KIM SON DISTRICT, NINH BINH PROVINCE

MSc. Nguyen Thi Thu Ha

hathu.ihgeo@gmail.com

Institute of Human Geography, Vietnam Academy of Social Sciences, Hanoi, Vietnam

Abstract

Mangroves are an important resource that provides many economic values to communities affected by natural factors (climate change, sea level rise) and socio-economic development activities. Part of the reason is that the economic values of mangroves have not been properly assessed, in which indirect use values are difficult to see. This study uses a combination of cost-based and benefit-transfer methods to estimate the indirect use value of mangrove forests in Kim Son district, Ninh Binh province. The results show that the indirect use value of Kim Son mangrove forest is 329.524 million VND/ha/year, of which the protection value is 38.119 million VND/ha/year; The value of carbon absorption is 248.177 million VND/ha/year and the value of creating new alluvial land is 43.228 million VND/ha/year. On the basis of studying the actual use and protection of mangroves and estimating the indirect use value of mangroves in Kim Son district, Ninh Binh province, some suggestions are proposed to effectively manage mangrove forests. salinity includes planning and effective management of mangrove land; Raising awareness and participation of the community in mangrove protection; Building sustainable economic models.

Keywords: *Cost based method; Indirect use value mangrove; Magroves.*

1. Introduction

Mangroves are considered an ecosystem that plays a particularly important role in the lives of coastal communities. Mangrove forests have many effects such as environmental, social, economic value and especially carbon storage value, sea dyke protection, erosion prevention, coastal land fixation, riverside drought, drought, etc. control storm winds, waves, high tides, contributing to climate regulation (Feller et al., 2017).

Despite their enormous economic and environmental roles, mangroves are also recognized as one of the most fragile and threatened ecosystems globally (Taylor et al., 2003; Martinuzzi et al., 2009). The decline in both quantity and quality of mangroves due to causes such as industrialization, urbanization, conversion of uses, logging and charcoal, especially the development of large-scale aquaculture large scale (Balsco, 2001). In the period 1980-2000, the world's mangrove forests lost up to 35% of their total area and continued to decrease by 0.4% per year in the period 2000-2014 (from 173.067 km² to 163.925 km²) (Hamilton & Casey., 2016). . In Vietnam, mangrove forests decreased rapidly in the period 1943-2000 from 450,000 ha to 155,290 ha, mainly due to war, conversion of forest land to agricultural production, aquaculture and urbanization (Sam et al., 2005).

In the current context, when everyday resources are being exploited and used in all forms for development, leading to degradation and depletion, the harmonious coordination

between protection and exploitation and use Using for sustainable development of resources is a challenge for each country and territory. To solve this problem requires understanding the values of resource types. The economic assessment of resources is an effective solution to help "monetize" the value of resources as an important basis for policy makers, government levels, and managers to choose solutions. optimal sustainable use of resources in the relationship between protection, exploitation and use.

Kim Son coastal mangrove forest with an area of about 858.85 hectares is a green wall to protect the environment, break waves to protect sea dykes, fix mud in coastal mudflats, increase nutrition sources for marine animals and habitats. habitat of many migratory birds, a source of seafood for humans. Especially in the Kim Son coastal area with its diverse ecosystem, it is an important part of the buffer zone, the transition zone of the Zone. world biosphere reserve of inter-provincial coastal wetlands in the Red River Delta. During the period 1990-2000, the area of this area decreased by 1,775 ha (79% of the area) due to unplanned aquaculture development (Ninh Binh Provincial People's Committee., 2016). The area of mangroves is reduced, making the sea dyke directly affected by the impact of storms and wind. The evidence is that Binh Minh III dyke has been overrun by storms for many years, causing serious landslides, unable to seal, affecting a large area of aquaculture in the region.

Coastal mangrove forests of Kim Son district are affected by many natural and social impacts, including the area in Kim Hai commune, Kim Son district, Ninh Binh province. This article examines the indirect use values of coastal mangrove forests in Kim Son district in order to contribute to the creation of a scientific basis for the environmental and economic values of mangroves, to raise awareness of local authorities. management and society about the role and value of mangroves.

2. Method

Methods of analyzing and synthesizing data

The main method used in the study is the method of collecting and processing information, researching secondary documents. The documents used in the project include studies on mangrove valuation in the world and in Vietnam, documents on biodiversity, the role and significance of mangroves in the development of mangrove forests. socio-economic, documents on the current status of mangrove exploitation and protection in Kim Son district.

Cost based method

Cost-based methods estimate the amount of money we save due to the presence of ecosystem services. This method is quite common and is used to estimate the value of regulatory and support services, especially the protective functions of ecosystems (e.g., control of erosion, flooding or prevention of floods). Storm). This approach has 3 main techniques including: (i) The replacement cost technique considers the costs of replacing an ecosystem service with man-made technologies or infrastructure; (ii) Mitigation cost engineering considers the costs of dealing with the effects of loss of ecosystem services; (iii) Damage avoidance techniques consider the costs incurred if an ecosystem service is lost.

Ecosystem services are assessed and quantified by calculating the costs and losses (monetary or non-monetary) that are avoided, as a result of conserving these ecosystem services. The strength of this method is that it can be both part of a rapid assessment and a

part of detailed analysis, which usually does not require large numbers of data or complex data, and the results of this method are easy to obtain. easily communicated to policy makers. The limitation of this approach is that it does not measure people's preferences or benefits but focuses on avoidable costs, losses and expenditures.

Method of value transfer

The value transfer method is a shorthand method for estimating economic or monetary value based on the use of results from studies conducted elsewhere. This method can be applied to estimate all ecosystem services, but its use depends on the location of the study site and the objective of the assessment. The strength of this method is that it is generally less expensive than primary data evaluation studies, is conducted relatively quickly, and can be used as a rapid assessment technique before consider conducting larger studies. The limitation of this method is that it is highly dependent on the results of available studies that are suitable or similar to the study site.

3. Results

The coastal mangrove forest of Kim Son district is formed in the deltas of the mouths of the Day and Can rivers. This place and the whole land south of the 20th parallel of Ninh Binh are honored to be recognized by UNESCO as a buffer and transition zone of the Red River Delta Biosphere Reserve with a unique diversity of flora and fauna.

The total area of forest and forestry land in Kim Son district is 1558.9 ha, of which the planted forest area is 633.25 ha; The vacant land area is 955.65 ha. The location from dike Binh Minh 2 to dike Binh Minh 3 is 224.27 ha. The area of mangrove forest outside dike Binh Minh 3 is 408.98 ha.

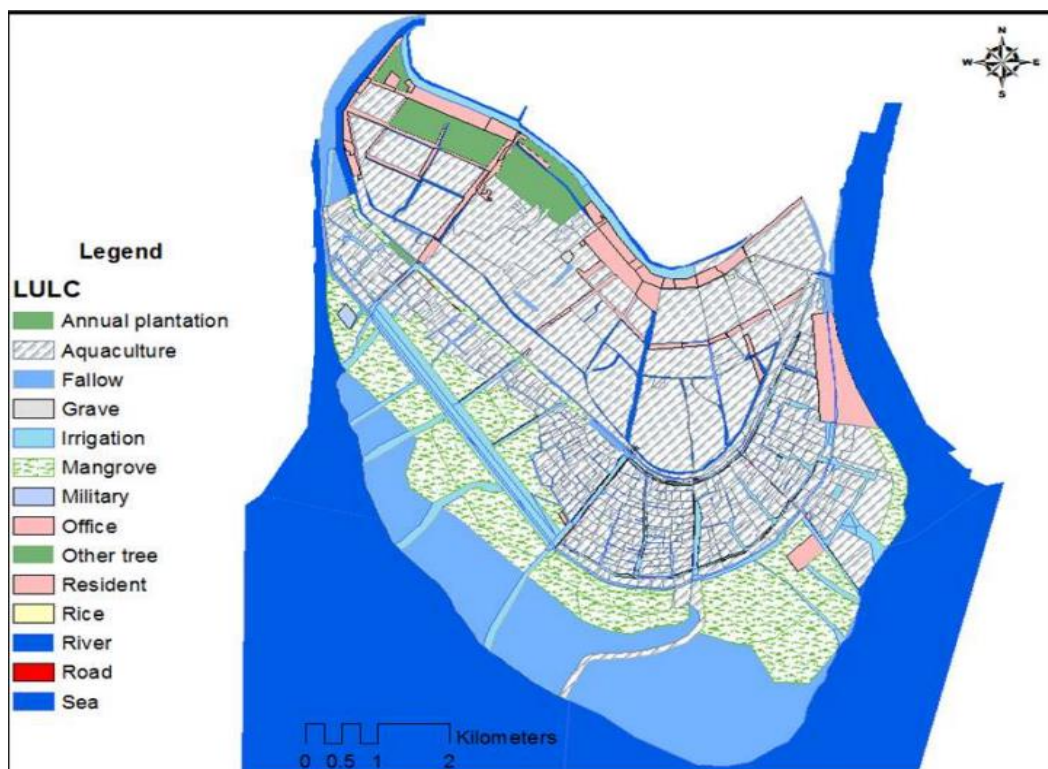

Figure 1. Map of mangroves in Kim Son district, Ninh Binh province

Source: Hong. Q. N et al., 2019

3.1. The value of damage prevention against storms and salinity

It is assumed that Kim Son mangrove forest has the same anti-storm and anti-saline-intrusion effect as a dyke built to break waves and prevent saltwater intrusion and a casuarina forest for windbreak. Using a replacement cost-based approach, the value of storm damage mitigation and saltwater intrusion prevention is calculated by the cost of constructing a dyke with a length equivalent to the length of mangroves along the coastal area and the cost of planting a casuarina forest with an area equivalent to that of a mangrove forest.

** Value of protection against sea waves, against saltwater intrusion*

According to research by Mazda and co-authors (1997) and Tang (2011), each coastal forest belt with a length of 1 km and a width of 1.5 km will have a protective effect equivalent to 1 km of dike/embankment works. The sea is built solidly.

On September 25, 2019, Ninh Binh Department of Agriculture and Rural Development issued Decision 431 on approving the contractor selection results "Bidding package No. 2: Construction and installation and equipment" under the Binh Minh 4 sea dike construction project, Kim Son, Ninh Binh. The Binh Minh 4 dike route is deployed from the mouth of the Day river to the road to the Con Noi border control station with a length of more than 17 km with the winning bid price: 382,227,199,000 VND.

According to Clause 5, Article 14 of Circular No. 09/2019/TT-BXD of the Ministry of Construction: The contingency cost for the arising work volume factor is calculated as a percentage (%) of the total cost of the bidding package. pre-contingency costs. In case for bidding packages the volume of works is determined specifically and precisely, the investor shall decide the reserve ratio for the arising volume factor and must not exceed 5%.

Thus, the cost of constructing a 17 km dyke in Kim Son in 2023 with an assumed slippage rate of 5% is estimated as:

$$382,227,199,000 * 105\% = 401,38,558,950 \text{ VND}$$

So, the cost of building an 18km dyke in Kim Son in 2023 is equivalent to the length of Kim Son coastal mangroves:

$$(401,338,558,950: 17) * 18 = 424,946,709,476 \text{ VND}$$

Depreciation period of sea dyke is calculated as 20 years (the framework prescribed by the State is from 6 to 30 years), so the depreciation value of dyke in 1 year is:

$$424,946,709,476 \text{ VND: } 20 \text{ years} = 21,247,355,473 \text{ VND/year}$$

With a total area of mangroves in Kim Son of 633.25 ha, the value of minimizing damage to breakwater and preventing salinity intrusion of 1 ha of mangroves in 1 year is:

$$21,247,355,473 \text{ VND/year: } 663.25 \text{ ha} = 32,035,183 \text{ VND/ha/year}$$

** Value of protection against sea wind*

According to the plan to plant casuarina forests in Truong Long Hoa commune, Duyen Hai town, Tra Vinh province of the People's Committee of Tra Vinh province on August 5, 2022, with the implementation site in the coastal alluvial area of the hamlet. Nha Mat hamlet, Truong Long Hoa Commune, Duyen Hai Town, Tra Vinh Province; planting scale of 01 ha of

casuarina forest, planting density of 5,000 trees/ha; The implementation period is 04 years (in 2022 to 2025, in which planting is 2022 and 2023 - 2025 is taking care of the forest after planting), with a total cost of 182,533,000 VND by Trung Son Alpha Co., Ltd. sponsor.

With similar conditions in terms of natural and socio-economic conditions, the coastal alluvial plains of Nha Mat hamlet, Truong commune and the coastal alluvial plains of Kim Son district, therefore, it is not necessary to adjust the price of Tra Vinh when applying the price of Tra Vinh. used in Ninh Binh. Therefore, the cost of planting 1 ha of casuarina forest in Kim Son is equivalent to the cost of planting 1 ha of casuarina forest in Truong Long Hoa commune, Duyen Hai town, Tra Vinh province, ie 182,533,000 VND. Thus, the cost of planting 633.25 ha of casuarina forest, equivalent to 633.25 ha of coastal mangrove forest, will need the following funds:

$$633.25 \text{ ha} * 182,533,000 \text{ VND/ha} = 115,589,022,250 \text{ VND}$$

The casuarina forest is old for about 30 years, so the depreciation value of 1 ha of casuarina forest in 1 year is:

$$115,589,022,250 \text{ VND} : 30 \text{ years} = 3,852,967,408 \text{ VND/year}$$

With an area of 663.25 ha of Kim Son mangrove forest, the windbreak protection value of 1 ha of Kim Son mangrove forest in 1 year is:

$$3,852,967,408 \text{ VND/year} : 633.25 \text{ ha} = 6,084,433 \text{ VND/ha/year}$$

The total value of protection against wind, storm and waves of 1 ha of Kim Son mangrove forest in 1 year is:

$$32,035,183 \text{ VND/ha/year} + 6,084,433 \text{ VND/ha/year} = 38,119,616 \text{ VND/ha/year}$$

(equivalent to 38,119 million VND)

3.2. The value of carbon absorption

To calculate the CO₂ uptake of mangroves, it is first necessary to calculate the carbon storage of mangroves. Kim Son mangrove forest has 02 dominant main biomes, OT1 and OT2 predominating cobra biomes. According to the People's Committee of Kim Son district, in 2022, the density of cork is 1,600 trees/ha. Density of mangrove tree in forests Kim Son coastal, Ninh Binh is taken equivalent to density in mangroves Xuan Thuy, Nam Dinh similar in natural conditions (3000 trees/ha).

Based on the value transfer method, the study applies the results of carbon accumulation in mangrove forests in the coastal area of the Red River Delta biosphere reserve to calculate carbon sequestration (Table 1).

Table 1. Carbon storage in Kim Son coastal mangroves

Tree	Density (tree/ha)	Carbon storage in plants (kg/tree)
Mangrove	3,000	2.09
Cork	1,600	134.6

Tateda Y., Imamura T.I, 2005

From there, the carbon storage of each OT1, OT2 community in a year can be calculated, shown in Table 2:

Table 2. Total carbon accumulation of biomes

Communities	Tree	Density (tree/ha)	Carbon storage in plants (kg/tree)	Total carbon accumulation in the community (ton/ha)
OT1	Mangrove	3,000	2.09	6.207
OT2	Cork	1,600	134.6	215.360

Determine the average amount of carbon dioxide (CO₂) absorbed by mangroves in a year according to the formula based on IPCC (2006):

$$\text{Total CO}_2 \text{ absorbed (ton/ha)} = \text{Total carbon accumulation (ton/ha)} \times 3.67$$

In which: 3.67 is the conversion coefficient calculated for all forest types.

The results of CO₂ absorption of Kim Son mangrove forest are shown in Table 3

Table 3. Amount of CO₂ absorbed by Kim Son mangrove forest

Communities	Amount of CO ₂ absorbed (tons/ha/year)
OT1	22.78
OT2	790.37
Average	406.58

From the reference to the carbon tax rates of the countries, this study applies an average fee to cut CO₂ of 26 USD/ton. From there, the average value of CO₂ that the mangrove forest at Kim Son is equivalent to is USD 10,571.08/ha/year. Calculated at the PPP purchasing power parity rate, the value of CO₂ In VND is:

$$23,477 * 10,571.08 = 248,177.245 \text{ (VND/ha/year) (equivalent to 248.177 million VND)}$$

3.3. Value of new alluvial land

The development of mangroves and the expansion of the alluvial land are two processes that always go hand in hand. Mangrove roots, especially densely planted pioneer plants, have the effect of making sediment accretion faster, both blocking the impact of ocean waves, reducing wind speed, and acting as an obstacle for sediments. deposition. Mangroves also have the effect of limiting erosion and coastal erosion processes.

Table 4. The dike crossing and expansion of alluvial area in Kim Son district in the period 1959-2019

Dike	Year	Expanded area
Dike Binh Minh 1	1959	877.92 ha
Dike Binh Minh 2	1980	1,649.48 ha
Dike Binh Minh 3	2008	1,958.69 ha
Dike Binh Minh 4	2019	2,600 ha

Thus, the accretion area in the period 1959-2019 is the total area from Binh Minh 1 dike to Binh Minh 4 dike, that is:

$$1,649.48 \text{ ha} + 1,958.69 \text{ ha} + 2.600 \text{ ha} = 6,208.17 \text{ ha}$$

Thus, the average annual accretion land area in the period 1959-2019 of Kim Son district (60 years) is:

$$6,208.17 \text{ ha} : 60 \text{ years} = 103.4 \text{ ha/year}$$

Assume that the additional area of alluvial land is completely used for aquaculture purposes with the value of products obtained per 1 hectare of aquaculture water surface in Kim Son district (in 2021) is 277.1 million VND/ha.

So, each year, the value brought from land accumulation in Kim Son district is:

$$103.4 \text{ ha} * 277.1 \text{ million VND/ha} = 28,671.39 \text{ million VND (28,671,398,450 VND)}$$

This is also the indirect value brought by 633.25 ha of Kim Son mangrove forest, so the value of new accretion land per hectare of Kim Son mangrove forest per year is:

$$28,671,398,450 : 663.25 = 43,228,644.47 \text{ VND/ha/year (equivalent to 43.228 million VND)}$$

From there, we have a summary table of indirect use values of Kim Son mangrove forest from protection, carbon sequestration and new alluvial values (Table 5)

Table 5. Summary of indirect value per hectare of Kim Son mangrove forest in 1 year

	The value of damage prevention against storms and salinity (I)	The value of CO2 absorption (II)	Value of new alluvial land (III)	Total indirect use value of Kim Son mangrove forest (I+II+III)
Amount of money (million VND)	38.119	248.177	43.228	329.524
Percentage	11.57%	75.31%	13.31%	100%

4. Discussion and Conclusion

4.1. Discussion

The value of protection against waves, reduction of saline intrusion due to sea level rise in the context of climate change, and reduction of damage caused by storms are evaluated by the construction cost of a dyke of the same length as the length. mangroves. Besides, the mangrove forest also acts as a casuarina forest with windbreak effect. The protection value of Kim Son mangrove forest is 38,119 million VND/ha/year, accounting for 11.57% of the total indirect use value of Kim Son mangrove forest.

Compared with the study of the author Tran Thi Thu Ha & nnk (2022), the value of protection against erosion of Can Gio mangrove forest is estimated at 21.3 million VND/ha/year. Kim Son salinity is higher because in this study, the wind protection value is

taken into account (equivalent to the role of casuarina forest). However, this calculation does not fully represent the protective value of mangroves. During storms, mangroves not only protect the dyke, but also protect all assets including the value of aquaculture ponds and the lives of people inside the dyke. Therefore, the protection value of mangroves, if fully calculated, will include the value of aquaculture, properties and works of people inside the dyke.

The value of CO₂ absorption of Kim Son mangrove forest is 248.177 million VND/ha, accounting for 75.31% of the total indirect use value of Kim Son mangrove forest. This value is equivalent to the high carbon sequestration value of Can Gio mangrove forest of 211,042 million VND/ha (Tran Thi Thu Ha, 2022). For more rigorous calculation results, it is necessary to calculate the area of dominant and remaining communities through standard plots to determine the total carbon accumulation in the entire mangrove area.

The value of creating new alluvial soil of Kim Son mangrove forest is 43,228 million VND/ha, smaller than the value of Xuan Thuy mangrove forest which is 54.75 million VND/ha (Thanh Viet Nguyen et al) due to the increased area due to accumulation of Xuan Thuy is larger (355.3 ha/year) compared to 103.4 ha/year of Kim Son.

It can be seen that the calculation of economic values of mangroves has different results, depending on the time of evaluation (market price, replacement price), parameters, Therefore, in each specific case, the application of evaluation methods and criteria is most appropriate in each mangrove area.

4.2. Conclusion

Mangrove forest is a forest that develops on marshy, saline soils in estuaries, coastal areas, along rivers and canals with brackish water due to daily rising and falling tides. Mangrove forest is a transitional forest between the tropical tidal forest ecosystem and the mainland in the tidally affected area.

The indirect use value of Kim Son mangrove forest includes the protection value of VND 38.119 million/ha/year, accounting for 11.57% of the total indirect use value of Kim Son mangrove forest. The CO₂ consumption of Kim Son mangrove forest is 248.177 million VND/ha, accounting for 75.31% and the value of creating new alluvial land of Kim Son mangrove forest is 43.228 million VND/ha, accounting for 13.31% of the total value. .

On the basis of studying the actual use and protection of mangroves and quantifying the use value of mangroves in Kim Son district, Ninh Binh province, some issues discovered for effective management of mangroves are as follows: :

** Effective planning and management of mangrove land*

Effective mangrove protection requires policy changes in land use planning that address the root causes of deforestation and forest degradation. This must be considered as an interdisciplinary plan, it is necessary to strengthen inter-sectoral coordination in the management, use and restoration and development of mangrove forests of coastal provinces.

Immediately review and re-evaluate the planning, clearly define stable forest areas among communes, between forest types, and review the management and use of forest land between planning and reality. Strictly control projects that use land planned for forestry. Minimize the conversion of forests to other purposes other than forestry. Resolutely suspend and recover land for projects that change forest land use purposes that commit violations or pose a risk of great damage to the forest, ecological environment, seriously affecting production activities and life. live people.

** Improve community awareness and participation in mangrove protection*

The fact shows that the forest area is reduced in quantity and quality because a part of people are not aware of the importance of mangroves. Therefore, it is necessary to propagate to social organizations and communities in coastal areas with mangroves about the role and value of mangrove ecosystems as well as the importance of sustainable management and use. mangroves for immediate and long-term benefits.

Through field survey, the exploitation of aquatic products under the mangrove canopy usually follows the direction of the receding water. In the coastal area of Kim Son district, this exploitation is usually done in the evening and at midnight, so it is easy to affect the young tree parts of the mangrove forest. Therefore, in addition to raising people's awareness about mangrove protection, it is necessary to have strict regulations on the areas of forest that are being supplemented or newly planted to avoid exploitation of new forest trees. plant.

** Building sustainable economic models*

It is necessary to build economic models that combine forest management and protection and aquaculture; create long-term stable livelihoods for people living near the forest, apply science and technology in aquaculture. Building a seedling nursery to reduce product costs and reduce risks when planting trees with fruit, forest owners have additional income by selling seedlings to have more funds for forest protection.

COMPARING THE INFLUENCE OF RICE HUSK BIOCHAR AND MAIZE STALK BIOCHAR ON THE INHIBITION OF CADMIUM UPTAKE BY PAK CHOI

Dr. Tran Thi Anh Thu

thutta@tdmu.edu.vn

MSc. Ho Thi Ha

hoha.131094@gmail.com

Faculty of Management Science, Thu Dau Mot University, Binh Duong, Vietnam

Abstract

*In this study, we aimed to explore the potential effects of biochar (rice husk biochar-RS and maize stalk biochar-MS) on the inhibition of cadmium (Cd) bioavailability to pak choi. Pot experiments with exposure to different dosages of cadmium sulfate ($3\text{CdSO}_4 \cdot 8\text{H}_2\text{O}$) and biochar (RS and MS) were treated. To compare the influence of RS biochar and MS biochar on the bioavailability of Cd, the levels of total Cd in different pak choi (*Brassica chinensis* L.) tissues (roots and shoots) and the distribution changes of Cd fractions in soil were determined. Results showed that RS biochar application reduced the concentrations of Cd in pak choi tissues more than MS biochar application. Thus, RS biochar application plays a more important role than MS biochar application in limiting the absorption and bioaccumulation of Cd in pak choi. Notably, this role may only be significant when biochar exposure at medium biochar content (2%). This affirmed the importance of the Cd fractions transformation in the assessment of their bioavailability.*

Keywords: *Biochar; Cadmium; Fraction; Pak choi*

1. Introduction

Cadmium (Cd) is one of the most toxic pollutants because of its high toxicity and persistent accumulation in the environment and in the food chain. Cadmium ions enter agricultural soils through anthropogenic activities, such as metalliferous mining, pesticide, fertilizer, and sewage irrigation. Cadmium ions are taken up by plants root and transported to edible plants parts, induce detrimental effects on plants growth and productivity, then pose a potential threat to human health. Therefore, to reduce toxic Cd concentrations, promote agroenvironmental sustainability and food safety, feasible countermeasures for the remediation of Cd-contaminated farmlands are urgently needed.

Over the past several decades, techniques such as soil washing, low-temperature thermal desorption, and phytoremediation have been applied to the treatment of heavy metals (HMs)-polluted soils. Although soil washing method can remove soluble and exchangeable HMs from polluted soils, it can also remove essential soil elements. The soils disturbance associated with soil washing also needs to be considered. The effects of thermal treatment on soil properties require careful balance. Therefore, other approaches that can maintain essential soil elements while reducing Cd accumulation in plants need to be identified.

The previous studies have proved that biochar is a highly stable materials that contains a negative charge on the surface, which can retain metals. The adsorption of metals on the surface of biochar reduces the risk of HMs exit to a longer extent due to the high durability of biochar. The study predicted that biochar could play an important role in limiting the mobility, bioavailability and toxicity of Cd in soil.

In this study, we mainly aimed at comparing the influence of RS and MS biochar application on the inhibition of the Cd bioavailability in pak choi based on the determination of total Cd levels and the distribution of Hg fractions in soil. The concrete objectives include: 1) clarification of the potential difference between RS and MS biochar application on Cd uptake and translocation of pak choi; 2) exploration of the insight of inhibition mechanism of Cd phytotoxicity from the changes of Cd fractions in soils; 3) determination of the appropriate level of biochar that will significantly prevent the uptake of Cd by pak choi.

2. Method

2.1. Experimental Materials

Agricultural soils were collected at a depth of 0 cm to 20 cm at the Chom Sao area, Hung Dinh commune, Thuan An town, Binh Duong Province, Vietnam according to Environmental Quality Standard of Vietnam (TCVN 5297:1995). Soil samples were completely air dried at room temperature, homogenized, and passed through a 5 mm sieve. The experimental soil is clay loam soil that basic physicochemical properties were as follows: proportion 3.09 g/cm³; density 1.15 g/cm³; humidity 21.1 %; pH 5.8; total N 0.132 %; total P₂O₅ 0.032 %; total organic carbon 4.07 %; and total Cd 0.6 mg/kg.

2.2. Pot experiments

Biochar was produced at 500 °C in an anaerobic environment and kept for 8 hours. The biochar was cooled to room temperature, pulverized and passed through a 2 mm sieve. The characteristics of biochar are show in Table 1.

Table 1. The characteristics of RS and MS biochar

Characteristics	Grain Size (mm)	Total C (%)	Total N (%)	Total H (%)	Total S (%)	pH	Surface Area (m ² /g)	Average hole diameter (nm)	Total Cd (mg/kg)
RS biochar	1.5 - 2.0	71.21	1.15	2.38	0.78	9.56	8.87	16.23	0.02
MS biochar	1.5 - 2.0	65.63	0.87	2.11	0.12	10.28	8.87	2.67	0.01

The dosages of metal exposure to soil samples in this study are set as 0, 1, 3, and 6 mg/kg soil for Cd (added as 3CdSO₄.8H₂O). One treatment without biochar and Cd was prepared and set as the control treatment. This experiment completely randomized designs with three replicates, including a total of 66 pots for 22 treatments (Table 2).

Table 2. Cadmium, biochar contents in single and combined treatments

Treatment	Content		Nghiem thức	Content		Nghiem thức	Content	
	Cd (mg/kg)	BC (%)		Cd (mg/kg)	RS (%)		Cd (mg/kg)	RS (%)
Cd1BC0	1	0	Cd3BC0	3	0	Cd6BC0	6	0
Cd1BC1	1	1	Cd3BC1	3	1	Cd6BC1	6	1
Cd1BC2	1	2	Cd3BC2	3	2	Cd6BC2	6	2
Cd1BC3	1	3	Cd3BC3	3	3	Cd6BC3	6	3

Note: BC: biochar; RS and MS biochar of each treatment are the same content.

Different concentrations of Cd-spiked solutions were aspirated on dry soil with a plastic nebulizer. After adding chemicals and mixing biochar, the soil was homogenized and equilibrated for 70 days, basal fertilizer that comprised 0.15 g/kg N (urea, AR) and 0.033 g/kg P (monopotassium phosphate, AR) were thoroughly mixed in a plastic pot (diameter: 18 cm; height: 15 cm) containing 2.5 kg of the equilibrated soil. The soil moisture content was kept at approximately 70% water holding capacity at equilibrating period. The pak choi seeds were sowed in each pot, and the seedlings were thinned to five in each pot after 10 days of germination. The plants were grown in pots in the greenhouse and watered periodically to keep soil moisture at 70% of the field capacity. Plants were harvested after 38 days.

2.3. Sample preparation

Soil samples were collected from each pot. Then, the soil samples were placed in the sealed polyethylene bags to prevent cross pollution, completely air dried at room temperature, homogenized, and allowed to pass through a 100-mesh sieve (0.15 mm) for chemical analyses of total Cd concentrations and fractions. Pak choi samples were thoroughly washed with deionized water, and their shoots and roots were separated. The samples were oven dried at 90 °C for 30 min and kept at constant weight at 50 °C. The dried samples were ground into fine powder and then stored in a dark room at room temperature.

2.4. Chemical Analysis

2.4.1. Determination of Hg concentration in plant and soil

Plant samples were digested using 2:3:8 (v/v) HClO₄ - H₂SO₄ - HNO₃ at 110-130°C, whereas soil samples for determining Cd concentrations were digested with an oxidative acid mixture of 3:1 (v/v) HNO₃-HClO₄ at 160 °C. In a typical procedure, 0.5 g of each sample was precisely weighed in a 100 mL glass tube. HNO₃ and HClO₄ with a combined volume of 10 mL was added and kept overnight at room temperature. Acid digestion was conducted

in an automatic temperature-controlled furnace until the digestion solution became clear. After acid digestion, the sample solutions were cooled and diluted with deionized water in a glass tube. Cadmium concentration in the digestion solution was determined with an atomic absorption spectroscopy (AAS AA-7000, Shimadzu Corporation, Kyoto, Japan) system according to the Standard Method TCVN 6496:2009 developed by the Ministry of Natural Resources and Environment of Vietnam.

2.4.2. Determination of Hg fractions in soil

Cadmium fractions analysis applied the five-step sequential extraction method. According to this method, Cd fractions were divided into exchangeable, bound to carbonates, bound to Fe-Mn oxidates, bound to OM, and residual fractions.

- (1) Exchangeable fraction (EXC-Cd): 0.1 mol L⁻¹ NH₄HAC 25 °C, shaken for 2 h, liquid/soil = 10:1;
- (2) Bound to carbonates fraction (CAB-Cd): 1 mol L⁻¹ NaAc 25 °C, shaken for 2 h, liquid/soil = 10:1;
- (3) Bound to Fe-Mn oxidates fraction (FEM-Cd): 0.1 mol L⁻¹ NH₂OH + 0.01 mol L⁻¹ HCl 25 °C, shaken for 0.5 h, liquid/soil = 10:1;
- (4) Bound to OM fraction (OM-Cd): 0.01 mol L⁻¹ HNO₃, 30% H₂O₂ heated for 2 h in 85 °C, shaken intermittently, liquid/soil = 10:1;
- (5) Residual fraction (RES-Cd): 15 mL of HNO₃, 5 mL of HF, 5 mL of HClO₄, heated to 300 °C for 2 h, until the solutions became clear.

The extracted supernatant was analyzed by AAS.

2.6. Statistical data analysis

Data were subjected to statistical analysis using SPSS 20.0 software. All results are presented as the mean ± standard deviation of three replicates. This study used Dunnett's multiple comparison test of one-way ANOVA. For all tests, $P < 0.05$ was considered as significant difference.

3. Results and Discussion

3.1. Changes of Cd fractions for different biochar applications

The distributions of Cd fractions in the soils with different content of biochar and Cd are presented in Figure 3.1. Cadmium fractions were arranged following the sequential mobile levels; such as mobile fractions (EXC-Cd, CAB-Cd), semi-mobile fractions (FEM-Cd, OM-Cd), and non-mobile fractions (RES-Cd). Before planting, Cd mainly existed in FEM-Cd (36.1%) and RES-Cd fraction (37.1%) in the native soil (control). According to the principle of hard and soft acids and bases, the 'classic' trace metals (Cu, Co, Ni, Al, Cd, and Zn) have strong binding abilities with hard ligands (O-

containing functional groups). Moreover, the other stable fractions also accounted for 12.7% (OM-Cd) of the total soil Cd; whereas the mobile fractions were rather low (5.3% EXC-Cd, 8.8% CAB-Cd).

For single Cd treatments, Cd tends to increase in mobile fractions. Comparing with the control, the researchers found that the proportions of EXC-Cd (56.8%), and CAB-Cd (26.1%) fractions significantly increased (3.0- to 10.7-fold) with the maximum value at the highest Cd level (6 mg/kg) when exogenous Cd were amended.

However, when soils were simultaneously exposed to Cd and biochar, Cd tended to transfer into stable fractions, indicating that biochar can enhance the compact Cd binding in soils. For RS biochar application, the proportion of RES-Cd fractions were markedly increased to 30.8%-422.5%, when compared with non-amended biochar; the maximum increasing proportion was at biochar 3%. However, EXC-Cd, CAB-Cd, FEM-Cd, and OM-Cd decreased to 11.6%-80.0%; 0%-47.2%; 7.8%-56.6%; 3.7%-80.0% compared with single Cd treatments. For co-exposed Cd and MS biochar, the distributions of Cd fractions also change following a similar trend but less effective. The proportions of RES-Cd fractions were less increased by 12.5%-334.3%; and the mobile and semi-mobile fractions, such as EXC-Cd, CAB-Cd, FEM-Cd, and OM-Cd were also less decreased by 6.4%-54.2%; 0%-36.8%; 7.0%-37.5%; 1.2%-80.0% compared with single Cd treatments. These results suggested that biochar application can also enhance the Cd binding in soils, but this binding is weaker than that in the MS biochar treatments.

The results of this study showed that although biochar application increased the organic matter content in the soil, the proportions of OM-Cd did not increase correspondingly as expected. These results are in full agreement with the previous study, Zubair et al. (2021) also showed that the addition of biochar significantly affected Cd mobility by reducing the fractions bound to organic matter, bound to carbonate, bound to Fe/Mn oxide; while increasing fractions of residual Cd (Zubair et al., 2021).

The conversion of Cd mainly to the immobilization fraction reduces the concentration of Cd in the soil solution, leading to a decrease in Cd bioavailability which can be explained by the following mechanisms: 1. Physical adsorption to the sites biochar activity site, ion exchange and complexation with its surface functional groups (eg, OH, COOH, R - OH) (Coumar et al., 2016); 2. An increase in soil pH enhances Cd calcification through precipitation between Cd and sulfate, carbonate, hydroxide and phosphate anions released from biochar (Gonzaga et al., 2020); 3. Biochar increases Fe concentration, increasing the fixation of Cd in soil.

Figure 1. The Cd fractions proportions in soils for biochar application

3.2. Effects of biochar application on Cd bioavailability

The concentrations of Cd in various parts of pak choi for different treatments are shown in Figure 3.2. For the single Cd treatments, Cd concentrations in plants increased along with elevated Cd exposure levels. Comparing with the control, the researchers found that the maximum Cd concentration were increased by approximately 5.7- and 11.1-fold in shoots and roots of pak choi, respectively, indicating that Cd concentrations in roots is considerably higher than in shoots.

However, when pak choi were simultaneously exposed to Cd and biochar, biochar can inhibit the Cd phytotoxicity of pak choi; this inhibition completely depended on biochar species and doses. Indeed, the decreasing proportion of Cd in pak choi shoots for RS biochar treatments (11,9%-67,3%; $P < 0,05$) was higher than that for MS biochar treatments (7,0%-39,1%; $P > 0,05$), and a sharp decline of Cd accumulation was found at the highest biochar level (3%) treatment. From these results, the application of appropriate levels (3%) of RS biochar is an easy way to inhibit Cd accumulation in pak choi.

Previous studies have also demonstrated that biochar effectively inhibits Cd bioavailability. Jing et al. (2020) reported that when applying biochar prepared from wheat straw at a concentration of 40 tons/ha, the Cd concentration in the soil solution was reduced by 49.4% compared to the control treatment. Biochar reduced the concentration of Cd in the vegetable by 27.2% and 41.1%, respectively, when applied at content of 2.5 and 5 g/kg (Coumar et al., 2016). Sayyadian et al. (2019) found that the concentration of heavy metals in roots and shoots of maize were significantly reduced when the rate of biochar application increased compared to the treatment without biochar.

Figure 2. The concentrations of Cd in pak choi tissues: in shoot (A), in root (B)

Data are presented as means±SD (n=3). The stars indicate significant difference from no biochar treatments (One-way ANOVA, followed by Dunnett's test, * $P < 0.05$; ** $P < 0.01$).

3.3. Correlation between different Cd fractions in soil and uptake of Cd by pak choi

To consider the changes of Cd fractions and binding strength on Cd bioavailability in soils, we analyzed the correlations between them (Table 3.1).

The result showed that the uptake of Cd by shoots and roots were significantly positively correlated with both EXC-Cd and CAB-Cd fractions ($R^2 > 0.8$, $p < 0.01$); while they were significantly negatively correlated with RES-Cd fractions ($R^2 > 0.7$, $P < 0.01$). However, no correlation was observed with OM-Cd và FEM-Cd ($R^2 < 0.55$, $P > 0.05$) for RS biochar application but they were significantly negatively correlated ($R^2 > 0.7$, $P < 0.01$) for MS biochar application. This analysis only prioritizes the correlation of the mobile

fractions, such as EXC-Cd and CAB-Cd fractions, possessing high availability and easy absorption by plants. Whereas the semi-mobile fractions had lower availability posed to almost only exist in soils.

Table 3. Correlation between Cd fractions in soil with the uptake of Cd by pak choi

Correlation coefficient	RS biochar					MS biochar				
	EXC-Cd	CAB-Cd	FEM-Cd	OM-Cd	RES-Cd	EXC-Cd	CAB-Cd	FEM-Cd	OM-Cd	RES-Cd
Cd in shoot	0.945**	0.839**	-0.419	-0.405	-0.811**	0.979**	0.922**	-0.803**	-0.763**	-0.713**
Cd in root	0.964**	0.893**	-0.540	-0.532	-0.739**	0.973**	0.953**	-0.796**	-0.783**	-0.720**

4. Conclusion

In this study, we demonstrated that the reducing of Cd bioavailability fully depends on the biochar application species with pak choi. The RS biochar application plays a more important role than MS biochar application in limiting the absorption of Cd in pak choi. Notably, this inhibition may only significantly occur when biochar is at an appropriate level (3%). In addition, the good correlations between the proportion of mobile Cd fractions (EXC-Cd and CAB-Cd fractions) with the Cd concentrations in plants were observed, indicating that they all can be used to predict Cd bioavailability in soil. In conclusion, this study clarify comparing influence of RS biochar and MS biochar in inhibiting Cd phytotoxicity to pak choi, the importance of the transformation of fractions in the assessment metals bioavailability, and provides a useful reference to select biochar species.

RELATIONSHIP BETWEEN CIRCULAR ECONOMY PRACTICES (CEP) AND SUSTAINABLE PERFORMANCE (SP) - THE CURRENT STUDY OF VIETNAMESE CONSTRUCTION MATERIAL INDUSTRY

*PhD student. Nguyen Dieu Linh
nguyendieulinh.dtn@gmail.com*

Faculty of Planning and Development, National Economics University, Hanoi, Vietnam

Abstract

Circular economy practices (CEP) is currently being prioritized in construction enterprises, particularly in construction materials production. After carrying out a context-based investigation and reviewing theories related to circular economy, sustainable performance (SP), the author has focally researched qualitative method on enterprises in Viet Nam from 2020 to 2021 in order to theorize hypotheses for coming statistical hypothesis test that will be finished by 2023. The objectives of current study are to explore the impact of CEP on products in construction materials manufacturing enterprises in Vietnam; develop model analysis and evaluation; suggest implications. However, the study is being on quantitative progress, key findings are identified from qualitative results: 4 sub-factors (resource consumption; environmental technology; sustainable supplier; environment practices) and awareness of Dynamic Capability (DC).

Keywords: *Circular economy practices, construction enterprises, construction materials, sustainable performance.*

1. Introduction

In recent years, Vietnam has made many environmental commitments in new-generation free trade agreements such as EVFTA and CPTPP. The commitments aim to minimize the impact from economic development on the natural environment and build a social model following the trend of sustainable development on all three pillars: economic, social and environmental (J. Wu et al., 2014).

Currently, the circular economy (CE) is considered an important component in sustainable economic development (Genovese et al. 2017). At the same time, the knowledge economy is built in parallel with regulations and policies from the government and efforts from all levels of government to create a strong green (Zeng et al., 2017) business system. In the knowledge-based economy, enterprises comply with environmental protection policies and consciously reduce waste and environmental pollution, and share useful resources (green materials, clean energy, efficient information, etc.) infrastructure and natural resources) and integrating the use of clean production forms is important (Bai et al., 2020a; C. J. C. Jabbour et al., 2019a). Along with that, when enterprises raise their awareness and carry out activities with more focus on sustainable development trends, they will bring

more economic benefits, social efficiency and improve environmental quality (C.-H. Yu et al., 2015). Stemming from the positive effects of the circular economy on enterprises, many previous studies have investigated the activities of enterprises in the process of implementing a circular economy (CEP) with the aim of achieving Sustainable Performance (SP) . Not only that, a number of studies have assessed the impact from CEP to SP with the intermediate influence being Sustainable Supply Chain Flexibility (SSCF) or Dynamic Capability (DC) in the context of economic events. many fluctuations (LAWSON & SAMSON, 2001).

Although the study of the self-contained economy has received attention from many scholars around the world, there are still limited studies evaluating the role of CEP in the development of the SSCF of enterprises (Bai et al., 2020a). Most studies have investigated the association between the concepts of CEP, SSCF, DC, SP in a distributed manner with little attention paid to understanding how this construct interacts with each other (Chirra et al., 2021a). This is considered a major limitation in the approach of many researchers - the research is in the form of preliminary inquiry, simple analysis and lack of an overall view. At the same time, due to the concept of CEP, SP is still limited in Vietnam; CEP is a new business and economic model (Edwin Cheng et al., 2021b) and not much empirical research has been done on CEP, SP (Bai et al., 2020a; Chirra et al., 2021b). In particular, there has been no research in Vietnam showing the influence of CEP on products in enterprises in the construction industry, specifically in the field of building materials (building materials) .

Currently, a number of enterprises in the field of building materials in Vietnam have prioritized sustainable development through the use of high and environmentally friendly technologies, activities related to the community and the environment, and application of support policies. support workers. However, actions towards CEP from building materials enterprises have not taken place continuously, so they have not created products for enterprises.

2. Theoretical framework

2.1. Circular economy practices

The basic economic model is applied to natural resource recovery activities. It aims to replace the traditional linear economic model of fast and cheap production with the purpose of producing durable goods, applying repair and recycling. In general, the application of production models based on the circular economy will have the aim of prolonging the life of the product, promoting repair, upgrading, reuse, and ultimately recycling into raw materials instead. because it is discharged into the environment. The general-purpose model is to simulate processes similar to those occurring in the natural environment (European Parliament, 2015).

Conceptually, there is no general agreement on the definition of a sustainable development economy, so the ways in which the basic economy, linear economy or sustainable development will be linked, compared in different ways can be applied to reality. However, scientists all agree that the implementation of a theoretical economy is an effective solution in sustainable development. For scholars in the field of environmental economics, sustainable development is a concept that is still independent, a social goal formed at the

macro level and includes many broad concepts of ecological sustainability, economic development, if the application of the market economy can bring better results for society, towards sustainability, then it is one of the effective tools for sustainable development (Bartelmus, 2013; Geng & Doberstein, 2008).

2.2. Theory of Dynamic Capabilities

The dynamic capacity theory proposed by (TEECE & PISANO, 1994) is based on the theoretical perspective on the strategic source of the enterprise (J. Barney, 1991; J. B. Barney, 1986). Based on the resource theory, firms in the industry operate differently because they have different types of resources (J. Barney, 1991; J. B. Barney, 1986), however, the resource-based theory is considered static in nature and is not sufficient to explain the competitive advantage of firms in changing the business environment (Priem & Butler, 2001). In addition, the resource-based view of enterprises is to consider unique and difficult to imitate resources so that the enterprise can have a solid competitive advantage for long-term growth (J. B. Barney, 1986), and the process of maintaining a competitive advantage is dynamic (Hung et al., 2010). As a result, scholars have made the claim that in order for companies to remain competitive in the business market, they need to develop their specific capabilities as well as undergo continuous learning. Argyris & Schon, 1978; Jashapara, 1993; Zott, 2003), comes from a dynamic point of view, especially in this new and ever-changing environment (Wilden et al., 2013). Indeed, the lack of dynamism limits firms to maintain their competitive advantage, especially in variable environment (Gnizy et al., 2014). Based on the previous research literature, an increasing interest in dynamic competence theory can also be seen, which also shows that dynamic capacity is a strong foundation for dealing with the complexity of the environment and international business (Hsu et al., 2013).

Indeed, scientists have also shown the product relationship between DC and the performance of enterprise based on experiments (Hung et al., 2010). The impact of firm dynamics on firm performance has also been demonstrated in different firms and in different DCs. From an international business perspective, (Luo, 2000) found that exploiting dynamic capabilities can increase a company's expansion in the international market and at the same time increase solid performance.

According to (Teece et al., 1997a), the initial proposals of DC also assert that it has a direct relationship with firm performance. (Zollo & Winter, 2002) also identified this direct relationship and emphasized that if the enterprise does not have the ability to be dynamic in the changing environment, the superiority and development of the enterprise is only temporary. Again reaffirmed by (Teece, 2007), whereby, the development of core competencies is identified as competitive advantages at the enterprise level and it also contributes to the success or failure of that enterprise.

However, there are also arguments about a direct relationship between DC and firm performance. As mentioned (Eisenhardt & Martin, 2000) also argued that the DC factor alone cannot guarantee the competitive advantage of enterprises, but the arrangement and stabilization of resources of enterprises are created by DC in a way. will lead to competitive

advantage. (Zott, 2003) also talked about the modification and change of the company's resources through the new DC, leading to the operational efficiency of the enterprise, not just the DC factor. (Eisenhardt & Martin, 2000) have also suggested that when firms are highly variable, they have an advantage over their competitors, indeed, (Zott, 2003) have also stated that firms have A good DC can develop different types of resources and produce different levels of performance as a result.

Furthermore, it should be noted that DC is not like other specific capabilities like supply chain or R&D etc. (Gnizy et al., 2014), which, in fact, DC represents as a spiritual resource, sustains the competitiveness of enterprises, especially in today's ever-changing environment (Wilden et al., 2013). DC is also associated with organizational factors such as habits, processes, management, learning (Easterby-Smith et al, 2009) and the ability to adapt, absorb and create (Grant, 1996; Pisano, 1994; Wang & Ahmed, 2007).

2.3. Sustainable Supply Chain Flexibility

The Sustainable Supply Chain Flexibility (SSCF) was first introduced by Slack, which, according to him, is the ability to respond to customer needs in a timely manner (Slack, 2005). (G. Li & Ma, 2009) also believes that supply chain flexibility refers to resource sharing, business integration and optimization, and cooperation between member enterprises in the supply chain to achieve the ultimate goal of satisfying customer needs at the lowest cost. Although the SSCF concept has not yet reached a broad consensus in academia, researchers also believe that supply chain flexibility is the ability to deal with uncertainty and meet customer expectations. goods (Gosling et al., 2010; Rojo et al., 2016). Supply chain flexibility is an important element of a business's dynamic ability to positively improve supply chain resilience and enhance its competitiveness. In this complex and volatile market, businesses need to actively improve the flexibility of the supply chain to reduce losses that may occur due to uncertain environment (Liu & Zhong, 2012).

2.4. Sustainable Performance (SP)

SP has been researched and proven in recent years. Enterprises tend to adopt sustainable technologies and optimize their operations in a sustainable way to be able to meet customer needs as well as market requirements (Nowak et al., 2011). Consistent with this, business leaders mentioned methods, techniques, and tools to research, analyze, and design business processes including improving cost factors. cost, quality, timing and flexibility, and according to (Seidel et al., 2015) also include sustainability. Based on the theory of three sustainable pillars, products can be approached from three aspects of economy, society and environment, according to which enterprises need to focus on all three factors simultaneously to be able to achieve products in the long term.

Objectives of the study

The overall objective of current study is to explore the impact of CEP on products in construction enterprises (specifically, manufacturing building materials) in Vietnam. Besides, the study sets out the following specific objectives: The theoretical basis system on

the impact of CEP on products in construction enterprises in Vietnam; Model analysis and model evaluation of the impact of CEP on products in construction enterprises in Vietnam.

This paper is organized in the following manner. Subsequently, we describe the methodology, conduct the analysis, discuss the qualitative result. By the end of 2023, the final study proposes solutions and recommendations towards Sustainable Development for Vietnamese construction enterprises, especially in the effective implementation of the concept economy.

3. Method

3.1. Qualitative method

Qualitative research methods create a tight and solid framework for the research work. After understanding the underlying theories and previous models, the study explores potential scales in the real context through qualitative research. The qualitative method chosen by the research is group and in-depth interviews. The goal of this process is to discover potential factors and complete the questionnaire for the survey process.

Interviews were taken from November 1, 2020 to December 15, 2021 with an interview sample of 115 managers from mid-level or higher from 15 construction enterprises across the country that selected according to large, medium and small scale. The interview process took place over two months from November 01, 2020 to December 15, 2021. Interview questions were developed and information about enterprises was collected preliminarily before conducting the interview.

Interviewees in this study are identified as middle-level leaders or higher in Vietnamese construction enterprises (heads / deputy heads of departments and directors, deputy directors). In order to have a representative quantitative survey sample, the study selected the subjects operating in construction enterprises based on the following criteria: size (large, medium and small), region (Northern region), Central, South). The subjects were contacted and scheduled via email with a commitment to ensure anonymity of all participants' personal information.

Research conducted to find out and select interviewees before contacting and expanding to select in many different departments. On average, each interview will conduct 3-5 leaders of the same business. Semi-structured interview method was used to facilitate meeting navigation and to maximize the amount of information collected. The general questionnaire is built first, then based on the operating characteristics of each enterprise, the interviewer will delve into specific contents. During the meeting, the interviewer needs to create a comfortable atmosphere for the subjects and at the same time follow their opinions and thoughts closely to ask appropriate provoking questions.

The interview form was conducted mainly through online software because of time limitations, geographical distance and the unusual situation of the COVID-19 epidemic.

The content of each interview was divided into 4 different sections based on the models and theories given. In the first part, the study was introduced and set out the

objectives. After that, the study found out the perceptions of the subjects about the knowledge economy and its application in the activities of enterprises. Part 2, interviewees were asked about activities related to the supply chain of enterprises and the DC of enterprises will be mentioned. Finally, the author collected the criteria for evaluating the enterprises' products. In order to minimize risks and errors in data collection and processing, the study conducted recording interviews with the support of Nvivo software.

3.2. Qualitative method

The study will be concluded preliminary and official quantitative research and method. Thus, preliminary follows the results of the qualitative research to distribute the preliminary survey sample, with 135 observations in the period from March 2022 to November 2022. The study used quantitative measures and techniques with the support of two software's SPSS.23 and Smart PLS 3.3 to remove unreliable scales, determine the reasonableness of the model, and calibrate as well as adjust the scale and survey form to enter the formal research process.

As the survey questionnaires adjusted from the preliminary research stage, the official research sample was collected from construction enterprises in three regions of Vietnam. Official quantitative research period: December 2022 - up to now with the aim of 608 valid survey questionnaires.

The study still uses two software SPSS.23 and Smart PLS 3.3, but analytical methods and quantitative techniques are performed with a more complete study sample. The study used exploratory factor analysis (EFA) and confirmatory factor analysis (CFA) methods with the aim of removing unnecessary scales and checking the appropriateness of the model. Using the PLS - SEM path model, the relationships in the empirical model were explored. The results of the formal research phase will be used to propose implication for both policy-makers and enterprises.

4. Results

After 21 interviews, 96 pages were compiled from audio files. Research conducted to check, compare with the records to unify information. After that, the information is aggregated and classified with the help of Nvivo software, allowing research to analyze, group factors and find new scales. The qualitative result is epitomized as follows:

4.1. Result on awareness of construction enterprises to circular economy

From the synthesized interview results, the study determined the level of awareness of the leaders (representing their businesses) about the circular economy in the construction industry. In general, the circular economy is not an unfamiliar concept to industry insiders. This is explained by awareness-raising activities from the government and the industry's burning problems related to the environment that have led to the trend of the construction circular economy becoming the core solution of the Vietnamese construction industry. However, awareness of the circular economy is expressed at different levels in enterprises. Mainly, leaders from large enterprises with long-term operating experience will have a

deeper and more comprehensive view of this concept. In contrast, some small businesses have only approached the circular economy from the perspective of recycling and constructive circular production.

“The circular economy is a solution to extend the life of a product without harming the environment.” - Director of a small company in the South.

“The circular economy is about increasing the recycling of materials, increasing the reuse of products and minimizing negative impacts on the environment.” - Sales director of a medium-sized company in Hanoi.

“The circular economy is a new solution that is different from the traditional one-way economy that only cares about exploiting resources to maximize output. The circular economy focuses on the management and use of this resource in a closed circle in many forms such as recycling, repairing, reusing and collecting materials.” - Production manager at a large company in Ho Chi Minh.

“Construction waste recycling is a new program promoted by the company. We work closely with other dealers and dealers to get used construction back into the business cycle. The collection is made full use of human resources at the branches of enterprises and the labor force and consumers in the society, associated with agents and especially freelance workers, etc.” - Production manager at a large company in the South.

It can be seen that the circular economy has been widely spread to construction enterprises in Vietnam. However, the level of awareness and scope of application of this solution is still vague and not deep in many enterprises. However, the construction industry has recorded many efforts and efforts in environmental protection activities. It can be seen that the environmental accounting at enterprises is considered and implemented through many activities from ensuring waste treatment systems, meeting environmental regulations; extending the product lifecycle to the collection of used end products. These factors are completely consistent with the variables describing Circular economy practices (perform cyclical research) respectively Management systems; Eco-design and Investment Recovery Practices have been introduced in the theoretical model.

4.2. Sustainable Supply Chain Flexibility and Dynamic Capabilities of enterprises

Building a sustainable supply chain is interested by construction companies, but most of them focus on large enterprises with a clear ecosystem. However, businesses all react to change and solve problems that may arise in their production and business activities.

“This year has been a difficult year for business as the pandemic has disrupted economic activity. But we depend a lot on imported raw materials, while transportation is both difficult and expensive, raw materials also increase while customer orders are already placed. That's why the company came up with a plan to ramp up its recycling activities to cut costs that are exceeding the plan.” - Chief accountant of a medium-sized company in the North.

“Reverse logistics is an effective solution to help the company perform better in waste management. Recall operations are initiated from retailers back to distributors. We

recover all materials and parts or products that do not meet demand or product packaging, and then restore the economic - MT value of these products. This not only cuts costs, but also helps the company and other partners in the supply chain to reduce waste optimally.” - Strategic director of a large company in the South.

The results show that many construction enterprises in Vietnam have the ability to flexibly transform and adapt quickly to MT to promptly meet the needs of customers. This flexibility is reflected in many factors. Through the results of the interviews, the study has summarized and considered this flexibility based on 4 factors as outlined in the model, respectively Resource consumption; Environmental technology (MT Technology); Sustainable Supplier and Environment practices.

DC is a fairly new term in Vietnamese construction enterprises. However, the expression of DC is still shown in these enterprises. This is especially evident in the context of the outbreak of the Covid-19 pandemic. Enterprises to survive and develop in the industry need innovation and restructuring to adapt to new environmental conditions. Especially facing the difficulty in importing raw materials, enterprises have been constantly looking for new partners. At the same time, the decrease in product consumption during the epidemic season has prompted businesses to restructure and train to improve labor quality, grasp new trends and follow more sustainable strategies. The assessment of DC in enterprises has been studied based on three variables Sensing (Awareness); Seizing and Reconfiguring.

4.3. Sustainable Performance of construction enterprises in Vietnam

The assessment of sustainable development activities is based on three main aspects: economic, social and environmental. Many businesses identify economic activity as the most core factor to help the company develop sustainably because “only when it fulfills its financial obligations well and has annual growth, can the company ensure its different goals and missions.” Activities related to society and community are also interested by businesses, especially in creating jobs for workers, building environment and creating safe working conditions for workers as well as implementing other measures. regimes and obligations for employees. Activities to support and help the community are also promoted, especially support packages for people during epidemics and disaster areas, activities to support medical supplies and food for people. troubled people, etc. The assessment of environmental performance by businesses is based on reducing the amount of waste to the environment, improving recycling activities and prolonging product life cycles, increasing research and development activities of biological products. These factors completely coincide with the three factors that the theoretical model gives, respectively, Economic; Social and Environmental.

Thus, the interview results show that the theoretical model is completely feasible when put into experimental research. Circular economy is an issue of concern and attention in the construction industry in Vietnam. At the same time, the combined results also show a positive relationship between the circular economy and SP in enterprises. Fully aware and deeply implemented the measures of the circular economy help businesses record positive results in the sustainable development strategy. At the same time, businesses that have more flexibility

and adaptability in the supply chain as well as responsiveness to improve competitiveness (DC) also record more clearly positive results. In addition, the difference in size also causes enterprises to have different perceptions and production and business capacities, which is the reason to study using the Size variable as a moderating variable for the empirical model.

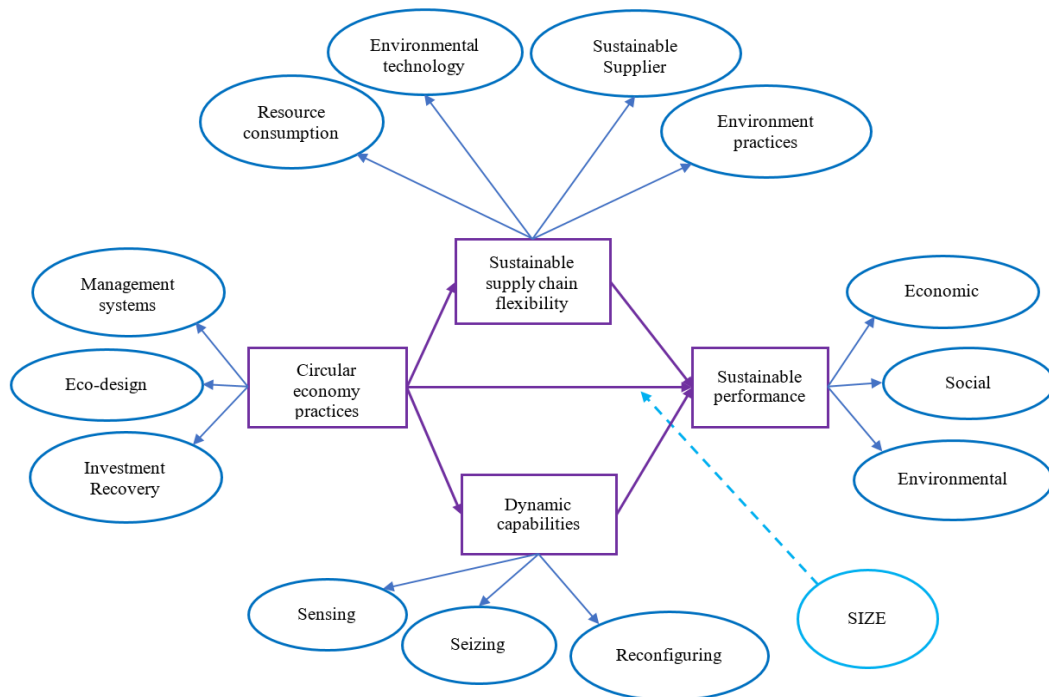

Figure 1. The Empirical Model

5. Discussion and Conclusion

5.1. Main findings

After qualitative research and data collection in preliminary quantitative stage, the study explored informations of 4 sub-factors (resource consumption; environmental technology; sustainable supplier; environment practices) and immediate factor (SIZE) in the expected model that could be identified for testing in the official stage. Besides, only a few of interviewees understand the concept of dynamic capabilities, so they reasked about the relevant activities of enterprises that ensure to interact with the author much more about the role of DC in enterprises and circular economy.

5.2. Limitations

In terms of both theory and practice, the circular economy in Vietnam is still unpopular that make the study face some few of challenges: the research model focuses on the construction industry in Vietnam and has not mentioned or suggested other sectors and fields in the economy. Although it can be seen that the study has marked successful steps in building a fairly detailed model of the correlation of CEP and SP. The last limitation of study is being dealt with data collection and analysis progress that leading to incomplete results and implication suggestion.

5.3. Implications

In context of the rapid development of the world and current market economy, while being well aware of the benefits of implementing a circular economy model is an indispensable requirement for Vietnam today, some implications should be seriously considered in the coming time as follows:

Firstly, focus on encouraging research and innovation. In the view of Stahel (2010), scientists recommend for all levels and fields of technology, society and commerce that research and innovation are the first and foremost factors.

Second, research and innovation play an important role and hold the first place recommended by Stahel (2010) for relevance across all levels and sectors. Specifically, the researcher emphasizes three key areas: technology, society and commerce. According to economists, making assessments and judgments about ecological impacts, the effects of costs and benefits of products is extremely important to determine the production and business efficiency of enterprises. To do these things well, it is necessary to do well in research and creativity at each agency and unit. At the same time, designing innovative products to meet consumer tastes and effectively serve the needs of reuse should become a mandatory goal and requirement of every business. Accordingly, products since the design stage have seen their role and position in the cycle.

Third, completing the legal corridor system to meet the development of the circular economy. Completing the legal corridor is the basis for effectively promoting the development of the circular economy. Therefore, the State needs to amend, supplement and perfect the Law on Environmental Protection. Specifying the specific responsibility of the manufacturer or distributor for the collection, sorting and recycling or payment of the costs of disposing of discarded products. At the same time, the Government needs to strengthen the completion and launch of preferential mechanisms and policies to support and leverage the development of the environmental industry, with the most emphasis being on the recycling industry.

Fourth, strengthening the construction of information systems and communication programs covering the whole country and expanding to the world. Thereby raising awareness of producers and consumers about their obligations and responsibilities towards products throughout their life cycle.

Fifth, encourage maximum internalization of exogenous costs such as pollution and discharge into direct costs of products through tight tax mechanisms. Promote a system of policies to encourage activities that bring benefits to society and establish a mechanism to punish behaviors with negative impacts. For the use of non-recyclable resources, it is necessary to have a policy to limit specific use such as tax increase... Value-added activities should be subject to value-added tax such as mining, construction or production. In addition, this tax does not apply to activities that maintain or preserve value such as a series of reuse, repair and production activities. At the same time, it is important to limit and prevent carbon-emitting activities in combination with promoting activities to reduce emissions...

Sixth, policies and programs set out towards a circular economy must be placed in the context of the Industrial Revolution 4.0, which has basic features such as the networking of all everyday objects, technology, and technology. Cloud computing technology and automation system with artificial intelligence. Because Industry 4.0 will play an important role in promoting the transition from a linear economy to a circular economy.

Finally, the construction and development of an in-depth economic growth model should be promoted. Focusing on using input resources effectively, increasing the application of scientific and technological advances to production processes, especially the process of collecting, sorting and treating waste in order to recycle materials.

Abstract

Homestay is a relatively new type of tourism developed in the world and in Vietnam. Phu Yen province has great potential to develop homestay tourism. The article analyzes and evaluates the development of homestay tourism in the coastal area of Phu Yen province. With that goal, the author has conducted a survey of 30 typical homestay business households in the coastal area of Phu Yen province, combined with an analysis of the actual development of this type of tourism. The survey results show that Phu Yen has great potential for homestay tourism development, the development of homestay will contribute to socio-economic improvement, protection of environmental resources in the coastal area of the province.

Keywords: *development solutions, type of homestay tourism, Phu Yen.*

1. Introduction

Homestay is a type of tourism based on the local community in which visitors will eat, stay and live with local people. Following the trend of developing homestay tourism of the world and Vietnam, homestay tourism in Phu Yen has begun to kick in and show signs of prosperity in some coastal areas. Through the survey, Phu Yen currently has 30 homestays in operation, of which only 4 homestays operate in the true nature of homestay with experiencing real life like being at home with local people, while most other establishments are only a form of homestay accommodation.

Therefore, it is necessary to have a specific analysis of the current situation of homestay tourism in the coastal area of Phu Yen province, thereby offering some reasonable solutions to develop the type of homestay tourism with high socio - economic and environmental efficiency for the province.

The article studies the conditions for the formation and development of homestay tourism in the coastal area of Phu Yen province. From there, find out the current situation of developing homestay tourism in the local coastal area. Finally, propose some solutions to develop homestay tourism in the coastal area of Phu Yen province.

2. Method

2.1. The method of data collection

Primary data of the study is collected through the following process: Step 1: The author consults with industry experts to select a research site. As a result, the author selected 4 coastal districts - towns - cities in Phu Yen province with developed homestay tourism, namely: Song Cau and Dong Hoa towns, Tuy An district and Tuy Hoa city. The objects of the study are households participating in homestay tourism. Step 2: conduct a trial survey (10 questionnaires): the author conducts a trial survey to check the suitability of the questionnaire, and at the same time adjusts the questionnaire to suit the actual conditions. Step 3: conduct a formal survey (30 question names): After conducting a trial survey and correcting the questionnaire, the author conducts a formal survey. After calculating the number of communities directly and indirectly involved in homestay tourism activities, in addition to the conditions of time and project funding, the author proposes a sample size of 30.

2.2. Methods of data analysis

In this study, the author uses the case study method of homestays combined with descriptive statistics tools (criteria such as frequency, average, standard deviation, ..) to analyze the actual status of community participation in homestay tourism organization. At the same time, the expert consultation method is used to refer to solutions to meet the scientific and practicality of the solutions proposed in the research (Nguyen, 2013).

3. Results

3.1. Potential tourism resources for the formation and development of homestay tourism in the coastal area of Phu Yen province

3.1.1. Natural tourism resources

- Topography:

+ Coastal plain: tourism resources with potential for exploitation such as: Bai Bai, Bai Tien, Long Thuy beach, Hon Chua island, Bai Mon, hillocks, sand dunes, coastal sand dunes, coastal brackish water sea and lowlands. With such topographical features, this is a favorable place for the development of marine tourism activities such as swimming, sightseeing, photography, entertainment.

+ Topography of lagoons, bays, beaches: is a resource that plays an important role in the development of the province's coastal homestay tourism... creating a "charming landscape" that is a feature of the beaches. , is an ideal place for leisure activities, entertainment, picnics, camping, swimming, scuba diving and enjoying seafood specialties.

+ Ghenh stone, coastal islands: The coastal area of Phu Yen has 16 islands. Large and small islands include: Yen island, Chua island, Kho island, Pineapple island, Than island,

Nua island, Ro island, Mot island, Ban Than island, Nhat Tu Son island, Mai Nha island, Cu Lao Ong Xa island (*Department of Culture, Sports and Tourism of Phu Yen Province, 2012*).

- *Climate:*

In general, the climatic characteristics of the coastal area of Phu Yen are relatively favorable for the development of homestay tourism with the conditions of sunny weather, clear clouds, clear blue sky, cool all year round. Tourist activities can take place almost all year round, abundant solar radiation creates favorable conditions for sunbathing, relaxation, sightseeing, medical treatment and wintering activities for tourists, especially international tourists. Coming from temperate countries with long, cold winters. The main tourist exploitation period is mainly concentrated in the summer months, from April to August every year (*Pham, 2016*).

- *Hydrography, oceanography:*

+ Hydrology: The coastal area is located downstream of major rivers flowing through the following areas: Ba River, Ky Lo River, Ban Thach River, Cau River, etc., creating an abundant source of fresh water. In addition, there are about 21,000 hectares of water surface in lagoons, bays and estuaries creating a unique coastal ecological zone.

+ Oceanography: The tides in Phu Yen sea area belong to the irregular diurnal regime, the amplitude gradually increases from north to south. It is this marine condition that helps tourism businesses have a way to adjust tours reasonably.

- *Sea and island biota:*

The coastal area has 21,000 hectares of wetlands, 300 hectares of coral reefs, 504 hectares of seagrass beds and 210 hectares of mangroves that are home to many valuable aquatic species (*Nguyen, 2015*).

+ With the unique marine fauna, the coastal waters, especially the bays, and lagoons are very convenient in organizing for tourists to visit, recreated, cruise, go fishing.

+ Marine plants: Phu Yen sea area has 62 species of large-sized seaweed living on coral reefs, belonging to 35 genera, 4 branches, widely distributed in the North of the province; Seaweed is a marine resource because of its ability to stabilize the bottom, synthesize organic matter from inorganic, used as food, and to process specialty candies for tourists to Phu Yen.

+ Coral reefs: there are 151 species of hard corals belonging to 48 genera, 14 families scatteredly distributed, which are narrow strips running along coastal or island waters (*Phu Yen Provincial People's Committee, 2012*).

3.1.2. *Cultural tourism resources*

- *Physical cultural tourism resources*

The physical cultural tourism resources of Phu Yen have 73 monuments and landscapes, of which 22 are national-ranked and 51 are recognized as provincial - level monuments, spreading over 9 administrative units . Particularly, 4 particular coastal

districts, towns and cities account for 46/73 relics - scenic spots. Although accounting for a small proportion, the monuments - landscapes associated with the life of coastal residents play an important role in tourism development because of their uniqueness and characteristics. Tourists coming here besides visiting the mausoleum architecture also understand more about the culture and beliefs of the inhabitants of the coastal area (*Phu Yen Provincial People's Committee, 2012*).

- Intangible cultural tourism resources

+ Festivals in Phu Yen are quite rich associated with the culture and productive labor of the coastal area. Along with that, there are traditional craft villages that have existed for a long time such as making fish sauce, making salt, building ships, weaving nets, farming, catching and processing seafood...

+ Culinary culture: coastal cuisine is one of the cultural tourism resources that stimulate the development of homestay tourism in the coastal area because all visitors have a need to eat when traveling. By enjoying the unique dishes of Phu Yen sea, tourists will fully feel the beauty, beauty and mystery of the sea and the people here.

3.2. Homestay and status of community participation in homestay tourism organization

3.2.1. Homestay

Homestay is a type of "green tourism", "responsible tourism to the community"... When traveling, instead of staying at hotels or motels, tourists stay at the homes of local people to explore the natural - cultural environment in the new land and live close to the local community there. About 6 years ago, the homestay business model flourished in localities in the province.

The trend of homestay business is now quite popular in Tuy Hoa city and other localities in Phu Yen province, meeting the diverse accommodation needs of tourists. In order for the homestay tourism model to develop in the right direction and bring real benefits to the community, besides the investment of private businesses, it is necessary that state management agencies and local government to support, facilitation and guidance. From 1 or 2 establishments, up to now, the whole province has over 30 homestays, not to mention a number of points under construction, of which. Tuy Hoa city is home to the most homestays compared to other localities. Homestays such as Nau, Madam Le's, July, Trai Hoa Vang, PHD, Joy, Lotus, Bon, Say, Ni, Moc Mien... are designed according to different classical and modern trends; All have bunk beds, including individual single rooms, dormitory rooms, family rooms, kitchens, offices and gardens. All are ideal for serving visitors.

However, most homestay establishments just stop at the level of accommodation business, and as for the orientation to develop and create homestay tourism products according to its nature, in the province according to the initial survey, there are only 4 satisfactory homestays. Therefore, the homestays born later need to have a clear orientation to be able to fully exploit and promote their true role, to meet the needs of tourists' actual experiences in the local community.

According to localities, the demand for homestay services will increase sharply in the near future. In order to retain guests, homestays need to develop according to the regional culture, characteristic of coastal Phu Yen, that is, for visitors to experience the real life, understand the regional characteristics, participate in the host family's activities and productions. The owner of the homestay needs to orient visitors and guide visitors to experience the reality. This model will contribute to promoting the image and people of Phu and Yen land.

In Phu Yen province, the homestay model is new, mostly spontaneous; however, the Department of Culture, Sports and Tourism encourages people to develop this model. The homestay model is very likely to be effective in the future and connect with rural areas or form community tourism. The unit has been coordinating with the locality to review, inspect and appraise the conditions of business locations; then have a plan to guide the people.

Some typical homestays: PHD homestay, Dat Phu homestay, Ong Ba Tam homestay, An Hai homestay.

3.2.2. Status of community participation in homestay tourism organization

- *Reasons for participation and non-participation:* According to the actual research results shown in Table 1, there are many reasons for people to participate in the development of homestay tourism in coastal districts - towns - cities. The first thing to mention is creating more income for the family (72.5%), followed by following the local movement (40.0%), matching the family's occupation (29.5%), improving expertise (16.0%) and a number of other reasons. On the contrary, the two difficulties that most affect the ability of households to participate in the development of homestay tourism in the localities are insufficient service facilities (60.5%) and financial inability. (55.4%). In addition, two reasons also contribute significantly to households' participation in providing homestay tourism: lack of human resources (35.5%) and limited professional expertise, especially foreign language proficiency. 43.3%).

Table 1. Reasons for participating and not participating in homestay tourism development

Reason for Participation	Rate (%)	Rating
- Increase income	72.5	1
- Follow the local movement	40.0	2
- Suitable for family occupation	29.5	3
- Advanced level	16.0	4
<i>Reasons for not participating</i>		
- Inadequate facilities	60.5	1
- Inability to finance	55.4	2
- Limited professional qualifications	43.3	3
- Lack of human resources	35.5	4

Source: Author's 30-sample survey data, 2022

- *Time of participation:* The activity of organizing homestay tourism in districts - towns - cities in Phu Yen province has been established for more than 6 years. However, the number of households participating in the development of homestay tourism over 6 years accounts for a very small percentage (6.6%). In recent years, due to the growing tourism industry, the number of households participating in the development of homestay tourism is increasing, specifically, the percentage of households participating in the development of homestay tourism under 3 years accounts for 69.3%. from 3 to 6 years accounted for 24.1%.

Table 2. Time involved in developing homestay tourism

Participation Time	Rate (%)	Rating
- Under 3 years	69.3	1
- From 3 to 6 years	24.1	2
- Over 6 years	6.6	3

Table 3. Ability to participate in tourism development Homestay

Characteristics	Rate (%)	Rating
<i>Highest level of foreign language in the household</i>		
- Don't know how to communicate	59.5	1
- Basic communication	33.0	2
- Fluent communication	7.5	3
<i>Tourism service activities</i>		
- Food service	60.5	1
- Provide accommodation service	50.4	2
- Practice farming	35.5	3
Performing arts transmission	20.2	4
- Souvenirs, crafts	10.4	5
- Souvenirs, crafts	10.0	6
<i>Household has good relationship with local government or tourism company</i>	50.0	

Source: Author's 30-sample survey data, 2022

- *Ability to participate:* According to the actual survey results summarized in Table 3, it shows that the foreign language proficiency of households providing homestay tourism services is still very poor. Specifically, the ability to communicate fluently is very little (7.5%), can communicate basic sentences (33.0%), the rest are mostly unable to communicate (59.5%). Limited foreign language proficiency greatly affects the level of satisfaction or service quality. The research results show that the majority of households in the areas only provide food services (60.5%) and accommodation services (50.4%). For food

service, households often choose to provide river specialties and traditional dishes. In addition, some households in the areas also expand entertainment services for tourists such as practicing farming (35.5%), performing traditional art activities (20.2%), displaying and selling souvenir products (10.4%) and some other recreational activities (10%).

- *Form of association:* According to the survey results presented in Table 4, signing commitment contracts with travel companies (accounting for 56.1%), profit sharing agreements between the participants (accounting for 17.5%). From that, it can be seen that the number of households participating spontaneously is still quite high (accounting for 26.4%). This has created differences in the quality of services provided between groups of household, affecting the image of homestay tourism in the areas.

Table 4. Forms of association of households participating in tourism development with travel agencies

Relationship	Rate (%)	Rating
- Sign commitment	56.1	1
- Participating spontaneously according to season	26.4	2
- Agreement (oral) profit sharing	17.5	3

Source: Author's 30-sample survey data, 2022

- Support policies: In 4 coastal districts - towns - cities of the province, localities authorities have made important contributions to the development of homestay tourism in the localities such as: promoting the image of local tourism. (40.5%), organizing professional training courses for households (30.6%) and upgrading infrastructure (31.6%), supporting loans (20.3%) and vocational training (7.8%).

Table 5. Policies to support tourism development of local authorities

Supporting policies	Rate (%)	Rating
- Promote tourism image	40.5	1
- Upgrading infrastructure for tourism	30.6	2
- Open a training course on tourism knowledge	31.6	3
- Loan capital	20.3	4
- Handicraft training	7.8	5

Source: Author's 30-sample survey data, 2022

- *Benefits received:* According to the survey data in Table 6, up to 72.5% of households have additional income and improved living standards; 39.6% of households created more jobs. Some other households received a lot of support from local authorities (22.5%), participated in professional training (16.5%), improved and expanded their knowledge (12. 2%).

Table 6. Benefits of participating in a community-based tourism organization

Benefits of joining	Rate (%)	Rating
- Increase income, improve good life	72.5	1
- Create more jobs	39.6	2
- Get the favor of the local government	22.5	3
- Participated in training tourism knowledge	16.5	4
- Improve and expand knowledge	12.2	5

Source: Author's 30-sample survey data, 2022

3.3. Comment on some shortcomings and causes affecting the development of homestay tourism in coastal districts - towns - cities in Phu Yen province

Through analyzing the reality of community participation in homestay tourism organization, the author identifies the causes and limitations affecting the development of homestay tourism in coastal districts - towns - cities in Phu Yen province, Vietnam as follows:

- *Firstly, the linkage in homestay tourism organization in the areas is not clear.* In fact, there are still quite a few households participating in spontaneous tourism service provision. This has led to heterogeneity in products and services, unfair competition among service providers, weakness in tourism organization, etc. These are the issues raised. Which need a solution soon.

- *Second, the professional qualifications of households providing homestay tourism services are still limited.* Most households do not understand much about the characteristics of homestay tourism, especially the understanding of the needs and characteristics of tourists has not been paid enough attention. The limitation of foreign language proficiency also partly affects the quality of homestay tourism services.

- *Third, lack of diversity, speciality and specificity of tourism products.* Most of the households and locations are all types of farming practice services, art performances, and souvenirs. The ability to create and change products and services is still limited, so it is difficult to retain tourists in the future.

- *Fourth, the promotion of the image of homestay tourism in the districts - towns - cities of the province has not reached a professional level.* Although the local government has support to promote the image of homestay tourism in the localities, the content and frequency are still very limited. As for households which organize homestay tourism, their understanding of marketing is very modest. Advertising signs at private homes are the only marketing tool of most households providing homestay tourism services.

4. Discussion and conclusion

4.1. Solutions to develop homestay tourism in the coastal area of Phu Yen province

From the results of analyzing the situation of community participation in homestay tourism organization, and identifying the causes and limitations affecting the development

of homestay tourism in the coastal areas of the province, the author proposed solutions to develop homestay tourism in the above locations as follows:

- *First, create a close association of "4 houses" including local people, the state, tourism enterprises and scientists.* In this connection, the state plays the role of an intermediary connecting households providing homestay services with travel companies. The local tourism industry needs to regularly organize meetings and dialogues between the four parties to strengthen the link of support and create a consensus between tourism service providers and travel companies. The local tourism industry needs to closely coordinate with the households participating in the homestay tourism organization to promptly support when necessary, and at the same time, it is necessary to study and review the planning to develop a strategy to develop this type of tourism. homestay in the long term. Scientists participate in the review of tourism development planning projects in order to exploit the highest efficiency, while minimizing harm to the environment and resources.

- *Second, improve the professional qualifications of the community providing tourism services.* Households participating in homestay tourism need to actively study and improve their education and foreign language skills as well as their knowledge and skills in tourism. In addition, households providing tourism services need to actively participate in professional skills training courses organized by local authorities and tourism companies, and at the same time constantly research, learn and grasp the needs of tourists to promptly adjust products and services to satisfy the increasing demands of tourists.

- *Third, create new, unique and specialized products and services.* Homestay sites need to pay more attention to the quality and quantity factors of services for visitors. In addition to the current activities, households can design other activities such as: trying out animal husbandry, learning how to grow clean vegetables, a night in the field, trying out cooking,..., or other cultural and artistic exchange activities typical of each locality. In addition, the local tourism industry needs to stipulate specific standards for homestay tourism services as a standard measure for the service provided. Especially, each locality has a number of typical products to avoid duplication of products in order to increase competitiveness and attract domestic and foreign tourists.

- *Fourth, develop a strategy to promote the image of homestay tourism to an increasingly professional level.* Homestay tourism in Phu Yen province is not without for a methodical promotion of the image of homestay tourism. The unity of images, media and events need to be professionally organized, large-scale and periodic. In addition, the construction and promotion of the "coastal homestay tourism" brand in Phu Yen province also needs to be properly invested by the local tourism industry, travel companies and the homestay tourism organization community.

4.2. Conclusion

Based on the extremely rich and diverse coastal tourism resources, Phu Yen has a lot of potential in developing homestay tourism. In the last 6 years, the situation of developing local homestay tourism has had many positive changes, but it has not yet met the current

tourism development requirements of the province. The type and product of homestay tourism need to be more local specific, must be a harmonious combination of traditional and modern elements, simple but new for the environment - a favorable resource for developing homestay tourism, to meet the needs of tourists and ensure competitiveness. The development of specific types and products of homestay tourism based on natural and cultural tourism resources needs to be linked to the development of diverse tourism services and at the same time long-term protection of the natural and cultural environment as well as effective conservation of the natural and cultural tourism resources, in order to ensure sustainable tourism development.

GREEN FINANCE DEVELOPMENT IN VIETNAM: CURRENT SITUATION AND RECOMMENDATIONS

Dr. Phung Thanh Quang

pt_quang@neu.edu.vn

School of Banking and Finance, National Economics University, Hanoi, Vietnam

Nguyen Mai Phuong

maiphuongnguyen0110@gmail.com

Foreign Trade University, Hanoi, Vietnam

Abstract

At the 26th Conference of the Parties to the United Nations Framework Convention on Climate Change (COP26) in 2021, the Vietnamese Government committed to develop and implement measures to reduce greenhouse gas emissions to achieve net zero emissions by 2050. This commitment of the Vietnamese Government was appreciated by the international community as a very strong and clear commitment to reduce emissions of a developing country. To completely achieve this vital goal, Vietnam needs to drastically transform its growth model, from the traditional “brown economic” model - growth depends mainly on fossil fuel sources - to an eco-friendly green economy. However, the “greening process” the economy requires huge financial resources. Therefore, the development of a green financial system is an urgent task for Vietnam in the coming time in order to popularize and develop green and eco-friendly financial instruments and products, associated with sustainable development. This article summarizes the experiences of some countries in green finance development, analysis the current situation of green finance in Vietnam as well as proposes some recommendations to develop green finance in Vietnam in the future.

Keywords: *Green finance, COP 26, SDGs, MDGs, greenwashing*

1. Introduction

In 2015, the United Nations adopted the Sustainable Development Goals (SDGs) aimed at eradicating poverty, protecting the planet, and enjoying peace and prosperity for all people by 2030. These are universal goals and are concretized by the following goals: eradicating poverty, eradicating hunger, ensuring a healthy life, gender equality, clean water and sanitation, clean and sustainable energy, good jobs and economic growth, industry, innovation and infrastructure development, reducing inequality between countries, sustainable communities, responsible consumption and production, climate action, marine environment preservation, conservation of land resources and environment, peace, justice and strong institutions, partnerships for sustainable development goals. The SDGs are considered as a further development of the Millennium Development Goals (MDGs). Accordingly, the SDGs pay more attention to the voices of those most affected by poverty and other issues that hinder sustainable development. The scope and influence of the SDGs are expanded and more comprehensive, with the participation of the whole political system, ministries, branches,

localities, agencies, business communities, mass organizations, society, communities, and development partners in the implementation of sustainable development goals.

Vietnam is considered as one of the successful countries in implementing the MDGs and is actively implementing the SDGs. Vietnam has approved the approval of the Action Plan (Plan) for sustainable development in Decision No. 622/QĐ-TTg dated May 10, 2017. The National Action Plan was developed based on a review of Vietnam's major current development policies, strategies and plans, compared with 17 global sustainable development goals (SDGs) and 169 specific goals. Accordingly, the Action Plan includes 17 general goals and 115 specific goals. Specific tasks are phased out in two phases 2017-2020 and 2021-2030. Compared with the MDGs, the goals set are higher, related to new fields or areas where Vietnam's achievements still have many limitations such as climate change, environmental protection, sustainable poverty reduction... To achieve the aforementioned goals, one of the essential requirements is to develop a green financial system, freeing up the economy's resources for green projects, green and environmentally friendly programs. This article provides an overview of the experience of developing green finance in some countries such as the US, India, China, UK, Bangladesh; analyzes the current situation of green finance development in Vietnam and proposes some solutions to develop green finance in Vietnam in the coming time.

This article gives some overview about green finance, summarizes the experiences of some countries in green finance development and analysis the current situation of green finance in Vietnam.

2. Literature review

According to the United Nations Environment Program (UNEP): "Green finance refers to the diversification of financial products and services provided by financial institutions towards the sustainable development of the country." Green finance enhances financial resources from the public, private and non-profit sectors to sustainable development priorities. According to Chowdhury (2013), green finance is understood as financial support towards green growth through cutting greenhouse gas emissions and reducing environmental pollution. Green finance is related to the process of creating and distributing financial products and services that have a positive impact on the environment on the basis of ensuring economic goals for businesses/projects. In fact, green finance is a broad concept, in which there are two main areas: green credit and green bonds.

Regarding green credit, according to Aizawa and Yang (2010), green credit is understood as lending by credit institutions for consumption, investment, production and business needs without causing risks to the environment, contributing to protecting the common ecosystem. Green credit is one of the effective solutions applied by the financial industry to deal with environmental and social challenges through financial tools. According to Jin and Mengqi (2011), green credits are credits that are supported by credit institutions for production and business projects that do not pose environmental risks, or for the purpose of environmental protection, contributing to general ecological protection. Green credit is a part of green finance aimed at the sustainable development of the country and the whole

world. According to the Loan Market Association (LMA), green credits are green loans used to finance or refinance all or part of green projects. Green loans can be term loans or revolving loans. Accordingly, the purpose of the loan shown in the financial statements or promotional materials of the business will determine the "green" nature of the loan. LMA has launched a list of green projects, loans granted to projects under this category will be considered green loans. Nguyen Trong Tai and Nguyen Kim Oanh (2019) define green credit as credit capital flows directed to activities that do not pollute the ecological environment, establish an equilibrium of natural conditions, step by step direct human life in harmony with the natural environment. In terms of loan sources, green loans or green credits for green projects in an economy include loans from the State, commercial credit, bank credit and international loans. Green loans from the State are loans provided by the Government for green projects that have a deep and wide impact on the overall socio-economic development of that country. Therefore, the scale of green loans is usually large, with preferential interest rates, and organizations must meet strict standards, regulations and constraints to access these green loans. Green commercial credit is common in developed economies and is a deferred purchase and sale relationship between the transaction parties and green commercial paper is proof of this relationship. The use of green commercial paper brings benefits to businesses in applying a low discount rate from commercial banks. The flow of green loans from international organizations is diversified and implemented through many channels such as official development assistance (ODA), preferential loans between governments, cooperation with commercial banks, etc. The above three types of loans are often in the form of priming capital flows, in order to deliver policy messages and orientations for sustainable and environmentally friendly development.

For green bonds, Article 150 of the Law on Environmental Protection 2020 stipulates on green bonds as follows: "Green bonds are bonds issued by the Government, local authorities and enterprises in accordance with the law on green bonds. bonds to raise capital for environmental protection activities and investment projects that bring environmental benefits". According to the World Bank 2021, green bonds are defined as a type of fixed-income security to attract capital for projects with environmental benefits. Accordingly, the proceeds from this bond issue will be committed to invest in programs to enhance climate change adaptation and mitigation, including clean energy projects, efficient use of energy, public transport and clean water... Green bonds can be issued by governments, commercial banks, development banks, international financial institutions, corporations, etc. As estimated by the International Energy Organization, to halve global emissions by 2050, the world will need an investment of up to 46 trillion USD. In that context, green bonds are considered an effective solution, which can help mobilize hundreds of billions of dollars per year for the development of a "clean" and sustainable economy. Giuseppe Cortellini (2021) and Phung (2022) has suggested that green bonds are one of the most used sustainable investment instruments and according to the 2015 Paris Climate Agreement, the climate bond market is expected to thrive in near future. According to Ashima Verma et al (2020), Quang and Thao (2022), green bonds are one of the important tools to reduce environmental pollution and climate change that is taking place today. The author's research paper analyzes

green bonds from a comprehensive point of view, first about the current scenario of green bonds in India. The study also highlights the future prospects of green bonds. And finally, give practical suggestions in the Indian context. In general, there have been many studies in the world and in Vietnam on the role of green finance in general as well as of green credit and green finance in particular for the sustainable development of the economy. According to Kun et al. (2022), green finance is emerging as an important strategy to reduce energy intensity in the region in the context of “peak carbon” and “carbon neutral”. Green finance has the potential to promote energy efficiency on many levels. In addition, green finance can provide financial capital support to environmentally friendly businesses such as high-tech enterprises and green technology enterprises. At the same time, as green finance continues to grow, it will provide investors with more investment options and tools for environmentally friendly investments. It will create advantages for improving environmental efficiency and energy use in the region and around the world.

In the long term, the development of the green finance industry will significantly promote the upgrading of the infrastructure of industrial zones and thereby promote industry innovation. The capital allocation function of green finance will focus more on the financial resources of environmentally friendly and energy-saving industries, and then towards optimization and upgrading of the industrial structure. Green finance can also bring about positive externalities related to regional environmental benefits and levels of energy use. First, green finance can guide policies to accurately predict technological achievements in the region and ensure the effectiveness of environmental policies. Second, green finance can force the government to improve the intensity of environmental regulations and develop environmentally friendly policies. Moreover, the development of green finance has become an indispensable need for the innovation and sustainable development of the financial industry.

3. Method

The study uses qualitative methods based on previous studies to study the experience in developing green finance worldwide as well as the current situation of green finance development in Vietnam. For international experience, the research team uses the desk-based research method to find out the experience of developing green finance in some developed countries in the world such as the US, UK and some other large countries such as China, India. For analyzing of the current state of green finance in Vietnam, the research data is compiled from the State Bank of Vietnam and the General Statistics Office in the period 2017-2022, including two main components: credit balance outstanding and green finance credit balance. The research team also used the in-depth interview method and consulted with experts to propose some solutions to develop green finance in Vietnam in the coming time.

4. Results

4.1. Experience in developing green finance worldwide

Green finance in general as well as green credit and green bonds in particular are now increasingly popular and widely applied in many countries around the world. We will learn the lessons from some countries in green financial development as follow.

The first country is the United States. In March 2009, the United States introduced the Green Banking Act with two main pillars: internal green and green project financing. For internal green banking criteria, the first requirement is to reduce the use of paper in banking activities. Next is to build a clean and hygienic banking environment, green buildings, strengthen online banking, waste management, install solar panels on the roofs of banks and use fuel-efficient vehicles, reduce audio pollution, use a webcam for video conferencing instead of physical meetings, online reports, emailed documents are included in the internal green bank. For financing green projects, the banking industry supports green projects such as biogas plants, solar/renewable energy plants, bio-fertilizer plants, and water treatment plants... The USA also develops "green" rating and rating standards for banks, which are periodically published by the Federal Deposit Insurance Corporation (FDIC).

The second is India. In India, the application of green programs for the environment and community has been implemented since the early 2000s, mainly loan programs for women, providing credit for economic development projects. local economy... Since July 2010, the State Bank of India (SBI) has implemented "Green Channel Counters (GCC)" and "No Line Banking" in more than 5,000 branches across India, as a step towards innovation. new "green bank" paperless transactions for depositing, withdrawing and transferring money, making domestic and international payments. Some public sector banks and private sector banks have also adopted green banking policies and provided green products and services. For example, ICICI bank in India has a "Go Green" initiative including Green interaction, green communication and green partners. Specifically, ICICI has provided their customers with the convenience of online bill payment, online money transfers and paperless electronic statement registration; ICICI also aims to expand partnerships with green organizations and NGOs. The Co-operative Bank of India implements more preferential interest rate activities if people buy water heaters, water pumps, and solar-powered lighting systems. Or state-owned bank Punjab offers medium-term loans for people to build biogas tunnels, lighting systems using solar energy. In addition, the Institute for Development and Research in Banking Technology (IDRBT) established by the Reserve Bank of India (RBI) has provided guidelines for banks to implement strategies to improve the environment. IDRBT proposes guidelines for rating criteria according to green efficiency bank criteria. IDRBT has coined the term green rating standard as "Green Coin Rating". The green coin rating will be the same as the energy star rating for home appliances. Banks will be assessed based on the percentage of carbon emissions in their operations, the amount of reuse, refurbishment and recycling concepts being used in building fixtures and in systems used by them, such as computers, servers, networks, printers, etc. These banks will also be evaluated based on the number of green projects funded by these banks, the number of bonuses and the acceptance of the banks willing to pay for the transition to green business. In reality, however, the banking sector still plays a minor role in the positive environmental impact in India.

The third is China. In the context of environmental pollution leading to many political, security, and socio-economic consequences, the Chinese government was forced to adjust its development strategy towards the goal of greening the economy and sustainable

development. Accordingly, Beijing considers the development of a green financial system to be an indispensable need today. As the Chinese government sets a target of being carbon neutral by 2060, the financial sector has stepped up efforts to realize green development plans. In particular, the People's Bank of China (PBOC) has been playing an important and active role in promoting the green transition. As of the end of May 2022, the People's Bank of China has provided more than 210 billion yuan (about 31.39 billion US dollars) to financial institutions, helping to reduce emissions by more than 60 million tons of carbon dioxide equivalent, accounting for about 0.6 percent of China's annual carbon emissions. As of March 2022, green loans in China exceeded 18 trillion yuan. Green bonds in circulation reached about 1.3 trillion yuan, one of the largest in the world. In addition, PBOC has also made efforts to improve climate information disclosure and prevent fake reports, and prevent greenwashing of borrowers, in order to provide the most accurate information in the process of implementing green projects.

The fourth is The United Kingdom. The UK is currently one of the leading countries in providing sustainable 'green finance' services, with a great deal of experience and influence in Europe. In 2015, the London Stock Exchange was the first exchange in the world to launch a dedicated green bond segment, which offered the first certified green bonds from China, India, the Middle East and the first sovereign green bond from the Asia Pacific and the Americas. Besides green bonds, the London Stock Exchange also promotes the issuance of social and sustainable bonds. In 2019, the London Stock Exchange expanded the green bond segment into the more comprehensive Sustainable Bond Market (SBM). SBM offers issuers a variety of opportunities for sustainability-related debt instruments and investors with improved accessibility and transparency. Til the end of 2022, the London Stock Exchange is offering more than 200 types of green bonds, social bonds, and sustainability bonds from 23 countries, raising more than 56 billion pounds. The UK is also a leader in the development and internationalization of green finance solutions to help countries around the world meet their climate commitments. Globally, it is estimated that \$90 billion of investment will be needed by 2030 to achieve the global climate and sustainable development goals.

Also, in the UK, the Green Investment Bank (GIB) has played a role in completing the policy framework and providing the necessary financial support to address the failures of the free market, concerns risks, high transaction costs and lack of capital. GIB's intervention helps to mobilize funds from equity and debt markets, facilitating the valuation of risk in financial markets by improving transparency and openness. investment in sustainable development projects.

The fifth is Korea. Korea officially implemented the Emissions Trading Program (ETS) in January 2015 aimed at effectively reducing GHGs in different sectors of the economy. According to the Law on Emissions Transactions, which came into force in 2012, companies with 3-year average GHG emissions exceeding 25,000 tons of CO₂ will be designated as ETS - entities participating in an emissions trading scheme.

As of January 2015, 525 companies from 25 industries participated in the emissions trading system as ETS subjects, and this number reached 549 in January 2017. The Korean Ministry of Finance and Strategy normally reallocates GHG emissions to Emissions Trading Program participants every five years based on the total GHG emissions over the five years. According to Oh (2018), in the Korean emission trading market, the price of each emission quota unit (KAU) has increased by about 3.6 times compared to the starting price, from 7,860 won/KAU (02/02/02/02/02/month) 2015) to 28,000 won/KAU (June 2018). This shows that, over time, the pressure to reduce GHG emissions becomes more and more stressful for businesses and the price of emission limit units is expected to continue to increase sharply in the future.

4.2. Current situation of green finance development in Vietnam

On October 1, 2021, the Government issued Decision No. 1658 approving the National Strategy on Green Growth for the 2021-2030 period, with a vision to 2050. According to this Decision, the green sector includes 12 sectors, fields and subjects as follow: Green agriculture; sustainable forestry; green industry; renewable energy, clean energy; recycle and reuse resources; waste treatment and pollution prevention and control; natural environment protection, ecological restoration and natural disaster prevention and control; sustainable water management in urban and rural areas; green construction works; sustainable transport; provide environmental protection and energy saving services; other green fields. Aware of the importance of green credit, in Vietnam, according to Directive No. 03/CT-NHNN dated March 24, 2015, the State Bank of Vietnam has requested commercial banks to promote green credit for projects with clear targets on environmental protection, encouraging environmentally friendly business activities.

Figure 1. Green credit's share in total outstanding loans in Vietnam's economy in the period 2017-2022

Source: State Bank of Vietnam

According to data from the State Bank of Vietnam, although the proportion of green credit outstanding loans in Vietnam tends to increase year by year, the size of outstanding loans is still relatively small compared to the total outstanding loans of the economy. In 2017, the scale of green credit was at 2.83% compared to the total outstanding loans of the economy, in 2019 it reached 3.46% (up 22% compared to 2017). By 2021, this figure was at 4.24%, equal to nearly 1.5 times compared to 2017. By the end of 2022, outstanding loans for green projects (12 green industries are funded by the State Bank of Vietnam, which was built and issued in 2017) reached nearly 500,000 billion VND (accounting for about 4.2% of the total outstanding loans of the economy), focusing on renewable energy, clean energy (accounting for the highest proportion of 47%), followed by green agriculture (accounting for over 30%). Thus, it is clear that although there are up to 12 sectors, credit balances only focus on a few key industries such as clean energy and agriculture, showing a lack of diversity in green project investment.

The reason why it is difficult to invest in green projects is that these projects require high costs, large capital sources, and complex funding requirements. Furthermore, green project sponsors often do not have enough data to analyze the project in detail. The green project implementation period is long, leading to various risks, especially related to cash flows such as too-long maturities or lower-than-average interest rates in the market, and R&D cost for green finance is very high and only brings benefits in the long run while the support of the State is still limited, so resources for projects on promoting green growth, sustainable development Sustainability is still largely dependent on the state budget.

According to data from the Trade Promotion Agency, as of June 2021, there are 84 credit institutions that have submitted reports on the results of implementing Decision 1552/QĐ-NHNN dated August 6, 2015 on the Action Plan of the Bank. The banking industry implements the National Strategy on Green Growth until 2020, representing over 80% of the outstanding loans of the banking system. However, only 67/84 credit institutions have implemented relevant contents on the development of green banks and green credit, on the basis of integrating regulations and guiding documents in their operations. Some commercial banks in Vietnam have a high proportion of green credit such as: Agribank, BIDV, Sacombank, TPBank, Vietinbank, VPBank, Nam A Bank, HD Bank....

Specifically, regarding some pioneer banks in green finance, as of September 30, 2022, BIDV is the market leader in financing green projects with 1,210 customers and projects, with a total amount committed to credit over 61,700 billion VND. Green credit's outstanding balance is about 49,000 billion VND, accounting for 3.3% of the total outstanding loans of BIDV. Green credit outstanding loans mainly focus on the field of renewable energy, including more than 800 renewable energy and clean energy projects with a total credit amount of more than VND 53,200 billion, (accounting for about 97% of the green credit balance). For wind and solar power projects with a loan scale of over 500 billion VND, in the period 2020-2021, BIDV has sponsored 25 projects with a total loan amount of about 23,400 billion VND (equivalent to 1 billion USD). Or at TP Bank, this bank is also actively implementing green finance when giving priority to spending VND 2,000 billion in

credit packages for green development businesses, export businesses, and women-owned businesses from WSME. A credit package of VND 5,000 billion is provided by Tien Phong Commercial Joint Stock Bank (TPBank) for businesses in 5 priority areas, export, green development, women-owned enterprises, and customers who use multiple services. of the bank... Depending on the interest rate, the interest rate will be reduced by 1.5% to 2% compared to the normal interest rate. Women-owned businesses will receive an additional 0.2% discount compared to the above incentive. In June 2019, Vietcombank was funded by the Japan International Bank (JBIC) with a \$200 million package to finance renewable energy projects. Vietcombank is also a partner of the Project on Energy Efficiency for Industrial Enterprises in Vietnam - VEEIE, providing \$USD 158 million in capital for businesses in the field of energy-efficient technology.

5. Conclusions and recommendations

It can be seen that although green financial development is a major policy of the State in the green growth strategy, the results achieved so far are still quite modest, in the banking sector, the proportion of green credit is still low and mainly concentrated in a few large-scale banks. This can be due to many reasons, for example: green financial products in banks in Vietnam are still lacking in abundance; not available yet; financial support for green projects and green products is still limited... Besides, awareness of green finance is still limited; policies and laws are lacking or have not effectively supported the development of green finance. Thus, based on international experience in green finance and the existing problems in Vietnam, the author proposes some recommendations on promulgating mechanisms and policies; monitoring and enforcement, specifically:

Firstly, the Government needs to perform the function of creating, developing a development roadmap, creating an appropriate and feasible legal corridor, following the green growth strategy phases so that the components of the green financial system can be improved. At the same time, build a public-private partnership channel in the operation of a green climate fund and an environmental protection fund like in Korea. The Government and the State Bank need to continue to develop and complete the specific legal framework on green credit as well as business investment projects that have an impact on the environment, develop a list of green industries standards for general and uniform application - serving as a basis for commercial banks to evaluate when granting green credit. Vietnam needs to quickly implement the energy transition roadmap and build a reasonable green financial framework for projects that can get bank loans.

Secondly, Vietnamese banks need to quickly develop a set of rules on environmental and social risk management in credit granting activities; carry out environmental and social risk assessment in credit granting activities; apply environmental standards to projects financed by banks; incorporate an environmental risk assessment as part of a bank's credit risk assessment. In addition, banks need to build a department dedicated to environmental and social risk management. Commercial banks also need to strengthen the capacity of officers and employees in implementing green credit through training, propaganda and dissemination to raise awareness among officers and employees about the operation of the

green bank - green credit; raise awareness of efficient and economical use of energy, natural resources and environmental protection; improve the professional level of appraisal of environmental and social risks of projects.

Thirdly, in order for credit capital to really come to green and environmentally friendly projects, it is necessary to promote information disclosure from borrowers according to the ESG set of standards (E - Environmental/Environment; S - Social/Social; G - Governance/Corporate governance) accurately and transparently to limit the situation of "greenwashing", fabricating results leading to capital flows do not come to projects that are really environmentally friendly. The State Bank should require commercial banks to strictly control the quality of reports and published information of loan enterprises in order to contribute to increasing the transparency and reliability of the information. To do that, the Government and relevant ministries and sectors need to develop reliable ESG reporting standards and frameworks to create a premise for transparent reporting, thereby limiting "greenwashing" behavior. In addition, there should be strong sanctions for businesses that are dishonest in reports, fabricate or inflate results to attract green capital from banks into "brown" projects of enterprises.

SUSTAINABLE TOURISM FOR ECONOMIC GROWTH AND EMPLOYMENT IN VIETNAM

MA. Bui Vu Luong

luongbv@vnu.edu.vn

*Faculty of Economics and Management, International School, Vietnam
National University, Hanoi, Vietnam*

Abstract

Tourism that takes full account of its current and future economic, social, and environmental impacts, dressing the needs of visitors, the industry, environment, and host communities. Tourism growth directly contributes to the GDP of a nation and creates employment opportunities for its people. In Vietnam, the tourism industry boosts economic development and GDP growth. This studies the impact of private tourism sectors on Vietnam's economic growth and employment, using data collected during 1993 -2018. This paper employs Augmented Dickey-Fuller and Phillips-Perron unit root tests, Johansen cointegration test, and regression technique. The empirical results shed light on the roles of sustainable tourism in economic growth and employment in Vietnam.

Keywords: *Sustainable tourism, private sector, economic growth, employment rate, Vietnam*

1. Introduction

The tourism industry has emerged as a key force for sustainable socio-economic development globally (Wakimin et al., 2018; Hwang & Lee, 2019). Sustainable tourism means that taking a visit to locations doesn't harm the country in any fields like local community, nature, and economy (Tang, 2011). Tourism with its business lines such as transportation, accommodations, entertainment, shopping, etc. can be linked to leisure or business travel (Peeters & Dubois, 2010; Hwang & Lee, 2019). Currently, there is a widespread consensus that private tourism sector growth should be sustainable, although the question of how to achieve this is a subject of debate (Gössling et al., 2005).

Vietnam is famous for being a distinctive region with rich physical features from North to South and East to West. Vietnam become more attractive by its natural resources, beautiful beaches, mountainous areas, rivers, and diverse climates. So the tourism industry must be an image of economic development in Vietnam.

Travel and tourism are important economic activities in the Vietnamese economy (WTTC, 2018). In many tourist destinations, tourism takes an important role in employment and income in the private sector. Thanks to tourists' satisfaction, there is an increase in tourism leading to economic growth and development rapidly in Vietnam. Similarly, a developing country like Vietnam can engender a huge amount of foreign exchange from

tourism which could also boost its sustainable growth and development (Ekanayake & Long, 2012). In Vietnam, it is the main source and foundation for a country's economic development and growth (Shahzad et al., 2016). Tourism revenue complements the exchange derived from the overseas trade of goods and services. This sector also finances capital goods imports in the development of the economy's industrial sector. Alternatively, economic expansion in neighboring nations like China influences business travel (overseas visits), which can lead to a rise in the nation's overseas reserves (Mahmoudinia et al., 2011). International tourism has become increasingly important in Vietnam (Lea, 2016). Export earnings are replaced by tourism revenue contributing a lot to the balance of payment (Scheyvens & Russell, 2012). The revenue can be generated and also household income is enhanced through the development of this sector. In many cases, tourism has a positive effect on the economy of any country (Ringer, 2013).

Globally, third-world nations like Vietnam started tourism to advance their economy, promote peace, develop human resources, and reduce the poverty level (Hall & Richards, 2002). Tourism helps to "enhance employment opportunities and earnings, which can be of major economic significance to the local population" (Durberry, 2004). Regarding employment, the local community will improve their living standard when they have good earnings and socio-economic conditions. It means that tourism helps to reduce poverty (Manag, 2015).

This paper studies the private tourism sector's impact on Vietnam's economic growth and employment rate, using data collected during 1993 -2018. The finding shows that sustainable tourism has a positive impact on Vietnam's economic growth and employment besides a long-run relationship. The policy maker is suggested to focus on the standardization and management of the private tourism sector due to its great potential in tourist destinations in the whole country. We also mention policy implications and future research from the findings of this study.

2. Literature review and theoretical framework

2.1. Literature review

Each researcher has his own view on tourism's contribution to economic growth and employment rate in the world. The significant role of tourism in the growth of the economy is being discussed. Tourism is the activity of traveling for the purpose of leisure outside the day-to-day environs (by UNWTO). The economic benefits of tourism are analyzed accordingly (Ayeni & Ebohon, 2012). Tourism has an important role in economic development, its impact on creating foreign exchange and generating employment opportunities and local revenue is positive (Modeste, 1995; Ramesh, 2002; Steiner, 2006). A significant correlation between tourism and economic growth is shown in different studies around the world (Kulendran & Wilson, 2000; Croes et al., 2008; Manwa, 2012). It's posited that if tourism must be sustainable, the society must gain economically from it (Manwa, 2012). Smith (2007) tourism could have economic benefits or not depending on the aptitude of that country.

A significant and positive correlation between GDP and tourism revenues is investigated in Guizhou, China (Wang et al., 2015). Causal relationships among the tourism

sector and economic development of Turkey is demonstrated by Akan et al. (2008). The Granger Causality test, Phillips-Perron test, the co-integration approach, and a Vector Autoregression (VAR) model are used for the time period 1985-2007 revealing that the tourism industry in Turkey was positively affected by economic development. A long-term steady correlation between economic development and tourism growth exists.

It's estimated for the long-run relationship between tourism revenue and economic development (Adnan et al., 2012). The data from 1971 to 2008 is used to confirm that there is a long-term relationship between revenue from tourism and economic development. And, it explains the revenue from tourism leading to increasing economic growth.

It explained a direct relationship between employment, tourism, and economic growth (Sr & Croes, 2008). The employment and income opportunities are highlighted to derive from a transfer of income and wealth in comparison with developed countries. According to the Shan & Wilson K (2001) and Kulendran & Wilson (2000) there is a strong association between international travel and trade in both China and Australia. Regarding Kea's case, economic development can attract more business tourists. In other words, economic growth can lead to tourism expansion.

According to Bahmani-Oskooee (1993); Chow (1987); Marin (1992), a relationship between international trade and economic development exists and there is also a strong correlation between exports and economic growth. And, tourism growth is linked to economic development. But tourism income can be dropped due to export-oriented economic development. But tourism may not be effective with no direct relation, because it happens when tourism's impact on the economy is positive.

2.2. Theoretical framework

In Vietnam, there are not many studies of tourism's impact on economic growth. Therefore, the relationship between tourism, economic development, and employment rate is examined in the case of Vietnam. Therefore, the hypotheses are used:

Hypothesis 1 (H1). *The relationship between sustainable tourism growth and GDP is positive.*

Hypothesis 2 (H2). *The relationship between sustainable tourism growth and employment rate is positive.*

Figure 1. Relationship between sustainable tourism, GDP and employment in Vietnam

3. Method

We took the time series data from 1993 to 2018 to study the contribution of sustainable tourism to economic growth and employment in Vietnam. While the annual growth of tourism was taken as an independent variable, employment rate and GDP were used as dependent variables in this study. Maybe, there is an exhibition in some stationary or non-stationary variables. Before it was determined that we integrated all the series and applied a unit root test.

First of all, to study an empirical relationship between two variables and hypothesis testing, the bivariate regression model is used (Manzoor et al., 2019). Second of all, to study a long-run relationship between variables, co-integration analysis is used. We used E-view 9 not only for statistical analysis but also for econometrics model estimation. We used different sources for data collection such as the Tourism Yearbook, the Economic Survey of Vietnam, the Vietnam National Association of Tourism, the World Travel and Tourism Council, and the Tourism Economic Impact annual reports.

Unit Root Test Results

It's necessary to test for a unit root of the variables for the possibility of non-stationarity of the data. Therefore, to check the stationarity of the GDP, employment, and sustainable tourism growth series, the accepted ADF and Dickey and Fuller unit root test are adopted based on the following regression:

$$\Delta y_t = \alpha + \delta y_{t-1} + \sum_{i=1}^n \beta_i \Delta y_{t-1} + \epsilon_t$$

where Δ is the first difference, Y is the time series, t symbolizes linear time trend, α denotes a constant, n is the number of lags on predicted variables, and e represents the error term.

Cointegration tests

Commonly, there is a unit root in time series, however, it's stationary to a linear combination of two or more nonstationary series. If there is a linear combination (Engle and Granger, 1987), it is said that the nonstationary time series are co-integrated, and we use the stationary linear combination to specify a long-run relationship among variables.

In this study, we used a co-integration analysis (Johansen and Juselius, 1990) to determine whether a long-run relationship among tourism, economic development, and employment rate, and numbers of co-integrating relations exists. A maximum likelihood approach is used in this test to provide two different maximum likelihood ratios: maximum eigenvalues (maximum-Lambda statistics), and trace test statistics.

We also use the test to identify the numbers of co-integrating vectors which describes linkages among variables. It is most equal between the numbers of co-integrating relations and numbers of endogenous variables minus 1. For instant, among two endogenous variables in this thesis, we find at most 1 co-integrating relation. It is helpful if we know the numbers of co-integration to specify a vector autoregression (VAR) and to perform causality tests.

Regression Analysis

We used a regression analysis technique to examine the contribution of tourism to economic growth and employment rate. It can be expressed as:

$$Y_i = \beta_0 + \beta_i x_i + \varepsilon \quad (2)$$

It estimates Y_i = dependent variable, X_i = independent variable, β_0 = intercept, β_i = coefficient. The modified regression model is:

$$\Delta \text{GDP} = \beta_0 + \beta_1 \Delta \text{TG} + \varepsilon \quad (3)$$

$$\Delta \text{Emp} = \beta_0 + \beta_1 \Delta \text{TG} + \varepsilon \quad (4)$$

It estimates Δ = first difference, GDP = gross domestic product, Emp = employment rate, TG = annual tourism growth, β_0 = intercept, β_s = coefficient, and ε = error term.

4. Results

4.1. Data description

The time series data of per capita tourism development, per capita GDP and employment are used for the 1993-2018 periods in Vietnam, whose starting period is constrained by the available data and historical milestone. The thesis obtains sources like The Vietnam's General Statistics Office (1990), the World Development Indicators (2011), WTTC (World travel and tourism council), VNAT (Vietnam National Association of Tourism), ...

4.2. Testing results

Results of unit root tests

Since 1993, there may be structural breaks in the data in Vietnam. We used a Chow test for both per capita variables in the logarithm form to test for structural breaks/changes. No evidence of structural breaks in both intercept and trend of the logarithm of tourism, economic development, and employment in Vietnam during 1993-2018 was shown. There are no changes in the variables during the period.

The calculated values of ADF and PP test statistics on the level of the logarithm of per capita tourism development, per capita GDP, and employment are larger than the critical values, so the null hypothesis cannot be rejected.

So, the logarithm of per capita tourism, per capita GDP, and employment are non-stationary series at their level. The first difference between the two variables is implied to be stationary from these rejections. There are the same rejection/non-rejection decisions; therefore, per capita tourism, per capita GDP, and employment in Vietnam during 1993-2018 are integrated in the same order.

Root test results of sequence level values			Root test results of the sequence first-order difference		
Variable	ADF Level	PP Level	Variable	ADF Level	PP Level
GDP	-2.278210	-2.507044	Δ GDP	-5.691782 (0.0004)	-5.790326 (0.0004)
EMP	-4.718528	-4.999226	Δ EMP	-10.41913 (0.000)	-14.13080 (0.000)
TG	-3.763403	-3.934207	Δ TG	-9,251,041 (0.000)	-9.784209 (0.000)

ADF: augmented Dickey-Fuller test; PP: Phillips-Perron test.

Note: null hypothesis rejected at 5% significance level.

Cointegration test results

We selected Johansen's Cointegration test to investigate the stable long-run relationship between annual GDP amongst several other techniques available for time series data. Estimating the stationary linear combination was the main objective of the variables under study.

We used maximum eigenvalue and trace statistics to test whether a long-term relationship between the variables by Johansen and Johansen Juselius exists. We used many methods for the determination of the lagging length like the Schwarz criterion, which has been scientifically proven (Lütkepohl H, 1985), and the critical values are more unbiased relative to other criteria. Therefore, the lagging length is determined based on Schwarz critical values. For the Johansen test of cointegration, the precondition was that variables must be non-stationary at level, but we integrated three variables of the same order.

The same thing is indicated that variables were co-integrated and have a long-run relationship, so, they could move together.

Johansen cointegration. Series: EMP, GDP, TG Lags interval (in first differences)									
Unrestricted Cointegration Rank Test (Trace)					Unrestricted Cointegration Rank Test (Maximum Eigenvalue)				
Hypothesized		Trace	0.05		Hypothesized	Max-Eigen	0.05

Max-eigenvalue test indicates 1 cointegrating eqn(s) at the 0.05 level

* denotes rejection of the hypothesis at the 0.05 level

** MacKinnon-Haug-Michelis (1999) *p*-values

Estimated results

Tourism, the fastest-growing industry, is the largest source of employment opportunities and a huge wealth originator, and a greater contributor to the diversified

economy. Through the tourism sector, most of the regions could be developed easily. To tantalize the economies of the tourist destinations in Vietnam, it is professed tourism is a tool that avoids the scarcity of development resources.

The causality relationship running from sustainable tourism to GDP in Vietnam is explained in this section. In Vietnam, sustainable tourism growth may increase GDP via some channels. First, when international and domestic investment increases, it can transform the image of tourism to attract more tourists. Second, foreign currency exchange would increase goods and products exporting/ importing since tourism becomes one of the most important industrial sectors of Vietnam. In the long-run, sustainable tourism helps to increase the employment rate, firms would have an extra investment in direct or indirect jobs and trained or untrained individuals have opportunities for full-time or part-time jobs. In fact, sustainable tourism has put pressure on firms and the government, and indeed, the “hot” growth of tourism has become more serious in Vietnam recently. From the unit root and cointegration tests, we have some empirical results to light up the relationship between sustainable tourism, economic growth, and employment in Vietnam.

This study is to examine the relationship between tourism, employment, and economic development in Vietnam. The positive connection between sustainable tourism growth and employment and economic growth is explored. The employment rate, as well as GDP, are improved by tourism growth. It's demonstrated that causal relationships between tourism and economic expansion (Kim et al., 2006) showed a long-term equilibrium association. The economic deficit had been caused by tourism expenses, but it was found a positive and significant economic impact on the economic expansion (Sanchez et al., 2008). The empirical studies pointed out that tourism had a significant effect on the employment rate (Balaguer J & Cantavella-Jorda M, 2002, Onder K. & Durgun A, 2008). According to Archer (1996) and Mathieson (1982), tourism creates. Direct and indirect employment opportunities were created by tourism (Archer, 1996 Mathieson, 1982). The findings of our study showed that the correlation between tourism, employment, and GDP is positive. From this result, there is the existence of a relationship between sustainable tourism growth and GDP. Additionally, there is a long-run relationship between sustainable tourism growth and employment. Growth in tourism takes a major role in the economic growth as well as the employment rate.

With empirical and theoretical studies, the tourism sector has a positive impact on employment. Any effects on travel and tourism can produce an additional employment rate. The total economic impact of tourism becomes better when the tourism sector is encouraged to acquire domestic services and goods.

5. Conclusion

Examining the relationship between tourism to employment and economic growth in Vietnam is the main purpose this study and time series data from the year 1993 to 2018 is used. We use sustainable tourism as an explanatory variable and we take both employment and GDP as outcome variables. We employ bivariate regression and the Johansen

cointegration technique for the analysis. The relationship between tourism, employment, and economic growth is investigated to be positive. So, tourism has an important part in the economic development of the country.

It needs talented people and developed infrastructure in places. And, the government draws policies to create employment opportunities, income sources, and revenue for the local inhabitants as well as economic activities in the country through the development of tourism. It is necessary to provide the incentive to the tourism sector in the form of basic infrastructures such as a high-quality transportation system, roads, immense airports, and tax incentives to the tourism-related industries. Improving Vietnam's image to the world could be done thanks to political stability. The security of all tourists needs to be ensured and sustainable tourism policies are formulated.

The main focus of the policymaker should be on a law and order situation and quality education. The maximum share of tourists for the poverty, unemployment, inflation, and infrastructure development have been attracted in the whole of Vietnam. In conclusion, it's necessary to have an international-level promotion of tourism in local distance areas to alleviate poverty and enrich the standard of life.

ORIENTATION AND SOLUTIONS TO DEVELOP LAO PDR'S ELECTRICITY GENERATION INDUSTRY IN A SUSTAINABLE WAY

Assoc. Prof. Dr. Le Thu Hoa

lethuhoaneu@gmail.com

*Faculty of Urban & Environmental Economics and Management,
National Economics University, Hanoi, Vietnam*

Ms. Thippavanh Southammavong

bg_konun2@yahoo.com

PhD Student, National Economics University, Hanoi, Vietnam

Abstract

Lao PDR is a developing country with favorable natural conditions with abundant natural resources, especially in the field of energy production and electricity transmission. The electricity generation industry plays a very important role in rising state budget revenue and national energy security, contributing to the socio-economic development of Lao PDR. Developing the electricity generation industry in a sustainable way is an urgent requirement of the country in the context of accelerating economic integration, social development, protecting natural resources and environment, and responding to climate change. Based on the approach to analysing of strengths, weaknesses, opportunities and threats (SWOT analysis), this paper proposes orientations and some solutions to develop the electricity generation industry of Lao PDR towards sustainability.

Keywords: *Sustainable Development, Electricity Generation Industry, Lao PDR.*

1. Introduction

Sustainable Development Goal 7 (SDG 7 or Global Goal 7) - one of 17 Sustainable Development Goals established by the United Nations General Assembly in 2015 - aims to "Ensure access to affordable, reliable, sustainable and modern energy for all". Access to energy is an important pillar for the wellbeing of the people as well as for economic development and poverty alleviation.

The report *Our Common Future* (also known as the Brundtland report) published in 1987 by the World Commission on Environment and Development (WCED 1987) describes four key elements of energy sustainability: capacity to enhance energy supply to meet growing human needs, economically and efficiently, public health and safety, and protect the biosphere and prevent localized forms of pollution. Since then, sustainable energy has been launched based on the three pillars of sustainable development. Environmental sustainability includes criteria on greenhouse gas emissions, impacts on biodiversity, generation of hazardous waste and harmful emissions; Economic sustainability includes criteria on energy costs, providing energy to users with high reliability, limiting the impact

on work related to energy production; Social sustainability includes criteria for preventing conflict in energy supply (energy security) and long-term availability of energy.

The electricity industry is a special economic sector, consisting of four closely related components: electricity generation, electricity transmission, electricity distribution and electricity consumption. In particular, electricity production is a field related to issues of natural resource use, environmental protection and response to climate change. Developing the electricity generation industry in a sustainable way will still include 3 aspects that combine harmoniously and reasonably, economic, environmental and social as mentioned above, but with its own characteristics.

Lao PDR was one of the earliest countries in Southeast Asia to define the Sustainable Development Goals (SDGs) and integrate them into the Eighth National Socio-Economic Development Plan (NSED) in 2016, with the NSED indicators linked to the SDGs in the three dimensions (economic, social and environmental) of sustainable development.

In the Lao PDR, electricity production plays a very important role in socio-economic development, ensuring energy security, protecting natural resources and the environment. However, the growth of the country's electricity production is still quantitatively increasing, using natural resources including soil, water, forests and minerals, but lacking effective planning and solutions to prevent damage harmful to the environment. Develop electricity production in a sustainable way to achieve greater economic value, ensure energy security, social security, protect natural resources, limit environmental pollution and respond to climate change is one of the urgent issues for Lao PDR.

This paper uses the SWOT analysis method to clarify the strengths, weaknesses, opportunities and challenges for sustainable electricity generation development in Lao PDR, thereby proposing orientations and development solutions to develop this industry in the period to 2030.

2. Strengths and Weaknesses for Electricity Generation Development in Lao PDR

Lao PDR is relatively well endowed with energy resources, especially hydropower, solar power and biomass.

In fact, Lao PDR is a country rich in natural resources, with forests accounting for nearly 47% of the land area and average rainfall ranging from 1,300 to 3,000 mm (UNDP, 2012). Laos has no sea but is blessed by nature with the Mekong River running along the length of the country and many other small rivers flowing from the North to the South.

The amount of water in the rivers of Laos is 334 billion m³/ year, which resulted in per capita 60,318 m³/ person/ year. About 35% of the Mekong River's water comes from rivers in Laos, the rest comes from rivers in neighboring countries. The combination of rich water resources and mountainous terrain helps Laos to have great potential in developing energy from hydroelectricity to serve domestic demand and export. Since 1990 resources are being intensively developed to provide electricity for the requirements of the country and neighboring countries. Currently, Laos only uses about 20% of the total potential of 26,000

MW available. The development of hydroelectricity with reservoirs not only ensures electricity production, but also contributes to the prevention of droughts, floods and effective use in other fields such as fisheries, irrigation in agriculture.

Laos is also a country with the potential to generate electricity from biomass, wind and solar energy. In 2015, 1.30 million tons of oil equivalent (Mtoe) of biomass, representing 13.7% of the total primary energy supply (TPES), was used.

Laos is located in the tropical monsoon climate area, with a lot of sunshine during the year with high radiation intensity, so it has the potential to be exploited and used in the production of electricity from solar energy. Especially areas in the central and southern regions with 1,800 hours of sunshine per year or more are considered to have very high potential.

The development of electricity generation from renewable energy contributes to limiting the impact of climate change, does not create any impact on wildlife and wildlife reserves, water reserves and aquatic animal sanctuary. Renewable energy, especially solar power, is classified as a clean energy and does not cause air pollution, especially during operation. The previous development of solar energy was in Lao's residential areas, water reservoirs, etc. almost did not affect natural forests and protected areas.

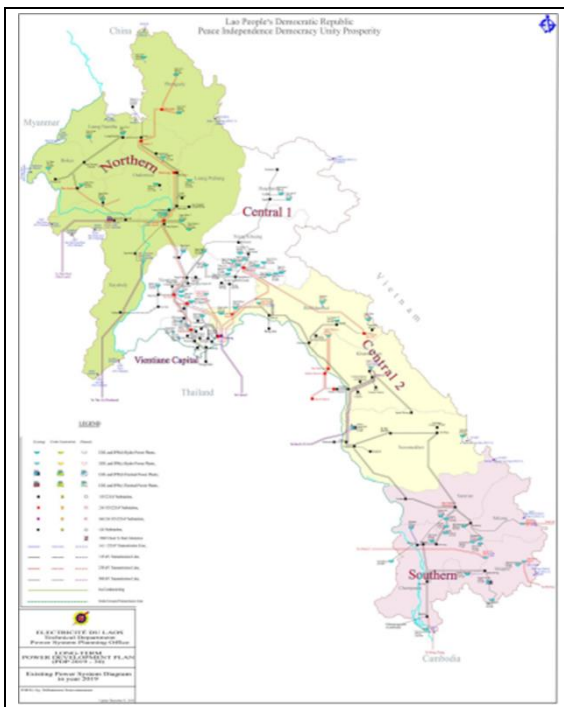

Figure 1: Power plants and transmission systems.

Source: EDL 2020

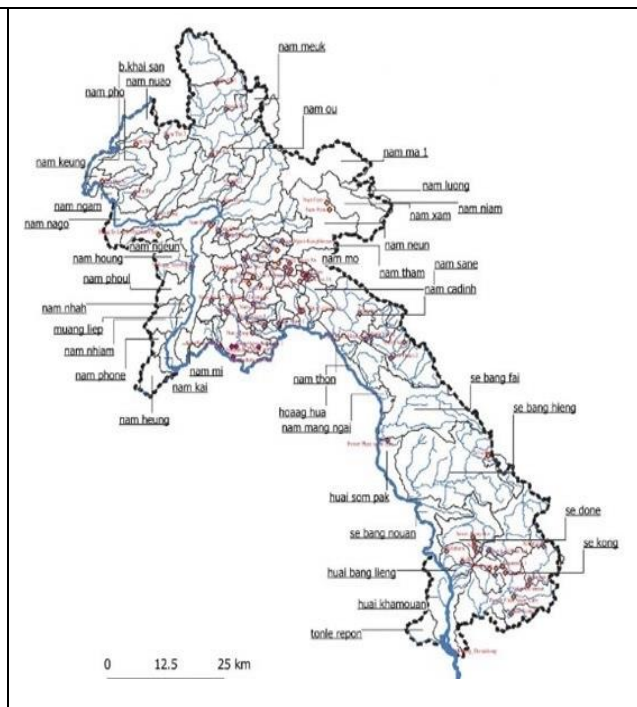

Figure 2: Hydroelectric projects in operation.

Source: MoEM, 2021

The electricity industry of Lao PDR has been established and developed over the years. So far it has always maintained a stable and continuous growth with a relatively high growth rate year after year. By 2020, Lao PDR has 85 power plants with a total installed capacity of 10,437.93 MW, which can generate a maximum electricity output of 54,029.03

million kWh/ year connected to the national power system. In the period of 2009 - 2020, the total electricity output reached 247,055 million kWh, the average growth rate is about 10-20%/ year.

Figure 3. Power generation in Laos, period 2009 - 2020

Source: Authours' presentation, data from EDL, MoPI&MoEM

❖ **Weaknesses**

At present, hydroelectricity and coal-fired power still account for a major proportion in the power source structure (70.67% and 29.08% in 2020). These are two sources that have the potential to affect natural resources (land, forests, and water sources) and produce greenhouse gas emissions, affecting climate change. Renewable energy electricity has not yet developed.

Figure 4: Electricity production from sources, period 2009 - 2020

Source: Authours' presentation, data from EDL, MoPI&MoEM

Despite having an abundant water source, it is not evenly distributed between seasons of the year, leading to instability in power output. In the dry season from December to April, especially the last 2 months of the season, the water level in the river drops, so electricity output also decreases. In that period of time, Laos still has to import electricity from Thailand to make up for the shortfall in output.

The development of hydropower plants with reservoirs will create more impact on forest areas, houses, agricultural regions and other areas than hydropower plants without reservoirs. From the data of EDL, MoEM and MoIP, it can be calculated that every 1 million kWh of electricity production will affect/ cause losses of about 1.17 to 1.47 hectares of forest. It is worth mentioning that hydroelectricity not only causes deforestation, but forest loss will lead to severe floods and continue to severely damage lands and forests, affecting biodiversity, life and economy activities of many people living in areas in the river basin.

Coal-fired power plants have been newly developed in Laos since 2014 but have quite a large impact on the environment, especially greenhouse gas emissions. Coal-fired power generates between 66% and 87% of the total greenhouse gas emissions in the Lao power sector. With the development of coal-fired power plants, the greenhouse gas emissions of the power sector increase from 4.866 million tons in 2014 to 23,084 million tons in 2020. In the future, if Laos continues to increase electricity output from coal-fired thermal power plants, the greenhouse gas emission factor will increase rapidly, greatly affecting the Lao's commitment on emission reduction.

Despite great potential, so far, the number of solar and biomass projects implemented in Lao PDR is very small. Renewable energy from solar and biomass currently accounts for less than 0.5% of the source structure. Wind power is hardly developed in Laos. Such slow development of renewable energy is due to the lack of strong and synchronous incentive policies, the lack of effective financial mechanisms for investment and operation of projects in remote areas. In particular, there is a lack of a master plan for renewable electricity development.

Infrastructure, especially the undeveloped power transmission system, is also a limiting factor in the development of the electricity industry in general and renewable energy in particular. In border areas, because there is no transmission system, Laos still have to import electricity to supply the needs of the people. In 2020, there are still about 5.7% of Lao's households that do not have access to electricity from the grid system (71,589 households of the total 1,254,748 households nationwide).

The technological level in electricity production has not reached the advanced and modern level. Human resources of the industry are still lacking in both quantity and professional qualifications as well as management capacity. The limited technical knowledge of some officials in the field of electric power in supervising power development projects is also a weakness of electricity production in Laos.

3. Opportunities and Challenges for Electricity Generation Development in Lao PDR

❖ Opportunities

The population and sustained economic growth are the main contributing factors to the increasing energy demand in the Lao PDR.

The economic reform and renovation policy of the Lao Government, which began in 1986, has helped Laos achieve a remarkably high economic growth rate. Figures from the Lao Statistical Office show that the country's average gross domestic product (GDP) growth rate was 7.79% in the period 2000 - 2016, the highest growth rate among all countries member states of the Association of Southeast Asian Nations (ASEAN) during the same period. The increase in GDP scale also helps the real per capita income of Lao PDR to increase rapidly. In 2009, the country's real GDP per capita was US\$907, rising to US\$2,408 in 2016 and US\$2,642 in 2020. Along with such development, per capita electricity consumption also increases from 367.21 kWh/person in 2009 to 1,075.65 kWh/person in 2020.

Also, the fast connectivity in terms of the electricity grid extension to remote areas brings additional demand in tandem with increasing per capita income. In 2009, the percentage of households without electricity accounted for 30.75% of the total 1,011,623 households nationwide. This number drops to 5.71% of the total 1,254,748 households.

Since the establishment of the Ministry of Energy and Mines in 2006, energy infrastructure is being developed and expanded. Also, energy policies are being developed and gaining public attention and support. The policies have gradually evolved from just the power sector policy to broader energy policies and the development of a sustainable and environment-friendly energy sector. The improvement of energy policies could be credited to the strong support from the Association of Southeast Asian Nations (ASEAN) and other international organisations, especially the Economic Research Institute for ASEAN and East Asia (ERIA) for their continued cooperation and support on energy policies of Cambodia, the Lao PDR, and Myanmar to catch up with other ASEAN countries.

Based on the policies of energy exchange in the platform of ASEAN energy cooperation, evidence shows that those countries have high energy demand and support the energy trade and power integration in this region because it can raise regional energy security and sustainable development. The Lao PDR has been trading electricity with Thailand for many decades; and now it expands this policy to other neighbouring countries to support regional energy cooperation. Particularly, the Lao PDR will increase power exports to 15,000 MW by 2030 - 10,000 MW to Thailand and 5,000 MW to Viet Nam, Cambodia, and Myanmar.

International cooperation and attracting foreign investment also bring many opportunities for the development of the electricity/ energy industry in general and electricity production in particular. Currently, Lao PDR has allowed French electricity to study the feasibility of a mixed floating solar energy project on Nam Theun 2 reservoir in Khammuan province with an installed capacity of 240MW, the goal is to build in 2022 and start operation from 2024. The development of floating solar power projects will take advantage of the

available space on hydropower reservoirs, save the development of power transmission lines and other works, thereby reducing capital demand for investors. Along with that, Laos has also approved many wind energy projects in Southern Laos invested by Thai, Chinese and Japanese enterprises.

Power exports are projected to increase sharply because of the government's agreements with neighbouring countries that, the Lao PDR should export to Thailand and to Viet Nam. In addition, in 2018 three hydropower projects are being constructed for the export of power. All export projects are being developed by foreign private investors through the build-operate-transfer (BOT) scheme.

❖ Threats

The challenge of developing the electricity generation sector depends on responsible resources, skills and investments, taking into account the economic, social and environmental aspects of sustainable management and development.

The biggest challenge that Lao PDR faces when developing renewable energy is the high investment costs and the ability of investors to arrange capital. Financial barriers have hindered economic project implementation due to lack of access to appropriate financial resources or lack of sustainable financing mechanisms. In addition, the power grid infrastructure in some areas with potential for renewable energy is not ready to release capacity, requiring large land use, especially solar power projects.

In terms of import dependency, the Lao PDR imported all its oil requirements and some electricity to meet consumption during the dry season and in the border areas without electricity access. Measuring import dependency is by dividing the total energy import to the total energy production. The total production of the Lao PDR consisted of coal, hydropower, biomass, solar and wind. The import dependency ratio was 19% in 2015, an increase from 17% in 2000 due to the increase in oil consumption, particularly in the transport sector. In the BAU scenario, the Lao PDR import dependency is projected to continue increasing and will reach 26% by 2040. If the Lao PDR increases domestic coal consumption for power generation instead of hydropower generation, the import dependency ratio should decline because of different thermal efficiency between coal power plants and hydropower plants. Nevertheless, oil consumption will increase faster than coal, which will result in an increase of the import dependency ratio.

Governance remains an important challenge that will increase over time, if the government does not consistently implement strategies and actions to strengthen the governance and capacity of the electricity enterprises.

Climate change and its consequences such as: global warming, heavy rain, hurricanes, floods and droughts have been challenges for the development of many economic sectors, including electricity production. As mentioned above, hydropower - the main source of electricity production in Laos today, could be severely affected by drought. Due to the effects of drought, Laos' electricity production has decreased by 10%, from 34,410 million kWh in 2018 to 31,134 million kWh in 2019.

4. Orientation to Develop Electricity Production in Lao PDR until 2030

Based on the actual development of the electricity industry in Lao PDR; Strengths, Weaknesses, Opportunities and Threats as analyzed above; Orientation to develop the electricity production industry in Lao PDR towards sustainability in the coming time should pay attention to:

- Following the policy of the Ministry of Energy and Mines set out in the *"Strategy for development of electric energy of Lao PDR for the period 2021-2030"* to improve the stable energy system, ready to supply enough electricity for domestic demand and export;

- Strictly implementing the conditions and processes for the development of electric power projects in accordance with the requirements in Laws and reflecting the reality of the project to improve the efficiency and effectiveness of the project;

- Select and develop power production sources with quality, low capital cost, high productivity and suitable production to meet the needs of domestic and export electricity markets;

- The development of power generation sources must be consistent with the master plan on expansion of the power transmission system and the plan on demand for electricity at home and abroad to ensure the system is stable and economically and technically feasible.

- The increase in electricity production output must go hand in hand with maximizing the resource recovery coefficient and protecting the environment in the process of exploiting hydropower, renewable energy and other power sources for electricity production;

- Regarding the import and export of electricity, it is not advisable to confirm the gradual reduction and cessation of electricity imports after year 2020. In order to match the socio-economic situation, the demand for electricity, after Laos joins the WTO and derived from the situation of the industry, it is worth to consider the point of view: "Exporting and importing electricity reasonably on the basis of prioritizing meeting the domestic electricity demand, ensuring socio-economic efficiency and financial balance for the electricity sector is suitable for each period, each locality, and each region according to the needs, electricity production capacity and socio-economic development situation of Lao PDR";

- Promote the mobilization of human resources in both terms: quantity and quality; improve professional qualifications in technology, professional management and understand the nature of employing energy sources to develop the electricity generation industry. Make a plan to submit to the Ministry of Education for scholarships in accordance with the plan to improve the qualifications of the industry's workers;

- Effectively implement the policy of socializing investment, mobilizing all resources - including international ones, to speed up the implementation of investment projects to improve power production capacity, ensure the construction progress of power plants, especially projects in key hydroelectricity, capable of exploiting more electricity.

5. Solutions to Promote the Development of the Electricity Generation Industry in a Sustainable Way

Policy solutions

- Promulgate, amend, supplement and complete current legal documents to create a favorable legal corridor for the management, exploitation, export and import of electricity according to the market mechanism with the state management and other related laws on the power generation industry in Lao PDR;

- Due to the big difference between domestic and imported electricity prices, it is necessary to have policies to encourage people to save electricity and use solar power instead of traditional electricity.

Solution on power source restructuring

- Restructuring sources to improve access to energy, energy efficiency, reduce greenhouse gas emissions, and increase the share of renewable energy in the energy structure. This alternative vision is consistent with the self-determined national contribution of Lao PDR and international commitments towards the Sustainable Development Goals (SDGs), including Goal 7 “Ensure access to affordable, reliable, sustainable and modern energy for all”. This requires an increase in the number of decentralized power producers; and reduce dependence on energy imports, fuel transportation;

- Continue to give reasonable priority to hydropower development, especially large projects with good flood and drought resistance; increase the proportion of electricity production by renewable energy such as solar and wind power; research and develop other renewable sources; develop thermal power plants with an appropriate ratio, in accordance with the power supply capacity and distribution of raw materials. By 2030, the proportion of hydropower will be 75%, coal-fired power 14% and renewable energy 11%.

Solutions for human resource

- Regarding human resource recruitment: to overcome the situation of the ask-for-grant mechanism, it is necessary to select human resources in a equally, objective and fair manner; develop recruitment criteria suitable to the power generation industry. Human resource recruitment must be based on the job positions to be recruited, each position needs its own criteria;

- After recruitment, it is necessary to pay attention to training and professional development for newly recruited employees. It is necessary to create conditions for new employees to quickly integrate into the working environment;

- Promulgating and implementing preferential policies, encouraging the attraction of highly qualified professional and technical workers to work in the power generation industry.

Solutions on science and technology development

- Focusing on research into advanced technologies, in-depth investment, renovation, upgrading and modernization in electricity production and consumption towards efficiency,

energy saving and minimizing impact on the environment; improve management, sales and customer service; applying 4.0 technology in production and business management.

Investment and financial solutions

- Speed up the progress of hydropower projects through diversifying investment forms to maximize resources and improve investment efficiency;
- Encourage investment in regions with difficulties in traffic, topography, environment and economy;
- Encourage investment in research and application of alternative forms of electricity production; encourage the expansion of investment in the development of overseas power source exploration and exploitation projects;
- Step up capital mobilization from domestic and foreign economic sectors through forms of cooperation, joint venture, association, and shares;
- Encourage enterprises producing electricity to mobilize capital through the stock market and commercial loans to invest in the development of electricity production;
- Allocate state budget capital and other preferential capital sources for the basic survey of electricity resources and formulation of development planning for the electricity production industry;
- The State partially supports from the state budget for research programs on energy efficiency, supports enterprises in the electricity industry with credit loans, ODA capital, etc.

ENVIRONMENTAL SUSTAINABILITY: MEASUREMENT, PRACTICE AND POLICY DIRECTION FOR VIETNAM

Assoc. Prof. Dr. Dinh Duc Truong

truongdd@neu.edu.vn

National Economics University, Hanoi, Vietnam

Abstract

Vietnam has achieved many socio-economic development achievements after carrying out economic reforms in 1986. However, the price to pay is the decline in natural resources and environmental quality, as well as existential threats from climate change. This article is intended to be an introduction to environmental sustainability, the measure of environmental sustainability used around the world. On that basis, assess environmental sustainability based on the criteria identified in Vietnam. The article also analyzes Vietnam's environmental problems from an economic perspective with an assessment of the growth model, on that basis proposes policy directions towards environmental sustainability in Vietnam in the coming period.

Keywords: *Environmental Sustainability, Sustainable Development, Economic Growth, Environmental Pollution, Environmental Performance Index.*

1. Introduction

Sustainable development has become an urgent need and an inevitable trend in the development process of society. The process of sustainable development requires a harmonious adjustment between economic growth and social security and environmental protection, especially in the context of the Fourth Industrial Revolution, innovation, The advancements of science and technology have changed a lot, geopolitical conflicts have taken place, as well as the impact of the Covid-19 Pandemic, which have affected the sustainable development goals for the period 2021-2030.

In 1987, in the Report "Our Common Future", the -World Commission on Environment and Development (WECD) introduced the concept of "sustainable development" as "development that meets the needs of the present without compromising compromised ability to meet the needs of future generations". WCED's concept of sustainable development mainly emphasizes the aspect of efficient use of natural resources and ensuring the living environment for people. In principle, sustainable development is the process of operating at the same time three aspects of development: sustainable economic growth, prosperous society, equity, stability, diverse culture and healthy environment are maintained sustainably. Therefore, the complete system of ethical principles for sustainable development includes principles of sustainable development in all "three legs" of economy, society and environment.

In Vietnam, the VI Congress (1986) marked an important turning point in the Party's awareness of sustainable development, completely in line with the world's concept. At the 6th National Congress, for the first time, the Party required the unification of economic policies with social policies, while emphasizing the meaning and importance of protecting forests and natural resources. In the VII Congress (1991), sustainable development was presented more clearly, specifically and fully, especially on the issue of environmental protection. Many phrases have been used to express the intrinsic content of sustainable development, such as "ensure the harmony between economic development and social development", "harmoniously combine economic development with cultural and social development, between economic growth and social progress".

After more than 30 years of strong socio-economic development after 'Đổi mới', Vietnam's lines and policies have always focused on harmonious development between economy, society and environmental protection. The XIII Congress (2021) pointed out, the overall development strategy of the country is to comprehensively and synchronously promote the Doi Moi, rapid and sustainable development of the country; ensuring close linkage and synchronous implementation of tasks, in which: Socio-economic development is the central task; Party building is key; Cultural development is the spiritual foundation; Ensuring national defense and security is vital and regular. Vietnam's awareness and views on rapid and sustainable development have both inherited the world's general development awareness and trends and have been applied, supplemented and developed in accordance with the specific conditions of the country. Vietnam.

This article is intended to be an introduction to environmental sustainability, the measure of environmental sustainability used around the world. On that basis, assess environmental sustainability based on the criteria identified in Vietnam. The article analyzes Vietnam's environmental problems from an economic perspective with an assessment of the growth model, on that basis proposes policy directions towards environmental sustainability in Vietnam in the coming period.

2. Foundation and measurement of environmental sustainability

Environmental sustainability is a part of sustainable development - a common trend that all regions and countries want to move towards. There is a close relationship between the environmental system and the economic system. The environment has three main functions with the economic system, including (i) providing space for economic activities, (ii) providing input resources and (iii) absorbing and transforming output waste. Environmental sustainability refers to the fact that environmental resources will be protected and maintained for future generations and used optimally by economic systems.

Environmental sustainability involves issues such as:

Ensuring the long-term health of the ecosystem: Protecting the productivity and long-term health of resources to meet future socio-economic needs, e.g. protecting food supplies, soil agriculture, fisheries, forest resources.

Intergenerational decision making: When making economic decisions, attention should be paid to integrating the interests of future generations, not just the present moment. For example, burning coal offers short-term benefits because fossil fuels are cheaper, but the extra pollution comes at a cost for future generations.

Renewable resources: Diversify and promote the use of renewable energy sources (solar, wind, tidal, geothermal etc.)

Preventing consequences of climate change: ensuring emissions are within the environmental load threshold, minimizing impacts and adapting to climate change

Protection of biodiversity and ecological structure: towards protecting species, their habitats and ecosystems from being removed or unduly invaded by impacts from economic activities.

Towards social welfare, not just GDP: social welfare includes the maintenance and improvement of resources and the environment, including use values and non-use values for the future (Figure 1).

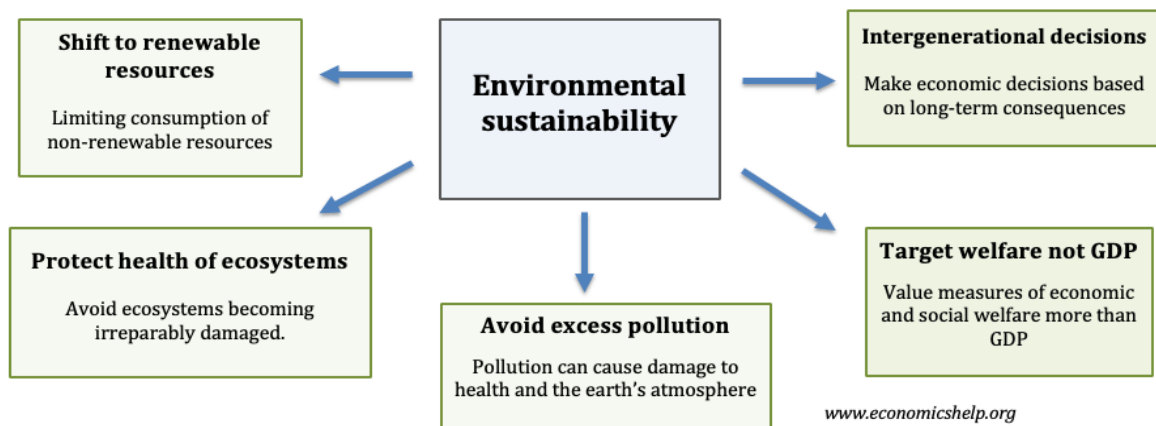

Figure 1. Concept of environmental sustainability

Environmental sustainability is a concept with broad connotations, multi-dimensional, but it is necessary to measure to compare the level of countries, and of each country over time to review and adjust development strategy towards more environmental sustainability and sustainable development. Currently in the world there are a number of indicators used to measure environmental sustainability, but the most commonly used indicator at the national level is the Environmental Sustainability Index (ESI) and since 2006 has been replaced by the Environmental Performance Index (EPI).

The EPI includes many component indicators and is divided into two broad themes. The first group to measure efforts to reduce pressure on the environment in terms of human health is called the Environmental Health index group. The second group measures the reduction of loss or degradation of ecosystems and natural resources, which is included in the Ecosystem Vitality index group. Indicators were selected on the basis of careful review of environmental policy studies, policy consensus through dialogues on the MDGs, and expert consultation. These indicators also represent a range of priority environmental issues that are quantifiable and measurable based on available data sources.

ESI is considered the "precursor" of EPI, which has been used since 2006. EPI is used to evaluate the effectiveness of environmental protection activities of a country. Up to January 2012, 04 EPI reports have been released - Pilot Environmental Performance Index 2006, and Environmental Performance Index 2008, 2010, and 2012. In 2012, YCELP continued to publish reports. EPI at the World Economic Forum aims to rank (EPI rank) and assess trends (Trend EPI rank) on environmental protection performance for 132 countries, allowing identifying which countries are improving and which country is in decline.

EPI in 2012 is calculated based on 10 groups of indicators with 22 specific indicators. The researchers divided the 10 groups of indicators mentioned above into 2 groups: Environmental Health (including 3 indicator groups) and Ecosystem Sustainability (including 7 indicator groups) (Institute for Health Metrics and Evaluation, 2017)

3. Measuring environmental sustainability in Vietnam

According to Yale's EPI ranking report, Vietnam has an EPI in 2012 of 50.6 points, ranking 79/132 countries, belonging to the group of countries with average environmental management capacity and equivalent to developing countries in the world such as Chile, Indonesia, Myanmar, Cambodia, Peru, Mexico, Venezuela, Honduras and the UAE (classified according to 5 levels: very good ability, good ability, average ability, poor ability and very good ability. least). In addition, ranking the trend of improving environmental management capacity, Vietnam reached 4.2 points and ranked 73/132 countries, belonging to the group of countries with small improvements in capacity (classified by 5 levels: very good improvement, good improvement, small improvement, relative decline, great decline) (YCELP 2012) (Table 1).

In the component indexes, the group of indicators on air quality affecting health: Vietnam ranks in the top 10 most polluted countries (class 123/132), equivalent to some Asian countries such as China, India, Pakistan, Nepal and Bangladesh. In the ASEAN region, Vietnam is currently ranked 7th out of 11 countries, in the same group as Thailand, Indonesia, East Timor and Myanmar. The highest ranking in the region is Singapore (ranked 49th) and the lowest is Laos (ranked 153).

Table 1. EPI and ranking of some OECD countries, NICs and neighboring Vietnam

	GPP/capita PPP 2017 (USD)	EPI (2018)	EPI 2018 ranking
OECD nations			
USA	59.495	71.19	27
Canada	48.141	72.18	25
Germany	50.206	78.37	13
Japan	42.695	74.699	20
Korea	39.387	62.30	60
Italia	37.970	76.96	16

	GPP/capita PPP 2017 (USD)	EPI (2018)	EPI 2018 ranking
New industrial nations (NICs)			
Brazil	15.500	60.70	69
Mexico	19.480	59.69	72
Malaysia	28.871	59.22	75
India	13.403	44.73	142
Án Độ	7.174	30.57	177
Some other nations			
China	16.624	50.74	120
Thailand	17.786	49.88	121
Indonesia	12.378	46.92	133
Singapore	90.531	64.23	49
Vietnam	6.876	46.96	132

Source: IMF (2017) và YCEPC (2018)

Basically, Vietnam's EPI is below the world average, in which the ranking trend is increasingly going down. If in 2102 Vietnam ranked 79/132, in 2016 it dropped to 131/178 and 2018 ranked 132/180 countries. In particular, in 2018, the Vietnam Environmental Health Index ranked 129/180 and the Ecosystem Health Index ranked 124/180 countries. In terms of points, Vietnam achieved 46.96 EPI points in 2018 compared to 50.6 in 2012. Thus, EPI shows that Vietnam is increasingly lagging behind in terms of environment compared to itself and other countries in the world.

4. Environmental issues in economic development in Vietnam

Vietnam's economy depends on natural resource exploitation, inefficient use of natural resources and increasing energy consumption

Natural resources have made great contributions to Vietnam's economy, especially in the agro-forestry-fishery industry, mining industry and commodity export, which is the basis for ensuring food security as well as creating foreign exchange revenue for the country. According to the OECD (2015), a significant contribution to Vietnam's economic growth over the past two decades has been the result of the exploitation of natural resources, especially the maximum use of land and water, and large areas of forest have been cleared to serve export-oriented agricultural production. For example, the total area of agricultural land in Vietnam increased by 61% between 1990 and 2012, mainly due to deforestation and occurred during the 1990s, since then the area of arable land has remained relatively stable. This shows that most of the arable land that can be exploited for farming is being used to its limit. If agricultural production is to grow further, productivity must be increased, although Vietnam's current productivity is already very high compared to other Asian countries. In

addition, deforestation due to the planting of highly profitable agricultural crops, especially coffee, took place very strongly in the early 1990s, significantly reducing the forest area and was only partially overcome through efforts. afforestation for nearly 20 years starting from 2000; As a result, the forest cover rate has increased gradually over time, namely 38.2% (2006), 40.8% (2015) (Ministry of Natural Resources and Environment, 2015) and reached 41.65% (Ministry of Agriculture and Rural Development, 2019). More than two thirds of the natural forest area is assessed as poor forest and the forest on the lowlands has been almost completely exhausted; Deforestation, forest degradation and fragmentation still occur in the Central Highlands, Central Coast and Southeast (OECD, 2015).

In Vietnam, the mining industry (including exploitation of energy sources such as oil, gas, coal; mining of metal ores such as iron, tin, bauxite; uranium ore mining, material extraction construction) plays an important role in providing input materials for the processing industry. On average, in the period 2010-2017, the mining industry contributed about 37.8% to the total value of industrial production and contributed about 10.4% to GDP. The main natural resources that are exploited to serve the mining industry are coal, crude oil and natural gas, and other minerals.

The norm of consumption of natural resources in production in Vietnam is still high. According to research by CSIRO and UNEP (2013), Vietnam has the highest level of domestic use of raw materials (coal, oil, steel) to produce a unit of GDP in the world. Not only that, the intensity of Vietnam's use of raw materials tends to go against the trend of the world. While the world is using less and less raw materials to generate a unit of GDP, Vietnam is increasing this proportion. For example, in 1990, Vietnam used more than 8 kg of raw materials to generate 1 USD GDP (the world average is 1.8 kg), in 2008, Vietnam used about 13 kg of raw materials. crude to generate 1 USD GDP (world average is 1.5 kg). In general, the rate of application of modern technology in production and business fields in Vietnam is still far from that of other countries in the region; Therefore, the production of goods requires more consumption of raw materials and energy, produces more waste, but the waste is not treated or treated improperly and causes environmental pollution (Ministry of Natural Resources and Environment). school, 2015b).

In addition, the growth strategy based on the export of raw products is also considered a priority development mode in Vietnam in recent years. Among the key export items of Vietnam, exports based on natural resource exploitation are agricultural and forestry products, fishery products, crude oil and coal. In the period 2010-2017, the total export value of these four commodity groups accounted for about 25% of the total value of Vietnam's exports.

Energy consumption in Vietnam is increasing

Energy consumption for production and consumption in Vietnam is increasing day by day. Total primary energy consumption has increased from 57,023 KTOE in 2010 to 64,797 KTOE in 2014. Total final energy consumption is also increasing, from 47,445 KTOE in 2010 to 52,248 KTOE in 2014. Considering the structure of primary energy consumption, fossil fuel consumption (coal, crude oil, oil and gas products) accounted for

70% in 2010 and increased to 72% in 2014. by consumption structure of final energies, consumption of fossil fuels (coal, oil and gas products) accounted for 55% in 2010 and 54.6 in 2014 (Ministry of Natural Resources and Environment, 2017). . In general, fossil energy consumption still accounts for a large proportion in the structure of energy use in Vietnam. The share of coal used for power generation will increase from 32% in 2014 to 54% in 2030, while about 60% of coal used for power generation will have to be imported (World Bank and Ministry of Planning and Investment, 2016). The depletion of fossil fuel sources in the face of pressure on energy demand also opens up opportunities to develop Vietnam's energy industry in a more sustainable direction while the country's wind power potential accounts for 63% of the total area. territory; solar energy potential, regional radiation gradually increases to the south with a relatively high total irradiance, enough to exploit solar power (Ministry of Natural Resources and Environment, 2015b). The energy policies issued in the coming years related to energy efficiency and renewable energy will determine the development trend of the energy sector and related issues. Promoting the development of renewable energy sources not only solves the problem of energy supply and demand balance and energy security, but also makes an important contribution to reducing greenhouse gas emissions and combating global climate change.

Environmental pollution from industrial production and transportation

Three major environmental problems for industrial production, especially in industrial zones (IZs) and industrial clusters (CCNs) are wastewater pollution, air pollution and solid waste.

Out of a total of 283 industrial zones operating in the country, 212 industrial zones have built a centralized wastewater treatment system (accounting for 74.9%), 24 industrial zones are building a centralized wastewater treatment system (accounting for 11. 5%); the remaining industrial zones are developing a roadmap to invest in a centralized wastewater treatment system. The centralized wastewater treatment systems in industrial zones can only treat about 60% of the wastewater generated. For the remaining amount of wastewater, partly because the facilities have been exempted from the connection and self-treatment, a part is not treated but discharged directly into the environment. Nationwide, there are only 66 CCNs with a common wastewater treatment system in operation, accounting for 10.5% of the total number of CCNs in operation (Ministry of Natural Resources and Environment, 2015). Some industrial production industries with large amounts of wastewater and high concentrations of pollutants if not treated are: food and food processing; textile dyeing, paper production, mining...

Air pollution due to industrial production activities is mainly concentrated in the vicinity of factories; production facilities still use outdated technology, poor environmental management, typically some factories in cement, metallurgy, mining, building materials, and processing, thermal power... Dust and emissions around these facilities often exceed the allowable standards many times.

The volume of industrial solid waste discharged at about 22,440 tons/day, equivalent to 8.1 million tons/year, mainly arises from industrial zones, export processing zones, high-

tech parks and production and business located outside the industrial zone. Notably, solid waste from mining industries (coal mining, thermal power industry, iron ore, non-ferrous metals, and bauxite mining...); shipbuilding and ship repair industry; thermal power industry; wine, beer, beverage industry... The average rate of solid waste collection and treatment in urban areas in the period 2013-2014 was about 84-85%, an increase of about 3-4% compared to year 2008-2010. The rate of hazardous waste collection and treatment in 2014 was about 40% of the national total and increased by 93.4% compared to 2012 (Ministry of Natural Resources and Environment, 2015).

Construction activities such as excavation and backfilling, demolition of old buildings, construction materials scattered during transportation, etc. often cause quite serious dust pollution to the surrounding air environment.

Transport activities are continuing to put great pressure on the environment, especially the air environment due to the increase in the number of vehicles and the density of traffic, especially in urban areas (for example, two cities). The big cities are Hanoi and Ho Chi Minh City, accounting for 30% of the total number of motorbikes and motorbikes and 50% of the number of cars of all kinds of the country) (Ministry of Natural Resources and Environment, 2015b). Transport activities are considered as one of the major sources of air pollution, especially in urban areas and densely populated areas where traffic activities thrive. In Vietnam today, the increase in road motor vehicles, especially cars and motorbikes, together with the quality of the roads not meeting the demand, the low quality of fuel used are the main cause of air pollution.

Vietnam's economy is vulnerable to the impacts of climate change

Vietnam is one of the countries most affected by natural disasters in the Asia-Pacific region due to its geographical location and topography. Of all types of natural disasters, storms and floods are the most frequent and dangerous. On average, Vietnam suffers from 6-7 storms each year; 74 floods occurred during the period 1990-2010. In addition, more droughts, saltwater intrusion, landslides and other extreme natural disasters have occurred (Institute of Meteorology, Hydrology and Climate Change and United Nations Development Programme, 2015). Most of Vietnam's population lives in river basins, lowlands and coastal areas, so more than 70% of the population is at risk of natural disasters (UNDP, 2012).

Climate change is increasingly evident in Vietnam. In the past 50 years (1958-2007), the annual average temperature has increased by about 2-3°C; sea level at Hon Dau station has risen about 20 cm; the average rainfall in the whole country has decreased by about 2%/year; and extreme weather events increase, especially storms with strong intensity appear more and the storm season ends later, cold air waves causing severe cold and damaging cold tend to last (Ministry of Finance, 2016).

Economic costs of environmental pollution

Environmental pollution has created economic costs for society and the economy. According to a 2008 World Bank study, Vietnam suffers from environmental pollution

losses of up to 5.5% of GDP annually; ie Vietnam's economy lost about 4.2 billion USD out of 76 billion USD in 2008. Environmental pollution not only causes economic losses but also has direct and negative impacts on human health. Every year, Vietnam suffers about 780 million USD in damages in the field of public health because of environmental pollution. The rate of payment for health care and protection due to the impact of environmental pollution in 2010 accounted for about 0.3% of GDP and is expected to increase to 1.2% of GDP by 2020. According to estimates of the Ministry of Finance If Vietnam's GDP in the next 10 years doubles without paying due attention to environmental protection, environmental pollution will increase 3 times and by 2025 may increase 4 times compared to the level of natural resources and environment. current level of environmental pollution (Vu Thi Hoai Thu and Dinh Duc Truong, 2014).

According to the Climate Change Vulnerability Index (CCVI), Vietnam ranks 23rd out of 193 countries and is ranked in the group of 30 countries most at risk to the impacts of climate change. Climate change (UNDP, 2012). According to the 2018 Global Climate Risk Index (CRI) assessment by Germanwatch, Vietnam ranks 5th among the countries most affected by weather-related damage (hurricanes, storms, hurricanes, hurricanes, etc.) floods, heat waves, etc.) in 2016 and ranked 8th among the countries most affected by extreme weather events in the period 1997–2016 with a total annual loss of about 2 billion USD (PPP). According to the General Statistics Office, in 2016, natural disasters caused an estimated damage of 39.7 trillion VND, equivalent to 1.7 billion USD, accounting for 1% of GDP. In 2017, natural disasters caused damage estimated at a higher level, about 60 trillion VND, equivalent to 2.6 billion USD, accounting for 1.2% of GDP and 1.5 times higher than 2016. On average over the past 10 years, the average damage caused by natural disasters in Vietnam is estimated to account for 1-1.5% of GDP/year although the actual losses could be much higher (Ministry of Natural Resources and Environment, 2015).

5. Forecast of EPI developments and EPI targets in Vietnam

Forecast of EPI

Vietnam's economy is showing signs of recovery after Covid. This recovery stems from a number of factors including (i) the impact of total social investment in the period 1998-2010, leading to the enhancement of material and infrastructure capacity for the economy (ii) economic integration. The deepening of international trade led to trade growth, the trade balance began to shift towards a trade surplus, contributing to growth (iii) gradually transforming the export structure to a number of valuable economic products. higher economic sectors such as electronic components and equipment (World Economic Forum 2018).

However, environmental developments in Vietnam will tend to decrease, leading to the decline of EPI, with some main reasons as follows:

Firstly, on the flip side of international economic integration, Vietnam will continue to attract FDI, but FDI flows still tend to be "dirty" falling into resource-intensive industries and generating a lot of waste, especially those mining, iron and steel, cement, textile dyeing, fertilizers, chemicals. The industries with high export value in the direction of more

integration such as electronic components also cause large pollution (heavy metals, emissions, wastewater, etc.)

Second, the process of industrialization in Vietnam is happening quite quickly, but structurally, the rapid growth falls in the groups of industries with a high risk of pollution such as processing and manufacturing. If not managed properly, industrialization will cause environmental disasters.

Third, the exploitation of natural resources is still an important contributing factor in growth and budget revenue. In the coming years, groups of industries exploiting and exporting resources such as oil and gas, coal, forest products, fisheries still play an important role in the economic structure.

Fourth, in the global value chain, Vietnam is still around in the lowest link, which is manufacturing and processing, but has not switched to "clean" and higher value-added links. Outsourcing and manufacturing will come with pollution.

Fifth, investment in environmental protection in Vietnam is still at the lowest level in the region with a total budget of only 1% for environmental protection. Vietnam has not yet mobilized resources from society, especially the private sector, in environmental protection activities.

EPI target in Vietnam

Currently, countries in the world are ranked EPI according to 4 main groups: countries with high EPI (top 50), countries with medium EPI (from 50-100), countries with low EPI (100-150) and weak EPI countries (150 to 180). In 2018, Vietnam ranked 132nd on EPI, which is the low group and close to the weakest in the world, with a tendency to increasingly lag behind in the rankings.

In the medium and long term, despite improving environmental quality, it is difficult for Vietnam to break into the top 50 EPI group because this group is mainly a country with very developed economies and social resources to invest in environmental protection investment. Therefore, the actual goal of Vietnam is to achieve environmental sustainability at a fairly average level like that of the advanced NICs. These are Brazil (#69), Mexico (#72) and Malaysia (#75) of EPI. The common feature of these countries is that they have a GDP per capita in PPP between 15-28 thousand USD/year currently. This is the level Vietnam can strive to achieve.

According to the Report "Vietnam 2035: Towards Prosperity, Innovation, Equity and Democracy" by the Ministry of Planning and Investment and the World Bank (2016), if the average growth rate of 6% is maintained, In the next 20 years, Vietnam will achieve a PPP per capita income of USD 18,000 in 2036. This level is equivalent to the current advanced NICs. Thus, if appropriate economic-environmental management solutions are implemented, Vietnam can achieve a good average EPI level of the world in 2035-2040.

6. Policy implications toward environmental sustainability in Vietnam

(i) Improve the valuation of resources and environmental pollution/degradation to fully account for the social costs of resource use and environmental pollution/degradation through environmental taxes/fees, taxes resources, eliminating inefficient subsidies;

(ii) Developing a circular economy to turn waste into a resource; dispose of plastic waste to contribute to the global effort to tackle ocean plastic waste;

(iii) Developing the marine economy to turn Vietnam into a strong marine country with developed marine economic sectors; restore and conserve important marine ecosystems; prevent the trend of pollution, degradation of the marine environment, coastal erosion and sea erosion; proactively adapt to climate change and sea level rise in coastal areas;

(iv) Towards a low-carbon economy through energy policy (saving energy, increasing energy efficiency, gradually increasing the share of renewable energy in energy production and consumption, natural clean and advanced fossil fuels and promote investments in energy infrastructure and clean energy technologies) and use market tools and carbon pricing to promote activities that reduce greenhouse gas emissions such as carbon markets, carbon taxes, climate finance, etc.

(v) Towards an economy that is resilient to the impacts of climate change by strengthening the capacity to adapt to climate change at the national, sectoral, local, community and individual levels in society.

(vi) Smart technology application in management areas of the natural resources and environment industry, including efficient exploitation and use of resources, waste treatment, smart and sustainable land management, environmental protection, water resource management, weather monitoring and forecasting; disaster prevention...

(vii) Creating an enabling business environment with the institutional reforms needed to promote growth and protect the poor, for example: creating new markets by boosting the demand for green technology, green goods and services, thereby creating opportunities for green jobs; investment in green infrastructure (especially in the fields of renewable energy, water, transport); mobilizing finance for green initiatives (eg public finance combined with private finance through PPP); institutional reform (better coordination of relevant ministries at central and local levels).

7. Conclusions

The result of more than 30 years of efforts to innovate is that a country of Vietnam has come out of underdeveloped status, become a middle-income country, a market economy strongly and deeply integrated into the system. global economy. The rapid growth of the Vietnamese economy in recent years has relied heavily on the contribution of natural resources. Exporting raw products has been a priority development strategy of the government. Along with that, inefficient exploitation and use of natural resources, losses due to weak technology, high consumption norms of natural resources in production are the causes leading to the risk of depletion of national resources. Another consequence of rapid growth in Vietnam is that production activities cause environmental pollution and degradation, which not only causes economic losses, but also directly and negatively impacts human health. . Vietnam's Environmental Performance Index (EPI) is currently ranked very low and Vietnam is increasingly lagging behind in terms of environment. Looking to the

future of future generations, the next five-year development plan needs stronger steps in efforts to restore the natural balance, as well as investment in finding alternatives to promote growth.

The Vietnamese government has recognized the need to develop an economy associated with resource management, environmental protection, and response to climate change in the country as well as complying with international commitments. However, Vietnam's environmental management capacity improvement trend ranking is currently 4.2 points, at 73/132 countries, in the group of countries with small improvements in capacity. This progress is certainly not enough for Vietnam to firmly follow the successful models in the region and move towards a desirable living environment. Current obstacles include institutions and policies related to natural resources, environment and climate change that have not been fully completed; Resources (human, financial, science and technology) in the country for resource management, environmental protection and response to climate change are limited.

In the coming time, Vietnam needs to make fundamental changes in its growth model in the direction of (i) gradually reducing dependence on natural resources and becoming more efficient in using natural resources; (ii) towards cleaner/cleaner production activities to reduce environmental pollution and degradation; (iii) low carbon emissions and increased resilience to the effects of climate change. Specific plans need to be prepared to transition the economy to a low-carbon and environmentally friendly growth model, strengthen capacity to adapt to the adverse effects of climate change and take advantage of international cooperation opportunities to strengthen resources and capacity to respond to climate change, green growth and sustainable development in Vietnam.

Abstract

The purpose of this article aims to assess the current status of the agricultural digital transformation in Vietnam, thereby suggesting some solutions to promote this process. Agricultural digital transformation in Vietnam has only been started since 2018, but it has brought many outstanding benefits, making an important contribution to the sustainable agricultural development and increasing income for farmers. Besides the advantages, the digital transformation of agriculture is facing difficulties that need to be overcome such as policies, laws on digital transformation have not met the practical needs of the agricultural production; the information technology infrastructure in the agricultural sector hasn't been synchronously invested and is still backward; awareness of agricultural digital transformation of most localities, businesses and especially farmers is still limited; the average size of arable land per household is very low and the level of mechanization is still low, the supporting technologies for agricultural development are inadequate.

Keywords: *Agriculture, difficulties, digital, transformation, solutions.*

1. Introduction

Agriculture is a foundation for a state's economic development, sustainable society, political stability, and national security. If agricultural development is managed well, it also preserves and promotes the national cultural identity and can contribute to ecological sustainability (Luong, 2013). Agriculture has always been a pioneer in the Doi Moi (renovation) process, contributing significantly to achievements in poverty reduction and

food security in Vietnam (Le & Carolyn, 2021; Otsuka, 2013; Wegren & Elvestad, 2018). Furthermore, Vietnam has a great role in ensuring food security of the world because it is a major exporter of rice, seafood, and coffee (D. L. T. Anh et al., 2023). Nowadays, agriculture plays a relatively important role in the development of the economy and society (Tu et al., 2021) with nearly half of the country's labor force working in this sector (N. T. Anh et al., 2022). In the context of the outbreak of the Covid-19 epidemic, agriculture was considered a bright spot and a pillar of the economy, with the growth rate reached 2.88%. Agriculture not only contributed to ensuring food security, but the export turnover of agriculture, forestry and fishery products in 2022 reached 24.73 billion USD, up 3.9% compared to 2021 (General Statistics Office of Vietnam, 2022). Although the agricultural sector has achieved encouraging results, it is also facing difficulties and challenges such as population growth, urbanization, climate change, epidemics, supply and demand disruptions, logistics costs, high input prices, which requires restructuring for adaptation. In addition, the share of the industry in GDP structure is only 13.96%, very low compared to the potential and advantages due to the small, inefficient production model and the lack of value chain linkages.

In order to solve all disadvantages completely as well as make a strong motivation in Vietnam's agriculture, which transforms thinking from "agricultural production" to "agricultural economy", towards an integrated multi-value agriculture, builds ecological agriculture with the objective of sustainable development agriculture, modern rural areas and civilized farmers, masters science and technology, promoting digital transformation in agriculture is an extremely inevitable trend. Digital transformation and high technology application are expected to help the sector improve production productivity, adapt to climate change, ensure income for farmers, and reduce food waste. However, digital transformation in agriculture in Vietnam is still local in nature and lacks comprehensiveness on the national scale. This article aims to assess the current status of the agricultural digital transformation in Vietnam, thereby suggesting some solutions to promote this process.

2. Method

The article uses document analysis method. The sources of documents are the policies and laws of the State; scientific articles, articles on agricultural digital transformation. Within the framework of this article, the arguments are analyzed and evaluated in order to make statements as a basis for proposing some solutions to promote agricultural digital transformation in Vietnam.

3. Results

3.1. Policy framework on digital transformation in agriculture

The Fourth Industrial Revolution creates many opportunities and poses many challenges for each country, organization and individual. In Vietnam, the Party and Government have recently led and directed all levels and sectors to promote the application and development of science, technology, research, and innovation, and improve the capacity to access and participate actively in the Fourth Industrial Revolution. Resolution No. 52-NQ/TW dated September 27, 2019, of the Politburo set out guidelines and policies to

participate actively in the Fourth industrial revolution, focusing on completing the institution that bring advantage to the active participation in the Fourth Industrial Revolution and the national digital transformation process (Central Committee of the Communist Party of Vietnam, 2019).

On June 3, 2020, the Prime Minister issued Decision No. 749/QĐ-TTg approving the "National Digital Transformation Program to 2025, with orientation to 2030". Digital transformation in agriculture is identified as 1 of 8 priority areas, in which farmers are identified as the center of digital transformation. Digital transformation of agriculture and rural development is an indispensable and objective requirement and is the responsibility, obligation and interest of the whole political system, enterprises and especially farmers; is a method to realize the goal of developing smart agriculture and modern rural areas, increasing the proportion of digital agriculture in the production, processing chain, as well as in market and economy. The main contents of digital transformation in the agricultural sector are as follows: (i) To develop high-tech agriculture in the direction of focusing on smart agriculture and precision agriculture, increasing the proportion of digital agriculture in the economy; (ii) To implement digital transformation in agriculture based on data. Focusing on building the big data systems of the industries such as land, crops, livestock and fisheries. Building an integrated observation and monitoring network in the air and on the ground for agricultural activities. Promote the provision of information on the environment, weather, and land quality so that farmers can actively improve productivity and quality of crops and support the sharing of agricultural equipment through digital platforms; (iii) To apply digital technology to automate production and business processes; managing and monitoring the origin and supply chain of products, ensuring fast, transparent, accurate, safe, and food hygiene. Consider piloting the implementation of the initiative "Every farmer is a trader, each cooperative is an enterprise applying digital technology" with the goal that each farmer is oriented and trained in digital technology application in produce, supply, distribute, forecast (price, season, ...) agricultural products, promote the development of e-commerce in agriculture; (iv) To implement digital transformation strongly in management to have timely policies and administration for agricultural development such as forecasting, providing market alert, managing master plan (Prime Minister of Vietnam, 2020).

Determining that the digital revolution will really create a breakthrough for the country in the coming decades, the 13th National Party Congress has set out a requirement to strongly promote national digital transformation, develop a digital economic and a digital society to create breakthroughs in improving productivity, quality, efficiency, and competitiveness of the economy. The specific goal of digital economic development in the Document of the XIII National Congress is to strive to complete the construction of a digital government by 2030, ranking at 3rd in the ASEAN in terms of e-government and digital economy (Communist Party of Vietnam, 2021).

On December 31, 2021, the Ministry of Agriculture and Rural Development issued Decision No. 5275/QĐ-BNN-VP on Promulgating the Digital Transformation Plan of the Ministry of Agriculture and Rural Development in 2022. In this plan, the Ministry of

Agriculture and Rural Development has set the goal of promoting enterprises and people to participate in agriculture activities, increasing the application of digital technology to the production process, providing agricultural services; managing and supervising product origin; forming a digital agricultural ecosystem... The ministry also set a target that 80% of agricultural databases will be built and updated on the platform of big data, which will be basically completed database on plants, livestock and aquatic products; building a digital agricultural map ready to connect, share and provide open data to perform online public services for people and businesses; 50% of observation and monitoring devices use digital technology, ensure direct reception of digital data, use the Internet of Things (IoT) to integrate in the air and on the ground to serve agricultural activities (Ministry of Agriculture and Rural Development, 2021).

On June 15, 2022, the Ministry of Agriculture and Rural Development issued Decision 2151/QD-BNN-VP on the plan for digital transformation of agriculture and rural development in the period of 2022 - 2025 with three specific purposes, they are as follows: (i) digital transformation in agriculture is to create an environment and an agricultural digital ecosystem as the foundation, create institutions, promote the transformation from "Agricultural production" to "Agricultural economy"; develop hi-tech agriculture in the direction of focusing on smart agriculture and precision agriculture, increasing the proportion of digital agriculture in the economy; (ii) Create a change from awareness to action on digital transformation of agencies and units in the industry and organizations and individuals participating in agricultural value chains; (iii) Propose orientations, plans and roadmaps for digital transformation of agriculture and rural development up to 2025, oriented to 2030 as a platform for formulating annual plans and organizing implementation a united, efficient digital transformation (Ministry of Agriculture and Rural Development., 2022).

Thus, up to now, the policy framework on digital transformation in general and on the agricultural sector in particular has gradually been completed, creating an important legal corridor to implement digital transformation in the agricultural sector in order to improve productivity, quality, and competitiveness; meanwhile, creating 3 axes of agricultural products: quality, food safety, and development towards green, clean and smart agriculture.

3.2. Situation of digital transformation in agriculture

In the agricultural sector the legal environment has been built and completed; the infrastructure has been developed and the technical platforms ensure and create favorable conditions for the deployment of digital transformation applications in agriculture: The Ministry of Agriculture and Rural Development has established a Steering Committee for Digital Transformation in the agricultural sector under Decision No. 2688/QD-BNN-TCCB dated June 16, 2021. The ministry has issued a plan for digital transformation of the agriculture and rural development sectors for the period of 2022 - 2025. Besides, this institution has implemented wide area network (WAN) that enable to connect the centralized headquarters of the units under the Ministry of Agriculture and Rural Development with 30 servers, of which 60% have been virtualized on VMware technology platform. Finally, the Ministry has also digitized the guiding document, providing data to connect, communicate

and share with local authorities and enterprises involved in the agricultural sector. Up to now, the Ministry of Agriculture and Rural Development has 113 types of databases and 32 specialized software for management and expertise activities in the fields of agriculture, forestry, fisheries and irrigation; deploying online public service applications through e-portals, online public service portals, e-one-stop office; synchronized and publicized 241 administrative procedures on the National Public Service Portal (Department of Informatization - Ministry of Information and Communications, 2021). In addition, the Ministry of Agriculture and Rural Development also applies digital technology to organize and host online conferences among departments; online conferences between the leaders of the Ministry and related Ministries and Departments and 63 online sites nationwide to promote agricultural product consumption in the context of the Covid-19 epidemic. Thereby, the management and administration of agricultural product consumption is more convenient, timely and effective.

Application of digital transformation in agricultural farming: Recently, most of the basic digital technologies in agriculture have been deployed or tested in Vietnam. According to Vietnam Digital Agriculture Association (2021), in farming, the IoT platform; big data; AI; autonomous technology (robotics); sensors; ... began to be applied through digital technology products such as software that allows analysis of data on the environment, genetic resources, plants and plant growth stages, which consumers can access and track these parameters in real time (Vietnam Digital Agriculture Association, 2021). Currently, many localities have issued identification codes to monitor and control production, track the origin, and improve the quality of agricultural products such as: Rice in the Mekong Delta; coffee, passion fruit in the Central Highlands; dragon fruit in Binh Thuan; longan, lychee in Hai Duong, Bac Giang, Hung Yen, Son La... (Nguyen, 2022). For animal husbandry, IoT technology, block chain, biotechnology apply for large-scale farms. The dairy industry leads the application of digital technology, with the prominent models being the modern farms of TH TrueMilk Group and Vinamilk Company. For fishery, the use of ultrasonic fish detectors, flow meters, satellite phones; seine receiver (standing); capture and drop net capture system, GIS and GPS technology are to help manage offshore fishing fleet. Applying biotechnology is to select and breed varieties with high yield, quality, disease resistance and good tolerance to the environment. Recirculating aquaculture systems - RAS, biofloc technology, nanotechnology, marine cage culture technology, cold water fish farming technology are all being researched and applied. Artificial intelligence (AI) technology has been used in shrimp farming to analyze water quality data, feed management and health of farmed shrimp. Automation technology has been widely applied in fishery processing from sorting, steaming, packaging, production lines..., helping to reduce production costs and ensure the quality of seafood products (Vietnam Digital Agriculture Association, 2021). For forestry, DND barcode technology is applied in the management of forest varieties and forest products; GIS technology (a tool used to collect, manage and analyze data from geospatial) and remote sensing images used to build forest fire warning software from satellite images, monitoring software in management forest, early detection of forest degradation or loss, thereby contributing to an effective assessment of forest resources as a basis for sustainable forest management, protection and development (Mien, 2022).

Many large enterprises such as VinEco, Hoang Anh Gia Lai, NAFOOD, and DABACO have also applied high technology in agriculture for their production, distribution and consumption. For agricultural cooperatives, according to the 2017 report of the Department of Cooperative Economy, there are 199/12,600 agricultural cooperatives (accounting for 1.5%) applying high technology, of which, 164 cooperatives apply high technology. Using cultivation, farming and preservation techniques, 17 cooperatives applied irrigation automation technology, 17 used biotechnology, 1 applied technology in the production of agricultural materials. Lam Dong is considered as one of the provinces that have achieved many achievements in the initial digital transformation for agriculture when up to 25/52 agricultural enterprises use IoT solutions... (Minh Le, 2022).

Many large enterprises such as VinEco, Hoang Anh Gia Lai, NAFOOD, and DABACO have also applied high technology in agriculture for their production, distribution and consumption. For agricultural cooperatives, according to the 2017 report of the Department of Cooperative Economy, there are 199/12,600 agricultural cooperatives (accounting for 1.5%) applying high technology, of which, 164 cooperatives apply high technology. Using cultivation, farming and preservation techniques, 17 cooperatives applied irrigation automation technology, 17 used biotechnology, 1 applied technology in the production of agricultural materials. Lam Dong is considered as one of the provinces that have achieved many achievements in the initial digital transformation for agriculture when up to 25/52 agricultural enterprises use IoT solutions... (Minh Le, 2022).

Digital transformation application in marketing and consuming agricultural products: marketing and consuming products play a very important role in agricultural production in order to improve productivity, quality and value of agricultural products, at the same time, to increase the scale of commodity production, apply modern production processes, improve management, administration and production organization capacity for enterprises and households. Recently, to overcome difficulties from the consumption of agricultural products due to the impact of the COVID-19 epidemic, many localities and enterprises have applied digital technology to promote and consume products in diverse forms. Various methods such as connecting with e-commerce platforms, promoting through social media channels such as Facebook, Instagram, Tiktok,... assists enterprises and farmers to connect directly with consumers. To promote the development of digital economy in agriculture and rural areas, the Ministry of Information and Communications has issued Decision No. 1034/QĐ-BTTTT dated July 21, 2021, and Decision No. 350/QĐ-BTTTT dated February 24, 2022 on approving a plan to support agricultural production households on the e-commerce platform. The goal of this plan is that 100% of OCOP products that meet the 3-star criteria at provincial central-city level are posted on the e-commerce platforms postmart.vn and voso.vn; 100% of agricultural production households listed on the e-commerce platform receive trainings in business skills; setting up 10 million active accounts on the e-commerce platform; promoting the increase in the number of transactions and transaction value on e-commerce platforms (postmart.vn and voso.vn); supporting agricultural production households to promote consumption of agricultural products on e-

commerce platforms; promote, introduce products, expand domestic and international markets; Through e-commerce platforms and digital platforms, useful information to agricultural producers such as agricultural product market information, demand forecast and agricultural production capacity, weather information. , crops, varieties, fertilizers, ... are provided. Raw materials, input materials, tools for agricultural production with reputable brands, good quality, reasonable prices are selected to put on the e-commerce platform for agricultural production households; promoting the development of the agricultural and rural digital economy in localities across the country.

According to the Department of E-commerce and Digital Economy, Ministry of Industry and Trade, from the early months of 2022, interdisciplinary units in the Mekong Delta such as Can Tho, Dong Thap...; or the Northern region such as Bac Giang, Hung Yen... have issued plans to consume agricultural products through e-commerce promotion. These provinces and cities have also worked closely with the Department of E-commerce and Digital Economy in connecting local departments and sectors with major e-commerce platforms in Vietnam (Minh Hoa, 2022). The most typical is Bac Giang province that connected to the 6 largest e-commerce platforms including Vo So, Sen Do, Shopee, Tiki, Postmart, Lazada through "National online Vietnamese stall for lychee consumption". In the two years of 2021 and 2022, over 10,500 tons of lychee were consumed on e-commerce platforms, of which 8 tons of lychee were exported to European countries. Up to now, Bac Giang has over 113,670 enterprises, Cooperatives and households who have Voso.vn and Postmart.vn platforms created shopping space on the e-commerce trading floor; many agricultural products and 180 OCOP products of the province have been and are being sold. support to upload to Voso.vn, Postmart.vn... (Trang, 2022). Lang Son province so far has more than 202,000 selling accounts and more than 115,000 buying accounts on postmart.vn e-commerce platform and voso.vn, bringing 19,438 turns of specialty agricultural products and OCOP products to online stores, sales on e-commerce channels reached more than 13.7 billion VND, especially custard apple products. On the e-commerce platforms voso.vn and postmart.vn so far, there have been 593 orders with a consumption volume of 2,945kg ... (Thanh Hien, 2023). Nghe An ranked third in the country in terms of the number of agricultural products put on the e-commerce floor, as of September 31, 2022, the province had 266,373 agricultural production households and 6,923 products were posted on the e-commerce (Kim Oanh, 2022). As of November 2021, the whole country has nearly 50,000 agricultural products listed on e-commerce floors and thousands of electronic transactions have been made. Up to november 2021, the country has nearly 50,000 agricultural products put on e-commerce floors and thousands of electronic transactions have been made (Khoi Nguyen, 2021).

Thanks to the cooperation with e-commerce platforms and implementation of product promotion programs through social media channels along with the development of selling sites in central areas, agricultural products of localities are more and more well-known and chosen. The growth of specialty agricultural products will contribute to local economic development and improve the livelihood of local people.

3.3. Difficulties in agricultural digital transformation

- Policies, laws on digital transformation have not met the practical needs of the agricultural production. The credit support policy of high-tech agriculture is mainly for businesses and cooperatives, but it is difficult to access because the procedures are cumbersome and complicated. Criteria on high-tech agriculture, smart agriculture and regulations for each animal and plant haven't been promulgated yet.

- The implementation of agricultural digital transformation requires a modern and synchronous information technology infrastructure, software system and database. However, nowadays, the information technology infrastructure in the agricultural sector hasn't been synchronously invested and is still backward, leading to difficulties in connecting, sharing and effectively exploiting agricultural databases with relevant agencies and localities. The agricultural data system currently has 113 types, but it is still small scale, incomplete, inconsistent, and it has not yet complied with the e-Government architectural framework. Although the number of software systems in the fields of agriculture, irrigation, forestry and fishery is large (32 software), but the ability to link and integrate data is still limited. In addition, the cost of 3G and 4G is still high, which makes it difficult for people to access and apply digital technology to agricultural production and business, especially in remote and isolated areas. The synchronization and publicity of administrative procedures has been well done and publicized on the National Public Service Portal, but the percentage of online public services reaching level 3 and level 4 is still low (about 10%).

- In Vietnam, digital transformation started to be mentioned a lot about 2018 (Ministry of Information and Communication, 2021). Therefore, the awareness of agricultural digital transformation of most localities, businesses and especially farmers is still limited. This makes it difficult to apply modern technologies to agricultural production. Besides, Vietnam is very short of skilled, highly qualified and professional workers to meet the demand for human resources for agricultural digital transformation. According to statistics, the rate of trained workers in our country is very low, reaching only 24.1% in 2020 (General Statistics Office, 2021). Meanwhile, if you compared with countries right in the region, this rate in Indonesia is 42%, in Malaysia this figure is up to 66.8% (UNDP, 2020). The number of farmers trained in digital transformation skills is small, with only over 2 million agricultural production households by November 2021 (Khoi Nguyen, 2021).

- The average size of arable land per household is very low, over 69% of households have less than 0.5 ha of cultivated land, 25% of households have 0.5-2 ha of cultivation area, and the number of households with cultivation area over 2 hectares accounts for a small proportion, only 6% (General Statistics Office of Viet Nam, 2017). In addition, the current land law only allows households and individuals to receive a transfer of agricultural land use rights no more than 10 times the agricultural land allocation limit are also major barriers to the application of digital technology in agricultural production.

- The level of mechanization is still low, the supporting technologies for agricultural development (mechanics, deep processing, agricultural product testing lines, etc.) are

inadequate. In addition, resources from the state budget and credit capital for digital transformation and high-tech and smart agriculture developing are still limited. Although the research, application and transfer of science and technology has been intensively invested, it still has not kept up with the actual production requirements.

3.4. Solutions to promote agricultural digital transformation in Vietnam

- Developing and perfecting policies and laws to create a legal corridor to promote the development of smart agriculture and precision agriculture, and at the same time increase the proportion of digital agriculture in the economy. Completing the system of legal documents, standards, regulations and technical regulations to meet the requirements of the agricultural digital transformation. Simplifying procedures for accessing digital technology infrastructure, land and capital for high-tech and smart agriculture development. Reviewing and finalizing policies to encourage organizations and businesses to provide agricultural digital services. Formulating and promulgating regulations on receipt, digitization, storage and handling of electronic documents; regulations on management, operation and maintenance of digital infrastructures, information systems and databases to ensure information security. Completing support policies, specifying criteria for the development of high-tech agriculture and smart agriculture.

- Upgrading and building a modern and synchronous digital technology infrastructure for data connection, exploitation and sharing. Developing infrastructure and connecting high-quality broadband internet (4G, 5G mobile network infrastructure, IoT connection infrastructure) to communes, villages and hamlets. Improving the quality and ability to access telecommunications services for the people; supporting farmers to use information technology equipment. Providing free wireless internet at commune centers, community cultural activities, rural tourist spots. Developing digital platform and integration platform to share data. Building and developing application platforms on mobile devices to support people and businesses in using digital agricultural services and utilities. Focusing on building and standardizing the database of the agricultural industry, building agricultural digital maps on a synchronous big data platform to connect, share and provide open data. Developing software to manage, monitor, evaluate and classify agricultural products, especially typical products of each locality. Focusing on building a large database on land, crops, environment, climate, weather... to provide people and businesses. Encouraging people and businesses to digitize production processes, towards product integration and transparency with a QR code scanning system.

- Raising awareness of localities, businesses and especially farmers about the role and importance of agricultural digital transformation in management, production and consumption of agricultural products in the context of climate change, technology 4.0 and international integration. In order to adapt to digital transformation, training and improving digital skills for farmers is an urgent requirement that needs more attention from the State agencies. In addition, farmers can actively go on the e-commerce trading platform to interact with buyers and introduce different agricultural products. It is necessary to ensure that there are enough human resources to carry out digital transformation. For business owners, cooperatives and individual production households, in addition to the knowledge of digital

transformation, it is necessary to foster knowledge about the agricultural product market, and be able to forecast the supply and demand movements of the market. to decide to invest in expanding the area of agricultural production...

- The State should accelerate the process of land accumulation and concentration to attract financial resources outside the State budget, especially resources from the private sector to invest in agriculture, to develop the closed agricultural model and sustainable agricultural value chain. The limit on the transfer of agricultural land use rights should be necessarily removed. The procedures for renting and receiving transfer of agricultural land use rights should be simplified.

- Modern and advanced technologies in the processing and preservation of a number of typical and typical agricultural products of the region should be invested, thereby prolonging the shelf life of agricultural products, forming the foundation to push up these products traded on e-commerce platforms. By implementing measures to simplify loan procedures, develop consulting services to support loans and use loans; allocate adequate budget to implement preferential policies to encourage enterprises to invest in hi-tech agriculture it further strengthens agricultural credit capital, especially credit for chain lending. agricultural value. To generate more capital for innovation and digital transformation application in agriculture, it is necessary to form venture capital funds and credit guarantee funds with the initial investment and capital share of the State. These funds should be managed and operated directly by independent professional private organizations. The State supervises these funds through the application of modern management software, such as applications of cloud computing technology to manage and trace cash flows in a transparent manner. In addition, amending the post-investment support mechanism specified in Decree 57/2018/ND-CP according to the disbursement mechanism for each item to ensure timely capital support for enterprises investing in public applications. digital technology in agriculture.

- Research, application and transfer of science and technology to agricultural production should be strengthened. New and modern technologies must be applied to all stages of production, harvesting, preservation, processing, transportation, and consumption of products. Propaganda, awareness raising and encouragement, businesses expand the application of technical advances, integrated pest management programs (IPM), integrated crop management programs (ICM) and the program of improved rice cultivation into agricultural production should be promoted; agricultural extension program, safe crop production according to VietGAP process... must also be promoted; finally, trade promotion activities to support enterprises to find markets to consume products must also be strengthened.

4. Discussion and conclusion

Agricultural digital transformation is understood and approached in different ways. According to Skvortsov (2020), the digital transformation in agriculture is an objective process associated with a scientific and technological progress. This process is due to the use of technologies of a new generation, which include the IoT, Big Data, AI, and robotics. The main scientific idea is that digitalization of agriculture will result in a significant transformation of labour relations (Skvortsov, 2020). Digital transformation in agriculture is

applying digital technologies from production to processing, distribution and consumption of products. Digital transformation in agriculture includes basic activities such as applying modern technology in farming, linking value chains and changing management methods (Linh, 2022). Digital transformation in agriculture has been happening for decades, however, it was mainly considered behind the concepts of smart farming, precision agriculture or *precision farming*, *decision Agriculture*, *digital Agriculture*, and *agriculture 4.0* (Klerkx et al., 2019). All of these terms could be part of the digital transformation because implies that management tasks in any part of the food system are based on data obtained from the use of different technologies (Duncan et al., 2021; Eastwood et al., 2019).

Many studies have shown that digital transformation is an effective solution to solve the challenges that agriculture and rural areas face (Trendov et al., 2019), as part of a transition towards 'Agriculture 4.0' (Klerkx & Rose, 2020) contributing to agrifood system transformation (Klerkx & Begemann, 2020). Applying of digital technologies in agriculture are necessary to increase the efficiency and sustainability of its functioning by cardinal changes in the quality of management of technological processes, decision making at all levels of the hierarchy based on modern methods of production and further use of information on the state and forecasting possible changes in controlled elements and subsystems, as well as economic conditions in agriculture (Mustashkina et al., 2020).

Agricultural digital transformation in Vietnam has only been started since 2018, but it has brought many outstanding benefits, making an important contribution to the sustainable agricultural development, especially during the context of the Covid-19 epidemic. In addition, digital transformation helps Vietnam's agriculture to reduce risks and damages caused by climate change. Vietnam is one of the countries most affected by global climate change... Rising sea level rise, rising temperature, rainfall change, extreme weather phenomena, natural disasters... have been seriously affecting the agricultural activities. The inevitable consequence is a decrease in arable land area and productivity, quality of crops (Yen et al., 2023). Applying AI technology, data analysis in agriculture will help early warning of risks (72 hours before the storm passes). The application of IoT, big data and biotechnology has helped to analyze data about the environment, soil, plants, and plant growth stages. Based on the provided data, the producer will make appropriate decisions (fertilizing, watering, spraying pesticides, harvesting ...), thereby reducing costs, environment pollution and protecting biodiversity. In fact, the application of digital technology to agricultural production has reduced costs and labor by half, reduced greenhouse gas emissions by 50%, increased productivity by 30%, thereby increasing income for farmers. Moreover, the application of digital technology in agriculture helps to strengthen the connection between producers and consumers, between supply and demand, limiting the situation of "good season, bad price", so that production more efficient and sustainable agriculture.

Agricultural digital transformation play a particularly important role in restructuring the agricultural sector, developing the concentrated and large-scale commodity agriculture towards modernity, high added value and sustainability. Digital transformation is an important solution to help farmers and businesses produce quality agricultural products at

the lowest cost but with the highest profit. This goal is also being promoted by industries, localities, businesses and people, with the expectation of creating a breakthrough in productivity, quality and competitiveness for agricultural products.

CORPORATE SOCIAL RESPONSIBILITY IN VIETNAMESE BANKING SECTOR: A LITERATURE REVIEW

MSc. Phan Thu Trang
trangpt912@gmail.com

Dr. Ta Nhat Linh
tanhatlinh@gmail.com

School of Banking and Finance, National Economics University, Hanoi, Vietnam

Abstract

Research on how to implement corporate social responsibility (CSR) has been launched since the 1950s in various industries, on a large scale in many countries. Among them, the banking and financial system - which is considered as a crucial of economic development - needs to apply the creation and use of CSR seriously, towards the development of a comprehensive system which is responsible for the environment and the community. Since the onset of many financial crises, especially after COVID-19, research on this issue has received more and more attention from policymakers around the world. Based on above consideration, the paper conducts research on the application of CSR for banking sector in the world in general and that of Vietnam in particular, through synthesizing 138 scientific articles, thereby giving some policy implications for CSR development in Vietnamese banking system in the coming years.

Keywords: *CSR, corporate social responsibility, Vietnamese banking system*

1. Introduction

Since the concept of corporate social responsibility (CSR) was born, its applications have been widely tested in many areas of life such as tourism, hospitality, media and so on. The application of CSR in the banking system has been carried out in a number of case studies nationally and internationally as it is believed that CSR can bring more positive impacts on not only customers, employees and organizations, but also at societal aspects. Different from the traditional development model that purely focuses on developing economic aspects and improving profits, many researchers believe that multi-dimensional focus, with more attention on environmental aspects, social and sustainable development should be concerned. In recent years, concepts such as sustainable banking, green banking or ethical banking flourished. In other words, the focus on social responsibility has been notably addressed.

According to The Global Economy (2022)¹, the attribution of banking assets on 140 countries was roughly 71.17 percent of GDP in 2021. The market capitalization of global

¹ https://www.theglobaleconomy.com/rankings/bank_assets_GDP/#:~:text=Bank%20assets%20to%20GDP%20%2D%20Country%20rankings&text=The%20average%20for%202021%20based,countries%20where%20data%20are%20available.

banking sectors accounted for approximately 7.5 trillion euros in the 3th quarter of 2022 (Statista, 2023)². It is to say that banking industry is generally considered as the backbone of national economies, which can support the international development as well as provide numerous financial services for millions of people all over the world. Within the sector, CSR initiatives are believed to play an important role on building sustainable and inclusive system. As such, further investigating in the topic, which integrates the past studies to get better understanding on CSR principles and practices may bring appropriate suggestions for the expansion of banking industry.

Vietnam has always been considered as a developing country with many progresses in financial and banking system. GDP contribution of finance, insurance and banking to Vietnam economy is around 4.73%, with total reserves of 109.37 billion US Dollar as of 2021. From the period of 4th quarter 2019 to the 1st quarter of 2022, number of bank cards in circulation increased significantly 34%. The value of online domestic transactions via internet and mobile banking in 2021 is around 29,470 and 23,649 trillion Vietnam Dong respectively. Although these data indicated a potential aspect, it still had to put into consideration with applicable and sound measures to improve the Vietnamese banking system. Thoroughly examining and fully utilizing the positive influence of banking industry is supposed to convey colossal value for indigenous people in particular and the national economy in general. By gathering and analysing 138 papers on this topic internationally, the paper aims at offering an updated insight of CSR main dimensions, its advantages and disadvantages as well as the CSR implementation in Vietnam' banking sector framework.

Based on these above considerations, this study aims at three main part: (1) delivering updated literatures on CSR, (2) explaining the impacts of CSR in banking sector internationally and (3) wrapping up with the application of CSR in that industry in Vietnam. From these stances, authors aim at providing policy implications. The paper is organized as follows. Section 2 denotes the research methodology. Section 3 emphasizes on literature on CSR dimensions, practices and implementation in banking industry. Last but not least, section 4 explains CSR practices in some countries in the world and in Vietnam.

2. Method

The study employed diverse methods through extensive literature review combined with secondary data collection. In order to make assessment and review high-quality papers, universally prominent citation databases, i.e. Scopus, Google Scholar and Web of Science are put into consideration. Papers with emphasis on CSR in general as well as CSR application in Vietnamese banking sector in particular are under review. Keywords, such as 'corporate social responsibility', 'banking', 'financial and banking' are used for searching appropriate articles. At the beginning, a number of 259 papers are obtained based on the analysis of title, keywords and abstract (**Figure 1**).

² <https://www.statista.com/statistics/265135/market-capitalization-of-the-banking-sector-worldwide/>

Figure 1. Number of papers by year

Source: Scopus, 2023

Notably, the focus on CSR has significantly increased over the period of 2004-2023, especially during 2019-2021 where COVID-19 pandemic happened. Of selected articles, only 10 papers are focused on Vietnam (Figure 2), which will be further processed and analysed in detailed in section 4.2.

Figure 2. Number of papers by country

Source: Scopus, 2023

After reviewing thoroughly, only 138 papers are selected for better assessment. The remaining ones are eliminated as they are beyond the research scope on corporate social responsibility in banking industry. Papers on Vietnam are evaluated to figure out CSR

implementation and its impacts in Vietnam banking sector. Secondary data of this paper are collected from official reports of Vietnam Ministry of Finance, State Bank of Vietnam and Vietnam Statistical Yearbook during the period from 2004 to 2023.

3. CSR: Overview and components

3.1. Definition of CSR

Even the term “Corporate Social Responsibility (CSR)” has been long mentioned, the unified concept has not yet been affirmed. As suggested in various literature, the easiest and most approachable way to consider CSR is formed based on its name, which are broken down in three perspectives: Corporate - Social - Responsibility. While the first word “Corporate” only focus on the types of firms and business, the latter words “Social” and “Responsibility” come with society burdens, duties and obligations. This view is consistent with the very first annotation from Bowen (1953) to later literature of Carroll (1979), Zu (2009). It can be able to say that, the CSR framework should be established to satisfy not only (1) the corporate side, but also (2) the society development.

From the first angle, corporate is believed to fulfill the duty to work towards increasing values for stakeholders. This can in turn lead to the lessening of fraudulent and undesired activities which can do more harm than good to corporates’ health in particular and the whole economy in general. Even though, the famous literature on principal-agent problems could always happen, which can raise the interest conflict between managers and shareholders. Managers, in some cases, could try to improve their reputation and recognition from the CSR application socially and politically at the shareholders’ expenses. From 1960s, researches on CSR was intensively expanded to second perspective: society and community responsibility aspect (Tsoi, 2010). Carroll (1979), Wartick and Cochran (1985) has opened the boundary to further reach to social response, philosophical reputation and environmental orientation. This does not imply that corporate value was omitted, it does emphasize to tell that businesses could work to preserve financial gains via economics activities in more social and responsible method (Van Beurden & Gössling, 2008). One more aspect to consider is ethical and philanthropic doings (Kucukusta et al., 2013; Luo & Bhattacharya, 2006; Martínez et al., 2014; Oliver, 2014).

In general, the literature changed from authors to authors, especially in the time of digitalization era. It can be noted that, CSR can largely be perceived as a broad field covering several aspects, from financial to social, environmental, philanthropic and voluntary activities. It is believed to bring various and enormous benefits for both corporates and society, especially the value still works on even in the crisis time (Tosun & Köylüoğlu, 2023; Trinh et al., 2023).

3.2. Components and drivers of CSR

As mentioned earlier, the unification of defining CSR still appears to be in process, and therefore, the views on aspects of CSR varied over time (Freeman & Hasnaoui, 2011). Carroll (1979) proposed a CSR framework with four main components, which included

economic, legal, ethical and philanthropic dimension. The view was again confirmed in the author' research in 1997. From another angle, Tuzzolino & Armandi (1981) considered a corporate as a person who has several need as mentioned in the well-known Maslow scale developed in 1959. The firm was believed to have corporate social responsibility if several requirements such as physical existence, safety, association, self-esteem and self-recognition were met. With the development from Carroll's viewpoint, Dahlsrud (2008) put five dimensions regarding social responsibility of corporate such as voluntary, social, stakeholders, economic and environmental into consideration. Figure 3 represents the developments in dimension of CSR.

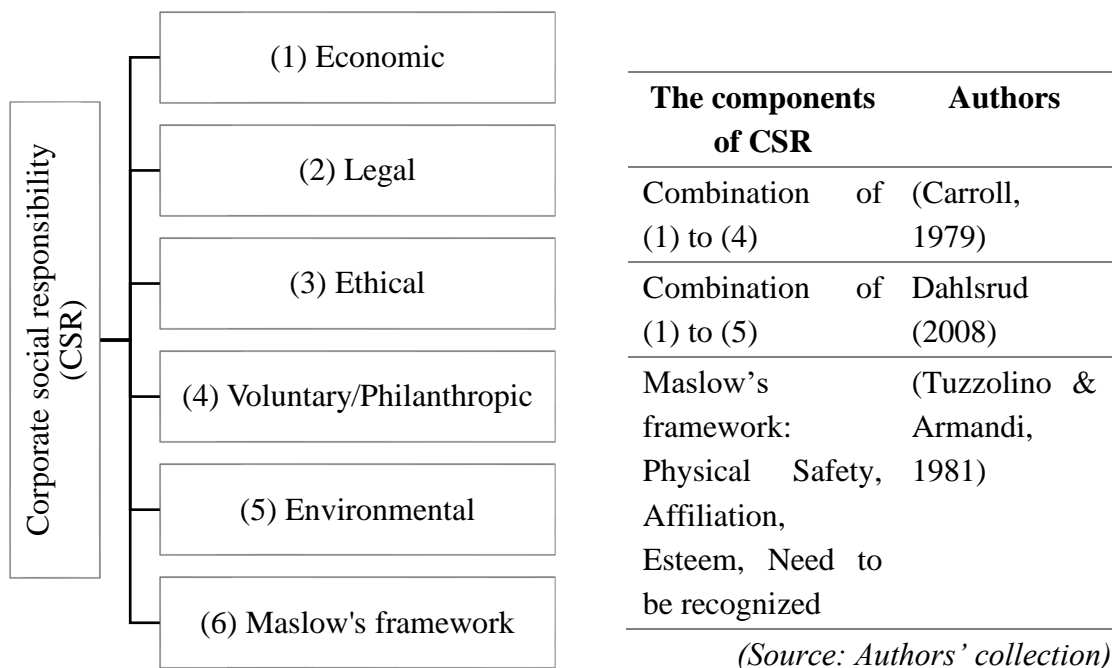

Figure 3. Different views on CSR Dimensions

The newest view on CSR component of (Dahlsrud, 2008) is now considered in widespread context. Among that, “economic” aspect can refer to financial performance, financial growth and advancement, “legal” mentions the level of compliance with legal system, legal structure both from inner and outer of the firm, “ethical” also indicated the following or moral norms and principles that control or have influence on the working motives, “voluntary/philanthropic” implies the doings and contributions to help others in willing manner. Last but not least, the newly-defined aspect “environmental” shows the responsibility toward preserving the natural world.

Another question to clarify is that what possible drivers of CSR could be. (Visser, 2008) divided the factors affecting CSRs could come from domestic and international issues. Domestic ones could include such demographic and cultural characteristics as traditions, customs, social values, governance, politics, corruptions, crisis responses and market reforms (Hossain & Alam, 2016). International drivers may come from overseas investors, the incentives of stakeholders, the impact of supply chain systems and international globalization and standardization (Galbreath, 2010).

4. Discussion on CSR application in banking industry

4.1. In the world

Even there could be several views on corporate social responsibility, the impact of it is believed to be of importance for most industries. For banking sector, the initiatives and implications of CSR are likely to support the banks in increasing profits, promoting efficiency as well as gaining the customer loyalty (Fauzi & Idris, 2009; Polychronidou et al., 2014). Even though, the results are not consistent between countries from different level of development.

In the recent study of (Djalilov & Hartwell, 2023) in 21 transitional countries with 319 banks, the authors show contradictory relationship between CSR disclosure and banks' financial performance. Positive relationship was only witnessed when CSR scheme was applied to banks which already experienced good profits. In China, the CSR appeared to be more helpful for domestic banks especially after COVID-19 than the foreign ones working there, and the CSR is not that could bring enormous changes in consumer's attitudes (Tosun & Köylüoğlu, 2023). The involvement of banks and financial institutions in shadow banking can put a detrimental effect on the development of the system as it could violate sustainability aspect, which in turn cause bad banking practices (Dong et al., 2023). The research in developing country with low level of social trust and modest philanthropic activities like Bangladesh seems to confirm that the spending on boosting CSR doings did not guarantee the efficiency and profitability, but the better financial performance, the higher expenditure could be for CSR (Kabir & Chowdhury, 2023).

From developed countries in the European areas and United States, CSR implementation always related closely to the components mentioned earlier: economic, ethical, legal, environmental and philanthropic. The application of CSR framework tends to be disclosed to public via media tools, digital platforms, websites or annual reports. This can in turn improve the reputation for the banks (Hossain & Alam, 2016). In the EU zone, the Directive 2014/95/EU on the requirements and guidance for non-financial reporting toward sustainability can be seen as a framework for CSR disclosure. With the dataset of 101 banks in Europe, (Cosma et al., 2022) indicated that the the banks reached the intermediate compliance level and data disclosure, but the existence of sole CSR committee could bring better results in achieving the sustainability goal. CSR framework is also extended to several aspects such as religion and social norm. In a research in United State banking sector context, Chantziarat et al. (2020), the CSR disclosure was again believed not only to have importance impact to the banks, but also positively related to the level of adherence to religion and religious as well as social norms. In general, these countries normally have higher requirement in information disclosure and public reputation, the implementation of CSR could be seen as one of the must-do-it activities. The balance between economic and society/voluntary/legal aspects is crucial, which is considered as a fundamental inspiration for sector in particular, and the whole society in general (García-Meca et al., 2018)

4.2. In Vietnam

The banking system is always considered as the backbone of the whole economy. After the eventful year 2019 with the outburst of COVID-19 pandemic, Vietnamese banking system have to deal with such a huge challenge to overcome, with lower growth and shrunk asset quality. However, thanks to the Government' policy, the support from State Bank of Vietnam and the high level of adaptability of the banks themselves, the system was still motivated in a more dynamic way (Finn Group, 2022)³. Besides, the application of digitalization, and the encouragement to maintain customers from the banks are some advantages to be put into consideration. In this scope of the paper, the authors do not focus on explaining how banks survived during and after pandemic but looking at older empirical studies to evaluate another important aspect: the corporate social responsibility.

The number of papers (both literature and empirical studies) covering Vietnam banks limited to 7, which seems to be modest. However, looking at these can bring several interesting points to (1) understand whether CSR is important in the case of Vietnam, and (2) if CSR proved to work, what could be the solutions to improve. Notably, these papers come mostly during the period of 2020-2022, where the banking sector has to face with several problems from integration and globalization and the post-COVID19 consequences. It can be said that, the developing of CSR within banking framework is regarded as a sound solution.

(Bui & Le, 2023) measured the relationship between CSR expenditure from public welfare undertaking, philanthropic and societal activities and the bank performance based on the information of 28 Vietnamese commercial banks, excluding the joint venture and 100% foreign capital ones during 2011-2019. Using the GMM model, the authors show negative correlation of total CSR expenditure where CSR society spending has positive link with banks' financial performance. Notably, the positive outcomes are more robust for listed banks. Explanation for the findings, the bigger and more transparent banks can improve their images through society contribution, which can in turn boost their financial results. This can also be implied as a solution for small and unlisted banks in order to thrive to the better. (Vo, Van, et al., 2022) used a dataset made from 13 Vietnamese listed banks from the period of 2011-2019 to evaluate the importance of CSR in banking industry. In the research, authors used the ratio between charitable offerings to bank profits as a proxy for CSR. The results showed robust findings on the positive correlation between CSR contributions to financial inclusions (Vo, Tran, et al., 2022). (Ady et al., 2022) made an empirical test hundred commercial banks in ten ASEAN countries from a more recent period: 2016 to 2011 using a FEM model to evaluate the relationship between the CEO incentives and the CSR implementation and the banks' financial performance. (Chi et al., 2022) employed they methodology called sys-GMM on the databases of 29 commercial banks in Vietnam from 2012 to 2019 to measure on aspects of CSR. The paper focused mostly on environmental responsibility and the financial performance through such ratio as net interest margin, return

³ Vietnam banking report 2022, <https://fiingroup.vn/upload/docs/fiinresearch-infographic-vietnam-banking-report-2022.pdf>

on equity, return on assets. The same significant positive correlation was also found, consistently with other researches in the scope of Vietnamese banking industry.

Besides the above mentioned consistent results, the paper of (Nguyen et al., 2021) showed an insignificant between financial performance and the CSR disclosure. The term “CSR disclosure” was being thoroughly researched, and also brings several policy implications for banking development. Another perspective such as examining the CSR on financial inclusion and consumer loyalty was seen in the paper of Vo, Van, et al., 2022. The interesting point of the research is that all aspects of CSR such as philanthropic, ethical, legal and economic were put into consideration on the primary dataset of 368 responses of Vietnamese commercial banks in 2019 through the SEM modelling. Among that, only philanthropic has significant effect on the loyalty of customers. Vo, Tran, et al., 2022 used the OLS regression on time series data of commercial banks in Vietnam during the period of 2015 to 2019 and clarified three determinants of CSR disclosure included board size, the existence of foreigner in board members and audit committee.

It can be noted that, these aforementioned studies share one in common, it is the positive impact of disclosure or implementation of CSR within commercial banks framework, even though they employed different databases or methodologies. The notation is not a newcomer in the world, but in Vietnam, it still appears to gain modest concern. Such aspects as philanthropic, economic, legal, ethical and environmental ones are of importance to improving financial efficiency, customer loyalty, income improvement and financial inclusion (Buallay, 2020). It implies that further consideration should be put into this aspect, to gain fruitful recommendation for future development of Vietnamese banking.

4.3. Policy implication and further research suggestions

It can be said that the CSR application is not just an announcement. It needs to have a specific roadmap and be monitored continuously throughout specific phases. Based on the analysis in countries around the world and in Vietnam, this section will give some policy suggestions to further develop the application of CSR in the banking system. Vietnam is a developing country with a large population, a developing economy, and limited infrastructure and legal system. These are common characteristics found in several studies taken in similar regions, so the application of CSR should base on international experiences, and redesign to fit in the country specific characteristics. Although numerous banks in Vietnam participate in sustainable development projects and community activities, most are still limited to aim at improving the bank’s image and reputation. As such, thorough CSR framework consisting of 5 elements will need to spend a lot of time developing, in order to create a balance between the benefits for society and the financial costs for the bank.

Under increasing pressure of integration and development, especially in a period when alternative technology is increasingly a trend around the world, the survival and success of the banking industry can be said to depend on significantly depends on customer loyalty. Customers are individuals using the service, and their behavior can be largely influenced by social, religious, and traditional factors, as well as their perception and

assessment of the banks' social responsibility. Therefore, in recent years, the two concepts "financial inclusion" and "sustainable development" have always been mentioned and promoted. In Vietnam, these concepts have hardly been focused on development, because of the limitation in financial ability, difficulties coming from global economic recessions, world political and social instability. Therefore, being socially recognized and building a system of social responsibility can be said to be a comprehensive strategy for the development of Vietnam's banking industry. As researched by (Nguyen et al., 2021), the legal framework is an effective factor to accelerate the development and implementation of CSR. Environmental and humanitarian are always sensitive issues, as such, clarity in the policy framework to separate the balance of finance and social performance needs to be seriously studied to achieve higher efficiency for CSR development in the coming time. Customers are a prerequisite for a bank's success or failure, so a customer-centric strategy, a closer study of customer-related CSR aspects will lead to higher customer satisfaction. banks, thereby contributing to improving financial efficiency. This is also considered as a form to help improve the competitiveness of banks.

In addition to the efforts of the management at the banks, State Bank of Vietnam is highly believed to address the needs to develop a legal, supportive and regulatory framework where necessary for CSR development. As some share in studies in developed countries, it is necessary to establish a CSR department for the banking system to assess compliance. This can contribute to improving the efficiency of information disclosure of banks, meeting the needs of customers, thereby towards the trend of integration of the banking system in the world economy.

Abstract

In recent years, promoting the development of cultural tourism coupled with the general unilization of local tourism resources is an inevitable trend. By analyzing and evaluating methods on the basis of an aggregate scale through criteria such as attractiveness, tourist capacity, location and accessibility, tourism service infrastructure, exploitation time... The evaluation results show that the potential for developing cultural tourism in the tourist site of in Mang Lang Church Phu Yen province is quite favorable. This is an important ground to promote exploitation, develop strengths and overcome limitations in order to link the destinations and tourist areas in the area with the purpose of sustainable tourism development in the future.

Keywords: *tourism, Mang Lang, Phu Yen*

1. Introduction

Mang Lang Church - one of the oldest churches in Vietnam, is located in a 5.000 m² campus about 35 km north of Tuy Hoa city in the division of An Thach commune, Tuy An district, Phu Yen province. It's built in 1892 by a Frenchman named Joseph de La Cassagne, whom the parishioners called in Vietnamese as Co Xuan, the first priest of Mang Lang parish.

After more than 130 years of existence, each wall, door, prayer table and the "marks" of the first martyred Master of the Catholic Church of Vietnam have been tinged with time, with the same uniqueness in the Vietnamese Catholic Church. The shape and lines are engraved with the architecture of the 19th century and the belief in God of the believers,

which has cultivated and created the unique features of the Church and the unique features of the life that the local people make, or called "Xu Dao".

Mang Lang Church consists of a number of tourist attractions such as Da Dia Reef, Sao Viet, O Loan lagoon... The historical sites of Da Trang pagoda, An Tho citadel, Le Thanh Phuong temple are attractive destinations for tourists, creating favorable conditions for economic development of tourism in Tuy An district in particular and Phu Yen province in general in the current period (en.wikipedia.org/wiki/Mang_Mang_Church).

2. Basics of assessment of cultural tourism resources for tourism development

2.1. Methods of evaluating cultural tourism resources

Cultural tourism resources are objects and phenomena created by humans through history. Cultural tourism resources include cultural traditions, cultural elements, folk arts, historical relics, revolutionary relics, architectural works, creative labor works of people and other natural resources. Other tangible and intangible cultural heritages may be used for tourism purposes.

Cultural tourism resources include historical and cultural relics (including archaeological relics, historical sites, cultural and artistic relics, museums, etc.), festivals, traditional crafts and villages, tourism objects associated with ethnography and cultural or sports objects associated with major events...

Evaluation of tourism resources in general and assessment of Cultural tourism resources in particular are assessment techniques to classify resources according to the degree of convenience for human tourism activities, relating to different types of tourism. Currently, there are two popular evaluation methods: evaluation by type and general evaluation of resources.

In this topic, the author has chosen the method of general evaluation of resources, as this method does not only stop at evaluating each type of resource based on defined criteria but also evaluates the conditions for exploiting that resource effectively. By this method, we can thoroughly see and recognize the potential of the evaluation site by the values that have been quantified through certain criteria.

2.2. The process of evaluating cultural tourism resources for tourism development

Based on travel documents and personal experience, the author has built an evaluation process that includes specific steps:

- *Determine the criteria, levels and targets of each assessment level*

In this study, the author has built 4 criteria, each criterion has 4 levels in the order K1, K2, K3, K4. Specifically:

+ **Attractiveness:** It is the most important criterion to evaluate tourism resources in general and humanistic tourism resources in particular because it determines the attractiveness and attractiveness to tourists. For humanistic tourism resources, the attractiveness is determined by the value of an architectural work (age, architectural style, preserved state...), the number - density of monuments, the number of ranked monuments,

the field of use, the artistic value... This criterion has 4 levels, the standard of each level is the quantity and quality of the resource in its ability to satisfy tourists. Tourism is based on exploiting the strengths and characteristics of that type of tourism resource.

- Very attractive: There are 4-5 recognized unique humanities or unique monuments and other resources that can be developed on 3 types of tourism.

- Quite attractive: There are 3 recognized unique human factors or at least 2 unique monuments and other resources that can develop 2 types of tourism.

- Attractive (average level): Having 1 or 2 unique humanities or at least 1 unique monument and other resources to develop 1-2 types of tourism.

- Unattractive: The value of humanistic tourism resources is monotonous, not unique...

- + Time of exploitation: This criterion represents the seasonal nature of tourism activities and is usually determined by the appropriate time to deploy tourism activities to serve the needs of tourists. Levels: Very long (tourism takes place almost all year round); Quite long (with 200 - 300 days/year suitable); Medium (with 100-200 days/year suitable); Short (with less than 100 days/year suitable).

- + Connectivity and accessibility: This criterion refers to the ability to link, the distance between tourist destinations in which tourists can use common means of transportation to ensure the purpose of travelling of the trip. Levels: Very convenient (there are more than 5 tourist attractions around, the distance is less than 100km); Quite convenient (there are 3-5 tourist attractions around, the distance is 100-200km); Advantages (with 2-3 tourist attractions around, distance 200-400km); Less favorable (with 1 or no tourist attractions around).

- + Tourist capacity: It is a fundamental element of a tourism territory, a concept of primary importance in tourism management. "Tourism capacity is the level of visitor use that an area can provide, providing a high level of visitor satisfaction and leaving very little impact on the resource." The concept of "capacity" includes four aspects: physical, biological, psychological and social. It also includes the level of tourism management (*People's Committee of Phu Yen province, 2020*).

It can be understood that tourism capacity is the maximum number of people that a tourist destination can accept, does not cause degradation of the natural ecosystem, does not cause social conflicts between the indigenous community and visitors, and does not cause degradation of the natural environment. recession of the traditional local economy.

The tourist capacity for an evaluation area is the total capacity of each tourist destination. It depends on the characteristics of visitors' activities (often changing with the seasons) and is closely related to the local population. Assessment of tourist capacity cannot be based on the trend of as many visitors as possible, but rather in accordance with local conditions as possible. Tourist capacity reflects the potential and scale of receiving tourists with the most suitable conditions... Tourist capacity reflects the capacity and scale of tourism activities at each tourist destination and is determined by the criteria established through design survey, experiment and practical experience...

- Very large: Can accommodate 800 - 1000 people/day
- Quite large: Can accommodate 500 - 800 people/day
- Medium: Can accommodate 100 - 500 people/day
- Poor: Can accommodate less than 100 people/day.

Determine the weight for each criterion, score for each level: Each criterion corresponding to the resource has different levels, properties and values, so to ensure the accuracy and objectivity of the assessment results. It is necessary to determine the coefficients for the criteria (R), scores for each level (K). Specifically (shown in Table 1)

Table 1. General assessment of cultural tourism resources for tourism development

Criterion	Coefficient	Degree			
		K ₁	K ₂	K ₃	K ₄
1- Attractiveness of tourism resources (A)	R ₁	R ₁ .K ₁	R ₁ .K ₂	R ₁ .K ₃	R ₁ .K ₄
2- Travel time (B)	R ₂	R ₂ .K ₁	R ₂ .K ₂	R ₂ .K ₃	R ₂ .K ₄
3- The synchronous combination between tourism resources and infrastructure, facilities	R ₃	R ₃ .K ₁	R ₃ .K ₂	R ₃ .K ₃	R ₃ .K ₄
4- Tourist capacity (D)	R ₄	R ₄ .K ₁	R ₄ .K ₂	R ₄ .K ₃	R ₄ .K ₄

- Conduct assessment: Conduct an assessment to determine the rating and grade of the resource for tourism development. The evaluation score consists of the individual score of each criterion and the total score of the criteria. Thus, the highest individual rating is $3 \times 4 = 12$ and the lowest is $1 \times 1 = 1$; The highest composite score is 28, the lowest is 7. Based on the maximum score, the assessment levels can be determined:

- + Very favorable: Over 80% of the maximum score (about 22 points or more).
- + Quite favorable: Reaching from 60-79% of the maximum score (about 17-21 points).
- + Average: Achieved from 40 - 59% of the maximum score (about 11 - 16 points).
- + Unfavorable: Less than 40% of the maximum score (below 11 points).

3. Results

3.1. The reality of Christianity in Phu Yen province

Along with the general trend of the country, Christianity in Phu Yen province also began to develop very early around 1627, although not the center of the Dioceses of the Vietnamese Catholic Church, its development of Phu Yen province has made many progress and is well known through historical evidences, it is the birthplace of Blessed Anre - the first martyr of the Church in Vietnam. The a special place of worship is Mang Lang parish with Gothic architecture in the 19th century.

Located on the harsh central strip of land, the difficulties of life have become a bond of affection and love between religions in Phu Yen. Every citizen, regardless of ethnicity or religion, works hand in hand, stands side by side under the common roof of harmony, and overcomes difficulties together towards a prosperous and happy life. That success shows Phu Yen's efforts in implementing ethnic and religious policies, in which the core role belongs to the Religious Affairs Committee of Phu Yen province (*People's Committee of Phu Yen province, 2004*).

After the re-establishment of the province (1989), although there were still many difficulties, the provincial leaders always paid attention to ethnic and religious affairs. Since 1994, the province has established a specialized agency for religious affairs. That shows that religion is always a matter of great importance to leaders of Phu Yen province. Together with economic development mechanisms and policies, ethnic and religious policies are the driving force for Phu Yen's success in its efforts to build a just, democratic and civilized society.

As of 2021, the whole province of Phu Yen has about 17.500 Christians, accounting for nearly 7% of the province's population, with nearly 80 priests. Christians are widely distributed in 9 districts and cities of the province. Currently, there are 23 parishes distributed mostly in districts. The parishes of Phu Yen province belonging to Quy Nhon diocese are located on the part of many communes and have partial churches where parishioners live, 23 parishes of the province are: Da Loc parish (Dong Xuan); Mang Lang parish (Tuy An), Dong My parish (Dong Hoa); Dong Tre parish; Go Duoi parish (Song Cau) with Go Duoi church; Hoa Chau parish (Tay Hoa); Hoc Gao parish (Phu Hoa); Song Cau parish (Song Cau); Son Nguyen parish (Son Hoa and Phu Hoa); Tra Kê; Tinh Son parish (Song Hinh), Tuy Hoa parish (Tuy Hoa city)...

All districts and cities of the province have each parish and living facility for parishioners, and every year parishes always have links and cooperation in organizing festivals with typical autumnal characteristics attracting parishioners a lot of tourists near and far, organizing charity activities with high efficiency. The most typical is the Paul monastic establishment in ward 2, Tuy Hoa city, Tuy Hoa parish, which has organized a "pot of love porridge" at the pediatric department, worth 36 million VND since 2004 to the present. The parishes of Song Cau and Son Nguyen have participated in humanitarian charity work through socio-political organizations, the Red Cross, the district's Vietnam Fatherland Front, and authorities such as: Helping to remove temporary houses for 5 poor households in Son Nguyen commune and cases of accidents, illnesses, families with difficult circumstances, the elderly, lonely, poor students and some charity activities of parishioners in the matter of overcoming the consequences of natural disasters in recent years have always been highly appreciated by departmental leaders.

3.2. Assessing the potential for tourism development of Mang Lang church

Mang Lang Church - Tuy An is a cultural and artistic relic that is most clearly associated with valuable architectural works belonging to the group of cultural and historical relics. Mang Lang Church in particular and humanistic tourism resources in general have cognitive and spiritual values rather than entertainment.

In terms of attractiveness, Mang Lang church has many unique humanistic elements:

- Mang Lang church is one of the oldest architectural works of Vietnam: More than 130 years ago, An Thach area was very sparsely populated, covered with forest trees, including a type of forest tree that grew a lot, large, wide canopy, oval leaves, purple-pink flowers bloom, local people call it Mang Lang, because it is related to Mang Lang tree. The traces of that mangosteen forest are no longer present, but the church at that time was named after this precious tree. Currently, in the church, there is still a round wooden table made of mangosteen from the time it was built, with a diameter of up to 1.5m. Built in 1892 with Gothic design of the nineteenth century, it has impressed visitors as a church in France or Rome full of fine art. On either side are two bell towers, in the middle is a cross that, when entering, you can see two zippers of bells announcing the ceremony.

- Mang Lang Church - the place to keep the first book in the national language of our country: Printed in Rome in 1651, it is the catechism "Eight-day preaching" of Alexandre de Rhodes (local people call Father Dac Lo) - the person who gave birth to the national language script. Currently, the book is displayed very solemnly in a glass box and placed inside the church next to the traces of the first martyred teacher of the Catholic Church of Vietnam through the engravings on the wall.

Next to the church there is a traditional room, named Anre Phu Yen, which solemnly stores and exhibits all the documents related to the blessed (title for missionaries and martyrs) Anre Phu Yen. This is the first of 117 martyrs who have been canonized. In this church, a little hair of Blessed Anre Phu Yen is still preserved. The next unique thing is the very old hanging lamps that are still intact. The space of the church is completely quiet, the door of the church is always open, except for the religious area of the priests.

The landscape around Mang Lang church is very airy, beautiful and quiet. In the church campus, there are many small hills, along with large and wide trees, which are a suitable place to develop resort tourism activities. At the same time, the land of "Xu Dao - An Thach" located next to Ngan Son river is one of the famous lands in Phu Yen with a number of traditional craft villages that have created special dishes. It is the thing that have created a tourist attraction when visiting this land.

Evaluate additional values for tourism development in the following criteria:

- Time to deploy tourism activities in Phu Yen in particular and the South-Central Coast: It takes place quite a long time during the year. The sunny period from January to August is the season for tourists to come a lot. The rainy season starts from September to December, along with storms and tropical depressions that concentrate a lot in October and November and directly affect the coastal strip. Thus, according to the statistics of the number of rainy days and adverse weather phenomena affecting sea tourism, there are more than 200 days/year here where tourism activities can be well deployed.

- In terms of connectivity and organizational ability: Along the coastal strip of Phu Yen province is a place where a lot of tourist resources are concentrated and a number of

tourist spots and resorts have been formed. Highlights are: Bai Bang, Da Dia Reef, O Loan lagoon, Sao Viet eco-tourism area, Long Thuy beach, Tu Quang - Da Trang Pagoda, An Tho citadel... Therefore, the ability to link to create routes Tours in the province are quite convenient. In general, the three study sites above are not too far from Tuy Hoa and surrounding tourist spots, about 50km on average, visitors can use popular means of transportation on National Highway 1A with a interval of about 50km, no more than 2 hours.

In fact, the tourist attractions of Phu Yen province have only been initially and effectively exploited The yield is not high, and there are still some places that are being invested and embellished... In the whole province, there are 2 tourist areas with the largest number of tourists and the most effective ones, which are Thuan Thao and Sao Viet eco-tourism areas. Therefore, the connectivity and organizational capacity are at a favorable level.

- In terms of tourist capacity: Mang Lang Church has an area of 5000m², with a large campus. Thus, with such an area, the church is considered to have a relatively large capacity (from 500 to 800 people/day), tourism activities take place with high efficiency (as shown in Table 2).

Table 2. Results of assessing the potential for tourism development of Mang Lang church

No	Coefficient	Degree	Points	Coefficient	Ingredients Points	TTotal points
1	Attractiveness of tourism resources (A)	Attractive	3	3	9	21
2	Travel time (B)	Very long	4	1	4	
3	The synchronous combination between tourism resources and infrastructure, facilities	Convenient	2	1	2	
4	Tourist capacity (D)	Big	3	2	6	

Thus: With a total score of 21, the assessment of the tourism development potential of Mang Lang church is quite favorable.

4. Results

4.1. Some orientations and solutions to exploit the potential for tourism development of Mang Lang church in Phu Yen province

Currently, Phu Yen province (especially localities with a lot of tourism resources) does not have many tourism business units, tourism activities are still limited, mainly created by tourists such as: Camping, swimming, fishing, organizing art, poetry, painting camps... Some travel agencies organize tours to visit Da Dia Reef, O Loan lagoon and enjoy specialties such as oysters blood, king crab, crabs, oysters, scallops, visiting Mang Lang church, Quang Duc pottery village... initially attracting domestic tourists to participate.

The province's tourism economy in general still has some limitations: The products and services are not rich, the quality of some services is still low compared to neighboring provinces; Infrastructure and human resources for tourism activities are lacking and weak, which has a significant impact on local tourism business during the implementation of the strategy of the Master Plan for Business Development socio-economic conditions in the sea and coastal areas of Phu Yen up to 2025.

On the basis of research and assessment of tourism development potential in Phu Yen province in general and humanistic tourism development potential of Mang Lang church in particular; Analysis of the current situation of tourism development; Based on practical conditions in the development of local tourism activities and based on "Vietnam Tourism Development Strategy to 2000, a vision to 2030 and the project of developing sea and island tourism" coastal areas of Vietnam to 2020", from the perspective of sustainable development, the author proposes some orientations and solutions for local tourism development.

- Orientation to develop types of tourism based on exploiting the values of natural resources: On the basis of exploiting the strengths of the province's humanistic tourism resources, developing a number of unique tourism activities, attract tourists with unique, high-quality and competitive tourism products. At the same time, here also concentrate a lot of natural tourism resources, these resources have unique geological and geomorphological values such as: Xuan Dai Bay, Da Dia Reef, O Loan lagoon, Da Bia mountain... Therefore, the combined investment between tourist attractions is essential to effectively exploit the resources. Types of tourism can develop here: Sightseeing, relaxation, study - scientific research (*Khanh, U. D; An, L. D & Thanh, N. N, 2010*).

- Orientation for spatial development: Invest in building local attractions, routes and tours by linking tourism resources together. Specifically, such as building tourist routes connecting humanistic tourist resource points such as: Da Trang Pagoda - An Tho citadel - Mang Lang Church, routes associated with natural tourist attractions related to potential exploitation at Mang Lang church such as: Xuan Dai bay - Da Dia reef - Da Bia mountain. Along this route, visitors can visit Mang Lang church, Da Trang pagoda, An Tho citadel relic, Sao Viet ecotourism area, Tuy Hoa beach... Some of the prominent tourist tours along this route are sightseeing, relaxation, entertainment, study - scientific research...

In addition, it is necessary to promote investment in the construction of inter-provincial tourist routes, in order to exploit tourism strengths in a continuous manner, highlighting the characteristics of each province's natural resources, and limiting the overlap repeat and avoid boredom for visitors, reduce tourism promotion costs but still achieve high efficiency. Tourist routes along Binh Dinh - Phu Yen - Khanh Hoa with the focus on tourist attractions with profound human values: Quang Trung Museum - Ghenh Rang tourist area - White Stone Pagoda - Mang Lang Church; combined with some natural tourism resources such as Quy Nhon Bay, Xuan Dai Bay, Da Dia Reef, Da Bi Mountain, Dai Lanh Cape, Nha Trang Bay, Hon Chong, Hon Mun... Typical development of tourism travel is: Sightseeing, convalescence, sports - adventure, convalescence and scientific research activities on the ecology of bays, lagoons and coastal islands (*Pham, 2003*).

- Other solutions: Invest in building infrastructure, especially traffic, restaurants, accommodation facilities for tourism in the locality. Focus on training human resources on the spot, open classes to improve professional qualifications, foreign languages for the guides... “Market development, promotion, and branding of tourism, protection , embellishing environmental resources towards sustainable tourism, investing and mobilizing capital for tourism, regional linkage...” (*thanhvien.com.vn/pages/20120916/nha-tho-co-mang-lang.aspx*).

4.2. Conclusion

Tourism has become an economic activity attracting a large number of tourists in recent years. Phu Yen is a locality with rich tourism resources in general and cultural tourism resources in particular. Initially, Phu Yen province has exploited these resources for tourism development and still has some limitations. In the coming time, based on national and local tourism development policies, programs and projects, provincial agencies and departments need to have appropriate policies and measures for tourism development on the basis investing in exploiting tourism resources of the province and linking with neighboring provinces. Especially cultural tourism resources, including tourist attractions with architecture and spirituality is the ancient church of Mang Lang with more than 130 years old...belonging to the central coastal strip; contribute to creating position and strength for the local socio-economic development in the integration period of the Industrial Revolution 4.0 globally.

CONTRIBUTIONS OF SCIENCE AND TECHNOLOGY TO LABOR PRODUCTIVITY GROWTH IN THE MECHANICAL ENGINEERING SECTOR

PhD Student. Kieu Nguyen Viet Ha

kieunguyenvietha@gmail.com

Department of Science and Technology, Vietnam Ministry of Industry and Trade, Vietnam

Abstract

This study measures the contributions of science and technology to labor productivity growth by size and type of ownership of enterprises in the mechanical engineering sector, which provides machinery and equipment, components and accessories to other sectors. In the past few years, machinery, equipment, and components have been Vietnam's third major export products group. Measurement results by estimating the production function of stochastic frontier on a sample of 78.590 mechanical engineering enterprises in the 2011-2020 period indicate relatively slow technological progress or technological change (0.119% on average), only accounting for 4.35% of the sector's labor productivity growth. In which, the group of micro-sized enterprises boast the highest technological change, hitting 0.121%, but have the lowest contribution of science and technology to labor productivity growth (2.4%). The group of medium-sized enterprises is featured with a technological change of 0.113%, only higher than the group of large-sized enterprises (0.110%) but have the highest contribution of science and technology to the growth of labor productivity (4.4%). The group of small-sized enterprises have the second highest level of technological change and contribution of technological innovation to labor productivity growth (0.119 and 4.2%, respectively). By type of ownership, foreign-invested enterprises (FIEs) have the lowest level of technological change (0.111%), but embrace the highest contribution of science and technology to labor productivity growth (9.9%); in which the respective ratios are 0.126 and 3.1% for state-owned enterprises (SOEs), and 0.121 and 3.8% for non-state enterprises or domestic private enterprises (DPEs). This result suggests that there must be adequate and appropriate policies for enterprises according to different sizes and types of ownership for them to enhance the level of technological innovation, access to modern technology, and master high technology in order to rapidly promote technological progress. This will help enhance the contribution of science and technology to labor productivity growth so as to improve labor productivity of the whole industry.

Keywords: *Science and technology, labor productivity, mechanical engineering*

1. Introduction

Mechanical engineering is an important sector, providing machinery, equipment, components, and accessories for other productive sectors. In general, the mechanical engineering sector has gradually controlled and improved localization, creating the dynamics

that drive other economic sectors forward, directly and indirectly generating jobs for million of workers (Do, 2022). By the end of 2022, there have been around 30.000 mechanical manufacturing enterprises nationwide, making up 30% of the total number of enterprises in the manufacturing sector with a total revenue of VND1.7 million, creating jobs for 1.2 million workers (Vietnam Industry Agency, 2022).

According to the General Department of Customs of Vietnam, the exports of the mechanical engineering industry has been increasing rapidly, yet the imports still prevail. Machinery, equipment, components, and accessories is Vietnam's the third major export products group. As depicted in Figure 1, the export value of these products was US\$27.19 billion in 2020 - a nine-fold increase since 2010, with an average annual growth of 24.4%. By 2022, the export value has reached US\$45.8 billion, a nearly fifteen-fold growth since 2010, exceeding the import figures. However, the larger export market share of machinery and equipment still belongs to the foreign direct investment (FDI) sector. In particular, the export value of machinery and equipment in the FDI sector estimates to stand at US\$42.58 billion, a 19.74% increase over the same period in 2021, accounting for nearly 93% of total export value (higher than 92.75% in 2021). Before export, mechanical manufacturing enterprises are to invest in production lines and create prototypes for sales. However, such products are beyond the capability of many domestic enterprises due to limited scale and resources.

Figure 1. The export-import revenue of the mechanical engineering industry (US\$ billion)

Source: General Department of Customs of Vietnam

According to the General Department of Customs of Vietnam, from 2010-2021, Vietnam has had a trade deficit in machinery and equipment. However, the trade deficit has decreased since 2020 due to a modest annual increase of 10.6% in the 2011-2020 import value.

In 2022, such import value decreased by US\$1.1 billion, leading to an export-import revenue surplus of US\$607 million. The slower import growth during the period 2010-2021 and decline of import value in 2022 implies an increase in production capacity of mechanical engineering enterprises and less dependency on imported machinery as a result of continuous investment.

The mechanical engineering industry has gradually controlled and improved localization: some mechanical products are of equal quality compared to those in other countries in the region. Mechanical accessories manufacturing enterprises have been in good production capacity, such as enterprises in manufacturing of molds, mechanical and plastic components, cables, technical rubber. Domestically manufactured metal components currently meet 85-95% total manufacturing demand of motorbikes; about 15-40% of automobiles; about 20% of synchronization devices; about 40-60% of agricultural machines and movers; 40% of construction machines; and 10% of metal components for high-tech industries (Vietnam Industry Agency, 2022). Considering the relatively high demand in the supporting industries market, some enterprises have invested in advancing their production capabilities, prioritizing high-quality products, supplying to FDI enterprises, and heading towards the international market.

Nevertheless, the number of made-in-Vietnam products is limited, and the self-management competency of the mechanical engineering industry is insufficient. Enterprises have been facing limited manufacturing material supply and tough competition from imported products. There are additional difficulties in market expansion due to a lack of market information, poor brand recognition among potential customers, and limited competitiveness. Without an internationally standardized quality management system, many mechanical enterprises in the domestic market are not eligible for investment projects to install equipment in such industries as steel, chemicals, and energy (An, 2022).

The technological capacity and proficiency of the mechanical engineering sector are below the world standards. Many enterprises do not pay much attention and have few opportunities to accumulate and invest in innovative technologies and equipment. Most inputs (such as steel, iron, and colored alloys) are imported. The quality and quantity of human resources are under standards. Few mechanical, science, and technology workers are sufficiently skilled. Skilled workers lack internationally recognized vocational and foreign language certifications. Research and development forces, including design consultants, are not eligible to meet the requirements set in synchronization device projects (Ngoc, 2022).

Measuring the contributions of science and technology to labor productivity growth in the mechanical engineering sector in Viet Nam are necessary for better productivity and competitiveness. Therefore, this study aims to measure the contributions of science and technology or technological progress to labor productivity growth of the mechanical engineering sector in Vietnam by the size and type of ownership of enterprises. Findings from this study would be a scientific base for recommending adequate policies for improving labor productivity in the mechanical engineering sector in Vietnam by the size and ownership of enterprise.

2. Method

2.1. Methods to determine scientific and technological contributions to labor productivity growth

Science and technology in this context refer to technological change or technological progress. According to Godin (2015), technological change is a broad concept with different definitions. In a narrow sense, it is a change in production methods or techniques, while in a broad sense, it is the social, cultural, and economic change induced by technology. In a narrow sense, technological change is quantified by an output measure of productivity that uses a production function to connect inputs and outputs. Following this perspective, this study measures technological progress by estimating the production function.

Godin (2015) reviews studies and produces three meanings of technological change: creation of new technology (to assess the impact of technology on social and cultural change), new production techniques (used to study the role of technology in economic growth--productivity), change in production function (used in measurement). In all definitions, technological change or technological progress are synonymous and often used interchangeably.

Progressive technologies bring about gradual economic changes (Coelli et al., 2005). In this sense, the technological progress factor is often represented by the t variable (time) in the production function; in other words, the time variable represents the nature of technological changes. If the production function is $Y = f(L, K, t)A$, the technological change will be $\frac{\partial Y}{\partial t}$. Different production functions (Cobb-Douglas function, transcendental logarithmic function--translog) indicate different levels of technological changes. Thereby:

* *Cobb-Douglas function*

$$\ln Y = \alpha t + \beta_L \ln L + \beta_K \ln K$$

The level of technological progress would be:

$$\frac{\partial \ln Y}{\partial t} = \alpha$$

* *Translog function*

$$\begin{aligned} \ln Y = & \beta_0 + \beta_L \ln L + \beta_K \ln K + \beta_t t + \frac{1}{2} * \beta_{LL} (\ln L)^2 + \frac{1}{2} * \beta_{KK} (\ln K)^2 + \beta_{tt} t^2 \\ & + \beta_{LK} \ln L \ln K + \beta_{tL} t (\ln L) + \beta_{tK} t (\ln K) \end{aligned}$$

The level of technological progress would be:

$$\frac{\partial \ln Y}{\partial t} = \beta_t + 2\beta_{tt} t + \beta_{tL} \ln L_{it} + \beta_{tK} \ln K_{it}$$

Labor productivity of an enterprise i in year t is calculated by value added (at constant prices) divided by the average number of workers in the enterprise. The labor productivity growth rate equals the two-year labor productivity gap divided by the previous year's labor productivity.

$$LP_{it} = \frac{VA_{it}}{L_{it}}$$

$$LP_{gr_{it}} = \frac{LP_{it} - LP_{it-1}}{LP_{it-1}}$$

The contribution of technological progress to labor productivity growth in each enterprise (i) is calculated as the indicator of technological progress (TP) divided by the rate of labor productivity growth (LP_{gr}).

$$TP_{LP_{gr_i}} = \frac{TP_{it}}{LP_{gr_{it}}}$$

Following the production function measuring the impact of technological progress on productivity growth, this study was conducted according to the following procedure:

Step 1: Identify production function form. The two most common production functions, Cobb-Douglas and Translog, are based on different assumptions. In particular, the Cobb-Douglas function assumes the effectiveness to be the same regardless of size. In other words, when the input increases a time(s), the output increases a time(s) accordingly. This assumption is strong and applicable only when the enterprise or economy is in full swing. The Translog function gives no such assumption and any other assumption related to the elasticity of input substitution; therefore, it allows for a more flexible input substitution regarding the input substitution effect. The latter function supposedly better reflects how enterprises operate in practice (Le, 2010).

The Cobb-Douglas production function, in which output is the value added (VA) and two inputs: labor (L) and capital (K), is logarithmically represented as follows.

$$\ln Y_{it} = \beta_0 + \beta_L \ln L_{it} + \beta_K \ln K_{it} + \beta_t t + v_{it} - u_{it}$$

v_{it} refers to random error while $v_{it} \sim N(0, \sigma_v^2)$ and $u_{it} \sim N(\mu_i, \sigma_u^2)$ refers to technical inefficiency.

Similarly, the translog production function is represented in logarithm as follows.

$$\ln Y_{it} = \beta_0 + \beta_L \ln L_{it} + \beta_K \ln K_{it} + \beta_t t + \beta_{LL} (\ln L_{it})^2 + \beta_{KK} (\ln K_{it})^2 + \beta_{tt} (t)^2 + \beta_{LK} \ln L_{it} \ln K_{it} + \beta_{tL} t \ln L_{it} + \beta_{tK} t \ln K_{it} + v_{it} - u_{it}$$

To determine whether the function is Cobb-Douglas or Translog, a likelihood ratio test (LR) must succeed, assuming that:

H_0^1 : Cobb-Douglas production function

$$\beta_{LL} = \beta_{KK} = \beta_{tt} = \beta_{LK} = \beta_{tL} = \beta_{tK} = 0$$

H_1^1 :: Translog production function

$$LR = -2\{\ln[L(H_0)] - \ln[L(H_1)]\}$$

In which: $L(H_0)$ is the likelihood value with the H_0 assumption; $L(H_1)$ is the likelihood value with the H_1 assumption. LR is Chi-squared distributed, in which the degree of freedom equals the difference between the numbers of parameters in H_0^1 and H_1^1 or $LR \sim \chi^2(6)$ in assumptions. If LR is smaller than the statistically critical value of 5%, then H_0^1 is accepted, and vice versa. The appropriate critical value is obtained from Kodde & Palm (1986).

Step 2: No technical inefficiency test. A zero technical inefficiency has a null hypothesis of $H_0: \gamma = \mu = \eta = 0$. The likelihood ratio is $LR \sim \chi^2(3)$.

Step 3: The distribution form of random residual. A test must occur when the production function estimation with the production function of stochastic frontier is the distribution form of u_{it} . The distribution of technical inefficiency follows the two most common types, half-normal or truncated-normal. The null hypothesis is that technical inefficiency distributes half-normal ($H_0: \mu = 0$), while the alternative hypothesis distributes truncated normal. The distribution of the likelihood ratio is by the square of a degree of freedom $LR \sim \chi^2(1)$.

Step 4: Time-invariant inefficiency test. The null hypothesis is

$H_0: \eta = 0$. The likelihood ratio is $LR \sim \chi^2(1)$

Step 5: No technological progress test.

- If the test result in Step 1 indicates that the production function is Cobb-Douglas, the null hypothesis without technological progress is $H_0: \beta_t = 0$. The likelihood ratio is distributed accordingly by the square of a degree of freedom, $LR \sim \chi^2(1)$.

- If the production function is Translog, the null hypothesis is $H_0: \beta_t = \beta_{tt} = \beta_{tL} = \beta_{tK} = 0$. The distribution of the likelihood ratio is by the square of four degrees of freedom, $LR \sim \chi^2(4)$.

Step 6: Hicks-neutral technological progress test. The null hypothesis is $H_0: \beta_{tL} = \beta_{tK} = 0$ with $LR \sim \chi^2(2)$. If the null hypothesis is accepted, the technological progress will be neutral and vary from year to year, and all enterprises will have the same yearly technological progress.

2.2. Data

This study uses the unbalanced panel data collected from the enterprise surveys in the period 2011-2020 by the General Statistics Office. The data looks at 78.590 enterprises over the ten-year period. From 2011-2010, the nonstate enterprises or domestic private enterprises (DPEs) account for an average of 86% of total enterprises in the data. These enterprises, however, have the smallest labor size, capital, and performance results on average (value added). Foreign-invested enterprises (FIEs) make up 13% of the data. This small proportion accounts for the majority of the import-export revenue of machinery and equipment. On average, a FIE has around 126 workers (5 times as many as that in a DPE), VND31,9 billion capital (10 times as much as that by a DPE) and generates VND20 billion value added (8

times as much as that by a DPE). Making up only 1% of the data, state-owned enterprises (SOEs) have the highest business size and performance results, with labor size, capital, and added value 10.8, 9.7, and 19.8 times as much as those of DPEs, respectively. Micro-sized and small enterprises account for 96% of the data, within which small enterprises constitute around 50%. Labor size, capital, and the average value added of mechanical engineering enterprises are 40 workers, VND7.3 billion, and VND5 million, respectively.

Table 1. Statistics showing data in the mechanical engineering industry, 2011-2020

		Obs.	Mean	S.D.	Min	Max
Total	Value added (billion VND)	78,590	5.0	13.4	0.009	138.0
	Labor (per person)		40.1	95.8	1	3668
	Capital (billion VND)		7.3	35.3	0.0001	3828.6
Micro-sized enterprises	Value added (billion VND)	36,501	0.5	0.9	0.009	50.4
	Labor (per person)		5.8	2.5	1	10
	Capital (billion VND)		0.7	2.9	0.0001	131.0
Small-sized enterprises	Value added (billion VND)	38,831	5.5	10.3	0.014	119.7
	Labor (per person)		42.4	40.0	11	200
	Capital (billion VND)		7.7	22.5	0.0002	1020.4
Medium-sized enterprises	Value added (billion VND)	1,471	36.4	24.2	0.295	126.0
	Labor (per person)		245.2	29.1	201	300
	Capital (billion VND)		48.1	64.5	0.001	951.1
Large-sized enterprises	Value added (billion VND)	1,787	59.0	30.3	0.372	138.0
	Labor (per person)		521.8	277.8	301	3668
	Capital (billion VND)		97.6	172.5	0.018	3828.6
SOEs	Value added (billion VND)	655	26.7	28.7	0.039	135.4
	Labor (per person)		244.9	287.2	1	3613
	Capital (billion VND)		60.4	172.8	0.001	2080.1
DPEs	Value added (billion VND)	67,759	2.5	7.8	0.009	137.1
	Labor (per person)		25.2	56.5	1	1561
	Capital (billion VND)		3.1	14.2	0.0001	1020.4
FIEs	Value added (billion VND)	10,176	20.0	25.0	0.015	138.0
	Labor (per person)		125.5	181.2	1	3668
	Capital (billion VND)		31.9	73.9	0.0004	3828.6

Source: Author's calculations; Note: Value added and capital are at the 2010 constant price.

3. Results

3.1. Contributions of science and technology to labor productivity growth of the mechanical engineering industry

Figure 2 shows that the average labor productivity of the mechanical engineering industry increased from 2011-2018. This period consists of two stages. Labor productivity underwent a slow increase in 2011-2014, then speeded up in 2015. However, there was no sharp increase from 2015 to 2018. The average labor productivity in 2018 was VND148.7 million per employee, a 48% increase compared to 2011. However, this figure decreased by 29.4% to VND105.0 million per employee in 2019. In 2020, it rose by 22.4% compared to 2019, reaching VND128.5 million per employee though not as much as in 2015. The author's calculations from a business survey data conducted by the General Statistics Office in 2021 shows that the labor productivity of the mechanical engineering industry remained lower than that of the energy industry (VND479 million per worker), the chemical industry (VND185.4 million per worker), steel (VND144.2 million per laborer), and plastics (VND132.8 million per worker). Meanwhile, it is higher than the industries of leather and footwear (VND59.8 million per worker), textile and garment (VND70.4 million per worker), and electronics (VND116.9 million per worker). Thus, the labor productivity of the mechanical engineering industry in eight key industries remains at a medium level, while this industry plays an important role in the economy, as it provides machinery and equipment, components, and spare accessories for many other manufacturing industries. It has a great impact on productivity and competitiveness of other sectors in the economy.

Figure 2. Average labor productivity of the mechanical engineering industry (constant price in 2010, million VND per employee)

Figure 3. Average labor productivity of the mechanical engineering industry in terms of size and ownership (constant price in 2010, million VND per employee)

Source: Author's calculations.

Figure 3 shows that, from 2011-2020, the average labor productivity of the mechanical engineering industry (at the constant 2010 price) was VND123.9 million per employee, an annual increase of 2.8%. Labor productivity tends to increase according to business size, which varies inversely with the rate of labor productivity. Medium-sized

enterprises have the highest labor productivity (VND148.3 million per employee - 1.8 times as much as very small enterprises), although the annual increase is only 2.5%. Very small enterprises have the lowest labor productivity yet the highest growth rate (5.0% per year). Small enterprises come second in labor productivity and growth rate. FIEs are more labor-productive than SOEs, with an average labor productivity of VND161.3 million per employee; however, these enterprises have the lowest growth rate (only 1.1 %/year). SOEs have the highest labor productivity growth rate (4.1 %/year), higher than DPEs (3.2%).

Estimations of production function using the production function of stochastic frontier and data tests of mechanical engineering enterprises during the 2011-2020 period (as shown in Table 2) indicate that the production function is translog; technical inefficiency is half-normal and time-varying; there is technological progress and technological progress is non-neutral. It means that technological progress varies by individual enterprise.

Table 2. Test results for the parameters of the stochastic frontier production function for the mechanical engineering industry

Assumptions	Date estimated	Value estimated (5%)	Conclusion
Production function form	475.04	12.59	Translog function
No technical inefficiency	815.14	7.045	Technical inefficiency
Distribution of technical inefficiency	553.81	3.84	Half normal distribution
Time-varying technical inefficiency	725.71	3.84	Time varying inefficiency
No technical progress	354.89	9.49	Technical progress
Neutral technical progress	8.28	5.99	Non-neutral technical progress

Source: Author's calculations

Figure 4. Average technological progress in the mechanical engineering sector by size and type of ownership in 2011-2020 (%)

Figure 5. Contributions of technological progress to labor productivity growth in the mechanical engineering sector in 2011-2020 (%)

Source: Author's calculations

Overall, mechanical engineering enterprises and groups categorized according to size and ownership did achieve technological progress; however, the rate is low. From 2011-2020, mechanical engineering enterprises made a slight technological improvement of 0.119% on average (Figure 4). It indicates that mechanical engineering enterprises have not paid much attention on creating new technologies, or/and on changing production functions, or technical or method adjustments to optimize existing equipment and machinery.

Technological progress tends to slow down inversely with business size, with very small enterprises making the most impressive progress. Perhaps, larger firms have more resources and tend to increase output by investing in new machinery or new technology instead of making optimal use of existing machinery and equipment. Meanwhile, smaller firms with scarced resources must do some changes or adjustments with given machinery and equipment and then achieve higher technological change rate. However, differences in the rate of technological progress among groups of various sizes are minor.

Comparisons among different ownership groups show similar developments in the rate of technological progress and labor productivity growth. FDI enterprises having the lowest labor productivity growth also make the slowest technological progress (0.111%). On the contrary, leading SOEs in labor productivity growth also make the most technological progress.

Given relatively slow technological progress, the contribution of science and technology to the mechanical engineering industry's labor productivity growth from 2011-2020 stands at only 4.3%. This result suggests that there is a big room for mechanical engineering firms to improve technological change in order to enhance labor productivity.

These contributions in domestic enterprises are less significant than those in their FDI counterparts. However, this figure in FIEs is approximately 10% compared to only 3.1% in SOEs and 3.8% in DPEs. This aspect is worthy of attention as slow technological progress that can reduce domestic enterprises' competitiveness and participation in the supply chain of FDI enterprises in Vietnam before becoming part of global value chains.

The contribution of science and technology to labor productivity growth tends to be more significant in larger enterprises; however, differences among groups are minor, and the contribution is moderate. Technological progress makes up 4.0-4.4% of labor productivity growth in small and larger enterprises, compared to 2.4% in micro firms.

4. Discussion and Conclusion

From 2010 onwards, the mechanical engineering industry has developed in size, production and business results, securing its major role as the input provider of many other economic sectors. However, enterprises in the industry made small technological progress (0.119%) in the 2011-2020 period, contributing 4.3% to the industry's labor productivity growth. This modest figure indicates the need for enterprises in this industry to gain improved access to and accelerate progress in modern technology, which can ultimately lead to more rapid technological advancements.

The State needs to provide adequate consultancy and financial support for businesses, especially micro-sized ones, to improve technological progress, especially prepare and

adjust business plans as well as production methods in an efficient manner and apply new production techniques to improve labor productivity. Meanwhile, enterprises need to proactively equip machinery and equipment, and advanced technology. It is also necessary for them to pay attention to applying new production techniques, and rearrange performance to improve their technical progress, productivity, and competitiveness. Also, large-sized enterprises with sound financial health should invest not only in new machinery, equipment, and advanced technology but also in applying new appropriate solutions to optimise the use of existing machinery and equipment.

Smaller-sized enterprises, especially micro-sized enterprises, need to conduct appropriate changes and adjustments such as business methods, and rearrangement of appropriate business divisions to improve technological progress so as to ameliorate the contribution of science and technology to increasing their labor productivity and competitiveness.

By type of ownership of enterprises, SOEs have the highest level of technological change, but they embrace the lowest contribution of science and technology to labor productivity growth. This means that the effectiveness in using inputs remains humble - especially ineffective machinery and equipment can lead to the fact that contribution of technical progress to labor productivity growth is lower than that of DPEs and FIEs. Thus, it is recommended that the government should accelerate the process of equitisation of SOEs, especially ineffective ones, in order to ameliorate the contribution of technological progress in increasing productivity and promoting the competitiveness of enterprises.

It is advisable that the Ministry of Industry and Trade, as the governing ministry, execute the following: *(i)* developing and activating the pathways for technological innovations in mechanical engineering enterprises following real-world conditions, needs, and trends in the 4th industrial revolution; *(ii)* promoting cooperations among administrators, scientists, and enterprises in technological research, application, and transfer; supporting enterprises and scientific bodies in advancing studies while investing in science and technology potentials for research, adoption, and transfer, heading towards taking control of designing and manufacturing production lines to provide equipment for all economic sectors; *(iii)* Reviewing and finalizing national technical regulations and standards for mechanical engineering products to match international standards; *(iv)* Encouraging continuous developments of the downstream sector to provide favorable conditions for supporting industries.

SUSTAINABLE DIRECTIONS FOR COMPANIES PROVIDING ADVENTURE TOURISM IN PHONG NHA - KE BANG NATIONAL PARK, QUANG BINH PROVINCE

Dr. Nguyen Van Duy

nguyenvanduydhqb@gmail.com

MA. Nguyen Thi Huong Lien

liendhqb@gmail.com

Faculty of Laws, Quang Binh University, Quang Binh, Vietnam

Abstract

Despite the harsh climate, Quang Binh has got the advantage of topography, unique geological tectonics and wild magnificent scenery. Including a diverse system of caves, beautiful rivers, and green primeval forests, Quang Binh has been a fascinating destination attracting many domestic and foreign tourists. These characteristics of Quang Binh are extremely favorable for the development of adventure tourism combined with experiential discovery - one of the types that attract a large number of tourists today. However, types of tourism have not been diversified. The promotional activities are limited, and ineffectively linked with localities and businesses. The article gives views and comments on sustainable tourism development, analyzes the advantages and disadvantages of Quang Binh in developing adventure tourism. It both gives appropriate directions to develop this type of tourism in a sustainable way with the desires of tourists.

Keywords: *Quang Binh Province, Adventure Tourism, Phong Nha - Ke Bang, Sustainable*

1. Introduction

In Vietnam, tourism not only brings economic benefits, protects the natural environment but also plays a role in promoting and preserving the traditional cultural values of the nation. However, it is the massive development of the tourism industry that has led to the copying of other types of tourism and tourism products such as ecotourism, shopping tourism, and medical tourism... In this context, Vietnam in general, and localities, in particular, need a completely new type of tourism to attract tourists and develop sustainable tourism. Quang Binh is a province that possesses advantages with diverse terrain, geological tectonics and a various system of caves, primeval forests, rolling mountains as well. Therefore, besides sightseeing tourism, adventure tourism is also increasingly being exploited and developed by businesses. Conquering one's limits is always attractive to everyone. That is why adventure tourism is more and more popular. Realizing the unique and mysterious geological advantages of the caves in Phong Nha - Ke Bang National Park, travel companies in this area have exploited various types of adventure tourism, turning this place into a tourist destination. It is an attractive destination for adventurous travelers who love to explore.

2. Method

2.1. Data collection

- Collecting information from published research works, reports, summaries, seminars to get data on travel companies, companies providing adventure tourism services in Phong Nha - Ke Bang National Park, Quang Binh Province.

- Collecting data on natural and socio-economic conditions of Quang Binh province at departments related to tourism such as Department of Statistics, Department of Natural Resources and Environment, Department of Information and Communication.

- Collecting information from reports, research on sustainable tourism, adventure tourism.

2.2. The method of analysis

From the advantages and disadvantages of economy, society, nature... in the development of adventure tourism in Quang Binh province, show the appropriate directions and solutions for sustainable development of this type of tourism.

3. Results

3.1. Perspective on Sustainable tourism and Adventure tourism

3.1.1. Sustainable tourism

There is no official concept of sustainable tourism but there are many different perspectives on this issue.

“Sustainable tourism development is the process of developing tourism products that satisfy the current needs of tourists, the tourism industry and local communities without compromising nature, future generations”.

According to the World Tourism Organization - WTO, this development is concerned with long-term economic and social benefits. Moreover, this ensures the contribution to the conservation and protection of resources, maintains the cultural integrity for the development of future activities; In addition, this helps to contribute to the living standards of local communities.

Clause 14, Article 3 of the Law on Tourism 2017 defines: “Sustainable tourism development is the development of tourism that simultaneously meets socio-economic and environmental requirements, ensures harmony between the interests of the subjects participating in tourism activities, does not harm ability to meet future tourism demand”.

3.1.2. Adventure tourism

According to the Adventure Travel Trade Association, “Adventure tourism is a tourist activity that includes physical activity, a cultural exchange, or activities in nature”. Adventure tourism is about connecting with a new culture or a new landscape and being physically active at the same time. It is not about being risky or pushing our boundaries. In fact, it is especially important to know and respect our limits while we are in an unfamiliar area.

This type of adventure tourism can be done domestically, abroad and overnight as well. “Adventure tourism is a journey of discovery, requiring participants to have certain skills to overcome known risks and challenges”.

This type of tourism also emphasizes the natural and cultural environment. Accordingly, participants will have physical activities to visit a new land or culture without having to take risks or push themselves beyond their limits. Adventure tourism is a type of travel through dangerous areas with intelligence, physical strength such as mountain climbing, canyoning, caving... “Adventure tourism is a form of tourism with many elements to explore, and experience different emotions from traveling to dangerous terrains, so the danger is also increased. And together with adventure tourism, there are adventure sports that are adapted and suitable for each type of tourism separately”.

3.2. The advantages and disadvantages of Quang Binh in developing adventure tourism

3.2.1. The advantages

Adventure tourism has been a current trend that becomes more and more popular in the world. This has attracted many tourists to explore. With the advantage of many hills, caves, rivers and streams, Quang Binh province in general and Phong Nha - Ke Bang in particular has great potential for developing adventure tourism.

** Mysterious caves, springs system*

In Phong Nha - Ke Bang, there is a system of about 300 large and small caves. Phong Nha cave system has been evaluated by the British Royal Cave Research Association (BCRA) as the world's top valuable cave with the 4 most points: having the longest underground rivers, having the highest and widest cave mouth, the widest and most beautiful sandbanks, the most beautiful stalactites.

Each cave in Phong Nha - Ke Bang National Park is a different wonder with unique and mysterious geological formations that make the adventure travel journey more interesting and attractive.

No	Cave	Length, height
1.	Son Doong Cave	5 km long and 200 m high
2.	Tra Ang Cave	667 m long and 15 m high
3.	Thung Cave	3351 m long
4.	En Cave	1645 m long and 78.6 m high
5.	Khe Tien Cave	520 m long
6.	Vom Cave	15.05 km long and 145 m high
7.	Dai Cao Cave	1645 m long and 28 m high
8.	Duot Cave	3,927 m long and 45 m high
9.	Ca Cave	1,500 m long, 62 m high
10.	Tiger Cave	1,616 m long and 46 m high
11.	Over Cave	3,244 m long and 103 m high
12.	Pygmy Cave	845 m long

In particular, Son Doong cave is considered the largest natural cave in the world. This cave is located in the Phong Nha-Ke Bang cave complex. Son Doong cave is a part of an underground system that connects more than 150 other caves in Vietnam near the border with Laos. The New York Times ranked Son Doong cave at number 8 out of 52 places on the list of places to visit in 2014. This is a unique adventure tourist destination of the Phong Nha - Ke Bang.

The development of adventure tourism can focus on 3 product groups: Group of adventure tourism products in the air (travel by helicopter, paragliding, skydiving...); Group of adventure tourism products on land (picnic tourism, climbing, climbing cliffs, exploring by car, motorbike, mountain bike, exploring national parks, caves...); Group of underwater adventure tourism products (boating, rafting, exploring waterfalls, experiencing hot mineral springs ...) Phong Nha's natural features are suitable for implementing these activities of adventure tourism.

** Dynamic travel agencies*

In Quang Binh province, there are 15 destinations for adventure tourism organized by companies providing different types of adventure tourism in Phong Nha - Ke Bang. The highlights are Oxalis Adventure Tours, Jungle Boss, Greenland Travel and Phong Nha Heritage. With their own services and destinations, companies offer tourists different experiences depending on the needs and adventurous nature of the destinations that tourists want.

Greenland Travel and Phong Nha Heritage provide easy-to-use tours suitable for all ages and genders such as camping, fishing, eco-tourism, bird watching... with typical destinations such as Mooc Spring, Phong Nha Botanical Garden, Ozzo Park... Particularly, two companies - Oxalis Adventure Tours and Jungle Boss specialize in organizing adventure tours such as Forest trekking and exclusive tours exploring caves in Phong Nha - Ke Bang National Park area; surrounding areas with difficulty levels and challenges. Two companies are licensed to operate tourism at the caves: Son Doong, En, Va, Tien, Nuoc Nut caves, and the cave system of Tu Lan. In particular, Jungle Boss company is exclusively licensed to explore the Tiger Cave system with 3 large caves: Tiger, Pygmy, Over with the point connecting these 3 caves is Kong sinkhole - the highest sinkhole in the world found so far.

With challenges tailored to each type of traveler, the companies listed above won the 2019 Certificate of Excellence from TripAdvisor, based on the best reviews from customers after experiencing adventure tourism products. These companies are aware that providing adventure tourism products requires a team of experienced consultants, senior technical guides, cave experts, porters team that ensure the safety for visitors. Therefore, all tours are carefully designed. The tour guides are also well-trained by experienced experts of the Royal Cave Research Association. The tours are organized exclusively and their program departs with a maximum of 14 guests per tour. Therefore, visitors will be completely released into nature, mountains, and forests. When visitors explore and enjoy the caves, they will be so comfortable without having any noise or jostling. Over the years, travel companies in Phong Nha - Ke Bang have created jobs for local people, Moreover, they attract more than 40,000

bookings to participate in the annual discovery, contribute to bringing Phong Nha - Ke Bang closer than with friends all over the world.

3.2.2. Disadvantages

Quang Binh has a lot of potential to develop adventure tourism, but the product has not been exploited commensurate with its strengths. In addition to the advantages above, the products of adventure tourism, technical facilities, human resources for business activities are still in their early stages. The implementation of adventure tourism programs is often difficult because of the long procedures, high costs and the need for well-trained tour guides. Moreover, the companies mentioned above still find it difficult to reach many tourists because of the adventurous nature of the tours they are exclusive.

In addition, specialized adventure tours are still very limited. That leads to less revenue from this type of tourism. The tourism products are not really diversified. In particular, there are no annual policies to develop adventure tourism from local departments and agencies

3.3. Sustainable Directions for Companies Providing Adventure Tourism in Phong Nha - Ke Bang National Park, Quang Binh Province

3.3.1. Coordinating between provincial authorities, local authorities and companies providing different types of adventure tourism

To do this, it is necessary to have a long-term strategy and adequate investments to realize the potential of adventure tourism and develop this type in a sustainable way. This means that the development of adventure tourism must harmoniously share benefits for Quang Binh province, for Phong Nha - Ke Bang, for businesses and especially for local people. In order to know how to do tourism, especially adventure tourism, and how to combine with travel companies, the local authorities need to open classes. The classes will train on tourism work such as welcoming guests, serving the needs of guests: entertainment, travel, dining, accommodation... These classes also consist of teaching English for learners. Developing tourism in general and adventure tourism in particular was not only the task of the authorities, travel and accommodation businesses but also the task of the whole community.

To step up the promotion work, it is so important to strengthen the link between the Vietnam National Administration of Tourism, the Tourism Association and Quang Binh Department of Culture and Sport in the construction of tourism promotion strategies, programs and plans. In addition, Quang Binh province need to coordinate with businesses to carry out promotion, link the promotion of local tourism images and brands with the promotion of adventure tourism products of enterprises.

3.3.2. Travel companies need to grasp the trend of tourists' access to tourism in the integration period

The 4.0 technology revolution helps tourists to change the way they travel. They can choose where to stay everywhere and change the habit of finding out tourist information. Instead of using books, newspapers, leaflets... they turned to look up tourist information on

the internet. Therefore, companies providing adventure travel services in Phong Nha - Ke Bang need to change to match the trend of the world, from the way of tourism, from management to promotion and advertising, travel services.... Besides managing and promoting the company's image through its own website, it is necessary to promote advertising of its exclusive types of tourism through travel websites and networks, Facebook, Instagram, videos, especially through the posts of famous Travel Bloggers.

In recent years, tourism marketing strategies have emphasized interaction and experience. The obvious manifestation is that the creation and spread of travel videos on social networking platforms Youtube, Instagram, Facebook, TikTok ... have increased sharply. Many experts consider the use of social networks as a main tourism promotion tool. It is said that Social networking platforms have been still a channel to exploit potential customers for agencies, organizations and businesses in the tourism industry because of their huge user base. However, it is also the most competitive in the technology age in providing travel knowledge and trends. Therefore, besides researching popular markets and changing policies of each social network, it is necessary to pay attention to how to make and create content to catch up with new trends. In addition, when using multiple social networks in promotion, it is advisable to focus on the facilitate management, target identification, market and promotion.

In particular, travel companies need analyze and research carefully in order to develop, connect with GenZ tourist groups, tourists from new target markets such as India, the Middle East... Moreover, creative and attractive communication campaigns through digital platforms will stimulate the needs of visitors to experience. The task in the coming time is to continue deploying technology applications and approaching new creative communication trends. This helps to carry on the effectively implement of the Digital Tourism Development Plan for the 2021-2025 period.

3.3.3. Combining various types of adventure tourism

Adventure tourism not only includes climbing rapids, deep-sea diving, but also lighter activities such as camping, kayaking.... so that visitors can overcome their limitations in a new destination. Companies should divide discovery types that are appropriate for different ages and backgrounds. Each tour must always meet different requirements compared to other tours so that customers will feel special. Moreover, in order to become the capital of adventure tourism, Quang Binh in general and Phong Nha - Ke Bang in particular need develop various types of adventure tourism. There are not only caves but also tourism companies need to exploit other types such as mountain climbing, zipline, cycling, trekking, kayaking, paragliding, diving ... This can attract tourists, compete with famous adventure tourism destinations in the region.

3.3.4. Integrating historical - spiritual elements into tours

Spiritual tourism exploits spiritual cultural factors in the process of tourism activities that based on tangible and intangible cultural values associated with the history of shaping people's perception of the world, values of faith, religion, beliefs and other special spiritual values. Accordingly, spiritual tourism brings about spiritual emotions and experiences of

people while traveling. It's so amazing to know about culture and history of destination where the travelers discover. Therefore, the travel companies should integrate historical - spiritual elements into tours in order to attract many visitors.

The guides of adventure travel companies need to be trained in different languages. This is a careful preparation to introduce the development history of mountains and caves of Vietnam with foreign languages. In the process of experiencing the tour program, Phong Nha - Ke Bang area will attract the attention of tourists, release the stresses in each line of exploring different types of tourism.

In addition, along with the development of the adventure tourism model, companies need to focus on community development by participating in community programs to conserve nature, protect the environment or contribute to the community.

4. Discussion and Conclusion

In the future, Quang Binh province in general and Phong Nha - Ke Bang area in particular is expected to become one of the centers of adventure tourism and nature discovery attracting many tourists everywhere in the world. The growth of companies providing different types of adventure tourism will contribute to promoting the province's adventure tourism potential. The authorities of Phong Nha - Ke Bang, local people are willing to improve conditions for companies so that they can promote and introduce this type of service to a large number of domestic and foreign tourists.

INVESTMENT IN DEVELOPING AGRICULTURAL PRODUCTION ACCORDING TO VIETGAP STANDARDS IN HAI DUONG PROVINCE

Dr. Tran Thi Mai Hoa

hoa@neu.edu.vn

Do Duc Thuan

thuanducdo22@gmail.com

Faculty of Investment, National Economics University, Hanoi, Vietnam

Abstract

Investment in developing agricultural production according to VietGap standards of Hai Duong province is a potential field and opportunities for investors. However, to achieve success in investing and developing agricultural production according to VietGap standards, investors need to have knowledge, experience and interest in issues related to agriculture, product quality standards, risk management and environmental protection. The Government and relevant agencies also need to introduce investment support policies to create favorable conditions for investors in developing agricultural production according to VietGap standards.

Keywords: *Agricultural production, Investment in agricultural production, VietGap standard*

1. Introduction

Hai Duong province is one of the agricultural production centers of Vietnam. The application of VietGap standards in the agricultural production will help Hai Duong farmers convert from traditional agricultural production to VietGap standard production, creating high quality agricultural products and meeting market requirements. Therefore, the research about investment in developing agricultural production according to VietGap standards in Hai Duong province is necessary. The aim of research will focus on some contents

- What is the situation of investment and development of agricultural production according to VietGap standards in Hai Duong province?

- What solutions can be applied to improve agricultural production and support investment in developing agricultural production according to VietGap standards in Hai Duong province?

2. Conceptual Framework

2.1. The concept of VietGap standard

VietGap standard is issued by the Ministry of Agriculture and Rural Development for each product, group of aquatic products, cultivation and animal husbandry.

VietGAP includes principles, order and procedures to guide organizations and individuals in production, harvesting and post-harvest treatment in order to ensure safety, improve product quality, ensure social welfare, health of producers and consumers; at the same time protect the environment and trace the origin of production.

VietGAP standards are based on 4 criteria:

- Standards on production techniques: specify production techniques from soil selection, seeds, fertilizers, feed sources to harvest in accordance with specific regulations for each field of cultivation, animal husbandry and fishery.

- Food safety: Including measures used to ensure that food does not have contaminated chemicals or physical contamination when harvested, absolutely safe when reaching consumers.

- Working environment: good arable land, adequate water sources to meet standards to prevent the abuse of labor power of farmers.

- Product traceability: This standard allows consumers to easily identify products through the process from seed source to finished product and market. At the same time, through traceability, users will know full accurate information about the manufacturing enterprise.

Products meeting VietGAP standards are good quality products, ensuring food safety and hygiene, not using chemicals and substances harmful to the human body as well as the environment. The products are produced and harvested in accordance with the process, with a clear source of traceability information.

2.2. The roles of VietGap standards for agricultural production

The application of VietGap standards to agricultural production has brought many benefits to farmers, consumers and society. Here are the specific roles of VietGap:

- For society: This is evidence to affirm the name of Vietnam's aquatic, crop and livestock products, increase export turnover by overcoming technical barriers, not violating regulations and requirements of importing countries. Applying VietGAP changes current production practices, society reduces health costs, people can use safe and hygienic products, which means improving the quality of life of the community and ensuring the sustainable development of society.

- For producers: Help manufacturers react more promptly to production issues related to food safety and hygiene through production control in the stages of tillage, animal husbandry until harvest, creating high quality products, stable. Manufacturing facilities that apply the process and are granted VietGAP certification will bring confidence to distributors, consumers and regulators. VietGAP certification helps manufacturers build product brands and create more stable consumption markets. Agricultural products certified according to VietGAP standards have higher value in the market, thereby increasing income for farmers. One study found that farmers who comply with VietGAP standards have an average income of 25-30% higher than farmers who do not.

- For processing and exporting enterprises: The source of raw materials ensures quality, so it will ensure the output quality of products, thus maintaining reputation with customers and improving revenue. Because the source of input materials has been guaranteed, businesses can reduce costs and time for inspecting input samples. Reduce the risk of products being banned from import or 100% inspected when imported due to non-compliance with chemical residue requirements.

- For consumers: Consumers will be able to use products with food safety and hygiene, which is also the main goal and biggest benefit that VietGAP brings. By setting out risks and implementing regulations, VietGAP will create the right of consumers, thereby contributing to creating a generation of consumers who easily identify products that ensure food hygiene and safety in the market when they see VietGAP product certification or certification mark, this is also the main motivation for people and manufacturers to innovate to produce and supply good products from agriculture to society.

- For the environment: VietGAP standards set high standards of environmental protection, requiring farmers to comply with regulations on waste management, soil and water protection, minimizing negative impacts on the environment.

3. Results

3.1. Investment situation for agricultural production development according to VietGAP standards in Hai Duong province

3.1.1. Scale of investment capital

Through the period of 2017-2022, the scale of investment capital in developing agricultural production according to VietGAP standards in Hai Duong province has recorded a significant increase. Below is a detailed statistical table of the size of investment capital by year in the above period:

Table 1. Total scale of investment capital in agricultural production development according to VietGAP standards in Hai Duong province in the period of 2017-2022

(unit: billion VND)

Year		2017	2018	2019	2020	2021	2022
Total Investment Scale (billion VND)		17,4	21,6	19,5	21,3	11,7	49,5
Rate of increase (%)		28,8	24,1	-9,7	9,2	-45,1	323,1

Through the above statistics, it is possible to assess an overview of the total investment capital in agricultural production development according to VietGAP standards in Hai Duong province in the period of 2017-2022 as follows:

- Scale of investment capital: From 2017 to 2022, the scale of investment in agricultural production development according to VietGAP standards in Hai Duong province has had noticeable fluctuations, increasing from 17,4 billion VND in 2017 to 49,5 million

VND in 2022. This is a positive sign, showing the interest and investment in developing agricultural production according to VietGap standards in Hai Duong province.

- Growth rate (%) and volatility: The growth rate of the scale of investment is uneven throughout the period 2017-2022. 2017 and 2018 recorded growth of 28.8% and 24.1%, respectively, indicating positive investment and development. However, 2019 saw a decrease of -9.7%, and 2021 saw a significant decrease of -45.1%. In contrast, 2022 recorded a very high increase of 323.1%. This shows the large disparity and fluctuation in the growth rate of the scale of investment during the aforementioned period. It is possible to explain the decrease of the scale of investment capital in agricultural production development according to VietGap standards in Hai Duong province in 2019 and 2021, mainly due to the impact of the Covid-19 epidemic.

3.1.2. Structure of investment capital sources

Table 2: Structure of investment capital in agricultural production development according to VietGap standards in Hai Duong province in the period of 2017-2022

(unit: billion VND)

Funding	Year					
	2017	2018	2019	2020	2021	2022
State capital	10,2	12,9	11,4	13,2	2,5	42
Private capital	6,6	8,1	7,5	7,5	8,6	6,9
Others	0,6	0,6	0,6	0,6	0,6	0,6
Sum	17,4	21,6	19,5	21,3	17,1	49,5

According to the table above, the significant increase in state capital and the stability of capital from other sources can create favorable conditions for the development of agricultural production according to VietGap standards in Hai Duong province in the future. However, in terms of capital structure, Hai Duong province still requires attention and support from private investors to maintain agricultural production activities according to VietGap standards.

3.1.3. Contents of investment in agricultural production development according to VietGap standards in Hai Duong province

Table 3: Statistics on investment capital structure in agricultural development according to VietGap standards by industry in Hai Duong province period of 2017-2022

(unit: billion VND)

Fields	Year						Sum
	2017	2018	2019	2020	2021	2022	
Livestock sector	9,75	5,58	4,0	4,26	7,32	20,7	51,61
Field of cultivation	6,03	6,15	6,2	4,11	2,31	24,69	49,49
Fisheries	1,62	9,87	9,3	12,93	2,07	4,11	39,9
Sum	17,4	21,6	19,5	21,3	11,7	49,5	141

The statistical table of investment capital structure in agricultural development according to VietGap standards by each industry in Hai Duong province shows that the investment distribution varies between key sectors of agriculture such as animal husbandry, crop cultivation and fisheries.

Livestock production is the most invested industry in the period of 2017-2022, with a total investment capital of 51,61 billion VND, accounting for more than 36% of the total investment capital in agricultural development according to VietGap standards in Hai Duong province. However, there is a significant change in the allocation of investment capital between years, with a significant increase in investment in 2022. It can be seen that investment capital in the livestock industry has tended to increase gradually in recent years, especially in the period of 2021-2022. The prospects for investors in this industry are also quite positive because the demand for poultry, cattle, poultry and pork is still increasing and the domestic and international markets are very potential

Meanwhile, the field of cultivation and fishery sectors both have relatively close total investment capital, 49,49 billion VND and 39,9 billion VND, respectively. However, the horticulture sector has a significant difference in investment levels between years, while the fishery sector has a significant growth in investment in the period 2018-2020.

For cultivation industry: Investments in the horticulture industry gradually increased throughout 2017-2022, especially in 2021-2022. However, the prospects for investors in this industry are not very large due to many challenges such as difficulties in production, low product quality, fiercely competitive market, unstable weather, and difficulties in accessing capital.

About the fisheries industry: Investments in the fisheries industry increased steadily throughout the period 2017-2022, especially the period 2020-2021. The prospects for investors in this industry are quite large because fishery is one of the key economic sectors of Hai Duong province, with many development potentials such as using high technology, expanding export markets and improving product quality.

In summary, the outlook for investors in the livestock and fisheries industry is quite positive, while the prospects for investors in the cultivation industry still pose some challenges. However, with investment in important factors such as science and technology, improving infrastructure and improving production capacity, the horticulture industry will also have better prospects in the future

3.1.4. Guidelines and policies of the State and local authorities on creating conditions for the production of VietGap agricultural products in Hai Duong province

In order to promote the development of agricultural production according to VietGap standards, the state and authorities in Hai Duong province have introduced policies and policies to contribute to creating favorable conditions for VietGap agricultural products, with support policies, capital incentives, etc Education and training, along with the development of a system of regulations, inspection, quality inspection, ensuring food safety, accompanying the sustainable development of the agricultural sector :

- Creating conditions for land settlement for agricultural production: Local authorities are committed to creating favorable conditions and settling land for agricultural enterprises and households meeting VietGap standards. Locally, agricultural production areas have been planned land and made a list of clean land to serve agricultural production meeting VietGap standards.

- Funding to support investment capital: The State and local authorities have sponsored and supported enterprises and households doing agricultural production to meet VietGap standards. Specifically, Hai Duong provincial government has implemented many financial support programs, including the program "1 commune, 1 product" and a support program for agricultural production enterprises meeting VietGap standards.

- Preferential loan policy of Vietnam Bank for Social Policy (VBSP): VBSP provides loans with preferential interest rates to households, collectives and agricultural production organizations according to VietGap standards.

- Tax exemption and reduction policy: According to the provisions of the CIT Law (amended), agricultural production enterprises according to VietGap standards are entitled to exemption or reduction of corporate income tax, registration tax, value-added tax, import tax on machinery and equipment.

- Policies to support investment in agricultural development: Local authorities provide investment capital support, financial support, market development support, professional training for agricultural enterprises and collectives according to VietGap standards.

- Policies to encourage cooperatives: Local authorities encourage households producing agriculture according to VietGap standards to join cooperatives to strengthen economic strength, jointly produce, consume, manage and share profits.

- Policies on training and improving professional qualifications: Local authorities provide training courses, programs to support training, innovation and professional improvement for households and collectives of agricultural production according to VietGap standards.

- In addition, implementing the Project "Development of commodity agricultural production focusing on high-tech application, organic agriculture in the period of 2021-2025, oriented to 2030", in 2022, Hai Duong province will support 12 smart agricultural facilities associated with digital transformation. These facilities will be supported with funds to purchase equipment to use digital platforms in production management, remote control systems, automatic irrigation water, forecasting systems, pest warnings, etc. The supported facilities are membrane houses, net houses with a minimum scale of 3,000 m² to produce hydroponic vegetables, melons, fragrant melons, seedlings ... for high economic value

3.2. Investment activities evaluation and some solutions

3.2.1. Achieved results

VietGap product production area of Hai Duong province increased significantly: According to the report of the VietGap National Steering Committee, as of September 2021,

Hai Duong is one of the leading localities in the country in terms of VietGap product production area with about 13,000ha, an increase of more than 2,000ha compared to the previous year. The number of VietGap agricultural products increased: VietGap products of Hai Duong were certified to meet international standards, trusted and selected by domestic and foreign units. Hai Duong's VietGap products have been exported to many fastidious markets such as Japan, Korea, EU, USA, Canada, Australia, China, Taiwan ... The number of VietGap agricultural products of Hai Duong sold to the domestic market and exported is increasing year by year. Specifically, in each field of agriculture, certain successes have been achieved:

3.2.2. Existing limitation

Although there have been policies and efforts of Hai Duong province in investing in the development of VietGap agricultural product production, however, there are still some notable shortcomings and limitations, from complicated investment procedures, difficulties in accessing capital, training a team of quality agricultural workers, etc to difficulties in building a system of monitoring, inspecting and evaluating the quality of agricultural products, contributing to limitations in the process of developing VietGap agricultural product production in Hai Duong province.

- Difficulties in implementing VietGap standards: Currently, the implementation of VietGap standards is still facing many difficulties due to the lack of knowledge and experience, and there are not enough resources and funds to fully implement these standards, especially for small farmers.

- Limited investment capital: Despite the attention and support from the government and donor organizations, the investment capital in developing VietGap agricultural production in Hai Duong is still limited. It is difficult for investors and businesses to access investment capital to implement agricultural production projects according to VietGap standards, making it difficult to improve product quality.

- Poor infrastructure: Transportation, electricity, water, waste treatment and other utilities infrastructure in Hai Duong is limited, especially in rural areas. This makes it difficult for businesses to transport and circulate goods, reducing the competitiveness of VietGap products of the province.

- Difficulties in securing human resources: Farmers need to be trained to master production knowledge and skills according to VietGap standards, however, this is still a big challenge for Hai Duong province.

- Poor management: Despite the application of VietGap standards, however, the management and control of production are still not fully guaranteed, there is also a situation of reality that is not in accordance with the set standards. Because the post-inspection work has not achieved results, 80 pigs have recently been found to have lean substances mixed into pigs raised according to VietGap standards easily in Ho Chi Minh City.

- Lack of coordination between units: Units in the process of producing, processing and consuming agricultural products according to VietGap standards do not coordinate well

with each other, which causes many difficulties in product quality management, and also makes products not accessible to full consumption markets.

- Lack of technical support and advice: To produce agricultural products according to VietGap standards, businesses need to have professional knowledge of agriculture, technology, management, and meet the requirements of quality and food safety. However, there is still a lack of adequate and quality technical support and advice for VietGap agricultural production enterprises in Hai Duong.

- Lack of attention and support from local authorities: To develop agricultural production according to VietGap standards, it is very important to have attention and support from local authorities. However, this is still a problem that many farmers in Hai Duong face.

4. Discussion and conclusion

a. Solution for planning

Organize the implementation of the planning of agricultural production zones and areas, especially agricultural land areas with high productivity and quality, to update in the planning of Hai Duong province to 2030 with a vision to 2045.

For rice areas that need to be strictly protected, they need to be managed by digital maps (GPS). Identify and develop key areas, specializing in the production of key agricultural products of the province in advantageous localities.

b. Solution for capital attraction

Increase the enlistment of central funding sources and prioritize local budget capital for the implementation of programs, schemes and projects of the agricultural sector on the basis of proper purposes and efficiency. Increase annual career capital for the agricultural sector to ensure the full implementation of the tasks: transfer of technical advances, agricultural extension, forestry extension, fishery extension, development and replication of new effective models; implement policies to support the development of agricultural production and infrastructure for agricultural production, programs, topics, research and application projects in the agricultural sector, especially research topics and projects on hybridization, selection and breeding of plant breeds and productive children, high quality, resistant to pests and diseases, adaptable to climate change conditions; preservation, processing, reduction of post-harvest losses.

c. Solution for developing technology and scientific

Continuing to innovate and improve the efficiency of scientific and technological research and application activities, transfer technical advances and new technologies, create strong changes in the application of new scientific and technological achievements in all branches and fields in order to accelerate the process of industrialization, modernization of the agricultural sector and rural development.

d. Solution for developing agricultural production infrastructure

The investment in production infrastructure projects needs to be focused, avoid spreading, and at the same time need to invest evenly between the fields of cultivation,

animal husbandry and aquaculture. Develop irrigation systems in the direction of multi-objectives, improve irrigation capacity, active pepper for crops, first of all, the entire rice land, aquaculture area and vegetable crops with high economic value. Consolidate, build and consolidate the river system to ensure safety for production and people's lives. Continue to pay attention to investment to improve the system of rural roads in general and internal roads in particular, contributing to bringing mechanization into service of production, reducing labor for farmers.

e. Solution for developing human resource

Plan to train and improve the quality of scientific and technical human resources to meet the requirements of agricultural and rural development in the direction of industry restructuring. Review and evaluate resources of scientific and technical personnel, paying attention to specialized human resources of key fields, most importantly the field of hi-tech application agriculture and organic agriculture. Complete and renovate teaching contents and curricula, associate training with the needs of society and enterprises, associate theory with practice, pay attention to training skills and skills, strengthen training in business management knowledge in the market economy mechanism; modernize teaching methods, enhance learners' initiative in the spirit of learning in conjunction with practice.

REDUCING POVERTY IN VIETNAM THROUGH SUSTAINABLE LIVING MODELS

PhD. Candidate. Nguyen Cong Nam

namnc.vids@mpi.gov.vn

Viet Nam Institute for Development Strategies, Ministry of Planning and Investment

Assoc. Prof. Dr. Bui Huy Nhung

nhuongbh@neu.edu.vn

National Economics University, Hanoi, Vietnam

Abstract

One of the causes of poverty in Vietnam is lack of livelihood. In recent years, there have been many livelihood models to help reduce poverty in Vietnam. However, in order to improve the effectiveness of these models further to suit each locality, region and to ensure the sustainability of these models, the participation of many stakeholders, especially farmers to successfully implement Vietnam's poverty reduction policy in the 2021-2025 period.

Keywords: *poverty reduction, model, livelihood, sustainability*

1. Introduction

According to the report on assessment of poverty and equality in Vietnam in 2022 published by the World Bank (WB) in April 2022, the period 2010-2020 is the decade that witnessed Vietnam achieve high growth and poverty reduction has achieved impressive results. On average, household consumption is growing at a rate of about 5% per year. Based on the World Bank's low-middle-income country (LMIC) poverty line (US\$3.20/day in 2011 purchasing power parity), the poverty rate has fallen from 16.8% last year in 2010 to 5% by 2020, which means 10 million people have been lifted out of poverty, the number of poor people has decreased to 5 million people in 2020. However, Vietnam's escape from poverty is not very sustainable. Households who have escaped poverty are at high risk of falling back into poverty, especially in the context of many fluctuations in the domestic and foreign macroeconomy, accompanied by the impacts of climate change and epidemics. The waves of Covid-19 epidemic in Vietnam in the past time have been a test for the economy in ensuring social security and reducing poverty. Facing the negative impacts of the Covid-19 pandemic, Vietnam's poverty reduction progress has been delayed.

In addition, in the coming period, if Vietnam measures the poverty level according to the multi-dimensional poverty standard for the period 2021-2025 with the income standard, nearly twice as high as the poverty line of the 2016-2020 period. At the same time, the standards of deprivation of social services and the indicators that consider it are also higher. Poverty reduction programs from the Central Government, in particular, the National Target

Program on Hunger Eradication and Poverty Reduction are a long-standing policy tool and play an important role in poverty reduction. In the Socio-Economic Development Plan for the 2021-2025 period, there are 3 national target programs targeting individuals, households and localities according to the aspects mentioned in this chapter (rural, rural, and rural). occupation and ethnic minorities). National target programs invest heavily in communes, with nearly 560 trillion VND (equivalent to 25 billion USD) being allocated to commune-level programs under National Target Programs since 2010. However, the actual implementation also shows that it is worth noting that the projects implemented under the National Target Program on New Rural Areas (2016-2020) invest heavily at the commune level, but only a small part reaches the poorest communes, as these communes are more dependent on direct central support and have less access to external financing options. In addition, most of the spending of the national target program is for socio-economic infrastructure investment, instead of other basic social services.

Therefore, in the coming time, in order to achieve 4 poverty reduction targets in the 2021-2025 period, in which the poverty rate maintains a reduction of 1.0 - 1.5%/year, it is necessary to choose investment options into smart and appropriate livelihood models in localities. Only local authorities can grasp the socio-economic characteristics as well as the advantages of each region to design sustainable livelihood models, contributing to ensuring stable jobs and creating long-term income for people. When people have income, it will help them escape poverty, secure their lives and in the long run have a source of accumulated income to be able to cope with the fluctuations of the economy in the future. Over the past decade, as the poorest households have increasingly focused on low-income agricultural activities, these groups are at risk of falling further behind and becoming more disconnected from areas of energy development. movement of the economy. Job creation and wage income growth are key drivers of poverty reduction. Therefore, the development of sustainable livelihood models in the agricultural sector is very necessary.

2. Theoretical Framework

2.1. Contents of sustainable livelihood model

There are different views on livelihoods. According to Vietnamese dictionary, “livelihood” is understood as "work to earn a living, to make a living". However, later on, the term livelihood has been recognized with a broad and complex meaning since support policies from the government, non-governmental organizations, and civil community - who are vulnerable to shocks caused by natural disasters and production risks. Since then, there are many definitions of livelihood. According to Chambers and Conway (1992), a livelihood includes the capabilities, capital resources (including physical and social capital) and activities necessary for a means of living. Based on the above points of view, within the scope of the research, it can be understood: a livelihood is a way of earning and supporting people's lives and contributing to enriching themselves and the community.

The concept of “Sustainable Livelihood” is rooted in sustainable development introduced by the Brundtland Commission on Environment and Development in 1987,

which sees sustainable livelihoods as a way to link the socioeconomic and ecological factors with policies and institutions. At the United Nations Conference on Environment and Development (1992), the concept of sustainable livelihoods was defined with a broader connotation, specifically: Sustainable livelihoods are seen as a goal to reduce poverty, i.e. sustainable livelihoods can act as an integrator that allows policies to simultaneously address three important issues, including: development, sustainable resource management, and poverty alleviation. A person's or a family's livelihood is sustainable when they are able to cope with and recover from stresses and shocks and sustain or enhance their abilities and assets and in the future. without harming environmental resources (Chambers and Conway 1992). From the perspectives of sustainable livelihoods above, within the scope of the research, the author views sustainable livelihoods as the use of necessary resources to implement livelihood strategies to achieve desired outcomes. wants and has little impact on environmental, economic and social factors.

Sustainable livelihoods are implemented through models. Accordingly, the sustainable livelihood model refers to the modeling of people's livelihoods (earnings) in accordance with specific conditions of a defined time and space with the aim of improving their lives and contributing to their livelihoods. contribute to the socio-economic development of rural areas. The sustainable livelihood model is not invariant over time, but its content and nature exist for a relatively long time. On the other hand, the sustainable livelihood model is also the solution for the socio-economic development of the community or, more generally, a certain group of people. Sustainable livelihood model Sustainable livelihoods are expressed in aspects, such as:

- (i) Livelihoods are highly efficient and relatively stable over a long period of time. That is, it is effective in a relatively stable increasing trend for a long time. Thereby bringing a prosperous and happy life for a long time, being accepted and excited by the people
- (ii) Little or no negative impact from climate change and from market changes
- (iii) No negative impact on other livelihoods and no negative impact on other livelihoods.

2.2. The role of sustainable livelihood models in poverty reduction

Sustainable livelihoods are the foundation to improve people's living standards both physically and mentally. Sustainable livelihood models suitable to local characteristics and needs of poor households have created many jobs, good incomes, improved people's quality of life and adapted to climate change. at the same time, contributing to realizing the goal of transforming the economic structure and labor structure for the locality. The experience of the previous period also shows that the cultural values of the nation and environmental protection, if promoted in the livelihood model, are more effective in helping sustainable economic growth.

3. Results

3.1. Some typical livelihood models to help reduce poverty in Vietnam

In the past years, there have appeared many livelihood models to help reduce poverty effectively by central and local agencies, international organizations, businesses, and young

people in poor localities. ...Generally, there are livelihood models deployed in fields such as agriculture, forestry and tourism such as:

The model of rice - shrimp, rice - fish is a new direction in the development of organic agriculture in recent years. This model appeared in the early 2000s in the Mekong Delta provinces. In this model, by-products from shrimp and fish farming will be used as nutritional supplements for rice plants; conversely, when the rice is harvested, by-products from rice production are a source of food for shrimp and fish. With this crop rotation model, plants and animals do not have to use pesticides and antibiotics, creating clean, safe products and protecting the environment, helping farmers improve their incomes. Up to now, this model is being transformed into "fragrant rice - clean shrimp" and "fragrant rice - clean fish" model. This is the product of the process of co-innovation and creation based on knowledge and natural conditions of the region. This model is considered to bring benefits, such as sustainable agricultural development, reducing environmental pollution, maintaining the ecological environment, creating and supplying the market with clean products. In particular, this model is a way for households in low-lying and flood-prone areas to shift production, improve income, and minimize negative impacts caused by climate change. The shrimp - rice model from some places in Ca Mau, Hau Giang, Kien Giang... has brought about efficiency and high income for farmers. The model has helped farmers earn an average profit of 60-70 million VND/ha/year, helping many households get out of poverty and have a better life.

The agro-forestry model is a land-use management system for intercropping, in which annuals, shrubs, and herbaceous plants are planted around or between perennial crops. combine pasture or livestock. This combination creates diversity, productivity, profitability, ecology and sustainability in land use. Biodiversity in agroforestry systems is generally higher than in conventional agricultural systems. Therefore, many farms and farmers have chosen to convert to agro-forestry models to diversify products, improve livelihoods as well as adapt to the impacts of climate change. In Vietnam, there are many forms of agroforestry farming that are applied in practice, in which, the model of planting legume species according to the contour line on the annual tree cultivation area in order to reduce erosion and green manure in situ; model of planting agricultural crops in combination with forestry trees; cropping models reserve a part of land for livestock; small-scale afforestation model combining food production, fruit trees and food crops; fruit tree model combined with long-term industrial plants. Typically, the Northwest provinces, when applying this model in the combination of growing longan, maize, and livestock grass, has brought high economic efficiency, when spending 1 dong of capital to cultivate agro-forestry models, Ethnic minorities can earn from 3.3 - 14.1 dong after the business cycle, even with this model, farmers start to make profits from the second year (about 6.1 million/ha), initial investment return (44.2 million VND/ha) after the fourth year and the profit in the 5th year onwards is about 29.3 million VND, more than 2 times higher than before planting a single crop [3]. Thanks to that, the income of upland people has increased significantly besides social benefits such as reducing the rate of forest loss, avoiding the situation of migratory farming.

Sustainable landscape agriculture is an integrated approach to address environmental degradation, adapt to climate change and enhance biodiversity, while improving food security, food and nutrition. Up to now, there are many models of sustainable landscape agriculture, such as landscape coffee model in Lam Dong and Dak Lak provinces; model of wetland ecosystem management and conservation and sustainable ecological development in Tram Chim National Park, Dong Thap province.

4F (Farm - Food - Feed - Fertilizer: Farm - Finished Products - Animal Feed - Organic Fertilizer) is researched and developed by Guilin Group to build an ecosystem. eco-agriculture through the implementation of organic agricultural product processing complexes, control of safe pork production by a closed farming system. Waste in the farm is collected and treated to produce microbial organic fertilizer for cultivation, forming a closed agricultural production process from livestock to cultivation, from trees to soil. The model contributes to improving economic efficiency, preventing epidemics, contributing to environmental protection, and reducing greenhouse gas emissions.

The model of agriculture combined with ecotourism is a system that uses the resonance principle of ecological agriculture. Eco-agricultural tourism is a model that has been increasingly invested and focused in Vietnam in recent years, creating a lot of attraction for domestic and foreign tourists as well as increasing income for agricultural producers. In the past time, there have been many successful agro-ecotourism models in Vietnam, such as agritourism in Hoi An (Quang Nam province); agricultural tourism in Ba Vi (Hanoi city), Tam Duong (Lai Chau province), Sa Pa (Lao Cai province),... Besides, there are eco-tourism models in the western mountainous provinces North. The Northeast mountainous region has many livelihood activities associated with local community eco-tourism, including accommodation services (homestays), tour guides, cooking, navigation, packing, service activities. serving tourism (weaving, making handicrafts, bathing with medicinal herbs of the Dao people, cultural markets, developing community-based eco-tourism towards creating sustainable livelihoods for the highland people...); performing arts (khen dance of the H'Mong ethnic group, bell dance of the Dao ethnic group, the pipe character of the Thai people...). In addition to direct livelihood activities, indirect livelihood activities in community-based tourism development areas are also developed, contributing to improving the quality of community life, such as agricultural activities. (cultivation of agricultural products, medicinal herbs; raising livestock and poultry...), small trading services, production of traditional handicraft products... Thanks to that, people's income and living standards are improved. In Sapa, households participating in tourism activities have a rate of hunger eradication and poverty reduction 3 times faster than households not doing tourism. The income of households doing tourism services is also 5 times higher than that of other households, reaching from 25 to 60 million VND/household/year [4].

Organic production model: Recently, organic agricultural production models have also been interested. Many models of organic agricultural production in cultivation, animal husbandry and aquaculture have been developed. Up to now, 59/63 provinces and cities across the country have implemented organic agriculture and spread it more and more

strongly. In 2021, the area of organic agricultural land in Vietnam will reach more than 174,000 hectares, an increase of 47% compared to 2016, ranking 9th in the 10 countries with the largest organic agricultural land in Asia. Hanoi is currently the locality where many high-quality organic agricultural models have been built, both in line with the development trend of modern agriculture, and bringing high economic value to farmers, reducing the percentage of poverty households in the city.

3.2. Challenges in developing a sustainable livelihood model to reduce poverty in Vietnam

In general, livelihood models in various fields are quite diverse and there is a tendency to combine sectors to take advantage of the available potentials of localities. At the same time, the general development trend of livelihood models is to apply technology towards the production of organic and environmentally friendly products according to a cyclic chain. Besides taking advantage of available resources of localities, the implementation of sustainable livelihood models also faces many difficulties (Table 1).

Table 1. Summary of sustainable livelihood model development in various fields

Model	Available resources and development situation	difficulty
Agriculture sector		
Agricultural development with high technology application	Just developed small and odd without the necessary linkage along the value chain	Lack of big business involvement; Lack of geographical indications, traceability and lack of trademarks
Developing organic agricultural products	There has been a development step in the production of rice and green vegetables; There is no necessary linkage along the value chain	Lack of capital, high cost and lack of certification of organic and food safety standards; lack of organic farmers' floors or markets; lack of geographical indications, traceability and lack of trademarks
Developing clean agricultural products	Developed in some districts both in the fields of cultivation and animal husbandry; There is no necessary linkage along the value chain	Lack of food safety certification, lack of clean farmers' markets or floors; lack of geographical indications, traceability and lack of trademarks
Forestry sector		
Sustainable forestry development according to EU standards accompanied by sustainable forest management.	People actively plant, care for and protect forests, so the effect is relatively good.	Lack of suitable forest tree varieties bring high efficiency.

Model	Available resources and development situation	difficulty
Agro-forestry development.	Effectively use the sloping land fund, at high altitude and bring economic value, thereby contributing to better forest preservation and increasing income for forest people.	It is difficult when there is no planning to develop a model of agro-forestry combination.
Tourism sector		
Developing a model of Homestay associated with craft villages and ecological zones	Make use of human resources, material and technical facilities of households.	Nhỏ lẻ, nếu không phối hợp sẽ dẫn tới nhầm lẫn.
Develop a model of tourism combined with eco-zones.	There are already agro-ecological zones and ecological forests, bringing dual values (improving the face of the countryside and raising people's incomes.	If you do not coordinate well with the travel company, there will be no guests and the income is not really high and stable.
Developing cultural and spiritual tourism models.	Availability of monuments, festivals, traditional culture and added economic value to the local community.	Lack of knowledge about promoting the values of monuments, festivals, culture and communication.

4. Discussion and Conclusion

In order to overcome the limitations in sustainable livelihood development in order to reduce poverty as well as exploit the potential, the strengths of localities should focus on a number of basic solutions as follows:

Firstly, completing the local master plan on the basis of exploiting and promoting local livelihood resources associated with the requirements of sustainable development, conservation and embellishment of natural resources, ecological environment community culture identity. On the basis of the approved planning, make investment projects to develop infrastructure and facilities for the development of agriculture, forestry and tourism in accordance with principles and resources for sustainable livelihoods, promoting the role of the community in participating in the implementation of planning projects. Improve the quality of construction planning and production plans; strengthen coordination, supervision, appraisal and evaluation of the effectiveness of projects implemented in the locality; promptly propose adjustments and supplements to the production planning to suit the market mechanism and local implementation conditions.

Second, it is necessary to identify key product groups and key production areas. Developing groups of products that are local specialties: localities based on reality, review and identify their own specialty products, develop plans to develop specialty products associated with specific geographical indications. body. Besides, organizing the production of key products along the value chain, strengthening trade promotion, taking production-consumption linkages and agricultural product quality as the center of the process of restructuring the agricultural sector. Focusing on developing the cooperative economy and attracting all economic sectors to participate in the value chain in crop production. Focusing on attracting businesses, especially in the tourism sector, need to cooperate with travel agencies to develop tourism products with characteristics of the local community in a methodical manner.

Third, attract private investment and support business-farmer linkages. Implement the highest preferential policies according to the State's regulations to attract enterprises to invest in agriculture; enterprises associated with farmers, have contracts with farmers. Investment priority policies, including: (i) Infrastructure, land and tax support for enterprises directly linked with farmers, preservation and processing enterprises using high technology; (ii) Credit incentives for businesses associated with farmers from the supply of input materials, drying services, storage and incentives for people to buy production machinery and apply new varieties; (iii) Conduct market research and development for key products; (iv) Strengthen the effective implementation of credit to support agricultural and forestry enterprises operating in disadvantaged areas to promote the exchange of agricultural products.

Fourthly, Strengthen the propaganda and mobilization to apply technical advances to agricultural production for the people. In particular, in livestock production, attention is paid to supporting information to propagate about the risk of disease; recommend to renovate husbandry methods to ensure disease safety, completely abandon uncontrolled grazing. Community capacity building is also demonstrated through the building of mechanisms, creating close relationships between "houses", especially between farmers and businesses, traders.

Fifth, developing human resources through training and transferring science and technology. Currently, most people lack scientific and technical knowledge in agricultural and forestry production, so production efficiency is not high. Therefore, the training and transfer of scientific and technical knowledge to people in production is a necessary requirement. In addition, it is necessary to strengthen guidance for indigenous communities to invest and trade in tourism services according to standards to improve investment efficiency.

Sixth, In order to avoid the fact that products from models such as fruit trees, medicinal plants, livestock, etc. cannot be sold or consumed at very low prices, the government needs to have some measures to support the market. market for the following products:

- + It is necessary to have the support of local authorities in market information, link with long-term and stable purchasing establishments of agro-forestry products in the form of signing product purchase and sale contracts.

- + To build facilities for processing and preserving agricultural and forestry products in the locality.

- + Set up local intermediary purchasing points, strengthen and develop product distribution channel networks./.

ON THE RELATIONSHIP BETWEEN STRUCTURAL SOCIAL CAPITAL AND ECO-INNOVATION ADOPTION IN AGRICULTURAL COOPERATIVES IN VIETNAM - THE MEDIATING EFFECT OF OPEN INNOVATION

Nguyen Thu Huong

huongnt@hvnh.edu.vn

Banking Academy, Hanoi, Vietnam

Abstract

With increase in the focus on environmental protection, agricultural cooperatives are integrating sustainability issues in process and product innovations. However, the adoption of eco-innovation practices depends on the structural social capital. In this paper, the author studies the relationships between structural social capital and eco-innovation adoption. Further, the paper examines the mediating effect of open innovation between structural social capital and eco-innovation adoption. The proposed framework is tested by data collected from 293 agricultural cooperatives and using Structural equation modeling (SEM). The findings demonstrate structural social capital as an important antecedent for eco-product innovation adoption. Second, open innovation mediates between structural social capital and eco-process innovation adoption. The results of the study are useful for directors of agricultural cooperatives as well as policy makers.

Keywords: *structural social capital; open innovation; eco-innovation; agricultural cooperatives; Vietnam*

1. Introduction

Agricultural cooperatives have been recognized as important actors for economic development given their ability to increase the gains of local economies, promote regional development and the well-being of populations (Castilla-Polo et al., 2017). It can also be said that cooperatives play an important role in agribusiness development. They can contribute to increased bargaining power, production scales, crop diversification and stabilization, adding value to agricultural products, expanding markets and capitalizing producers. Innovation has become a major source of farmer cooperatives' competitive advantage (Luo et al., 2017). Indeed, technological innovation has been found to be critical for agricultural cooperatives' scaling up, and even survival in developing countries (Garnevska et al., 2011). Recent studies have focused on analyzing 'eco-innovation', which is described as a type of innovation that combines innovation and environmental phenomena in the context of this sector (García et al., 2018). These studies have identified a number of internal and external factors related to eco-innovation. Internal factors, including chairpersons' profiles, technological characteristics (Luo et al., 2017), research and development (R&D) resources (Triguero et al., 2018), are all considered useful sources of

product and process innovation. As for external factors, it is widely accepted that market and regulatory forces are the main drivers of eco-innovation (Qi et al., 2021). However, the current literature on eco-innovation in agriculture has several limitations. First, the majority of eco-innovation literature has focused on traditional investor-owned firms (IOFs) because co-operatives differ significantly from IOFs in terms of their objectives, governance, and financial structures, resulting in disparities in innovation management (Drivas and Giannakas, 2006). Second, studies on innovation and eco-innovation in general and eco-innovation adoption by co-operatives in particular have been conducted primarily in the context of developed countries (He et al., 2018).

Social capital is a relevant asset in the creation of innovation capabilities. Social interactions enable people to learn how to effectively share important information with others and develop a common agreement on tasks or goals, as well as gain other resources and ideas (Chen et al., 2017). Because social capital enables a greater transfer of knowledge, many authors argue that it encourages innovation, particularly in cooperatives where the members have an undoubted role in the creation of structural capital. In addition, for cooperatives, the effect of social capital in innovation is crucial as they almost all place innovation among their top three priorities (Brat et al., 2016). Therefore, this research investigates the relationship between structural social capital and the adoption of eco-innovation by agricultural cooperatives, a topic which has never been explored in the literature. Moreover, as micro-enterprises, agricultural cooperatives need external knowledge sources to conduct its eco-innovation adoption. Open innovation as a new paradigm for managing innovation, introduced by Chesbrough (2003) is defined as “the use of purposive inflows and outflows of knowledge to accelerate internal innovation, and expand the markets for external use of innovation, respectively”. However, the existing literature has been focusing on open innovation in large enterprises. This research argues that structural social capital is necessary but not sufficient to generate eco-innovation adoption. What matters is that an agricultural cooperative can transfer the network ties to the knowledge sources needed for the adoption of eco-innovation.

Innovation requires the convergence of different forms of knowledge, which is not always available within the organization. Consequently, innovation is not perceived as a series of isolated events deriving from inventors, but as the result of interactions and knowledge exchanges that involve a diversity of interdependent actors (Zheng, 2010). The relationships with other agents are essential for innovation performance, as they grant access to external knowledge and resources. In this vein, the social capital theory highlights the relevance of social relationships in the economy.

Social capital is “the sum of the actual and potential resources embedded within, available through, and derived from the network of relationships possessed by an individual or social unit” (Nahapiet & Ghoshal, 1998). This definition of social capital includes different aspects of the social context such as interactions and social links - structural social capital, trusted relationships, relational social capital, and systems of shared values that facilitate the interactions between individuals located in a specific social context - cognitive

social capital (Nahapiet & Ghoshal, 1998). This paper focuses on structural dimension of social capital. By allowing firms access external knowledge, it is widely agreed that social capital has a positive effect on innovation (García-Villaverde, Parra-Requena and Ruiz-Ortega, 2010).

The objective of this study is to investigate the relationship between the structural social capital, and the adoption of eco-process innovation and eco-product innovation as well as the mediating effect of open innovation on the relationship between structural social capital and the adoption of eco-process innovation and eco-product innovation.

2. Hypotheses development

2.1. Structural social capital and open innovation

In this research, structural social capital refers to the network ties of agricultural cooperatives to other agricultural cooperatives, the customers, universities and other other agencies such as Non-profit organizations (NGOs). Network ties with other cooperatives provide access to tacit know-how and privileged resources (Zhou et al., 2014). In open innovation, when facing unfamiliar situations, the close ties with other cooperatives enable agricultural cooperatives to gain access to market information, which helps them better understand their primary innovation value and commercialized potential in unfamiliar markets (Lichtenthaler, 2010). The ties with the customers enables agricultural cooperatives to understand about the needs of the customers to tailor the innovation process. Research also suggests that universities and NGOs can play an active role in supporting innovation activities (Etzkowitz & Leydesdorff, 2000). Network ties with academics and scientists at universities and NGOs provide unique opportunities to access the latest scientific information and convert knowledge-based resources. Moreover, close personal connections with universities and NGOs enable the training of cooperatives' members. Therefore, the following hypothesis is developed:

H1: Structural social capital of an agricultural cooperative is positively related to its innovation openness.

2.2. Open innovation and eco-innovation

Open innovation as a new paradigm for managing innovation, introduced by Chesbrough (2003), defined as “the use of purposive inflows and outflows of knowledge to accelerate internal innovation, and expand the markets for external use of innovation, respectively”. In this research, open innovation refers to the knowledge source from customers, other agricultural cooperatives, universities and other other agencies such as Non-profit organizations (NGOs). Some studies (Busse & Siebert, 2018) highlight the importance of customers/consumers as key actors in the co-creation of new products. Particularly, market-based sources (e.g., customers and suppliers relationships) are beneficial for incremental innovation and marketing time periods, whereas science-based sources (relationships with academia members and independent experts) are more beneficial for radical innovation. Therefore, the following hypothesis is proposed:

H2: Innovation openness of an agricultural cooperative is positively related to its eco-process innovation adoption.

H3: Innovation openness of an agricultural cooperative is positively related to its eco-product innovation adoption.

2.3. Structural social capital and eco-innovation

Structural social capital determines relationships among firms and access to resources; that is, structural capital covers the scope and intensity of network contacts (Nahapiet & Ghoshal, 1998). Agricultural cooperatives with broader network connections and greater network intensity are more likely to obtain resources conducive to environmental innovation through a wide range of structural relationships and close links, such as government policy support and advanced technology exchanges in their industry. Agricultural cooperatives boasting more structural holes connect with different units through network exchanges, making it easier to access superior resources and valuable information and establish a heterogeneous competitive advantage. Meanwhile, the stronger the relationship an agricultural cooperative maintains with external organizations with more unique resources, the easier it will be for the cooperative to obtain the resources for eco-innovation. Therefore, this study proposes the following hypothesis:

H4: Structural social capital of an agricultural cooperative is positively related to its eco-process innovation adoption.

H5: Structural social capital of an agricultural cooperative is positively related to its eco-product innovation adoption.

2.4. The mediating effect of open innovation between the relationship of structural social capital and eco-innovation

Structural social capital is chiefly considered to have a positive impact on innovation performance. Dense and cohesive social networks enable learning and the exchange of knowledge and resources, which ultimately fosters innovation performance (Tsai and Goshal, 1998). Nonetheless, such networks can also generate problems of redundancy in the information exchanged (Koka and Prescott, 2002), as well as opportunity costs that arise from the time, money, and energy needed to keep and expand the actor's social network (Zheng, 2010). In light of these controversial results, it has been seen that the availability of structural social capital is necessary but not sufficient to generate eco-innovation adoption. The important thing is that an agricultural cooperative can transfer the network ties to the knowledge sources needed for the adoption of eco-innovation. Therefore, the following hypothesis is proposed:

H6: Innovation openness of an agricultural cooperative mediates the relationship between structural social capital and eco-process innovation.

H7: Innovation openness of an agricultural cooperative mediates the relationship between structural social capital and eco-product innovation.

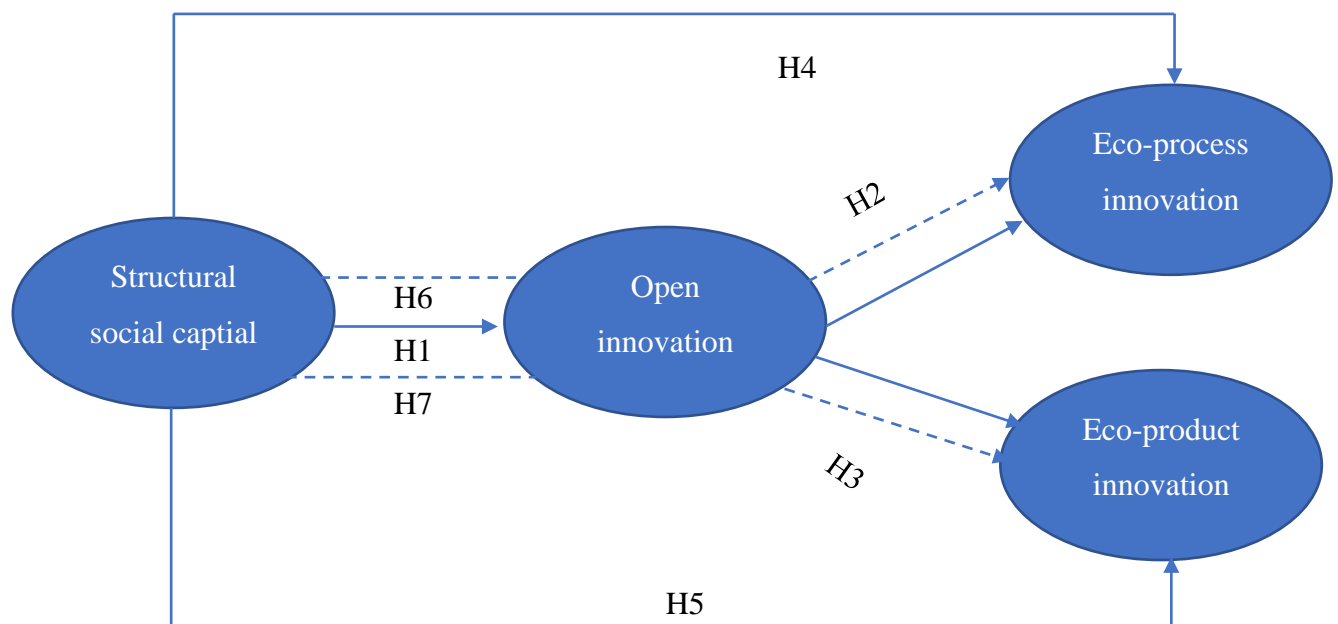

Figure 1. Proposed model

3. Method

3.1. Sampling and data collection

The author first conducted in-depth interviews with five directors of different agricultural cooperatives to gain first-hand knowledge of eco-innovation practices. In order to test the proposed research model, a survey method was employed to collect quantitative data. Following the procedures recommended by Anderson and Gerbing (1998), the author developed the questionnaire. For the formal survey, The author initially selected a random sample of 350 agricultural cooperatives from eleven midlands and Northern mountainous cities of Vietnam including Thai Nguyen, Son La, Hoa Binh Lao Cai, Ha Giang, Bac Can, Lang Son, Tuyen Quang, Yen Bai, Phu Tho and Bac Giang from the list of the local agricultural cooperatives taken from the the websites of Provincial People's Committee. The author contacted by telephone all the directors to set up appointments and presented the questionnaire and collected the surveys after their completion. The author then collected 293 valid questionnaires to use in the analysis. This represented a response rate of 84% (293 out of 350 telephone contacts).

3.2. Measurement instruments

Structural social capital, a second-order factor construct, were measured through four reflective first-order factors. The items were derived from Wang et al. (2021). Six items for Open innovation items were adapted from Yang and Roh (2019), Chesbrough and Crowther (2006), Chesbrough et al. (2006). Four items for Eco-Product innovation were derived from Li et al. (2010), Triebswetter and Wackerbauer (2008) and Horbach et al., (2012). Five items for Eco-Process innovation were derived from Chen et al. (2006), Chen (2008) and Chiou et al. (2011). The Likert scale is often used to measure the sample's attitude or opinion on something and can be divided into five, seven, or nine levels. Compared to other scales, the

five-point scale has a high degree of discrimination that can increase the accuracy of the measurement and reduce measurement error. Therefore, the 5-point Likert scale was used in the questionnaire, and the most realistic option was selected from the number “1 (strongly disagree)-5 (strongly agree)”.

Table 1. Constructs and measurement items

Construct	Label	Items	Sources
Structural social capital (SC)	SC1	Have cooperative relations with other co-ops, enterprises and organizations in the network.	Wang et al. (2021)
	SC2	Communicate frequently with suppliers, customers, universities, scientific research institutions, and other cooperative units.	
	SC3	Communicate frequently with the government, trade associations, etc.	
	SC4	The communication between the various part and members of the co-op is frequent and close.	
Open innovation (OI)	OI1	Among the external innovation activities performed by our cooperative, customer is an important source of information.	Yang and Roh (2019); Chesbrough and Crowther (2006); Chesbrough et al. (2006)
	OI2	Among the external innovation activities performed by our cooperative, research institution and university are an important source of information.	
	OI3	Among the external innovation activities performed by our cooperative, Non-governmental organization is an important source of information.	
	OI4	Among the external innovation activities performed by our cooperative, the associations are an important source of information.	
	OI5	Among the external innovation activities performed by our cooperative, Conferences, fairs and exhibitions are an important source of information.	

Construct	Label	Items	Sources
	OI6	Among the external innovation activities performed by our cooperative, other cooperatives are an important source of information.	
Eco-Process innovation (EPCI)	EPCI1	The manufacturing process of the cooperative effectively reduces the emission of hazardous substances or waste.	Chen et al. (2006), Chen (2008) and Chiou et al. (2011)
	EPCI2	The manufacturing process of the cooperative minimize the use of agrichemicals (e.g., through use of petiole analysis, optical weed spray controllers).	
	EPCI3	The manufacturing process of the cooperative reduces the consumption of water.	
	EPCI4	The manufacturing process of the cooperative recycles waste that allow them to be treated and re-used.	
	EPCI5	The manufacturing process of the cooperative use alternative energy sources (e.g., green electric power, solar, wind)	
Eco-Product innovation (EPDI)	EPDI1	Increase of the green product's variety	Li et al. (2010), Triebswetter and Wackerbauer (2008)
	EPDI2	Quality improvement by using standards	
	EPDI3	Advocating the use of green product labels	
	EPDI4	Expanding the market coverage of green product	

3.3. Analysis method

Structural equation modelling (SEM) was adopted to test the hypothesised model. Structural equation modeling (SEM) is a multivariate statistical framework that is used to model complex relationships between directly and indirectly observed (latent) variables. Before testing the hypotheses, the measurement scales of each construct were evaluated following the guidance proposed by Anderson and Gerbing (1988). In order to test and estimate the path coefficients for hypothesised relationships in the model, AMOS 24 was employed for SEM analysis.

4. Results

4.1. Assessments of measurement model

The measurement model analysis confirmed whether the constructs were measured correctly by the proposed variables. The author followed the guidance on the use of structural equation modelling in practice suggested by Anderson and Gerbing (1988) and Churchill (1979) to assess the measurement model in terms of overall fit with the data, reliability and convergent and discriminant validity. Firstly, the author conducted confirmatory factor analysis (CFA) on AMOS 24 to test the convergent validity of measurement items used for each latent variable. Table 2 shows factor loadings and t-values resulted from the CFA. According to CFA results for multi-item constructs including Social capital, Open innovation, Eco-Process innovation, Eco-Product innovation, all factor loadings were statistically significant. However, the measurement scale item OI1, EPCI1 and EPDI4 were lower higher than the cut-off value of 0.5 suggested by Hair et al. (2010) and therefore were removed. All other measurement scale items of the four variables were retained for further exploratory factor analysis (EFA) on SPSS with principal factor as extraction method followed by a varimax rotation. The EFA results showed four factors emerged subjected to how these constructs were initially measured. The construct validity and the unidimensionality of the measurement scales of the four latent variables, therefore, are confirmed (Straub, 1989). Moreover, a CFA on the four-factor model also revealed a good model fit (CMIN/df = 2.843; $\rho = 0.000$; RMR = 0.056; GFI = 0.916; CFI = 0.931; AGFI = 0.862; RMSEA = 0.079) as shown in Table 3.

Cronbach's alpha was calculated to evaluate the reliability or the internal consistency of the constructs. According to results shown in Table 2, the Cronbach's alpha coefficients for all four constructs were higher than 0.7 which is the threshold value suggested by Hair et al. (2019); therefore, their reliability were satisfactory. In addition, as shown in Table 4, Average Variance Extracted (AVE) value for Social capital, Open innovation, Eco-Product innovation exceeded the recommended level of 0.5 (Bagozzi and Yi, 1988) except that of Eco-Product innovation. The author therefore, removed the measurement scale item EPCI5 to improve AVE (Anderson and Gerbing, 1988; Fornell and Larcker, 1981). The author further used Fornell and Larcker which is extensively accepted technique by Fornell and Larcker (1981) to assess the discriminant validity in the study, following the recent literature (Ashfaq et al., 2020). The first technique in Table 4 satisfied Fornell and Larcker's (1981) criteria.

Table 2. Measurement model

Construct scale items	Factor loading	t-value
SC1	0.695	_____
SC2	0.782	11.479
SC3	0.791	11.576
SC4	0.715	10.682

Construct scale items	Factor loading	t-value
OI1	0.459	_____
OI2	0.696	7.207
OI3	0.679	7.129
OI4	0.782	7.531
OI5	0.756	7.444
OI6	0.688	7.172
EPCI1	0.479	7.161
EPCI2	0.667	_____

4.2. Hypotheses testing

The author examined two models in this phase of analysis. In the first model, the proposed mediating variable is not considered. The results show significant positive effect of SC on EPCI ($\beta = 0.432$; $p < 0.01$) and SC on EPDI ($\beta = 0.407$; $p < 0.01$). The variance explained (R2) for dependent constructs are 18.7% (EPCI) and 16.6% (EPDI). In the second model, mediating constructs (OI) is also included, and relationships are examined. The findings support the following hypotheses: H1 (SC and OI, $\beta = 0.507$; $p < 0.01$); H2 (OI and EPCI, $\beta = 0.547$; $p < 0.01$); H5 (SC and EPDI, $\beta = 0.406$; $p < 0.01$). Hypothesis H3 (OI and EPDI) and H4 (SC and ECPI) are not supported by the data; rather, SC indirectly affects ECPI through OI.

Table 5. Hypotheses testing

Hypotheses	Path	beta	t value	p value	Supported?
H1	SC \rightarrow OI	0.507	6.496	0.000	Yes
H2	OI \rightarrow EPCI	0.547	6.013	0.000	Yes
H3	OI \rightarrow EPDI	-0.029	-0.386	0.699	No
H4	SC \rightarrow EPCI	0.145	1.915	0.056	No
H5	SC \rightarrow EPDI	0.406	4.997	0.000	Yes

4.3. Mediation analysis

To examine the mediating effect, two statistical tests are conducted. First, mediation is tested by Baron and Kenny (1986) method. Two models M1 and M2 are considered to test the mediation effects. Model M1 includes only the link between SC and EPCI and EPDI, while the proposed mediating variable is not considered. Model M2 also includes the indirect relationships between SC and EPCI and EPDI, through OI. Table 5 shows the path coefficients. In model M1, SC positively affects EPCI and EPDI. In model M2, the direct path from SC to OI is significant. Further, the path from OI to EPCI is also significant. However, the path from OI to EPDI is statistically insignificant. Moreover, the path from SC to EPDI is statistically significant while the path from SC to EPCI is statistically insignificant. Therefore, OI fully mediates between SC and EPCI. The author further examines the mediating effect by using bootstrapping technique. Bootstrapping technique statistics are given in Table 5. The results from the above two statistical tests confirm the mediating effect of OI between SC and EPCI.

Table 6. Mediation analysis

Path	M1	M2	Std. error	Bootstrapping (p value)	Decision
SC → EPCI	0.432***	0.145	0.088	0.001	Full mediation (H6 is supported)
SC → EPDI	0.407***	0.406***	0.064	0.730	No mediation (H7 is rejected)
SC → OI		0.507***	0.047		
OI → EPCI		0.547***	0.175		
OI → EPDI		-0.029	0.1		

5. Discussion and Conclusion

In this section, we summarize key findings and managerial implications, which can be useful for improving eco-innovation adoption, specifically through innovation openness. The study tests a theoretical model demonstrating the role of SC on OI and mediating effect of OI between SC and EPCI and EPDI. First, the author found significant positive effect of SC on OI. It implies that the network ties with other agricultural cooperatives, customers, universities and other agencies such as NGOs and the intensity of such ties help agricultural cooperatives to get access to tacit know-how and privileged resources. It can help agricultural cooperatives to take advantage of different source of knowledge like the needs of customers, the successful innovation models from other cooperatives in the industry, the latest scientific information from universities and capacity building programs from NGOs. Second, this research has revealed that SC has a significant positive effect on EPDI while SC does not have a significant positive impact on EPCI. Rather, the relationship between SC and EPCI is mediated through OI. It can be explained that SC is enough for agricultural

cooperatives to adopt EDPI. The adoption of EPDI by agricultural cooperatives is mainly to increase the variety of the products; improve the quality of the products by applying standards such as VietGAP, GlobalGAP, PGS organic...; advocating the green product labels. Therefore, the more network ties and the stronger intensity of the ties will help agricultural cooperatives to adopt EPDI. However, the EPCI is more complicated than EPDI because it is related to the changes in the production process of the agricultural cooperatives therefore required in-depth knowledge and technology transfer process from different sources of networks through the innovation openness. This research therefore proposes some recommendations. First, agricultural cooperatives should improve personal contacts to expand network ties with customers, other agricultural cooperatives, universities and other agencies such as NGOs. Second, local government should take actions to hold trade shows and exhibitions, scientific conferences so that agricultural cooperatives can take part in. Moreover, more capacity building programs from NGOs should be introduced to agricultural cooperatives so that the members can be trained by experts and receive technology transfer in order to adopt EPCI.

SUSTAINABLE DEVELOPMENT OF SOLAR POWER IN DANANG CITY

PhD Candidate. Nguyen Duc Duong

duongnguyenvkt@gmail.com

East Asia University of Technology, Hanoi, Vietnam

Abstract

Vietnam is currently one of the fastest-growing economies in the world. Along with the development of the economy, Vietnam's electricity consumption demand has increased significantly in the recent decade. According to EVN, the average annual growth rate of electricity consumption is about 11%. According to data about the climate of Da Nang city from RETScreen software provided by NASA: Da Nang is located in a tropical climate zone, with an average temperature of about 26°C and a relatively high number of sunny hours a year around 2000 - 2600 hours/year, has a high solar heat radiation potential of about 4.87 kWh/m²/day. This is favorable for exploiting solar power to serve industries in Da Nang city. Solar power will partially replace electricity and other forms of fossil energy such as coal, oil, gas, etc., to reduce production and operating costs and use energy economically and efficiently. The study has identified the factors that affect the sustainable development of solar power in Da Nang; the results of this study help relevant agencies business owners to apply and replicate the application. Solutions to save energy using solar energy sources in Da Nang city and a valuable reference document for provinces across the country to study and apply

Keywords: *Solar power, Renewable energy, Danang, Vietnam*

1. Introduction

Energy-intensive companies can make a positive contribution to increasing solar energy usage if business owners actively participate in the work of replacing energy sources and using power by the electricity. application of the power of the face of the public host [2].

The identification of industrial fields with significant potential for solar energy application to meet business requirements is an inevitable trend in line with the Government's development policy to promote the development of solar energy. Rooftop solar power projects help reduce the load on the grid. Moreover, when installing solar power systems at factories, businesses not only save operating costs when they are self-sufficient in some of their electricity consumption needs, but also can sell to the national grid. family. Therefore, the potential application of solar energy for industries needs to be replicated nationwide

Da Nang is a political-economic center of Central Vietnam, according to a report by the General Statistics Office [3], in January 2018, Da Nang leads in industrial growth with a growth rate of 48, 7%. Along with the rapid growth of industries in the city, the demand for electricity is increasing rapidly, leading to an increase in investment capital to develop the power system to meet the reliability of power supply for industrial parks. Karma. The

economical and efficient use of energy as well as the exploitation of solar energy to reduce the amount of electricity consumed from the national grid and fossil energy sources are essential to contribute to the goal of the whole country on keeping the environment clean and reducing greenhouse gas emissions as committed

2. Theoretical Basis and Hypothesis Development

2.1. Theoretical Basis

Renewable energy is a broad, scientific concept that is currently being conceptualized in many different ways. A physical science approach, whereby renewable energy is understood as energy sources or methods of energy extraction that, if measured by human standards, are limitless. Infinite has two meanings: (i) energy exists so much that it cannot become exhausted because of human use (eg solar energy); (ii) short-term and continuous self-renewable energy (e.g. biomass) in processes that continue for a long time on earth. **renewable energy** approach, no matter how it is considered, shows that these are non-fossilized, renewable forms of energy, including: small hydroelectric sources, marine energy (generation electricity by waves, tides, ocean currents), wind energy, solar energy, geothermal energy; biomass energy and biofuels.

Regarding the theoretical models related to consumer behavioral intention, there are many theories, typically: Technology approach theory and model (TAM) was developed by FDDavis (1989) based on the theory. “Theory of Reasoned Action”, proposed by Ajzen.

Many researchers have developed components from this TAM model into new technology acceptance theory (TAM2). According to this technology acceptance theory, customers' desire to use technology depends on factors such as: (i) perceived ease of use; (ii) perceived ease of use. There are 3 factors that need to be taken into account constituting the TAM technology acceptance model, including: (i) Perceive Usefulness (PU); (ii) Perceive Easy of Use (PEU) and (iii) Attitude towards use

However, depending on the characteristics of the technology, many researchers have added some features in the use of different technologies (Adams, Nelson, Todd (1992); Venkatesh, Davis (2000). In high-tech services, in addition to the factors in the theory of technology acceptance, there are other characteristics, such as: the risk caused by the use of technology, the perceived cost... like Venkatesh (2000), Venkatesh, Morris, Davis, Davis (2003), or Workman's (2007), Venkatesh, Bala, (2008),...

On the basis of previous studies, this study continues to use the technology acceptance model based on the concepts in the extended Davis (1989) TAM model to solve the behavior in the intention to use technology. solar energy technology in Da Nang city. The study has included specific variables affecting the application of this service based on the concepts of this TAM model, including perceived usefulness, perceived ease of use, perceived cost perceived risk. In there:

Usefulness: is the degree to which you believe that using solar technology in Danang will improve job performance.

Perceived ease of use: is the degree to which it is believed that using solar power technology in Danang will take no effort.

Perceived risk: is the risk that households perceive when using solar power technology in Da Nang.

Perceived convenience: is the convenience that households feel when using solar power technology in Da Nang.

Policies on the use of solar power: are the government's incentive policies when using solar power technology in Da Nang.

Perceived cost: is the cost that households perceive when using solar power technology in Da Nang.

Trust: is the belief in the use of solar power technology in Da Nang

Intent to use: expressing intention and interest in using solar power technology

2.2. Research model and hypotheses

On the basis of theory and empirical studies as mentioned above, the research model of factors affecting the intention to use solar power in Da Nang City is as follows:

The proposed hypotheses to be tested in this study are as follows:

H1: Perceived usefulness of solar power technology has a positive (+) impact on intention to use solar energy.

H2: Perceived ease of use of solar power technology has a positive (+) effect on intention to use solar energy.

H3: Perceived risk of solar power technology has a negative (-) impact on intention to use solar energy.

H4: Perceived convenience of solar power technology has a positive (+) impact on intention to use solar energy.

H5: The policy on the use of solar power has a positive (+) impact on the intention to use solar power.

H6: Perceived cost has a negative effect (-) on intention to use solar power.

H7: Trust has a positive effect (+) on intention to use solar energy.

3. Method

The methodology in this study consists of two steps: preliminary research and formal research. Preliminary research using group discussion skills to calibrate the model and design the questionnaire. The formal study used closed-ended questionnaires modified during the preliminary study to collect and analyze data to test models and hypotheses. All research data will be supported by SPSS software.

3.1. The scale

To measure research concepts, the author uses a 5-point Likert scale with 1: completely disagree to 5 completely agree for 26 observed variables.

H1: Perceived usefulness is measured by 4 observed variables, including: Using solar power as a renewable and inexhaustible source of energy, using solar power as a renewable energy source less polluting the environment, using solar power saves costs in the long run, using solar power helps to be more active in daily life and production.

H2: Perception of the ease of use of solar **power technology** measured by 3 observed variables, including: Easy installation and maintenance of solar power equipment, using solar power is easy to use, given that solar power equipment is easy to operate.

H3: Perceived risk is measured by 6 observed variables, including: Products and services are not the same as guaranteed under warranty, the quality of solar panels is not as expected. Expectations about longevity, poor quality, slow payback, solar panels can produce harmful substances into the environment, the use and sale of solar energy depends on the government. According to the State's policy, the life of solar panels is reduced compared to the transaction.

H4: Perceived convenience is measured by 4 observed variables, including: Solar energy can be used anywhere, solar energy is active in daily life and production, installation Installing solar power is easy to implement, not technically difficult, and the production and use of solar power matches the time frame of high demand.

H5: The policy on the use of solar power is measured by 3 observed variables, including: The government needs to facilitate the deployment of solar power technology application, financial support for the development of solar energy. installed in Da Nang on the development of solar power, and it is necessary to issue regulations on the development of solar power in Da Nang

H6: Perceived cost is measured by 3 observed variables, including: Cost of installing solar power system in line with income. Cost is the most important factor when installing solar power technology, the cost of installing solar power technology is competitive compared to other energy sources.

H7: Trust is measured by 3 observed variables, including: complete trust in the consulting/providing services of consultants on solar power technology, complete confidence in the provision of solar energy technology. power output from excess solar power (if any), fully believe in the mechanism and policy of investment in energy infrastructure.

3.2. Survey sample and study site

According to Bentler & Chou (1987), the minimum number of samples for an estimator is 5 samples. In this study, there are 29 observed variables, so the required number of samples is 145 (Nguyen Dinh Tho, 2011). However, to ensure representativeness of the population, this study will survey 279 samples. The study sample was selected by non-probability quota sampling method with a sample size of 279 .

Scale test results

The scale is evaluated through the following methods: reliability assessment, exploratory factor analysis. Evaluating the scale through Cronbach's Alpha coefficient allows assessing the reliability of establishing a composite variable on the basis of many

single variables. To calculate Cronbach's Alpha for a scale, there must be at least 3 measurement variables. Cronbach's Alpha coefficient has a variable value in the range [0,1] and the total correlation coefficients are all greater than 0.3.

In the results of testing the reliability of the observed variable, the correlation coefficient of the perceived usefulness variable is 0.721; of perceived ease of use margin is 0.927; of the perceived risk variable is 0.987; of the perceived variable of convenience is 0.828; of the policy margin on the use of solar energy is 0.802; of the perceived cost of solar power system investment is 0.620; of the perceived variable of trust in buying, selling and using solar energy is 0.858; of intention margin for the use of solar energy in Da Nang is 0.831.

Thus, the observed variables are not uniformly required and no variables are excluded and the component variables in the study all have a fairly high confidence coefficient.

4. Results

4.1. Current status of solar energy development

4.1.1. Solar energy, potential and technology to exploit solar energy

Solar energy is electromagnetic radiation produced by the sun. It is the cleanest, most abundant source of renewable energy available for use on earth and is estimated at 3.8 million EJ, more than 10,000 times the consumption of fossil fuels and nuclear fuel. consumed in 2002. Solar energy that keeps the earth's surface at a temperature warm enough to support human life can be converted into useful forms of energy through thermal conversion, photosynthesis electrically or through high-temperature centralized receivers. Solar energy has long been captured through collectors and used for heating purposes very efficiently. The total installed capacity of solar thermal energy systems in the world increased from 62 GWth (89x10⁶ m²) in 2000 to 472 GWth (675x10⁶ m²) in 2017, corresponding to an increase in heat production from 51 TWh. in 2000 to 388 TWh in 2017 [6].

Figure 1. Installed capacity of solar thermal systems in the world and annual thermal energy 2000 - 2017

Source: *Solar thermal worldwide 2018* [6]

Figure 2. Installed capacity of wind and solar energy systems in the world and growth rate from 2010 to 2017

Source: AEE INTEC, Global Wind Energy Council (GWEC), SolarPower Europe, REN21 - Global Status Report 2011 - 2018

Solar radiation can also be converted directly into electrical energy through the use of photovoltaic cells [7]. The above data shows that the development rate of solar battery systems is much faster than that of solar thermal and wind energy systems.

4.1.2. Solar potential in Vietnam

Vietnam is one of the countries rich in solar energy potential. Scientists estimate the average solar radiation intensity about 5 kWh/m²/day (1,825kWh/m²/year) [8]. Solar energy in Vietnam is available all year round, is quite stable and widely distributed across different regions of the country.

Table 1. Solar radiation data in Vietnam

Region	Sunshine hour of the year	Solar radiation intensity (kWh/m ² /day)	Evaluate
northeast	1600-1750	3,3-4,1	Medium
northwest	1750-1800	4,1-4,9	Medium
North Central	1700-2000	4,6-5,2	Good
Central Highlands and South Central	2000-2600	4,9-5,7	Very good
Southern	2200-2500	4,3-4,9	Very good
National average	1700-2500	4,6	Good

The provinces from Da Nang on average have about 2,000-2,600 hours of sunshine, the amount of solar radiation increased by 20% compared to the northern provinces. Therefore, for localities in the South Central and South Vietnam, the source of solar radiation

is a great resource to exploit and use. Solar energy can be used to successfully develop the solar energy industry, including solar photovoltaic (PV) as well as solar thermal (ST) applications for the production of heat for hot water. services for commercial, industrial and civil purposes. A recent study by the German development cooperation agency in May 2015 [10] estimated that in two decades, rooftop solar PV systems could reach capacities from (2,000 -5,000 USD).) MW and solar power plants using solar cells can reach a capacity of 20,000 MW. Although the potential of solar thermal radiation in Vietnam is very high, in fact, the implementation of new solar energy applications is in the first stage, only a few projects with small capacity have been inaugurated and put into operation. into mining. According to statistics as of May 15, 2019, Vietnam has a total installed capacity of 866.5 MW including 10 solar power plants and 1800 rooftop solar power plants.

Table 2. Solar power plants put into operation

TT	Projec	Province	Total installed capacity (MW)	Annual power output (GWh)	Test run

Source: Vu Quang Dang, energy expert, May 2019

In particular, after the Prime Minister issued Decision No. 11/2017/QĐ-TTg dated April 11, 2017 on the mechanism to encourage the development of solar power projects in Vietnam, many solar power plant projects According to data from Electricity of Vietnam (EVN), after 2 years of implementation, up to now, there have been 365 registered and supplemented solar power projects. added to the plan with the total expected capacity 29,000 MWp. Currently, there are 141 projects added to the plan with a total capacity of over 14.00 MWp, of which 95 projects have signed power purchase agreements with EVN. As for roof-mounted solar power, after 2 years, only 1,800 customers (offices, businesses, households...) have joined offices, businesses, households, and accumulated electricity output to the grid. is 3.97 million kWh. This capacity is very modest compared to the potential.

As for rooftop solar power, although the rooftop solar power potential is assessed to reach a capacity of (2,000 -5,000) MW, according to EVN data [11], by the end of February

2019, only There are 1800 rooftop solar power projects deployed across the country, with a total installed capacity of 30 MWp. Some typical grid-connected rooftop solar power projects for commercial and industrial purposes with a capacity of over 100 kWp have been deployed and put into operation.

Currently, the deployment and installation of equipment using solar thermal energy is quite popular [10]. About 30,000 to 40,000 domestic solar hot water systems are installed annually for small-scale residential and commercial purposes, totaling an estimated 100,000 systems operating nationwide, corresponding to installed capacity is about 280 MWth with an annual capacity of 340 GWh. Up to now, only a few large-scale commercial and industrial solar thermal systems have been mentioned in the reports.

4.1.3. Current status of solar energy use in Da Nang city

Currently, the deployment of solar energy exploitation applications in Da Nang is at the beginning stage, most of the solar energy exploitation systems are heating for hot water for domestic and commercial purposes, only one several systems for industrial purposes

The deployment and installation of rooftop solar battery systems has only just begun, according to data from Da Nang Power Company provided by July 2018, a total of only 29 agencies and businesses. Businesses and households have registered to sell rooftop solar power to Da Nang Power Company with a relatively small installed capacity of 192.79 kWp. In addition to the systems registered to sell electricity to Da Nang Power Company, a small number of rooftop solar PVs with larger capacity are installed to produce electricity to serve the needs of the units.

After issuing Official Letter 1532/EVN-KD dated March 27, 2019 of the Electricity of Vietnam on guiding the implementation of rooftop solar power projects, Central Power Corporation (CPC)) held a seminar "Developing rooftop solar power" on April 19, 2019, DSED organized a training program "Developing rooftop solar power in Da Nang towards efficient and sustainable energy use". sustainable" on April 25, 2019, and especially on May 16, 2019 Vietnamese television station in Da Nang city VTV8 organizes a live TV program following the current news with the theme "Use electricity to get more money". ", the awareness of people and businesses about rooftop solar power increased very quickly, by the end of May 2019, there were 157 households and businesses in Da Nang installed rooftop solar power. with a capacity of 1,028 kWp. With the rapid development of rooftop solar power, people and businesses in Da Nang aim to use energy efficiently and sustainably.

4.2. Analysis results

Exploratory factor analysis is used to test the validity of the scale's concepts. Observable variables with factor loading weights less than 0.4 will be excluded (Clack & Watson, 1995). In this study, the method of extracting the coefficients of the main components (Principal components) is used with the factor rotation is Varimax and the index represents the amount of variation explained by the factor greater than 1 (Eigenvalue > 1). (Ngoc & Trong, 2005). A total extracted variance value greater than or equal to 0.5 will be accepted (Hair et al., 1998).

In exploratory analysis, the analysis results draw out 5 factors. KMO coefficient = 0.913 with significance level of 0.000. Research results have given 5 factors with factor weighting coefficients greater than 0.4. At levels of Eigenvalue greater than 1, 5 factors have been extracted with extracted variance of 71,666%. This means that 5 factors explain 71,666% of the variability of the data. Besides, most of the variables have factor loading coefficients greater than 0.4. Thus, the scales reach convergence value.

There are 5 factors drawn including: (i) Risks caused by using solar power equipment (RIST); (ii) Convenience and confidence when using solar power equipment (TRUSCONV); (iii) Ease of use of solar power equipment (EAS); (iv) Government utility and policy towards solar power (GOVUTIL); (v) Cost of installing solar power equipment (COST).

From the results of EFA analysis, it shows that the scale is extracted into 5 corresponding factors, these factors have factor loading coefficients of 0.4 or more, so the scales have convergence. However, there are a number of scale components that all belong to different factors. Therefore, the scales are not unidirectional.

Results of regression analysis and hypothesis testing

The results of regression model estimation by OLS estimation method with dependent variable BI and independent variables RIST, TRUSCONV, EAS, GOVUTIL, COST, showed that the data set explained the variation of the dependent variable. The dependence on the independent variables of the model is quite good. From the R^2 Adjusted index, it shows that the data set has explained 65.5% of the influence of the independent variables on the dependent variable, the statistical index $F = 34,137$ at the significance level of 0.000 (Sig. = 0.000) with the assumptions of multiple regression being satisfied. In which, most of the explanatory variables have the expected sign and have statistical significance at 1% significance level. Factors with positive regression coefficients imply that, if other factors are constant, an increase of one unit of the independent variable will increase the intention to use solar technology by β units (where β is the regression coefficient). In contrast, for factors with negative sign (-) regression coefficient, an increase of 1 unit of the independent variable will reduce the use of solar technology by β unit (with β is the regression coefficient).

The results show that, 4 out of 5 factors of the model have a statistically significant influence on the intention to use solar power technology in Da Nang city. In which, the factor Perceived cost of installing solar power equipment has the greatest influence; Perceived usefulness and Government policy has the second biggest influence; Perception of convenience and confidence when using solar power technology has the third biggest influence; Perceived ease of use of solar technology has the smallest effect. The results of the analysis are shown in Table.

Perceived factor of convenience and trust when using solar power equipment ($\beta = 0.446$): This factor has a regression coefficient of $\beta = 0.446$. Thus, if other factors remain the same, when the perception of convenience and trust when using solar power equipment increases by 01 point on the 5-point Likert scale, the intention to use solar energy increases

by 1 point. Da Nang's solar power in Da Nang increased to 0.446 points. Thus, if Da Nang is locally aware of the convenience and confidence in using solar power equipment, they will increase their intention to use this type of energy for Da Nang. The analysis results of the scale components in this factor are the lowest 1 and the highest 5. The average score ranges from 2.9913 to 3.9561 points on the 5-point Likert scale.

Perceived factor about the ease of use of solar power equipment ($\beta = 0.250$): This factor has a regression coefficient of $\beta = 0.250$. Thus, if other factors are held constant, when the perception of ease of use of solar power technology increases by 1 point on the 5-point Likert scale, the intention to use solar power technology increases by 1 point. of Da Nang in Da Nang increased to 0.250 points. Thus, if local people perceive the ease of use of solar power technology, they will increase their intention to use this type of energy. The analysis results of the scale components in this factor are the lowest 2 and the highest 5. The average score ranges from 3.3313 to 3.5826 points on the 5-point Likert scale.

Factor perceived usefulness and government policy ($\beta = 0.479$): This factor has a regression coefficient of $\beta = 0.479$. Thus, if other factors are constant, when Da Nang perceives the usefulness and the government's policy on the use of solar energy increases by 1 point on the 5-point Likert scale, the intention to use solar energy increases by 1 point. Da Nang's solar power in Da Nang city increased to 0.479 points. It can be seen that if the locality perceives the usefulness and the Government's policy on using solar power technology, they will increase their intention to use this type of energy. The analysis results of the scale components in this factor are the lowest 1 and the highest 5. The average score of the scales is quite high, ranging from 4,5304 - 4,991 points on the 5-point Likert scale.

Perceived factor about the cost of installing solar power equipment: This factor has a regression coefficient of $\beta = 0.368$. Thus, if other factors remain constant, when Da Nang's perception of the installation cost of solar power technology increases by 1 point on the 5-point Likert scale, then the intention to use solar energy technology Da Nang's sun in Da Nang City increased to 0.368 points. The analysis results of the scale components in this factor are the lowest 2 and the highest 5. The average score of the scales is quite high, ranging from 2.7977 to 3,956 points on the 5-point Likert scale.

Regression analysis results show that only 4 out of 5 factors have an impact on **use of** solar energy in Da Nang city, that is: perceived usefulness and ease of use have the greatest impact; Perceived trust has the second biggest impact; perceived convenience in using solar power has the third biggest impact; ease of use in installation, maintenance, operation with minimal impact. In which, 4 factors have a positive impact on the intention to use solar power in Da Nang and have statistical significance at the Sig.= 0.000 significance level.

The research results of the topic are quite similar to the studies of the author (Davis, 1989). These studies all use technology acceptance model (TAM) as the base model. In the author's research (Davis, 1989), there are perceived usefulness and ease of use, Da Nang's trust factor and perceived risk factor mentioned similar to the research results. . In which, the perceived usefulness and ease of use and the trust factor of Da Nang have

a positive influence on Da Nang's attitude in using solar power technology. In the author's study, the factors of perceived usefulness, perceived ease of use, convenience, trust of Da Nang and perceived risk are similar to the research results. The perceived usefulness, perceived ease of use, convenience, and trust factors of Da Nang all have a positive impact on the intention to use solar power technology. The risk perception factor was not statistically significant. Through relevant studies at home and abroad, the author can draw conclusions and research results that are quite consistent with the reality and the factors that affect the intention to use solar power technology. heaven in Vietnam in general and in Da Nang city in particular.

5. Discussion and Conclusion

First, promote the usefulness and ease of use of technology. Promote propaganda and dissemination of knowledge, documents, leaflets, brochures, organize seminars, training and training on the usefulness and ease of use of solar power technology. First of all, propaganda for cadres, civil servants, public employees and business sectors in the city; Next are the people about the usefulness and ease of use of the technology of solar power. In addition, propagandize the importance, about the great economic, social and environmental protection of the development and use of renewable energy in the process of sustainable development, so that there are practical actions to contribute to the development and use of renewable energy.

Second, reduce risks in using solar power. In fact, there are many factories at home and abroad that manufacture solar panels. Therefore, for Da Nang who intend to invest in solar power (attic), choosing solar panels is a difficult problem for them, because there is not enough information to determine What are the good or bad quality products? Da Nang needs to pay attention to the following information: (i) Certificate of quality insurance issued by independent insurance companies. This is common practice in international trade, especially for high-tech products; (ii) Manufacturers of solar panels must be certified to meet international standards IEC (International Electrotechnical Commission) and UL standards (Underwriters Laboratories Inc.). IEC and UL standards differ greatly. IEC standards specify minimum equipment safety requirements. UL standards by contrast provide comprehensive specifications for product safety and application; (iii) Solar panels must have a design solution against potential inductive degradation - PID (Potential Induced Degradation); (iv) For each shipment of solar panels, upon delivery, the seller must provide the buyer with an ex-factory inspection report for each model indicating the product's serial number; (v) After the purchase - sale contract is signed, the seller must facilitate the buyer to visit/survey at the manufacturing plant at the right time to test the output and pack the products for release. solar battery.

Third, support the cost of investing in solar power equipment for Da Nang. The development of rooftop voltage energy has many obstacles, such as high investment costs; lack of information on product quality, construction unit, installation and operation and maintenance mode. In the coming time, authorities or management agencies need to step up propaganda work so that each Danang can understand the economic benefits as well as

investment capital, the usefulness and ease of use of technology. and environmental friendliness. Since then, the State should have mechanisms and policies to support the investment costs of rooftop electric energy equipment for Da Nang and a number of other policies, specifically: Credit support policies; support each Da Nang to install 1 kWh roof voltage energy, support 3 million VND but not more than 9 million VND from the environmental protection fund; or exempting Da Nang from tax for the period not yet paying back; at the same time, establish a center to support operation, maintenance and consulting on rooftop voltage energy...

In addition, promulgating mechanisms and policies for preferential loans (low interest rates), simple and convenient loan procedures for all Da Nang; create conditions for domestic and foreign donors to support Da Nang to install roof voltage.

Fourth, there is a policy of buying - selling electricity for **Da Nang** using rooftop voltage energy. In the context that the power system is under a lot of pressure to ensure electricity supply, especially after 2020, when there is no new source of exploitation in the whole country, the development of rooftop solar power for Da Nang is considered an important consideration. is one of the solutions contributing to reduce pressure on the Power industry; At the same time, this is also a favorable condition to accompany the country's economic development in the future.

With the goal of developing solar power to reach 1GWp by 2020, the Prime Minister issued Decision No. 2068/QĐ-TTg dated November 25, 2015 approving Vietnam's renewable energy development strategy to 2030, vision to 2050; Decision No. 11/2017/QĐ-TTg dated April 11, 2017 on the mechanism to encourage the development of solar power projects in Vietnam (Decision 11) and Decision No. 02/2019QĐ-TTg dated January 8 2019 of the Prime Minister on amendments and supplements to a number of articles of Decision No. 11; The Ministry of Industry and Trade issued Circular No. 16/2017/TT-BCT dated September 12, 2017 stipulating project development and sample power purchase agreement applicable to solar power projects (Circular 16) and Most recently , Circular No. 05/2019/TT-BCT was issued on March 11, 2019 on amending and supplementing a number of articles of Circular 16. In order to improve the mechanisms and policies of electricity purchase and sale between units. electricity with Da Nang investing in rooftop electric energy for living and doing business.

The application of the expanded technology acceptance theoretical model in explaining the intention to use new solar power technology stops at the survey level in Da Nang city, which is one of the localities in the world. selected to be the national center of renewable energy, and at the same time used the traditional regression analysis method to test the intention to use solar power technology in Da Nang for the research variables. The generality and persuasiveness of the study will be higher if the research model evaluates the impact shown from the intention to use the service to the actual installation investment. This is also a direction for further research.

Deputy Director of Department of Information and Communication of Phu Yen province

Abstract

General assessment of resources for tourism development is a common trend of countries around the world, because resources play an important role in guiding tourism activities. Phu Yen is located on the Central - Central Highlands heritage road, having many advantages to develop tourism into a spearhead economic sector of the province. This is a locality with unique natural and cultural resources; the basis for developing tourism products with specific characteristics of the province, with high competitiveness. This paper uses the synthetic scoring method to analyze and evaluate the following criteria: the number of tourism resources in the cluster; time can be activated travel; infrastructure and material - technical facilities for tourism. The assessment results show that the potential for the development of a cultural tourism cluster in Phu Yen province is quite favorable. This is an important basis for the province to promote exploitation, strengths, and overcome limitations to build tourist clusters in the direction of sustainable tourism development in the period of regional and international integration.

Keywords: *tourist cluster, Phu Yen, assessment, tourism resources*

1. Introduction

Currently, the exploitation of natural and cultural resources of Phu Yen for tourism activities is still limited compared to the inherent potential of the province. In some coastal localities, tourism potential has not been converted into tourism resources (Phạm, 2016). Over the years, there have been a number of topics and projects to assess natural and cultural resources for tourism development. However, most of these topics only stop at the level of general assessment, preliminary assessment on a large space, not clearly seeing the

differentiation in the evaluation of clusters of integrated tourism resources specifically. To overcome the above unfavourable situation, our article focuses on assessing the potential resources of tourist clusters. Based on the calculation of scores of cultural tourism clusters, we estimate the ranking potential of all tourist clusters.

The results of the article contribute to supplementing documents, serving as a research basis for planning and building specific tourist clusters, typical and effective products, suitable for sustainable tourism development in Phu Yen province.

2. Results

Evaluation is the estimation of the role or value of the research object. Or evaluation is to determine the degree of convenience (very favorable, favorable, unfavorable) of the object for a certain socio-economic requirement. Evaluation tasks are often associated with specific research objectives and objects and from that, an appropriate assessment method is selected. Assessments can be classified into different categories: elemental resource assessment and territorial resource assessment; qualitative assessment and quantitative assessment (*Phu Yen Provincial People's Committee, 2012*). In this paper, the author chooses a cluster-based synthetic resource assessment method, combining qualitative and quantitative assessment, which is suitable for the situation of economic development in general and the tourism industry in particular in Phu Yen province.

2.1. Synthetic assessment method

Step 1: Build a system of criteria for evaluating tourist clusters

Based on the reality of tourism development in Phu Yen province, tourism resources, socio-economic conditions and inheriting the studies of previous authors, the author of the article builds a system of evaluation criteria. tourism clusters include: Number of tourism resources in the cluster; Travel time can be flexible; Infrastructure and material - technical facilities.

In the organization of the provincial tourism territory, the tourist cluster plays an important role in orienting the exploitation and use of resources and tourism development. The number of tourist resources is an important criterion to be able to classify clusters, which clusters with more tourism resources will have more potential for development than those with fewer tourism resources. However, having tourism resources with little tourism activity time, tourism business efficiency is not high, so tourism operation time is considered an important criterion. Infrastructure and material - technical facilities for tourism are the criteria to evaluate the convenience of tourist clusters. If there are many resources, but the infrastructure system and physical and technical facilities are weak, the tourism revenue is not high and the number of days of stay is short (*Nguyen - Vu, 2017*).

a. Number of tourism resources

Tourism is one of the industries with a clear resource orientation. Tourism resources directly affect the organization of the territory, the formation of specialization and the economic efficiency of tourism activities in each cluster. The quantity and quality of resources are essential in determining the scale of tourism activities. The quantity of tourism resources is assessed by 4 levels:

+ Agreatmany: tourist clusters with 31 or more tourism resources, density >0.04 resources/km².

+ Many: tourist clusters have from 21 to 30 tourism resources, density from more than 0.025 - 0.04 resources/km².

+ Average: a tourist cluster has from 10 to 20 tourism resources, the density is from 0.01 to 0.025 resources/km².

+ Several: tourist clusters with less than 10 tourism resources, density less than 0.01 resources/km².

b. Tourist activity time

Tourist activity time is the time of year when tourism activities are likely to be organized. The exploitable time will determine the seasonality and rhythm of the tourist flow. This time is based on the climatic conditions to evaluate. This criterion is divided into 4 levels:

+ Very long: clusters with more than 200 days a year can well deploy tourism activities and have the most suitable climatic conditions for human health;

+ Long: clusters with 150 to less than 200 days a year can well deploy tourism activities and have climate conditions suitable for human health;

+ Average: clusters with between 100 and less than 150 days a year can well deploy tourism activities and have relatively suitable climatic conditions for human health;

+ Long term: clusters with less than 100 days a year can carry out tourism activities and have relatively suitable climatic conditions for human health;

c. Infrastructure and material - technical facilities for tourism

If tourism resources are one of the basic factors to create a tourist area, the infrastructure and physical - technical facilities create conditions to turn the potential of the resource into reality. There is a close relationship between these two criteria, complementing and supporting each other. Without the infrastructure and physical - technical facilities, tourism resources will only forever be in the form of potential. Tourist clusters with good infrastructure and facilities are attractive to tourists, and at the same time can retain tourists for longer and generate greater tourism revenue. This criterion is assessed on the convenience of traffic, at the capacity of hotels and restaurants, and is divided into 4 levels: very good, good, average, and poor.

+ Very good infrastructure and physical and technical facilities: are tourist clusters with convenient transportation, all types of vehicles can operate to tourist destinations in the cluster, operate tourism is from 8 to 12 months a year, has a system of motels, hotels, and restaurants that can meet over 1,000 people/day;

+ Good infrastructure and physical and technical facilities: are tourist clusters with quite convenient transportation, all types of vehicles can reach most tourist destinations in the cluster, only from 1 to 2 places are inoperable, can operate tourism for 6 to 8 months, have a system of motels and hotels to meet the needs of 500 to less than 1000 people/day;

+ Average infrastructure and material - technical facilities: tourist clusters have quite convenient transportation, only cars with less than 30 seats can operate at all tourist destinations. The rest of the cars with over 30 seats cannot operate in tourist spots. Tourism in the cluster lasts from 4 to 6 months, has a system of motels and hotels to meet the needs of 300 to less than 500 people/day;

+ Poor infrastructure and physical - technical facilities: as a tourist cluster with unfavorable transportation, only vehicles with less than 16 seats can operate at all tourist destinations. In the cluster, tourism can be operated for less than 4 months, there is a system of motels and hotels to meet the needs of less than 300 people/day (Son, 2000).

Criteria hierarchy, score determination: Each criterion in the assessment is divided into 4 levels, each level corresponds to a certain number of criteria and is determined with a different score as follows: 4 points - very favorable : 4 points - favorable : 3 points - average favorable; 2 point - poor favorable: 1 point.

Determining the weight for each criterion: Each selected criterion will have a different degree of influence on the evaluation object, so determining the weight in the evaluation is very necessary. Weighting will give more objective and accurate assessment results.

To determine the weights, we apply both qualitative and quantitative analysis methods. For example, the number of tourism resources in the cluster is essential in determining the scale of tourism activities, and the possible time of tourism activities will determine the seasonality and rhythm of the tourist flow, so it is a very important factor 3; while infrastructure and material - technical facilities are the criteria to evaluate the convenience of tourist clusters, currently tourist clusters in Phu Yen are almost similar, so there is a coefficient of 2.

On the basis of evaluating the scores of each criterion by a weighted multiplier, we finally aggregate the scores of the criteria to obtain objective and quantitative evaluation results and ensure the correct level of accuracy for each criterion. tourist attractions as well as scientific results.

The weights can be determined in many different ways, such as the triangular matrix method, the expert method, the AHP hierarchical analysis method, etc. In this paper, we determine the weights. by applying the expert method. The evaluation weight is defined as an integer. Corresponding to the value of each evaluation criterion according to previous works such as (Nguyen, 2005; Ngo, 2016; Nguyen 2015; Thanh, (2005); Mai, 2019). In addition, we based on the results of field studies in Phu Yen to choose the appropriate coefficient.

Step 2: Determine the score for the evaluation criteria

The rating score for each scale is similar to that of tourist attractions and is determined with 4,3,2,1 points depending on the rating level.

a. Number of tourist resources in the cluster: a great many: 4 points; many: 3 points; average: 2 points; poor: 1 point.

b. Tourist activity time: very long: 4 points; length: 3 points; average: 2 points; short: 1 point.

c. Infrastructure and facilities - technical services for tourism: very good: 4 points; good: 3 points; average: 2 points; poor: 1 point.

Step 3: Presenting the results of the integrated tourism cluster assessment

The results of the evaluation are presented in the form of a statistical table. The assessment results will be the basis for proposing and discussing the rational use of cultural tourism resources for sustainable tourism development in Phu Yen. The overall evaluation results are shown in Table 1.

Table 1. Criteria, level and weight of tourist attractions synthetic assessment

Criterion (Cr.)	Coefficient	Degree			
		4	3	2	1
(Cr. 1) Number of travel resources	3	12	9	6	3
(Cr. 2) Tourist operating hours	3	12	9	6	3
(Cr. 3) Infrastructure and technical facilities	2	8	6	4	2
Total		32	24	18	8

Source: Nguyen & Vu, 2017

Through the above summary table, the score is divided into 3 levels. Level 1 from 24 - 32 points, Level 2 from 18 - 23 points, Level 3 from 8 - 17 points. Each tier has a different level of convenience and meaning. The maximum score is 32 points, the minimum score is 8 points. Thus, tourist clusters will be rated from 8 to 32 points. The summary of the meaning of each tourist cluster is determined as shown in Table 2.

Table 2. Criteria for assessing the convenience of tourist attractions

No	Assessment degree	Point
1	Very favorable	24-32
2	Favorable	18 - 23
3	Unfavorable	8 - 17

Source: Tran & Dang, 2015

2.2. The assessment results

Based on the spatial distribution of tourism resources, as well as the socio-economic conditions, infrastructure, etc., tourism space organization in Phu Yen province is divided into 4 clusters. The key spaces for assessment and exploitation are as follows:

2.2.1. Tuy Hoa city and surrounding areas

- *General characteristics:* this tourist cluster includes Tuy Hoa city and Dong Hoa town with a natural area of 373.2 km², and a population of 353,340 people, accounting for 7.4% of the area and 37% of the province's population. Average density: 947 people/km²,

the highest in the province. This is the driving space for tourism in Phu Yen province today. Tourism activities are mainly associated with Tuy Hoa urban area with advantages in infrastructure, physical - technical facilities and human resources. Most of the important traffic hubs are concentrated here: National Highway 1A, Highway 25 National Highway 29, North-South railway station, Dong Tac airport, Vung Ro port.

- *Tourist center*: Tuy Hoa city is the center of this tourist cluster and also the tourist center of Phu Yen province. Vung Ro Trade and Service Center is an auxiliary center associated with South Phu Yen Economic Zone.

-*Tourism resources*: tourism resources here are diverse and abundant: Tuy Hoa beach, Long Thuy beach, Vung Ro, Da Bia mountain, Dien cape, Bac Deo Ca forbidden forest... There are many craft villages here, unique living habits: Vinh Phu knitting, Hoa Vinh pottery, Binh Ngoc flowers...

- *Main tourism products*:

+ Tourism products associated with natural tourism resources: sightseeing, sea resort, eco-tourism, mountain climbing, yacht...

+ Tourism products associated with cultural tourism resources: visiting scenic spots, learning historical - cultural relics, learning about traditional craft villages...

+ Tourism products associated with urban areas: sightseeing, shopping, public services, MICE, transit, entertainment.

In this tourism space, the focus of investment and development of tourism products is concentrated in Tuy Hoa City, Vung Ro Bay area.

- *Main tourists*:

+ Tourism products associated with natural tourism resources: sightseeing, sea resort, eco-tourism, mountain climbing, yacht...

+ Tourism products associated with cultural tourism resources: visiting scenic spots, learning historical - cultural relics, learning about traditional craft villages...

+ Tourism products associated with urban areas: sightseeing, shopping, public services, MICE, transit, entertainment.

In this tourism space, the focus of investment and development of tourism products is concentrated in Tuy Hoa City, Vung Ro Bay area.

- *Main tourists*:

+ Tourists with commercial and official purposes associated with Tuy Hoa City, South Phu Yen Economic Zone, Vung Ro port.

+ Domestic guests from Ho Chi Minh City, Hanoi, Central Highlands, South Central coastal provinces, and internal guests.

+ International guests: Russia, USA, Japan, Korea, Taiwan, China...

2.2.2. Song Cau town and its vicinity (North Phu Yen)

- *General characteristics:* This tourist cluster includes Song Cau town and the east of Tuy An district with a natural area of 904 km², a population of more than 231 thousand people, accounting for 17.87% of the area and 26.1% of the population. whole province. Average density: 255.7 people/km². This is the main space for beach and island resort activities of Phu Yen, experiencing the culture of coastal residents. Tourists can come here by road, rail, or water.

- *Tourist center:* The main center is Song Cau town with the landmarks of Xuan Dai Bay, Tu Nham beach, and Ganh Da Dia. Among them Xuan Dai Bay is one of the most beautiful bays in Central Vietnam. The auxiliary tourism center is the Cu Mong lagoon area.

- *Tourism resources:* The North Sea of Phu Yen has many beautiful scenes and typical tropical ecosystems. The winding coastline, and mountains close to the sea create large bays, lagoons, islands and beaches with high tourist exploitation value: Xuan Dai bay, Cu Mong lagoon, O Loan lagoon, Yen island, Chua island, Beach Bang, Bai Bau, Beach Rang, Beach Xep... In addition, this is also home to many historical sites and special festivals of local residents: fishing festival, O Loan lagoon festival, and horse racing festival. Go Thi Thung... This is a favorable place for general tourism development.

A very important feature that increases the value of tourism space is that the natural environment here is quite wild and has not yet been affected by socio-economic development activities. However, if aquaculture activities here are not strictly controlled according to the plan, it is possible that in the near future, the tourism values of this area will gradually disappear.

- *Main tourism products:*

+ Tourism products associated with natural tourism resources: sightseeing, sea resorts, eco-tourism, mountain climbing, scuba diving, yachts, culinary culture such as blood cockles, king crabs, oysters, crabs, lobsters...

+ Tourism products associated with cultural tourism resources: visiting and learning about the archaeological relics of An Tho citadel, Long Binh palace, Le Thanh Phuong tomb and temple, Dao Tri famous tomb ...

In this tourist cluster, the focus of investment in tourism products is concentrated in O Loan lagoon, Da Dia reef - Xuan Dai bay, and Cu Mong lagoon.

- *Main tourists:*

+ Domestic guests from Ho Chi Minh City, Hanoi, Central Highlands, Binh Dinh...

+ International guests: Russia, USA, Japan, Korea, Taiwan, China...

2.2.3. Van Hoa Plateau and its vicinity (in the west of the province)

- *General characteristics:* This tourist cluster includes the entire Dong Xuan district, a part of Son Hoa district and Tuy An district. The area is 1,543 km², accounting for 30.6%. This is an area where many ethnic minorities live, a revolutionary base area. The biggest limitation here is traffic, topography, promotion, etc. Currently, this tourist cluster is still underdeveloped, with only a few sporadic tourist spots.

- *Tourist center:* The tourist center of this cluster is Van Hoa plateau. The auxiliary tourist center is La Hai town.

- *Tourism resources:* The most important tourist resources are the landscape and climate of Van Hoa plateau, ethnic minority cultural villages, landscapes along the Ky Lo river, hot mineral water source Tra O, Triem Duc, and Go Thi Thung tunnels...

+ Tourism products associated with natural tourism resources: mountain resort tourism in Van Hoa plateau, sightseeing tourism associated with unique landscape areas along the Ky Lo river, and resort tourism in Triem mineral springs Virtue.

+ Tourism products associated with cultural tourism resources: community-based tourism associated with learning about the national culture in the village of Xi Thoai and Ha Rai, tourism about sources to learn about revolutionary bases.

In this tourist cluster, the focus of investment to develop tourism products is concentrated in Van Hoa plateau resort.

- *Main tourists:*

+ Domestic guests: Binh Dinh, Khanh Hoa, and domestic customers.

+ International visitors: prioritize the visitor market segment associated with research activities, learn about local cultural values, adventure discovery, long-stay tourists: Japan, France, Australia, and Russia...

2.2.4. Sông Hinh and its vicinity (Southwest Phu Yen)

- *General characteristics:* this tourist cluster includes the entire district of Song Hinh, Tay Hoa, Phu Hoa and a part of Son Hoa district. The area is 2,236 km², accounting for 46.1%. This is an area where many ethnic minorities live, a revolutionary base area, and majestic mountains. The biggest limitation here is traffic, topography, dispersion of tourist attractions, advertising and promotion... Currently, this tourist cluster has only a few sporadic tourist spots.

- *Tourist center:* The tourist center is Hai Rieng town associated with Song Hinh hydroelectric lake. The auxiliary center is Cung Son town associated with Krong Trai nature reserve, Song Ba Ha hydroelectric lake, and Hoa Nguyen waterfall.

- *Tourism resources:* natural tourism resources include: Krong Trai nature reserve, Phu Sen mineral water, Lac Sanh hot spring, Hoa My spray area, Dong Cam dam, Song Ba Ha hydroelectric lake, lake Song Hinh hydroelectricity... Cultural tourism resources include: Hoa Thinh co-origin relic, Eo Bong prehistoric relic, Duong mound, Dinh mound...

- *Main tourism products:*

+ Tourism products associated with *natural* tourism resources: eco-tourism associated with Krong Trai nature reserve, Song Ba Ha hydropower reservoir, Song Hinh hydropower reservoir. Medical resort tourism associated with Lac Sanh and Phu Sen mineral water sources.

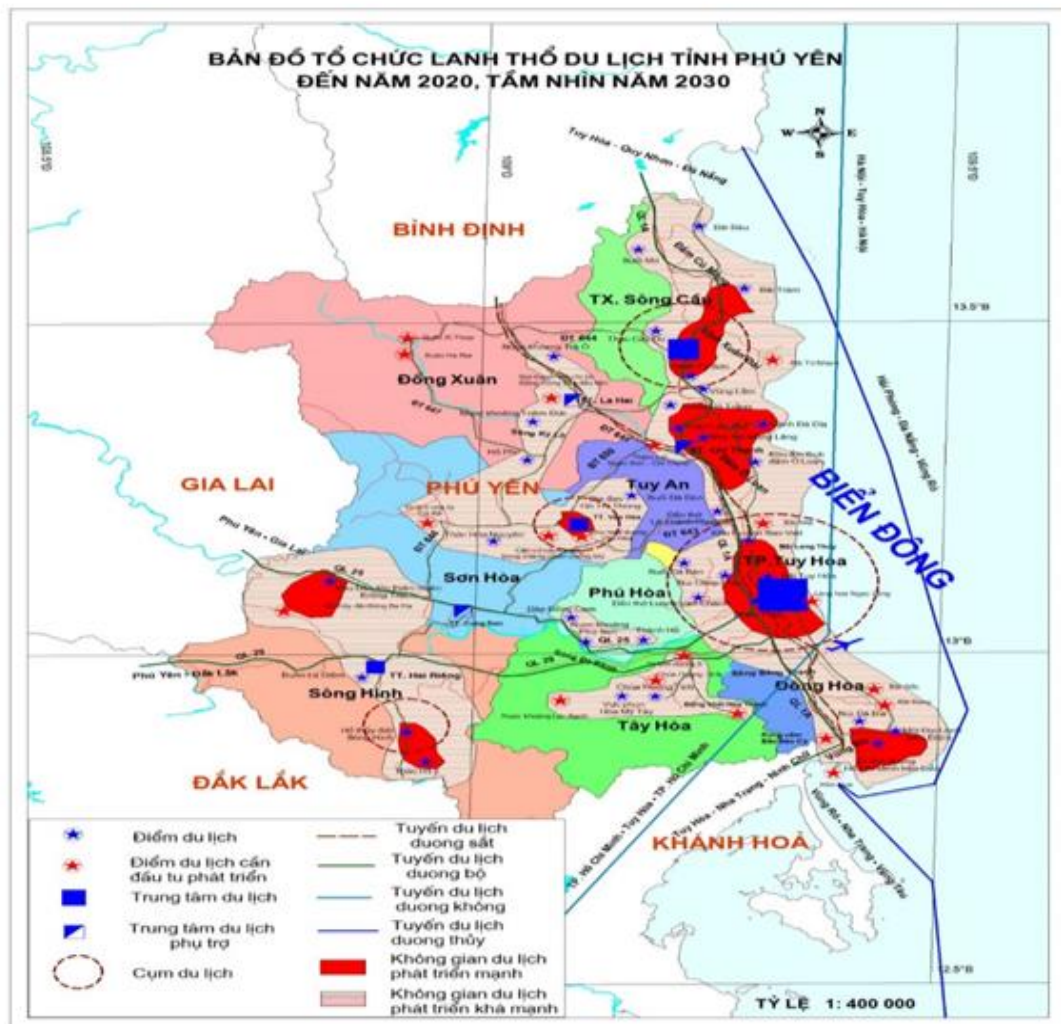

+ Tourism products associated with cultural tourism resources: tourism associated with learning about the culture of ethnic minorities and forming routes connecting with the Central Highlands, craft village tourism: brocade weaving, knitting... Develop a number of cultural and tourist villages of ethnic minorities, develop Dong Cam dam festival.

In this tourism space, the focus of investment and development of tourism products is concentrated in the northern and western areas of Song Hinh hydropower reservoir, Krong Trai nature reserve.

- *Main tourists:*

+ Domestic tourists: Binh Dinh, Khanh Hoa, Central Highlands and domestic tourists.

+ International visitors: prioritize the visitor market segment associated with research activities, learn about indigenous cultural values, long-stay tourists: Japan, France, Australia, Russia... where there are mountain tourism activities to change the "taste" for sea tourists.

(Source: Phu Yen Department of Culture, Sports and Tourism)

Author: Cluster tourism and evaluate

3. General assessment of tourism resource cluster in Phu Yen province

3.1. Evaluation of criteria for the composition of tourist clusters

Table 3. Assessment the number of tourist resources of the tourist cluster

Tourist cluster	Area (km ²)	Number of Natural Resources	Resource Density (resources/km ²)	Multiply Points factor 3
- Tuy Hoa city and surrounding area	373,2	20	0,053	12
- Song Cau Town and its vicinity	904	37	0,040	9
- Van Hoa Plateau and its vicinity	1.545	12	0,007	3
- Song Hinh and its vicinity	2.236	20	0,009	6

Source: The author's survey, 2022

Table 4. Evaluation of the operating time of the tourist cluster

Tourist cluster	Number of days can deploy tourism	Most favorable days	Multiplier points factor 3
- Tuy Hoa city and surrounding	240	180	9
- Van Hoa Plateau and its vicinity	240	180	9
- Song Hinh and its vicinity	240	180	9
- Song Cau Town and its vicinity	240	180	9

Source: The author's survey, 2022

Table 5. Assessment of the infrastructure and physical - technical facilities of the tourist cluster

Tourist cluster	Infrastructure	Technical Infrastructure	Multiplier points factor 2
- Tuy Hoa city and surrounding area	Very good	Very good	8
- Van Hoa Plateau and its vicinity	Good	Good	6
- Song Hinh and its vicinity	Poor	Poor	2
- Song Cau Town and its vicinity	Poor	Poor	2

Source: The author's survey, 2022

Table 6. Results of the overall assessment of tourist clusters in Phu Yen province

Tourist cluster	Number of Natural Resources	Tourism operation time	infrastructure and technical infrastructure	Total points
- Tuy Hoa city and surrounding area	12	9	8	29
- Van Hoa Plateau and its vicinity	9	9	6	24
- Song Hinh and its vicinity	3	9	2	14
- Song Cau Town and its vicinity	6	9	2	17

Source: The author's survey, 2022

3.2. Evaluation of the tourist cluster aggregator score

Table 6. Results of general assessment of the convenience of tourism clusters in Phu Yen province

Tourist cluster	Total points	Degree
- Tuy Hoa city and surrounding area	29	Very favorable
- Van Hoa Plateau and its vicinity	24	favorable
- Song Hinh and its vicinity	14	Unfavorable
- Song Cau Town and its vicinity	17	Unfavorable

Source: The author's survey, 2022

Thus, summarizing the criteria, the tourist cluster with the greatest potential and high exploitation efficiency is the tourist cluster of Tuy Hoa city and the surrounding area. The score is 29, the maximum score to score ratio is 90.6 %, degree very favorable. Song Cau town cluster and surrounding areas have the second highest exploitation potential and efficiency. The score is 24, the maximum score to score ratio is 75%, degree favorable. The cluster with the third highest favorable level is Song Hinh cluster and its vicinity with 17 points, the ratio compared to the maximum score is 53.1%. The cluster of Van Hoa Plateau and the surrounding area has the lowest score of 14 points, the ratio of the maximum score is 43.7%. This is the cluster with limited visitor attraction and the worst exploitation efficiency, degree unfavorable.

In general, the biggest limitation of the tourism in Phu Yen is the limited infrastructure and facilities for tourism. Many tourist cluster spots are recognized at the national level but are still exploited spontaneously, sketchy, lack of strict management in the stages of marketing, advertising, passenger transportation, catering services, security. environment ... so the efficiency is not high. . The most effective is Tuy Hoa city cluster and surrounding areas.

4. Discussion and conclusion

Phu Yen has special valuable natural and cultural tourism resources, which are widely distributed in the territory of the province, which is an important basis for developing tourism products according to its own characteristics. However, to effectively exploit the province, it is necessary to develop tourism services in balanced and appropriate clusters. Therefore, the locality needs to focus on assessing the overall tourism resources in terms of spatial distribution accurately and objectively; At the same time, focus on investing in infrastructure, upgrading material and technical facilities, training highly qualified tourism human resources, proficiently using technological means of the 4.0 era to manage the industry. travel. Combining promotion with the enhancement of local culture, creating a strong competition for products in specific tourist clusters of the province, bringing high efficiency in terms of economy, society and environment, deserves to be the spearhead economic sector of the province as planned by the provincial plan.

The results of the research article have shown the strengths and limitations of tourism resources for sustainable development. On that basis, the locality will develop suitable

specific tourism products, increasing competitiveness with other provinces and cities in the country. The results of this paper also show that, in addition to the assessment of tourist spots and routes; It is also necessary to comprehensively assess resources in tourist clusters to develop sustainable tourism for the locality. In terms of methods, the author chooses a research method that combines both qualitative and quantitative assessment as appropriate, helping to achieve the most accurate and objective evaluation results. In particular, these results will contribute to the stable and sustainable development of Phu Yen tourism in the future, contributing to the province's tourism industry to integrate with the whole country and international friends.

MANAGING AND DEVELOPING THE TEACHING STAFF IN VIETNAM TODAY ACCORDING TO HO CHI MINH'S IDEOLOGY

Dr. Le Trung Kien

kienlt1511@gmail.com

*The Institute of Ho Chi Minh and Party Leaders,
Ho Chi Minh National Academy of Politics, Vietnam*

Abstract

President Ho Chi Minh was a great educator who aimed to establish a comprehensive and scientific education system in Vietnam with profound contemporary values. His views on the training of teaching staff, including management quality, educational management methods and manners, professional training, building a healthy, democratic, and synchronous educational environment, and linking schools, families, and society, are very important and necessary issues for management agencies to contribute to improving the quality of training and development of teaching staff in Vietnam today.

Keywords: *Vietnam, teaching staff, Ho Chi Minh*

1. Introduction

The management and development of the teaching staff is of special importance and is a decisive factor in the quality of training at all levels in Vietnam. Therefore, the creative application and development of Ho Chi Minh's ideology on management innovation and development of the teaching staff has theoretical and practical values today.

2. Method

This study is based on the methodology of dialectical materialism and historical materialism. The study uses a combination of specific methods, including the historical method, logical method, analytical method, synthetic method, comparative method, generalization-abstraction method, expert method, survey, and statistical methods, to carry out study tasks.

3. Results

3.1. Ho Chi Minh ideology on the management and development of the teaching staff

Firstly, about the quality of management and development of the teaching staff.

Management of the teaching staff is the conscious influence of the management agencies on the teaching staff in order to bring the most effective activities of the pedagogical system. Management and development of the teaching staff come in many different ways in terms of levels, but their common point is administrative management according to law and management according to training objectives. Ho Chi Minh advised the education management team: “Editing the education system to suit the people's new circumstances”¹.

¹ Ho Chi Minh (2021), *Complete Volume*, National Political Publishing House, Hanoi, vol. 15, p. 617.

Training institutions must ensure a scientific and synchronous process in the design of programs, curricula, learning materials, and methods of examination and assessment. In order to do well in teaching tasks, management levels need to form for teachers pedagogical competencies such as teaching capacity, language capacity, organizational capacity, communication language capacity and occupational skills, etc. The ultimate aim of the management and development of the teaching staff is to improve the overall quality of teachers in order to “train successors to the great revolutionary cause of our Party and people”². Therefore, He suggested the need to “review carefully the work of “reform” in terms of programs, policies and implementation to find shortcomings for modification, advantages for further development”³ to contribute to improving quality in all aspects for the teaching staff.

Ho Chi Minh paid special attention to the training and retraining of teachers - the main objects of the cause of education. He said: “Now the task of education is different from before. The teachers have very important tasks: Nurturing the next generation of citizens and officers. The purpose of education now is to serve the people and the country, and train new citizens and officers”⁴. The management of training must create a team of teachers who love their job, ready to dedicate themselves to the profession, for the education of the whole people, “everyone can learn”⁵. He advocated: “Popularization of education according to agrarianization”⁶. Therefore, the management agencies of teachers need to associate education and retraining with scientific research and practical application of teaching in a practical and effective way for educational institutions.

Stemming from the role of the teaching staff, He emphasized: “Without education, without officers, there is no cultural economy”⁷. In management work, it is necessary to well implement all regimes and policies, honour, reward and correct discipline in a timely manner, replicate advanced examples, the teachers striving for excellence in study, work and contributing to the cause of education. He said: “No matter how difficult it is, we must continue to emulate and teach well and study well”⁸.

Secondly, methods and manners of training the teaching staff in the direction of modern, advanced and practical education.

Management leaders always have the orientation that education must combine tradition and modernity, the nation and the world, in line with development trends. He affirmed: “Society is developing day by day. Action thinking also evolved. If we don't try, we don't do something for ourselves”⁹. The management of education needs to innovate thinking on the basis of theory associated with practice. He said: “There are two ways to

train theory: One way is to just fill our brains with dry theory. *That's empty and useless theory*. The other way is while making theory, it is necessary to study actual work and practical experience. *That's practical and useful theory*"¹⁰. In renovating the teaching method, President Ho Chi Minh instructed the Ministry of Education to issue a statement stating that the purpose, method and organization of the new education are to abolish the formal learning style, to help learners have a scientific perception, develop critical analytical and synthesis thinking, creative spirit and practical mind. For teachers, it is necessary to learn how to teach, to innovate teaching methods when the curriculum and textbooks have been reformed so that learners can understand quickly, remember for a long time and progress quickly; Avoiding the way of overload teaching, running after achievements, not achieving practical efficiency but also wasting money and effort. The teacher training must also ensure the sequence, science, update, so that teachers have good pedagogical methods. He said: "Teaching gradually from less to more, from easy to difficult, from low to high, not be greedy, not cram. Teaching in a practical way"¹¹.

In order to successfully complete the task, the teaching staff must be good at professional skills, good at grasping the psychology of learners, have the personality, love the job, be eager to learn and update modern education, seek new things. He said: "Officers and teachers must also progress to keep up with the times to be able to perform their duties. Don't be complacent and then stop. Because stopping is to take a step back, to be backward, to eliminate ourselves first. Therefore, we must try our best to study to reform ourselves, to reform our thoughts, to reform our children, and to help in social reform"¹².

He has the view that "education is linked with the people's life, with the resistance war and national construction of the nation"¹³. For the management of teachers, it is necessary to unify the orientation for learners not only in books, but also to put knowledge in the economic, political, cultural and social contexts of the region, the country and the world. Education management through the teaching staff should aim at the highest goal of raising people's knowledge, training good citizens, good workers, good soldiers, good officers to serve the union, the country and the people. "Teaching and learning to serve the country and the people. The school must be associated the reality of the country with the people's life. Teachers and students, depending on their circumstances and abilities, need to participate in social work, benefiting the country and the people"¹⁴. Therefore, the management of education has been linked with social reality, directly participating in the construction and defense of the country. He said: "Enhancing the people's cultural level is also a necessary thing to build our country into a peaceful, unified, independent, democratic and prosperous country"¹⁵.

Thirdly, on professional training for teachers.

According to Ho Chi Minh, teachers are intellectual workers, creating knowledge, without good teachers, there is no good school, “without teachers, there is no education”¹⁶. The training and retraining of teachers should focus on comprehensive education, political ideology, ethics, expertise, health and lifelong learning. He wrote: "In education and learning, it is necessary to pay attention to all aspects: revolutionary ethics, socialist enlightenment, enlightenment of culture, technology, labor and production"¹⁷. In order to educate learners to be ethical, the teaching staff must be ethical and set an example for learners to follow. Good teachers have a good impact on learners, on the contrary, they have a bad impact on many learners and generations. He said: “In education, there must be not only common knowledge but also revolutionary ethics. Talent goes hand in hand with virtue. Talent without virtue, corruption is harmful to the country”¹⁹. In addition, he asked educational administrators to “promote the research and dissemination of science and technology in a focused, steady step-by-step manner”²⁰.

Ho Chi Minh paid special attention to and gave valuable instructions on building the teaching staff imbued with educational methods, specifically:

Educational methods are suitable for the target audience, associated with skills and practical applications. Education must ensure appropriateness and suitability to age characteristics, and at the same time ensure systematicity, solidity and continuity in the educational process. He required that the teaching must be based on the capacity, conditions and qualifications of the learners; side by side with learners, thereby finding suitable teaching methods for each subject. He said: "No matter how big or small, we must clearly examine and match our cultural level, living habits, enlightenment level, struggle experience, desire, will, and the practical situation of the people"²¹.

Educational methods must be practical and basic, evoking intelligence and creativity of learners. He pointed out how to teach: “The core is more practical and thoughtful than being greedy. The main thing is to make the learners understand the problem”²². He criticized the custom of cramming knowledge and advised teachers: Training must be practical, clear, easy to understand, so that those who come to study, then return to the locality, they can practice immediately. He reminded teachers to promote the initiative of learners, make learning practical, fun, not formal, giving them a positive sense of independent thinking, automatic research and learning, accessing to the truth, promoting their full potential and creativity in the learning process. Teachers need to focus on emotional education methods to promote voluntariness, self-discipline, and persuasive discussion, not binding for both teachers and learners. In training management, special attention should be paid to the training

¹⁷ Ho Chi Minh (2021), *Complete Volume*, Ibid, vol. 127, p. 647.

¹⁹ Ho Chi Minh (2021), *Complete Volume*, Ibid, vol. 10, p. 345-346.

²⁰ Ho Chi Minh (2021), *Complete Volume*, Ibid, vol. 14, p. 69.

²¹ Ho Chi Minh (2021), *Complete Volume*, Ibid, vol. 5, p. 288.

²² Ho Chi Minh (2021), *Complete Volume*, Ibid, vol. 6, p. 357.

of exemplary methods for teachers and pedagogical students. All behaviours of teachers have a great influence on the education of learners; “Good or bad students are due to good or bad teachers”²³. He said that if the society wants to have many good and useful people, the elderly must also be examples and have the responsibility to guide and help the young generations. He said: “The elderly are very precious, examples of perseverance in fighting, guiding, retraining and training the young people. The elderly must help the young people to progress”⁵. Thus, each of his points, for administrators and teachers, is a valuable pedagogical lesson.

Fourthly, creating a healthy, democratic and synchronous educational environment; connecting school, family and society.

Stemming from the importance of teacher training management towards a civilized education, the goal of comprehensive human development. Ho Chi Minh said: "Our school is the school of the people's democracy, aiming to train good citizens and officers, who are good future owners of the country"⁶. For each level and age of education, there are differences in training content, methods and objectives, but it is required that the teaching staff always respect the education career as the most glorious, to create a healthy and fair educational environment. In pedagogical schools, he said: "It is not only a pedagogical school but also a didactic school of the whole country"⁷. He emphasized the issue of democracy and discipline in the educational environment, "at school, must respect the teachers, love the friends"⁸, and at home "must love and help the parents and siblings"⁹.

The management of training should not run on quantity but should pay attention to the quality of training. “Open any class, serve that class. Choose teachers and learners carefully. Do not open poor quality classes”¹⁰. The process of classroom organization must combine synchronously between the training program and methods, between learning and practice, between theoretical and practical knowledge, between lesson plans and testing and assessment. On October 21, 1964, speaking to teaching staff and students of Hanoi National University of Education, He said: “Students should not mug up and learn by rote, etc. Learning must go hand in hand with thinking, learning must be related to reality, must have experiments and practice. Learning with practice must be combined”¹¹. Learning goes hand in hand with practice is a golden rule in pedagogical education. Implementing this rule will at the same time form both knowledge, skills and methods for learners.

The society is changing more and more, science is developing, there are more and more jobs, each teacher must uphold their spirit of non-stop learning to improve their capacity, qualifications and quality; learn anytime, anywhere, “learning at school, in books,

¹¹ Ho Chi Minh (2021), *Complete Volume*, Ibid, vol. 14, p. 402.

learning from each other and learning from the people”¹², lifelong learning to progress forever, effectively serving the cause of “human development”. He affirmed: “Learning never ends. Learning forever to improve forever. The more we progress, the more we see that we have to learn more”¹³. Knowledge is endless, learning is infinite, “to stop is to step back, to be backward, to eliminate ourselves first”¹⁴. “The coach who thinks he enough is the most ignorant”¹⁵. He advised educational administrators and teachers to follow “Democracy in which students must respect teachers and vice versa”, discuss and debate together to find the truth and the right results, democracy and equality but not “six to the one and half a dozen to the other”¹⁶.

The cause of education is the cause of the Party, the Government and the whole people, so it is necessary to “build a very good relationship and close solidarity among teachers, between teachers and students, among students, among officers at all levels, between the school and the people” to successfully complete the educational task. He taught “Educating students is a JOINT task of the family, school and society”¹⁷. Each component has different roles, but creates a unified and synergistic whole, need to really pay attention to the cause of educating teachers to train “revolutionary forces for the next generation”. Education results depend on the attention, care and active leadership and support of the Party committees, authorities, departments and unions. Because it's not enough just for the school to do the educational work, “no matter how good it is, the lack of education in the family and in the society, the results are not complete”¹⁸.

3.2. Orientation to apply Ho Chi Minh's ideology on management and development innovation of the teaching staff in Vietnam to meet the requirements of the current situation

Firstly, state management and school management ensure to improve the training quality of the teaching staff.

State management of teacher training is a system of institutions, mechanisms, and management apparatus and staff in training and retraining teachers at all levels. In management, there are three components: the management subject, the management object and the management goal. The management subjects are state agencies at all levels, school councils; the management objects are teachers, students and trainees of pedagogical schools, pedagogical research centres and agencies; The management goal is to ensure compliance with the provisions of law in the activities of teachers, for the purpose of improving people's knowledge, training human resources, retraining talents for the society, perfecting and developing citizen's personality.

¹² Ho Chi Minh (2021), *Complete Volume*, Ibid, vol. 6, p. 361.

¹³ Ho Chi Minh (2021), *Complete Volume*, Ibid, vol. 6, p. 61.

¹⁴ Ho Chi Minh (2021), *Complete Volume*, Ibid, vol. 12, p. 266.

¹⁵ Ho Chi Minh (2021), *Complete Volume*, Ibid, vol. 6, p. 356.

¹⁶ Ho Chi Minh (2021), *Complete Volume*, Ibid, vol. 9, p. 266.

¹⁷ Ho Chi Minh (2021), *Complete Volume*, Ibid, vol. 10, p. 175.

¹⁸ Ho Chi Minh (2021), *Complete Volume*, Ibid, vol. 10, p. 591.

The leadership of the Party, the educational management sectors and levels is very important, in order to create a driving force for the strong development of the cause of education at all levels. Therefore, education management focuses on implementing resolutions and conclusions of the Party and National Assembly, guiding and operating documents of the Government and the Prime Minister on education and training, especially the effective implementation of the Resolution of the 13th Party Congress, Conclusion No. 51-KL/TW dated May 30, 2019 of the Secretariat on continuing to implement the Resolution of the 8th Central Conference of the XI term on fundamental and comprehensive renovation of education and training; Conclusion No. 49-KL/TW dated May 10, 2019 of the Secretariat on continuing the implementation of Directive No. 11-CT/TW of April 13, 2007 of the Ministry of Politics on strengthening the Party's leadership over the with study promotion, talent promotion, building a learning society; thoroughly grasping the Government's motto of “breakthrough” action to complete the 5-year plan 2016-2020. Strictly complying with Decree No. 72/2015/ND-CP dated September 8, 2015 of the Government stipulating the classification and ranking framework and criteria for ranking university institutions in association with Circular No. 24 /2015/TT-BGDĐT, dated September 23, 2015 of the Ministry of Education and Training stipulating national standards for higher education so that each training institution is responsible for building an educational philosophy associated with the motto, process and assessment of training quality accreditation to meet current practical requirements. “It is necessary to have a supporting mechanism to build a number of large universities and pedagogical universities to become prestigious training centers in the region and the world”¹⁹. Leaders of the education sector and related organizations need to closely coordinate, develop specific and appropriate plans in accordance with the school's capabilities and the current human resource needs of the country. State agencies need to support funding for training and building physical foundations and equipment for schools, creating conditions for teachers and pedagogical students to have the opportunity to train and exchange, learn from experience in teaching methods and add new knowledge to the curriculum inside and outside the country. In addition to the policy of assigning autonomy to schools, educational management levels also need to have inspection and supervision activities for enrollment and training of the school to combat negativity, overcome credit mania and promptly direct the work of education and training.

Strengthening the inspection and evaluation of the teaching staff. It is necessary to change the thinking about management, not to administrativeize, not to be conservative in the management of lecturers and teaching activities of teachers, to attach importance to creativity and innovation in management methods according to output goals. All activities of teachers are directed towards dual goals: for themselves and for the school. Normally, criteria for evaluating lecturers are concretized from the following four main factors: Teaching; research; professional services serving the community and civic duty as a teacher and scientist. Therefore, the evaluation of teachers today needs to adhere to one principle:

¹⁹ Communist Party of Vietnam (2021), *Document of the 13th National Congress of Deputies, National Political Publishing House, Hanoi*, vol. 1, p. 234.

contributing to improving the quality of the teaching staff, being the orientation and motivation for the teaching staff to self-improve according to the standards; promoting the active role of teachers so that they can voluntarily participate in the assessment and self-assessment process, and at the same time, the assessment must be practical and suitable to the actual conditions, socio-cultural factors of the schools and referring to the advanced school models in the world.

Once there is a way to evaluate, the conduct of the test must follow a scientific process, it is necessary to build a team of competent and experienced experts in assessment. These objects can be the teachers; colleagues inside and outside the agency; managers at all levels; students (currently studying, or graduated); social organizations in which the teacher participates. Evidence is collected from these subjects through various forms as follows: questionnaires, interviews, observations, and evaluation by writing. For each type of teacher's work, there may be different sources and methods of assessment. Evidence can be classified according to four main types of work that fall under a teacher's responsibilities: teaching, scientific research, professional service, and civic duty.

In addition to the above solutions, it is necessary to increase investment, create favorable conditions for facilities (classrooms, specialized classrooms, laboratories, libraries, etc.), working conditions of teachers and strengthen the teaching means for the innovation of teaching methods and testing, assessment, and application of information and communication technology in the teaching process.

Secondly, well performing of the recruitment, supplementing and retraining of specialized expertise and pedagogical methods for the teaching staff.

Teachers at all levels are the core force, playing a decisive role in the quality of education and training. The 2005 Education Law affirmed: “Teachers play a decisive role in ensuring the quality of education. The State organizes teacher training and retraining; adopts policies on the use, treatment, and assurance of necessary material and spiritual conditions for teachers to perform their roles and responsibilities; preserve and promote the tradition of respecting teachers and honoring the teaching profession. In Vietnam's education development strategy for the period 2009-2020, the Ministry of Education and Training has also emphasized: “Improving the quality of teachers is a strategic and breakthrough solution”. Building a teaching staff with sufficient numbers, high professional qualifications, capable of accessing and practicing advanced educational methods, good moral qualities and clear professional conscience. Doing well in the selection and training of officers and lecturers through professional examination and entrance examination. The Council of pedagogical schools needs to strengthen the high-quality recruitment process to train teaching human resources in the future.

UNESCO has come up with a new 21-point education strategy, which states: “Teachers must be trained to be educators rather than experts in imparting knowledge”²⁰

²⁰ <https://moet.gov.vn/giaoducquocdan/giao-duc-thuong-xuyen/Pages/default.aspx?ItemID=5493>

(Point 18). Facing that reality, universities in the Federal Republic of Germany have set out a strategy to build a teaching staff, focusing on capacity of lecturers with 2 activities: teaching and being an education expert; teaching capacity includes: Preparation capacity (selecting references, determining lesson objectives, knowledge and skill requirements, choosing teaching methods and techniques, anticipating the possibilities and handling); performance capacity (including skills of directing new content, practicing skills, developing knowledge, testing and motivating students); assessment capacity for the ability to absorb lessons and organize social activities inside and outside the school²¹.

Educational institutions need to consult and apply valuable educational experiences of organizations and countries around the world and continue to grasp the Party and State's policy on building the teaching staff, such as Decision No. 16/2008/QĐ-BGD DT, issued by the Ministry of Education and Training, promulgating the Regulation on teacher ethics, with specific criteria including solid political courage, clear professional quality and conscience, active learning, constantly improving professional expertise and pedagogy, having a lifestyle and standard behavior, being really an example for learners to follow. This point of view is the inheritance and development of Ho Chi Minh's educational policy, which is valuable for building the teaching staff. Good implementation of the Resolution of the 13th Party Congress is: "Paying more attention to education on morality, personality, creative capacity and core values, especially education in patriotism, pride and self-respect of the people, etc., arousing the aspiration to develop a prosperous and happy country and firmly defending the Socialist Vietnamese Fatherland"²²; Resolution No. 29-NQ/TW, dated November 4, 2013 of the XI Central Executive Committee on fundamental and comprehensive renovation of education and training with the overall goal: "Striving to 2030, the Vietnamese education reaches an advanced level in the region"²³. Resolution No. 29 discusses innovating major, core and urgent issues from guiding viewpoints and ideas to objectives, contents, methods, mechanisms, policies and conditions to ensure implementation; innovating from the leadership of the Party, the management of the State to the management of education and training institutions and the participation of families, communities, society and learners themselves; innovating at all levels and disciplines".

State and school management need to continue to thoroughly grasp the awareness of teachers and pedagogical students about their positions, roles and professional responsibilities. Ho Chi Minh pointed out: An ignorant nation is a weak nation; Education is the leading national policy in national revival. Every teacher and pedagogical student must constantly consolidate, improve knowledge, research and master theoretical knowledge to

²¹ See: Dr. Pham Hoang Tu Linh (2019), "Development of competency-oriented university lecturers in the Federal Republic of Germany", Proceedings of the National Workshop on *Developing quality criteria for the teaching staff and administrators of educational institutions to meet the requirements of educational innovation*, Nghe An, p. 149-160.

²² Communist Party of Vietnam (2021), *Document of the 13th National Congress of Deputies*, National Political Publishing House, Hanoi, vol. 1, p. 136.

²³ <https://thuvienphapluat.vn/van-ban/thuong-mai/Nghi-quyet-29-NQ-TW-nam-2013-doi-moi-can-ban-toan-dien-giao-duc-dao-tao-hoi-nhap-quoc-te-212441.aspx>

effectively serve the educational cause of the Party and State. He confirmed “don't learn theory, your will is less resolute, see no further than the end of your nose, you will easily lose your way during the struggle, resulting in “political blindness” even degeneration and alienation from the revolution”²⁴ and “lack of theoretical and practical research, when faced with victory, becoming an overoptimist, when faced with difficulties, easily fluctuating, being pessimistic, unstable revolutionary stance, lacking the spirit of independent thinking and creative initiative. Therefore, there are many difficulties in work, and the leadership effect is limited”²⁵.

Strengthening the organization of scientific seminars on professional content and educational methods, contests of excellent teachers at school and departmental levels. School administrators at all levels focus on leading and directing innovation to improve teaching quality, create conditions for lecturers to attend training and retraining courses, and create a forum to exchange academic issues, sharing experiences of learners and responsibilities of teachers. Regularly sending teachers to participate in advanced pedagogical classes in order to equip the teaching staff with pedagogical capacity and to apply professional teaching methods. Maintaining and organizing contests for excellent teachers at all levels to encourage and motivate lecturers to actively teach well and to interactively apply teaching methods to achieve the best results.

Strengthening the administration and organization of summarizing, drawing lessons and experiences on the management and training of teachers. Education management agencies need to further strengthen the close coordination between functional units in activities such as regularly organizing emulation movements, organizing research clubs for pedagogical sciences, practical application of teaching, etc., contributing to improving the quality of learning and research for teachers and students, meeting training requirements and output standards in education at all levels.

4. Discussion and Conclusion

Ho Chi Minh's views on the management and training of teaching staff provide the theoretical basis for determining the strategy for training people, the policy, and the direction of the Party's development of education in Vietnam throughout the revolutionary periods. These lessons and practical educational experiences are very vivid, practical, and effective for those in charge of state management, school council management for teacher development strategies at all levels. With the requirements of current educational innovation, it is necessary to innovate the management and training of teachers to increase the effectiveness of conveying scientific information, creating the ability for qualitative transformation in the formation, fostering, and updating of the knowledge system of teachers and pedagogical students. The management of teacher education plays a decisive role in the quality of education. Therefore, in the process of teaching quality management, administrators must apply President Ho Chi Minh's views in the following directions:

²⁴ Ho Chi Minh (2021), *Complete Volume*, Ibid, vol. 8, p. 234.

²⁵ Ho Chi Minh (2021), *Complete Volume*, Ibid, vol. 12, p. 24.

strengthening the quality management of teachers according to the education and training orientation of the Party and State, improving the quality of enrollment, recruitment, and in-depth training of teachers in expertise and teaching methods, closely following the learning object, promoting the activeness and creativity of learners, linking theoretical content with real life, maximizing the effectiveness of teaching techniques, and regularly training the teaching methods for the teaching staff to meet current training requirements and objectives.

SMALL AND MEDIUM ENTERPRISES INCENTIVES FOR HUMAN RESOURCE DEVELOPMENT IN TIEN GIANG PROVINCE: POLICY AND PRACTICE

Doan Minh Nguyet

doanminhnguyet@tgu.edu.vn

Tien Giang University, Tien Giang, Vietnam

Vo Kim Nhan

nhanvk@ueh.edu.vn

University of Economics Ho Chi Minh city, Vietnam

Abstract

The purpose of this paper is to review incentive policies for small and medium enterprises (SMEs) for human resource by identifying, outlining and discussing definitions of SMEs, incentives from other countries that are relevant for SMEs' incentives. Besides, this paper contributes an overview of human resource development in policy design and in practical meaningfulness applied in Tien Giang province that has not yet been sufficiently reviewed. It provides value for both researchers and retail practitioners. In Tien Giang province, provincial policies for SMEs human resource development is the most influential factor on human resource development in Industry 4.0.

Keywords: *SMEs, human resource development, incentive policies, human capital*

1. Introduction

The majority of firms that comprise almost every country's business sector are small and medium enterprises (SMEs), and these firms have become central to the debate on the role of the business sector in sustainable development (Amankwah-Amoah et al., 2019). Small and medium enterprises are an important role and contribute a large part of GDP in the economy. According to (Kiêm, 2013), small and medium enterprises create more than a million new workers, employing up to 51% of labor and contributing more than 40% of GDP. Small and medium enterprises (SMEs) create jobs and income, improve skills in enterprise management, and promote entrepreneurship and creativity. Besides, SMEs also help build a flexible system with close linkages exploiting all potential of localities and creating more labor resources.

Therefore, the study of supporting SMEs should be paid attention to as well as human resources incentives for business activities, contributing to contribute to economic growth and social stability. Recent studies in Vietnam and the world have focused on SME incentives from different perspectives. Recent studies have mentioned SME incentives in general, however human resource incentives for SMEs in Vietnam are still limited. Recently, some of the current support policies for women-owned enterprises, and types of business. In order to help small and medium enterprises overcome difficulties and promote

production and business, it is necessary to continue reviewing and reforming policies and mechanisms to create a favorable environment for increasing human resource incentives.

Human resource policies for SMEs are complicated from practical and theoretical perspectives. Thus, this paper has systematized the literature review of SMEs and clarified their role in the social economy. To further clarify research gaps, this paper has studied some human resource incentives for SMEs in some similar countries in the world. The paper also analyzed the advantages, disadvantages, and limitations of effective incentives to support SMEs in Tien Giang province. The paper focuses on the analytical criteria based on the comparison of data with a basic indicator, the analysis of the factors affecting the development of SMEs in Tien Giang province.

2. Literature review

2.1. Review of SMEs

There are some different definitions of SMEs in Vietnam and other countries. According to the countries of the Organization for Economic Cooperation and Development (OECD, 2010), SMEs are financially independent companies but not affiliated companies of big companies. SMEs have a labor force of 10-250 people in the European Commission (2007) and 10-200 people in the USA. According to the World Bank Organization, SMEs are business having labor force of from 10-300 people. Pecuniary assets are also used to define SMEs. In the EU, SMEs must have annual revenue equal to or over Euro 40 million and/or the balance sheet value must not exceed Euro 27 million. In Vietnam, the basic criterion for classifying SMEs is based on the number of the labor. According to Decree 80/2021/NĐ-CP dated 26/8/2021, SMEs can be classified into micro-sized enterprises, small-sized enterprises, and medium-sized enterprises in certain sectors. Besides the features of enterprises, SMEs have their own specific characteristics. SMEs are often limited both capital and labor, budget for doing business is often not high. Moreover, the competitive capacity of SMEs is still low with economic crises, so their profits are not high. In addition, the labor force of SMEs is usually at an average level (from 10-300 people) with restricted working skills.

With that backdrop, human resource development in SMEs plays an important role in 4.0 industry. Many previous studies have empirically investigated the human resources development in enterprises. Existing studies on the human resource management models focus mostly on the measuring components that enhance the effectiveness of human resource management (Pravdiuk et al., 2022). There are extensive researches on the factors affecting SMEs human resource development. In general, these studies point to SMEs human resource development (Miloloža, 2018; Rozsa et al., 2019). Knowledge around world evolves and it is vital for companies to keep pace with new trend. Thus, training becomes vital especially for the new employees. Also investing in workers' health including flexible leave policies, can easily save more money than these new policies cost to implement", workers that are not only healthy but also satisfied with their jobs becoming the essential element in generating greater productivity, as well as lower absenteeism and turnover rates. Many current studies have empirically investigated necessary skills, education and training

activities for human resources in enterprises, organizations and countries in the Industrial Revolution 4.0. The findings of the study support the idea that human resource positively affects productivity and economic efficiency.

2.2. Incentives policies for SMEs from countries

Recently, there are several policies supporting SMEs in the world. The country's growth relies on enterprise development strategies. SMEs' incentives can create different comparative advantages. In comparing with countries, this paper aims to analyze incentives policies in supports of SMEs in some countries, such as The Europe Union, Malaysia, South Korea, Singapore, Japan. In order to help SMEs, the government attached special importance to the development of solutions in support of science and technology (Autio et al., 2007).

In Europe Union, there are several incentives provided timely support for SMEs, creating internal relationships among the countries in the use of the common currency and the European Central Bank. Different business environments in the EU stimulate different economic development levels among the countries. These policies not only create the potential for enterprises to develop but also act as support for enterprises to overcome crises from other countries apart from the EU. The State's incentives policies in providing information for SMEs about trade promotion, market opportunities, and development trends of the region and the world, enhancing the relationships among SMEs. Especially, financial policies play a crucial role in the sustainable development of SMEs. In short, the State's policies in support of SMEs involve finance, credit; legal policies; information technology development, human resources; information and consultation; market opportunities. However, policies in supporting SMEs depend on the country's economic characteristics.

In Malaysia, government promulgated the Law on investment encouragement in 1986 and Law on Corporate Tax in 1967 aimed at supporting enterprises in general and SMEs in particular in solving problems and creating momentum for development. These laws applied incentives in each specific sector such as agriculture, forestry, and service(Autio et al., 2007). For industry, the State effectuated re-granting capital credit to SMEs at preferential interest rates Malaysia Central Bank and Negara Bank, from that to solve the problem of capital for SMEs inside the country, particularly enterprises involved in export. Along with this are policies to encourage SMEs to expand the market by exporting to non-traditional markets. These enterprises are entitled to charge twice as much credit insurance premium. These enterprises are entitled to charge twice as much credit insurance premium and this has been approved by Minister of Finance. For agriculture, in order to support SMEs activities in agriculture, the State permits full exemption from import tax on raw materials in the case such raw materials are not domestically produced. As to enterprises with export activities, support in export equals 5% of export turnover so as to encourage enterprises to export some certain agricultural products.

South Korea is a developed economy in Asian region. This country has a incentives for SMEs in economy and in science and technology. These support policies have focused on the credit, investment in technology sectors(Lilischkis, 2011). The government encourages financial organizations to permit SMEs to borrow loans when these enterprises have prospective projects but do not have sufficient mortgage assets nor credit

documentation. Based on these incentives, SMEs in South Korea can easily get access to bank loan resources through financial institution when there is an agency comes forwards with guaranty and evidence to prove their financial capacity. Especially, the government can research support programs in the regions. Regional research centers have been supported in capital and 80% of salary for experts.

Singapore is a small country in in geographical conditions in Asian region. Singapore ranked third for global competitive capacity with 99% of SMEs. Hence, government gives considerable priorities to SMEs. To support SMEs, those enterprises with high potential and creativeness will be considered by the Government. Good graduated students will be selected for supporting in setting up enterprises to become excellent entrepreneurs. The government supports capital through guaranty with the banks to permit SMEs to borrow. The government also has some support policies in human resource training for SMEs, especially in the export sector. The Government sets up training funds to improve leadership and management's competences for SMEs. Market-related information for SMEs is an effective support channel of Singapore. Internal Enterprise Singapore (IE) directly under Singapore Ministry of Industry and Trade has a network of over 30 offices in many countries over the world. The duties of these offices are to collect and provide market opportunities; looking for partners; strengthen co-operation with other countries to help them understand more about Singapore. Through these offices, domestic enterprises can gain crucial information for their business. In Vietnam, there are two IE branches of Singapore in Ha Noi capital and Ho Chi Minh City.

In Japan, most of support policies for SMEs aimed at narrowing the gap between enterprises. The goal of these incentives is to provide support in technology, finance, labor and to creating legal environment for SMEs. The support network for SMEs in Japan is divided into several levels. In order to gain these incentives, SMEs in Japan have confirmed their competitive capacity in the domestic and international markets.

2.3. The status of SMEs incentives in Vietnam

Statistical data from Vietnam Association of SMEs indicated that till the end of 2014, throughout the country, there were over 500 thousand small and medium-sized enterprises, accounting for 97.5% of the total number of enterprises. According to the Ministry of Planning and Investment (2021), SMEs have contributed over 60% to the GDP and attracted 51% of the labor force annually in Vietnam. Up to 2020, there were more than 800 thousand active enterprises. On average, there are 8.3 SMEs operating with over 1,000 people. It is clear that SMEs play a crucial role in the economy. SMEs with less than 300 employees play an crucial role in the economic development of Vietnam. SMEs account for 98% of the total number of business enterprises in 2019, contribute 50% of the country's gross domestic product (GDP) and generate 50% of the total employment(Roxas, 2021). After Doi Moi reform in 1986, private business sector development, especially SMEs has become a major focus of government reforms(Angelino et al., 2021). The development of small and medium enterprises has opened a local economy for sustainable growth as well as the integration of Vietnam with world markets. Since 1986 reforms, Vietnam has become one of the growing economies in Asia and a close integration with the world economy(Jaax, 2020). Although

recent studies related to SMEs in Vietnam have addressed innovation, performance, and business constraints (Long, 2021), some studies still exist. Empirical studies examining how Vietnamese SMEs relate to human resource support policies are still limited. (Machmud et al., 2018) argue that efficiency is an important tool to measure the operational performance of the enterprise. This need to use a minimum of input resources to create effective output levels for firms. Therefore, efficiency is considered the use of the head input to produce the most optimal output. According to (Mujeyi et al., 2016), economic theory, three types of efficiency have been developed (1) Technical efficiency refers to the ability to the combination of inputs (such as labor and capital resources) to produce levels of certain output; (2) allocative efficiency reflects the optimal combination of factors of production from the price given inputs and technologies; (3) the combination of technical efficiency and analytical efficiency supplements become economic efficiency. However, resource allocative efficiency and economic efficiency are based on the assumption of adequate technical efficiency, so the estimation of technical efficiency is the foundation for reviewing the overall performance of enterprises. New business is considered a responsibility mandatory by workers, so there is no need necessarily reward or encourage those improvements. In developed countries such as Japan, Korea, Singapore, human resource is always taken into account. Therefore, human resource are always provided with the best conditions to develop to create added value for the business. Human resource have a proactive, passionate working attitude, make continuous improvements in the company individual work and group work. When human resource created and combined with other factors, businesses will achieve steps significant breakthrough in business activities. Working together for a common goal is the key to success and creating characteristics of the corporate culture. Vietnam's human resources index ranks 62nd in the world and 14th in the Asia Pacific region; only 5% of the laborers are proficient in English and only 10.4% are skilled workers (*Manpower Group Solutions, 2018*).

Figure 1. Average employee's income per month in Vietnam and some Asia Pacific countries

Source: Manpower Group Solutions, 2018

However, the growth in the economy has begun to slow down and decline from the post-Covid-19 pandemic. Although there are some incentives of the Vietnam government aimed at reducing difficulties for SMEs and focusing on recovery and socio-economic development have been implemented, the business sector still suffers many negative impacts of the Covid-19 pandemic.

In Vietnam, the government has developed, adjusted and completed many policies to support human resources development in general and SMEs human resource development in particular in Industry 4.0. The most recent support policies for SMEs, such as Decree 80/2021/NĐ-CP of Government detailing a number of articles of the Law on Supporting SMEs, Circular 06/2022/TT-BKHĐT of Ministry of Planning and Investment but mainly developing general human resources and there is no specific policy on developing human resources for SMEs in Industry 4.0. Human resource development policies for SMEs are related to recruiting, locating, training and evaluating human resources performance. Therefore, SMEs need to take advantage of incentives to develop their own business capacities, enhance their employee competence to adapt the changes in the world. It is clear that human resource development is considered as a long-term strategy recently, besides financial or tangible resources (Craciun, 2015; Rozsa et al., 2019)

3. Discussion

In recent years, Vietnam government has provided SMEs incentives policies supporting for small and medium-sized enterprise development dated on 30/6/2009. Human resources are the sum total of human labor potentials in a particular country. Human resource in an enterprise is a part of an overall human resource, having the following characteristics such as enterprises can mobilize from human resources of the country; the working ability of the employees in the enterprise, it depends on the ability to work in groups of the people in the organization. Human resource development is the process of creating a change in the quantity and quality of human resources with the improvement of the efficiency of their use in order to better meet the needs. Human resource development of enterprises should pay attention to the following main influencing factors of macro-environmental factors (economic environment, law on labor and labor market, science and technology and cultural and social factors) and micro-environmental factors (competition to attract human resources of enterprises and the supply capacity of training institutions). From the overview of policies in support of SMEs in Vietnam and in the world, it is necessary to have legal policies, as follows:

Firstly, reorganizing organizational structure, SMEs need to build a team of leaders and managers with knowledge and skills in human resource development. In order for human resource development to be highly effective, it is necessary to organize the human resource management at all levels in order to move towards a modern human resource management with the main function and task of advising and assisting the director in directing and managing the organization, personnel work and human resource development of the enterprise.

Secondly, enhancing the awareness and management skills of leaders. Human resource development capacity of leaders and managers is a decisive factor to the effectiveness of human resource development of enterprises. Because, they are the ones who

direct and organize the implementation of human resource development in their organization. Therefore, SMEs need to build themselves a team of leaders and managers with awareness, knowledge and skills on human resource development. Leaders can share information with their employees about the direction of development, the actual situation as well as the challenges and opportunities facing the business.

Thirdly, building human resource strategies in a systematic, scientific manner to ensure the enterprise's human resources are sufficient in quantity and suitable in structure. However, human resource planning in SMEs is still fragmented and passive with short-term business plan. Recruitment can be considered as one of the key solutions to ensure that enterprises have a sufficient number of human resources, suitable in terms of structure, and fully meet the requirements of the company. qualifications, experience and necessary qualities to realize the strategic development goals of the enterprise.

Last but not least, it is necessary to harmonize the interests of enterprises and employees; maintaining the optimal relationship between the accumulated share and the share for the self-organizing employees to reproduce their labor and the share for general organization of the whole enterprise; use forms of payment that best suit the urgent needs, prioritizing satisfaction of each type of worker. Design and rebuild the salary system for each group of specific job titles on the basis of professional qualifications, processing skills, complexity and consumption of mental and physical strength of the employees. each title with the content to ensure a reasonable correlation between the titles as well as between the coefficients of the same specific title, on the basis of reference to the labor price on the labor market of the country. Tien Giang province.

4. Conclusion

Small and medium enterprises play an extremely crucial role, but they are still very young, inexperienced, lack of capital, lack of knowledge, etc. Human resources are the most valuable asset that every business has and how to use that resource effectively. However, there are still many important contents that have not been mentioned such as: labor motivation, labor relationships, labor safety. The author will continue to research to first implement human resource management activities at enterprises effectively. There will be more scholars and authorities focusing on research on human resource management issues at the micro-level to support SMEs to get solutions be feasible and be applied in practice.

Abstract

Under the impact of the accelerating technological revolution, the fundamental characteristic is the increasingly close connection between the real world (physical systems) and the digital space (cyber systems). Accordingly, in the medium to long term, technology and innovation will play an increasingly important role in the global economy, starting to disrupt many traditional production methods in agriculture, industry and services, creating new opportunities and challenges that strongly affect the development choices of all countries in the world and this is no longer a story of the future but a story of the present, therefore, no There may be more delay, but each individual, each organization, and each country needs to choose development goals and development paths. The article contributes to Vietnam choosing an appropriate economic development model for social development to meet the current trend.

Keywords: *Model; Economic development; Vietnam*

1. Introduction

There are many different conceptions and interpretations of social development management. However, from the overall view, it can be seen that, although different concepts and understandings, they all agree to understand that social development management is a targeted activity through different tools and solutions, especially is through and by policy to promote the development of society. The concept of social development management in a broad sense is understood as: "management of the overall social development, including economic development management, political system development management, cultural development management, etc. management of social development in a narrow sense, management of human development, management of man-made material resources, especially socio-economic infrastructure"¹. In this sense, social development management is understood as the totality of management activities in all different fields constituting society, which includes both material and immaterial elements. With this understanding, the management of socio-economic development plays a very important role

¹ Pham Ngoc Thanh (2020): Managing social development in the Central Highlands in hunger eradication, poverty alleviation, social protection and health care, Communist Journal, No. 132 (May), p.24.

in the social development model. Starting from this slice, we focus on considering the appropriate economic development model for social development in Vietnam today. That is the “chasing” economic development model.

2. Method

The article uses document collection methods, document reading and data analysis, synthesis, comparison, generalization, take into consideration

3. Results

3.1. The choice of economic development model in Vietnam

After 35 years of reform, Vietnam successfully applied the East Asian development model, bringing about many positive changes and proud achievements in the economic development of the country. The economy has clearly changed, from a planned economy, centralized bureaucracy and subsidies to a multi-commodity economy, operating under the market mechanism and managed by the state. People's living standards are continuously improved, social security is ensured, and the position and strength of the country are maintained.

The East Asian development model, also known as the state-protected development model, is a system of economic policies and guidelines that are invested and supported by the state to develop certain areas especially in industry in the private sector, to stimulate economic growth.

This is a model applied very successfully in East Asian countries such as Japan and the four Asian dragons (Korea, Taiwan, Singapore, Hong Kong). Today, with its achievements in economic development after 40 years of doi moi and reform, China is also considered a successful country in applying the East Asian model.

In essence, the success of the East Asian model is the perfect combination of a free market economy with strong state support and regulation. Governments, recognizing some of the limitations of the market in the Western liberal development model, have thoroughly applied interventions to promote economic development.

3.2. The inadequacy of Vietnam's economic development model

The Covid-19 pandemic has completely changed the global economic and political life. The biggest consequences are slowing global economic growth, broken product supply chains, and rising transportation costs.

According to the International Monetary Fund (IMF), global economic growth in 2021 will be at 6%, higher than the figure forecasted by the World Bank (WB) of 5.6%. However, with economic growth falling by 6.17% in the third quarter of 2021, Vietnam's economic growth forecast has been dragged down to 3.8% (according to data from the European Development Bank). Asia - ADB).

It shows that, with an "open" economy like Vietnam, any bad influence from the world will have a direct, negative impact on the economic growth rate, affecting the economic plans. , 10 years, 20 years vision.

Politically, the Covid-19 pandemic is considered a bell signaling the end of the globalization movement, promoting nationalism with the idea of upholding national interests above international interests. The immediate consequences are likely to cause political instability and armed conflicts in many hot areas of the world.

When comparing the Vietnamese economy with the world, we should look at it from two perspectives. First, in 2020, Vietnam's economic growth rate will reach 2.9%, the lowest in the 2011-2020 decade. However, if you look at the world, the figure of 2.9% is a small number. A proud number, Vietnam is among the few countries with double victories, both repelling the Covid-19 pandemic and maintaining positive economic growth. In the second aspect, the world enters 2021 With advances in vaccine development, vaccination speed in many countries, and global growth showing positive signs, Vietnam's economic growth is in a state of "short of breath".

Vietnam's economy still has a lot of potential for development, the goal of turning the country into a high-middle-income country by 2030 is achievable. However, looking at the long-term vision, position, and national strength, Vietnam needs to change a lot, in order to fulfill its goal by 2045 to become a developed country with per capita income in the country. high level.

In essence, Vietnam's economic development model has signs of inadequacy for two reasons: first, the Vietnamese economic development model itself, applied according to the East Asian model, has been going all the way to development. development; Second, the global economic and political situation is revealing many challenges, creating negative impacts on the Vietnamese economy.

3.3. About Vietnam's economic model itself

In essence, the economic model Vietnam pursues takes exports and foreign direct investment (FDI) as the driving force for growth.

Firstly, in terms of exports, in 2019, Vietnam's total export and import turnover reached over 200% of GDP. This is a proud number but also worth paying attention to, when any negative impact of the global economy or politics will directly affect Vietnam's economic growth rate.

In 2020, Vietnam had a trade surplus of 19.1 billion USD, but only in the first 7 months of 2021, Vietnam had a trade deficit of 2.7 billion USD. The problem is that an "open" economy like Vietnam is under a lot of pressure and pressure comes from the "health" of the international market.

Not only that, the Vietnamese economy is in a state of dependence on a few foreign-invested enterprises. The first case is Samsung, whose total investment capital in Vietnam is announced at 17.3 billion USD, bringing in export sales of 59 billion USD (2019), equivalent to 22% of Vietnam's export turnover. Thus, as long as Samsung encounters production difficulties and product defects like the Note 7 case in 2017, Vietnam's economy will be affected.

Secondly, the achievements in attracting FDI into Vietnam have not achieved much desired expectations in spreading, creating linkages and supporting domestic enterprises, to form a supply chain of goods for enterprises FDI industry.

The gain in attracting FDI is obvious, but the loss is less noticeable. Vietnam offers a lot of tax incentives and policies when attracting foreign-invested enterprises, which will cause an imbalance to the development of domestic enterprises, especially private enterprises. This is the fundamental and sustainable strength of the Vietnamese economy.

Third, the FDI sector has contributed a lot to Vietnam's economic growth, reducing the rate of trade deficit, but the value Vietnam receives in the global supply chain is not high. The reason lies in the fact that Vietnamese enterprises often only receive the task of processing and assembling ... while the highest value of the product is technology and copyright, Vietnam has not yet obtained it.

Fourth, is the low quality of Vietnam's human resources, which has a direct impact on two factors: the development of the private enterprise system in the global supply chain and the value received by workers, respectively income and expenditure levels of the people.

This is a very difficult problem for Vietnam when building a new development model, the world is entering the Industrial Revolution 4.0, Vietnamese workers have the advantage of being industrious, smart, hardworking....but The most important and necessary virtue in the Industrial Revolution 4.0 is "creativity", which Vietnamese workers do not have.

Fifth, the competitiveness of Vietnamese enterprises compared to enterprises in the world and the region is still weak. After more than 35 years of doi moi, the biggest success is that Vietnam has successfully transformed from a centrally planned and subsidized economy to a commodity economy with many sectors operating under the market mechanism.

The private sector is an area that is identified as the economic future of the country, making the most of the dynamism of businesses and creativity of employees to compete fairly with businesses in the region in the world, and is the driving force for Vietnam's economy to grow sustainably.... but do not receive as many incentives as the foreign-invested enterprise sector and the state-owned enterprise sector.

Sixth, the state's management in two aspects, the economy and the management of state-owned enterprises still have many shortcomings. The state-owned enterprise system with a focus on corporations and corporations is facing many difficulties in operation, failing to fulfill its goal of becoming the "steel fist" of the economy, promoting, attract small and medium enterprises of the country to go up. The reason is that in the management work, Vietnam applies too many administrative orders to the operation of enterprises.

On the national level, Vietnam's economic growth model takes exports as the driving force for economic growth, but the major export market is the United States, which has not yet recognized Vietnam as a country with a free market economy, and the future prospect, the risk of conflict, trade dispute with the United States is possible.

Seventh, inequality, the gap between rich and poor is widening by the negative side of the market economy. As a result, the achievements in economic development are not evenly distributed among all classes of people, in all regions of the country, more or less causing social unrest.

Economically, income imbalances will affect domestic consumption. A sustainable economy is one that achieves a harmonious balance of income, improves living standards and spending levels, and creates its own and strong market for domestic enterprises.

Eighth, Vietnam is about to enter the golden population phase, the immediate consequence is the "not rich and old" status of the Vietnamese population, directly causing pressures on social security issues, the social security system and the social security system. health care, family relations... for the future economy.

3.4. Implement the “chase” model to ensure fast and sustainable growth for Vietnam in the coming years

Vietnam should give maximum priority to economic development along with ensuring social security, improving welfare and protecting the living environment. Only with rapid growth, Vietnam will not be left behind in the world and regional economy. Therefore, renewing the growth model and restructuring the economy to ensure fast and sustainable growth are the core requirements of Vietnam in the coming time.

The current international economic situation is characterized by the globalization of the post-industrial era. Therefore, the problem that Vietnam faces and has to deal with is development to "chase" both the industrialization and the post-industrial era. The industrial production capacity based on the potential of science and technology will determine the economic "chase" of the period of accelerating industrialization, modernization and the Fourth Industrial Revolution. In the current new context, Vietnam's industrialization and modernization strategy needs to:

First, carry out industrialization and modernization. If Vietnam wants to build an economic model according to the standards of developed countries, the State needs to follow the rules of the market economy. Accordingly, the State must ensure equal competition conditions, liberalize economic activities and prices, abolish the planned distribution of national resources in order to gradually reduce the State's intervention in the economy. economic. The role of the State is to select priority industries and occupations, develop planning and implementation plans to promulgate a system of mechanisms and policies to mobilize all resources to implement the planning, especially the linkage between The State and enterprises in the direction of openness and transparency. When Vietnam implements a socialist-oriented market economy, the State is still the representative owner of many large enterprises and important national resources. Therefore, when implementing the "chasing economic model", the State's direct or indirect participation is inevitable.

Second, about the business development model. From the experience of the G7 countries and NICs recently, some comments can be drawn in the "chase economic model", the level of concentrated industrialization of the economy is quite high, large corporations and enterprises have decisive role in success. However, this model also has its downside, such as: 1- When forming an industrial-financial enterprise model, there will be a link between a part of state officials and employees with enterprises, invalidate the positive side of the market mechanism, leading to the distribution of national resources deviating from

the original target; 2- The formation of industrial-financial enterprises has the potential to form a "crony capitalism" that manipulates the market and restricts equal competition; 3- Industry-financial corporations create a new group of millionaires from the inequality in using the country's resources. Looking at the development process of emerging economies, we understand the concerns of society about these limitations. For Vietnam, besides the above limitations, the industrial-financial group model has also formed and has an impact on macro policy making in determining the order of investment priorities. the use of state capital to invest in projects, increasing tax pressure as well as being sued by countries against the Organization for Economic Cooperation and Development. World Trade (WTO) due to violations of commitments on product subsidies.

Corporations, also known as raising the size of enterprises, expanding the scope of activities of enterprises is an inevitable way to improve production efficiency and the efficiency of the economy in the process of industrialization. In the period of the Fourth Industrial Revolution, due to the specificity of scientific and technological progress, which plays a huge role, capable of better meeting the diverse needs of society, the small business model and have an advantage over large-scale enterprises. In the next 20-30 years, Vietnam must harmonize the relationship between the development of large-scale enterprises and small and medium-sized enterprises. At that time, state-owned enterprises should be proactive and responsible in signing and implementing association agreements with small and medium-sized enterprises.

Vietnam's "chasing" model of industrialization and modernization needs to take advantage of the role of industrial-financial corporations regardless of ownership form to concentrate capital and resources, reduce transaction costs. The State now has the role of orienting the inspection (rather than acting) in the relationship between large enterprises and small enterprises and with preferential policies in a certain time frame. Thus, reducing the economic burden of the State, helping the national finance operate more stably and effectively.

Third, the economic model to ensure fast and sustainable growth. This is an issue that has been pointed out by the Party's Platform for National Construction in the Transitional Period to Socialism (supplemented and developed in 2011) and given a general concept of shifting from broad-based development to develop in depth. However, many years have passed, the model of in-depth development is still slowly being formed. It is necessary to develop the economy - protect the environment - ensure social security and welfare, consider this as a growth triangle as a basis for evaluating and building an industrialization development model in such development conditions. storm of science - technology on the digital platform. With the axis of social security and welfare, in the current context of our country, it is necessary to consider the implementation of many social policies that exceed the balance of the budget, push up public debt, and threaten development investment development and the ability to ensure social security and welfare of the next generation. The problem is to publicize the maximum we can do to create social consensus in the issue of social welfare - social welfare. Breaking the organic relationship of the development triangle is a manifestation of unsustainable development.

Fourth, it is necessary to restructure the economy. Restructuring the economy on the basis of the Fourth Industrial Revolution, national full employment, ensuring social security

and welfare. In particular, national full employment is the central goal to suggest a plan to restructure the economy to ensure social stability, rich people, and strong country.

First, we need to agree that innovation of the growth model is always associated with economic restructuring and this is a process of constant renewal of the economy. The 13th Party Congress has specified three key tasks and three breakthroughs for economic development. Many scientists have provided explanations for the concept of economic restructuring as restructuring resources in the direction of flowing to a better place to use capital. After a period of extensive innovation with important results, each region and region has changed, creating its own advantages of the region and the industry. Therefore, restructuring the economy is to bring into full play the comparative advantages of each industry and locality to create products with competitive advantages and create Vietnamese brands in the global value chain. Here, the comparative advantage of the country has been multiplied by taking advantage of advantages within each industry and field of the country. Clarifying this will help us implement the socio-economic development plan from a different perspective. The central government will no longer assign targets for each locality to achieve high growth rates, but will assign development requirements in accordance with local realities.

Second, rationally allocate national resources. Law on Public Investment and Law on Investment (amended). The Platform (added and developed in 2011) and the 2013 Constitution both affirm that in our country's multi-sector economy, the state economy plays a leading role. Therefore, effective use of public investment to attract investment of other economic sectors into economic development is the most important issue of the State. Improving the efficiency of capital use in state-owned enterprises (SOEs) in order to have more resources to invest in key industries and fields with many initial risks is a vital requirement to create additional resources in regulation. The country's resources are limited.

Third, it is necessary to choose a breakthrough point in the implementation of the socio-economic development plan 2021 - 2025 based on the spillover effects of dynamic regions in the economy. In the past period, the restructuring of the economy, specifically the three focus areas, has not been linked with each other and with the regional economy. We have not seen a close relationship between the handling of bad debts by credit institutions and the health of not only SOEs in particular but also the business system of Vietnam in general. Along with dealing with the above problems, it is necessary to make a fundamental change in the investment and development mindset to focus enough on creating economic locomotives capable of bringing Vietnam's economic ship. quickly to the goal of rich people, strong country, democracy, justice and civilization.

From the above general and basic identifications and the aspiration to develop the country "on par with the great powers, on the five continents" on the basis of making the best use of the results of the fourth industrial revolution, so Therefore, the target orientation for Vietnam's economic development model is as follows²:

² Communist Party of Vietnam: Resolution of the 13th National Congress of the Communist Party of Vietnam, Documents of the XIII National Congress, National Truth Publishing House, H 2021, pp. 326-327.

General objective: By the middle of the twenty-first century, our country will become a developed, socialist-oriented country.

Specific objectives:

- By 2025: To be a developing country with modern industry, surpassing the low-middle income level.

- By 2030: To be a developing country with modern industry and high average income.

- By 2045: To become a developed, high-income country.

The above explanations have partly shown the scientific bases for the target orientation of Vietnam's economic development model in the context of the fourth industrial revolution. However, in order to realize the above-mentioned orientations and goals, it is necessary to have consensus, determination, high and synchronous efforts of all economic and social actors.

4. Discussion and Conclusion

The above analysis shows that, for Vietnam today, the choice of the "chase" economic growth model is inevitable and objective. Because, it will overcome the limitations of East Asian development model or export-based model and attract foreign investment. The "chase" economic growth model will also create the basis for solving the problem of social security well. Thus, promoting social development management.

Abstract

Due to global population growth, urbanization, and economic expansion, garbage generation rates are increasing nowadays. In order to handle municipal garbage sustainably, reverse logistics is used in the collection, recycling, and reuse procedures as well as in the reduction of consumables and environmental compatibility. Reverse logistics (RL) is the most crucial aspect of supply chain management in industrialized countries, but it is still in its infancy in developing nations. This study intends to pinpoint the major impediments and incentives for businesses utilizing reverse logistics in developing nations, particularly Vietnam. The results show that there are two barriers and four drivers for RL practice. This study has shown several management and practice implications.

Keywords: *Corporate social responsibility, drivers and barriers, reverse logistics, sustainability*

1. Introduction

With the increase in global population, there is a greater demand for things like food, housing, clothing, healthcare, and other necessities. Due to the rising use of raw materials during large-scale production, landfills are becoming more fully occupied (Wassenhove and Besiou, 2013). The World Health Organization (WHO) reported that over 4.2 million people die each year as a result of breathing toxic air (An et al., 2021; Landrigan, 2017). Developing countries are also burdened by environmental governance. Nations currently employ a number of strategic methods to reduce the negative environmental consequences of economic activity, including the development of renewable energy, the use of waste management techniques, and the use of products and technologies that reduce air and water pollution.

Reverse logistics (RL) is becoming more significant as a strategic differentiator for organizations and corporate entities striving to create a sustainable environment, value creation, and a circular economy (CE). Researchers have also identified a number of benefits that may be reached via RL, such as efficient resource usage and environmental protection (Abdulrahman et al., 2014; Gunasekaran and Spalanzani, 2012; Fernandez et al., 2010). Reverse logistics is becoming into a crucial part of the supply chain in industrialized countries due to legal issues, but it is still in its infancy in emerging economies like Vietnam (Bouzon et al., 2018). The results of the study will aid in understanding the factors affecting RL acceptance and serve as the foundation for suggestions on how to promote its usage, particularly in poor countries where pollution levels are typically high.

2. Literature Review and Hypothesis Development

2.1. Literature Review

2.1.1. Reverse logistics

In an ever-growing corpus of research on reverse logistics, authors have created a number of definitions of RL (Rachih et al., 2019). All of these definitions are based on the Council of Logistics Management's (CLM) most popular definition, which goes as follows: "The process of planning, implementing, and controlling the efficient, cost-effective flow of raw materials, in-process inventory, finished goods, and related information from the point of consumption to the point of origin to recapture value or proper disposal" (Roger & Tibben-Lembke, 1999).

According to Agrawal et al. (2015) and de Campos et al. (2017), reverse logistics (RL) is an effective corrective technique for handling waste problems in a range of industries. According to Nunes et al. (2009), RL refers to actions and procedures for reintroducing goods into the production cycle after they have been bought and consumed. Due to societal or environmental pressures, or as a result of its inherent economic or competitive advantages, many firms may have begun utilizing RL (Agrawal et al., 2015). As a result, more companies are using RL as a tactical tool to increase their bottom line and uphold their commitment to corporate social responsibility (Govindan et al., 2012). They also recognize that efficient RL and a better understanding of product returns may provide them a competitive advantage (Stock and Mulki, 2009). RL networks, for instance, have been developed by businesses like IBM and Dell, and their recovery techniques make it easier for clients to update their computers or buy new parts.

2.1.2. Reverse logistics and sustainable performance

The integration of environmental, economic, and social goals that results in a balance between the three factors is what is meant by sustainability from a triple-bottom-line perspective (Carter and Rogers, 2008; Elkington, 1998). RL, an organizational approach that helps the company financially and may also prevent or slow down environmental deterioration (Eltayeb & Zailani, 2011; Masudin et al., 2021), satisfies the three pillars of sustainability (Table 1).

Table 1. The performances of RL

Product value recapture, cost control, decreased inventory investment, enhanced profitability, and worker productivity are a few metrics that may be used to gauge the economic impacts of RL, according to Daugherty et al. (2005). Although an organization's ability to minimize solid waste, air and water pollution, consumption of hazardous, toxic, and dangerous goods, and frequency of environmental mishaps are all recognized as indices of its environmental performance (Zhu et al., 2008), these factors are not the only ones that should be considered. Aside from that, Maxwell and Van der Vorst (2003) pointed out that a number of indicators, including decreased energy and material consumption, decreased air and water pollution, decreased or eliminated waste production, and the use of toxic and hazardous materials, may be used to assess an organization's environmental performance. Finally, RL has a good influence on a variety of societal problems. The public display of a company's commitment to social responsibility is known as its social performance. Management standards, health and safety regulations, pay and benefits, equal opportunity laws, training and education, child labor, forced labor, freedom of association, and human rights and services are a few examples of such concerns (Dixon et al., 2005).

2.1.3. Vietnam reverse logistics context

Southeast Asia's fastest-growing economy is in Vietnam, a developing nation. Vietnam does, however, face significant environmental issues. Climate change has a particularly negative impact on the area of Vietnam around the Mekong River Delta (Trinh et al., 2021). By the year 2100, 90% of the territory of Vietnam would be under water, and by the year 2030, saline-sodic soil will cover around 45% of it, predicts OXFAM (Oxford Committee for Famine Relief) (Nguyen et al., 2022).

25 million tons of solid waste is created annually, with a 10% annual growth rate, according to estimates. While collection rates range from 83 to 85% in urban areas to 40 to 50% in rural areas, recycling and reuse rates are only about 10 to 12% (News 1, 2021). Vietnam's institutional waste management and disposal systems are noted for their lack of an effective circular economy-based strategy to treating garbage. The only two disposal alternatives in this system are landfills and incinerators, and post-consumer waste is delivered directly to these two locations rather than being recycled from secondary materials used in the collection. Or, to put it another way, the recycling aim is largely supported by the private and gray market before being handled by the formal program because the official treatment plan does not contain a material recycling step (Tong et al., 2021). Despite the fact that solid waste is one of the main causes of environmental deterioration, RL is not mandated by law for businesses in Vietnam (Xu and Yang, 2022). In terms of waste reduction, environmental preservation, and sustainable economic growth, Vietnam will gain by implementing RL practices.

2.2. Hypothesis Development

2.2.1. Regulation drivers

Regulation is any area of law that calls for a company to return or collect its items (Brito and Dekker, 2002; 2003). Companies are no longer excused from responsibility for a product's whole life cycle. Businesses are accountable for bringing back or returning their

items due to the severe environmental legislation reflecting the higher producer obligation. Laws mandating manufacturers to cover the expenses of handling the destruction, collection, and reuse of end-of-life equipment are being implemented in an increasing number of nations (Alumur et al., 2012). The prevention of waste and the promotion of waste recovery are mandated by stringent legislation in the European Union, including the End-of-Life Vehicles Directive (ELV), Waste Electrical and Electronic Equipment Directive (WEEE), Restriction of Use of Certain Hazardous Substances Directive (RoHS), and Packaging and Packaging Waste Directive. Since 2009, Turkey's electronic sector has been governed primarily by the Waste Electrical and Electronic Equipment Directive. Producers are in command of everything, according to the rule, including the development of new goods, the procedures employed in their manufacture, and the manner waste is disposed of.

The results of research showed that regulation is the driving element for RL activities for businesses in order to avoid penalty (Atasu and Subramanian, 2012; Kannan et al., 2012; Schamne and Nagalli, 2016). Thus, we anticipate that:

H1: Reverse logistics implementation is correlated with regulation drivers, with the regulation drivers having a positive impact on reverse logistics adoption.

2.2.2. Outsourcing drivers

According to Agrawal et al. (2016) and Vazifehdan and Darestani (2019), reverse logistics outsourcing is a form of planned external preparation that entails hiring other businesses to handle all or portion of an organization's logistical duties, such as collection, inspection, sorting, and disposal (Ferguson and Toktay, 2006; Martin et al., 2010; Meade and Sarkis, 2002). Manufacturers have the choice of creating their own RL system or outsourcing to a third-party logistics service. Daugherty and Dröge (1997) state that a range of qualitative as well as quantitative factors, including the organizational structure, affect the choice to fully or partially outsource the RL services. Arnold (2000) distinguishes four types of activities: core, core-close, core-distinct, and disposable. Core activities contribute the most to competitiveness, whilst disposable activities contribute at the lowest level. How the outsourcing strategy is carried out depends on the amount of contribution to competitiveness.

In businesses with substantial return variability and short product life cycles, keeping a firm's own RL is no longer financially beneficial, claim Serrato et al. (2007). According to Ko and Evans (2007), the main driving reasons for outsourcing are the necessity for customized infrastructure, which calls for specific equipment for processing returns and nonstandard production procedures as well as distinct information systems for tracking and storing data. According to Grabara and Kot (2010), the following are some of the primary causes of RL outsourcing: the costs of logistics activities are easier to track, which makes them more transparent. Cost reduction is also possible by choosing the most competitive offer available, which allows for more flexible use of owned resources, and by removing internal problems that hinder task performance.

These studies (Boyson et al., 1999; Grabara and Kot, 2010) demonstrate that outsourcing operations not only enable organizations to concentrate on their core skills and

decrease the number of complicated jobs, but also have a favorable effect on their costs and profitability. Therefore, we think that the availability of the market to providers of outsourced services will benefit the adoption of RL. We hypothesize that:

H2: Reverse logistics implementation is correlated with outsourcing drivers, with the outsourcing drivers having a positive impact on reverse logistics adoption.

2.2.3. Economic drivers

Businesses formerly depended on an open-loop supply chain with a primary focus on the forward flow of goods and services. However, integrating RL techniques into a closed-loop supply chain may offer chances for current businesses to generate additional income and save money (Das and Dutta, 2013; Oliveira et al., 2021; Zhou et al., 2011). Using RL techniques to save costs is a crucial tactic in a highly commoditized sector because price affects repurchase behavior (Marchi et al., 2013). The cost savings from RL practices may be seen in the lower costs of materials and energy as well as the lower spending on environmental issues, according to Diabat et al. (2013). Additionally, companies may boost their profits by recycling and reusing returned goods to recover their value (Govindan et al., 2015; Nikolaou et al., 2013). As a result, the economic performance of the organization may be significantly improved by RL's influence on cost savings and increased revenue from sales of recovered and remanufactured items (Jack et al., 2010; Mollenkopf and Closs, 2005). Based on the financial benefits obtained from implementing RL, we predict that businesses will be motivated to expand their RL practice. Therefore, we speculate that:

H3: Reverse logistics implementation is correlated with economic drivers, with the economic drivers having a positive impact on reverse logistics adoption.

2.2.4. Competitive drivers

According to Porter (1985), competitive advantage is "the fundamental basis for superior long-term performance" and is solely based on how customers perceive greater value, which can be attained through either lower costs with equivalent benefits or better features at prices that are comparable to those of the rest of the market. According to Sigalas and Pekka Economou (2013), a corporation has a competitive advantage when it "creates more economic value than its less efficient competitor".

RL practice is a strategic approach that may help a company in a variety of ways. In a highly commoditized sector, adopting recycled materials may first help businesses reduce product costs, retain market competitiveness, and please customers with cheaper pricing (Chan et al., 2012; Mafakheri and Nasiri, 2013). Customer satisfaction has a direct and positive impact on the customer's desire to buy and their tendency for repeat business (Tsiotsou, 2006), which is crucial for fostering client loyalty (Oliver, 1999). Reuse, remanufacturing, and recycling are the three main RL operations that help businesses promote an image of environmental sustainability to their target consumers (Chan et al., 2012; Zhang et al., 2013). According to Wang et al. (2010), buyers may choose a company that uses environmentally friendly methods over rivals that don't. Finally, RL was created to

stop competitors from obtaining the company's technology or infiltrating the market. For instance, IBM values RL initiatives highly. To handle the flow of returned goods and stop rivals from exploiting their outdated products, they created a subsidiary named GARS (Global Asset Recovery Services) (Fleischmann, 2001). With the help of the above facts, we contend that competitiveness-related performance will positively influence the implementation of RL in the organization.

H4: Reverse logistics implementation is correlated with competitive drivers, with the competitive drivers having a positive impact on reverse logistics adoption.

2.2.5. Financial barriers

Reverse logistics is the planning, execution, and efficient management of the transportation of products from consumption sites to origin points. The information systems that track and trace product returns and recoveries are essential to the success of RL operations, but they are expensive to develop and maintain (Bernon et al., 2011; Ho et al., 2012). It is also challenging to manage RL practices since staff training is required for a successful RL operation yet costs money, which the organization may not have or may not want to spend on RL (Meyer et al., 2017; Sarkis et al., 2010). The more highly trained people that are accessible, the more efficiently the RL firm performs (Meyer et al., 2017; Sharma et al., 2011), since education and training are essential elements of organizational success. Additionally, prior studies have revealed that the biggest hindrance to the use of RL in the plastics sector is a lack of internal facilities (storage, handling, and vehicles) (Abdulrahman et al., 2014).

Lack of initial capital as well as funding for returns monitoring systems, storage, and in-house processing of returns is a key barrier to RL operations (Abdulrahman et al., 2014; Sharma et al., 2011). Conducting RL practices is a dangerous undertaking for management since they contain financial concerns that might impact an organization's long-term success (Meyer et al., 2017). Previous studies have revealed that the biggest financial barrier to RL adoption in the automotive, steel/construction, electronic/computer, and plastics industries is a lack of early funding while a lack of money for training is the main financial issue facing the textile and paper/paper-based goods industry (Abdulrahman et al., 2014). Thus, we anticipate that:

H5: Reverse logistics implementation is correlated with financial barriers, with the financial barriers having a negative impact on reverse logistics adoption.

2.2.6. Infrastructure barriers

To complete the process of recovering, recycling, and reusing the product from the consumer, reverse logistics' infrastructure consists of a site for product collection and sorting, a mode of transportation, and recycling equipment (Forkan, Rizvi, & Chowdhury, 2022). According to earlier research (Abdulrahman et al., 2014; Lau & Wang, 2009; Rahman & Subramanian, 2012), the biggest barrier to RL adoption would be a lack of infrastructure in several industrial industries. For instance, Abdulrahman et al. (2014) identified the main

obstacles to RL implementation in the Chinese manufacturing sectors. These barriers included the reported absence of internal facilities like storage, handling equipment, and vehicles as well as the general paucity of systems (hardware/software) to monitor returns. Steel and textile industries specifically cited the lack of mechanisms (hardware and software) to track returns as the biggest infrastructure challenge, whereas the biggest challenge in the plastics industry is reportedly a lack of internal resources (storage, handling, and vehicles). These findings supported various previous study findings that suggested a technologically sound infrastructure would make it easier to adopt RL (Moktadir et al., 2020). According to Waqas et al. (2018), while items are reused and recycled in developed nations, they frequently wind up in landfills in developing nations owing to a lack of logistical infrastructure and technology. This has a significant negative impact on the environment. Therefore, we hypothesize that:

H6: Reverse logistics implementation is correlated with infrastructure barriers, with the infrastructure barriers having a negative impact on reverse logistics adoption.

3. Discussion and Conclusion

Problems of climate change and extensive environmental challenges have caused corporate enterprises to act. In response, businesses have been attempting to reduce their impact on environment. Up to now, there are just a few examples of how RL can help businesses operate more sustainably. RL can help businesses save costs (Jack et al., 2010); increase sales of recovered or remanufactured products (Mollenkopf and Closs, 2005); or enhance customer satisfaction thanks to operate business in an ethical and sustainable manner (Li and Olorunniwo, 2008). Furthermore, RL can help to increase customer loyalty by handling defective products (Aitken and Harrison, 2013) and play an important role in dealing with climate change and global warming by recycling items and reducing carbon footprint (Carter and Rogers, 2008).

The main purpose of this study is to identify drivers and barriers for businesses applying RL activities in developing countries, particularly Vietnam. The results show that there are two barriers and four drivers for RL practice. Two barriers include financial barriers and infrastructure barriers. Financial barriers are closely followed by a lack of funding for internal facility purchases, vehicle purchases, or a lack of funding for recycling technology investments and personnel training. Since high setup and operation costs of reverse logistics systems and infrastructure prevent their broad deployment since these expenses increase the entire cost of production (Wu and Cheng, 2006; Lau and Wang, 2009). Besides, Vietnam is a developing country and its infrastructure system has not been well – developed yet, thus, infrastructure obstacles can be the barriers for RL adoption in Vietnam. On the other hand, there are four incentives that encourage businesses to adopt RL activities including regulation drivers, outsourcing drivers, economic drivers and competitive drivers.

Managerial implications

In developing nations with rapid economic growth, like Vietnam, managers have a great opportunity to innovate and improve the efficiency of RL operations. Businesses'

owners should invest money and labor on operating RL in order to save costs and boost revenue which in return can help businesses maintain market price competitiveness. Damaged and returned products will constantly occur, therefore, it's imperative to enhance RL process's efficiency.

Businesses' owners should be aware that RL activities can significantly increase company's competitive advantage. If a company doesn't have a competitive advantage, it will undoubtedly be quite difficult for them to draw in and maintain customers. Managers are encouraged to comprehend that RL operations increase client pleasure with the business, hence boosting the number of devoted customers who contribute significantly to the company's revenue.

Outsourcing has gained popularity among businesses and academics in the industrialized business world. Businesses are putting more focus on enhancing their core competencies and outsourcing non-essential activities. It was highlighted that as RL is frequently not a core business activity for many firms, it might be an area for outsourcing. In order to reduce the investment in infrastructure technologies and human resources needed to set up RL operations, managers might employ partners to outsource RL. Businesses that outsource RL increase stakeholder satisfaction, ensure product recall, and also free up their attention from having to concentrate significantly on RL.

Abstract

In the 26th Conference of Parties (COP26) to the UN Framework Convention on Climate Change (UNFCCC) in 2021, about 100 countries made pledges to reach “net-zero” emissions by mid-century, as Viet Nam did, and more countries followed later. In the Green Growth Strategy of each country, especially developing countries like Vietnam, besides the efforts of the Government, businesses in the private sector, receiving the support from international cooperation is the key to achieving the goals that set out earlier and Just Energy Transition Partnership is one of the agreements entered into for that purpose. The research aims to analyse and draw the lessons learned from the preparation, development, and implementation of JETP in South Africa and Indonesia for the establishment and development of the JETP Secretariat and JETP Resource Mobilisation Plan (RMP) in Vietnam in order to achieve the goal of NetZero Emission in 2050 that Vietnam has committed at COP26. From there, point out challenges and recommend solutions to support Government agencies, relevant organizations as well as policy makers take timely measures to promote growth and development. increase investment attraction for green growth.

Keywords: *Climate Change, COP26, JETP*

1. Introduction

November 2021, the 26th United Nations Climate Change Conference (COP26) took place in Glasgow to evaluate the implementation of the goals of the Paris Agreement (adopted at COP21 in 2015) to limit global warming. The final COP26 agreement emphasized urgency in scaling up clean power, phasing down coal and phasing out fossil fuel subsidies. A group of 46 countries - including the U.K., Canada, Poland and Vietnam - committed to phase out unabated domestic coal, while an additional 39 countries committed to end new overseas finance of fossil fuels by the end of 2022 and redirect this investment to clean energy. Overall, countries are putting many efforts in order to achieve the commitment that they have set out earlier: Australia bumped its pledge into credible territory after its woefully inadequate 2015 target to slash emissions 26-28% below 2005 levels by 2030. The country now aims to cut emissions by 43% by 2030. Vanuatu submitted a

particularly inspiring plan that aims to phase out fossil fuels, invest in electric vehicles, and undertake a number of detailed measures to address loss and damage. Ahead of COP26, the United Kingdom put forward an ambitious target to cut emissions 68% below 2010 levels by 2030. The U.K.'s latest revision offers greater clarity on the policies to get there, such as investing in clean energy and ending the sale of petrol and diesel vehicles by 2030. Indonesia slightly improved its top-line goal to cut emissions from 29%- to 31.89% by 2030 compared to business as usual. The nation will increase this target to 43.2% on the condition it receives enough financial assistance. India's plan includes a target to reduce the emissions intensity of its GDP by 45% and achieve 50% renewable energy capacity by 2030; it also reiterated the country's pledge to reach net-zero emissions by 2070.

Since COP26, the South African government has worked to define priority interventions for its Just Energy Transition Partnership (JETP) and engage with relevant domestic stakeholders and donor countries. South African government officials are currently developing an investment plan to support workers that will be most impacted in the clean energy transition ahead, with a specific focus on the power, electric vehicles and green hydrogen sectors. South Africa is the first country to agree on a JETP with the International Partners Group (IPG).

Just Energy Transition Partnership (JETP) is a new financing cooperation mechanism between developed and developing countries to help coal-dependent emerging economies make a just energy transition. The goal is to support self-defined pathways as recipient countries move away from fossil fuel production and consumption in the electricity sector in a way that addresses the social consequences involved, such as by ensuring training and alternative job creation for affected workers and new economic opportunities for affected communities.

The vision and objectives of the JETP are articulated in a Political Declaration, which aims to establish an ambitious long-term partnership to support South Africa's pathway to low emissions and climate resilient development, to accelerate the just transition and the decarbonisation of the electricity system, and to develop new economic opportunities such as green hydrogen and electric vehicles amongst other interventions to support South Africa's shift towards a low carbon future.

Following South Africa, Indonesia became the second country to launch a JETP with IPG in November 2022. The Indonesia JETP will mobilize USD 10 billion each from public and private sources, the latter from financial institutions that are members of the Glasgow Financial Alliance for Net Zero (GFANZ), over the next three to five year.

At COP26, Vietnam pledged to bring Vietnam's net emissions to zero by 2050 to join hands with the international community to respond to climate change and change the economic structure to help Vietnam overcome the income trap, becoming a high-income developed country by 2045. In order to accomplish the commitment at the COP26, the challenge now is funding this transition and the JETP agreement is a crucial first step. On 14 December 2022, Vietnam became the third country to sign a JETP with IPG "to support

Viet Nam's low-emission and climate resilient development, as well as to support Viet Nam to accelerate the just transition and decarbonisation of the electricity system and develop new economic opportunities to support Viet Nam's transition towards net zero future”.

The research will analyse challenges and opportunities for Vietnam to invest in sustainable field to achieve net zero emissions by 2050, lessons from countries around the world, collectable statistics and survey results through the combined use of research methods such as interpretative method, meta-analytical method, comparative analysis method, etc. From there, it points out barriers for Vietnam and recommend solutions to help Government agencies, relevant organizations as well as policy makers take timely measures to promote green growth and development, enhance investment attraction from the private sector for climate change response and green growth implementation.

2. International Experiences

Table 1. Emissions reduction targets of selected countries

Country/Group	2030 CO ₂ e target (NDC) ² (unconditional/conditional)	CO ₂ e peaking year	Net zero year
China	Lower CO ₂ emissions per unit of GDP by 60-65% from the 2005 level	2030	2060
EU-27	55% below 1990		2050
Germany NDC = EU- 27	Germany: 65% below 1990		2045; negative greenhouse gas emissions after 2050
Indonesia	29/41% below BAU		2060
South Africa	350-420 Mt CO ₂ e (30%-16% reduction compared to 2015 of 500 Mt CO ₂ e)	2020-2025	2050
Thailand	30/40% below BAU		carbon neutrality by 2050, net-zero 2065
Vietnam	15.8/43.5% below BAU		2050

Source: Our World in Data

2.1. South Africa

South Africa faces serious climate risks: physical impacts of climate change, the carbon intensive nature of our economy, and the risks of not managing a low carbon transition in an orderly way that supports affected workers, communities, and industries. South Africa’s economy and its energy system are strongly coal dependent. In the 2018 total

primary energy supply, coal accounted for 65%, crude oil (imported) 18%, gas 3%, nuclear 2%, geothermal 1%, and renewables 11%, according to an official report in 2022¹. According to the “Integrated Resource Plan” of 2019 (South Africa’s latest Electricity Plan)², the power mix would include over 50% renewables by 2050 in its most ambitious scenario, which would be mainly wind and solar power, but observers believe that this could be even more.³

South Africa is in the early stages of a move from a high-carbon economy to a net zero economy by 2050. In an effort to support the energy transition in emerging economies, the US, UK, France, Germany and the European Union (EU) have signed an Energy Transition Partnership with the Government of South Africa (JETP) worth \$8.5 billion. The IPG US\$8.5bn offer comprises grants, concessional and commercial loans, and guarantee instruments, contributing to approximately 12% of South Africa’s JET IP funding needs for the period.

Table 2. Sources and financing instruments of the IPG offer⁴

US\$ millions	Grants / TA	Concessional Loans	Commercial Loans	Guarantees	Total
CIF/ACT (\$500m to leverage an additional \$2.1bn)	50	2555	0	0	2 605
European Union – EIB	35	1000	0	0	1035
France	2.5	1000	0	0	1002.5
Germany	198	770	0	0	968
United Kingdom	24	0	500	1300	1824
United States	20.15	0	1000	0	1020.15
Total (instrument)	329.7	5325	1500	1300	8455

JET IP Implementation currently includes the following:

- Incorporation of Stakeholders’ feedback from recent Presidential Climate Commission (PCC) consultations.
- With National Treasury, addressing the implications of Eskom debt relief arrangements and developing new models for financial
- Flows for the JET IP capital investments in Transmission, Distribution, and the Decommissioning, Repowering and

¹ <https://www.energy.gov.za/files/media/explained/2021-South-African-Energy-Sector-Report.pdf>

² <https://www.energy.gov.za/IRP/2019/IRP-2019.pdf>

³ <https://theconversation.com/south-africa-could-produce-a-lot-more-renewable-energy-heres-what-it-needs-185897>

⁴ South Africa’s Just Energy Transition Investment Plan for the initial period 2023-2027

- Repurposing of retiring coal power stations.
- With a potential delay in the planned decommissioning of power plants, assessing possible adjustments to timelines for investments
- In Decommissioning, Repowering and Repurposing.
- Working on the Just Transition Portfolio with the Mpumalanga Premier’s Office, government departments, civil society, private
 - Sector investors, and JET IP funders.
 - Developing a JET IP Financing Register matched to JET IP project priorities to include: IPG grant funding, IPG concessional
 - Loans, public financing budgeted for JET IP, financing from local DFIs (IDC and DBSA), private sector financing, philanthropic financing.
 - Clarification of government policy on Electric Vehicles to target JET IP investment opportunities.
- Design of the JET IP Monitoring & Evaluation Framework and Risk Management Framework, along with data systems
 - Alignment with government and funding partners.
 - Identification of new JET IP financing sources beyond the initial IPG commitments.

2.2. Indonesia

Indonesia is the world’s largest coal exporter. It has invested in numerous coal power plants, leading to overcapacity in some parts of the country. It also has a history of direct subsidies on fossil fuel consumption, notably on petrol for vehicles, so consumers have low energy cost expectations.

Indonesia has various climate change policies, including a “Long-Term Strategy for Low Carbon and Climate Resilience 2050”, and the “National Energy Grand Plan”. In addition to the GHG emissions reduction targets in Indonesia’s “enhanced NDC” of 2022. Indonesia plans to increase the share of renewable energy in its primary energy mix to at least 23% by 2025 and 31% by 2050; oil should be less than 25% in 2025 and less than 20% in 2050; coal should be minimum 30% in 2025 and minimum 25% in 2050; gas should be minimum 22% in 2025 and minimum 24% in 2050. Indonesia is producing green fuels from bio-resources, aiming e.g. for 40% biofuel blending in diesel by 2030. Indonesia will be developing various sources of renewable energy such as geothermal, hydro, solar, wind, biomass, and biofuels. It also plans to improve energy efficiency and conservation in industry, transport, buildings, and households. The Government will facilitate green financing and investment, it will strengthen the monitoring, reporting and verification (MRV) system, and generally it will strengthen the regulatory framework. The Just Energy Transition Partnership (JETP) in Indonesia aims to support policy reforms. In September

2022, Indonesia's president signed regulation no. 112/2022 on the early retirement of coal power plants and a moratorium for new coal power plants after 2030. This also mandates cross-ministerial cooperation and it provides for improved renewable energy tariffs. This regulation would speed up Indonesia's energy transition along with the JETP finance mobilisation.

The Indonesia's Just Energy Transition Partnership is co-led by the US and Japan and supported by the UK, Germany, France, EU, Canada, Italy, Norway and Denmark. Of JETP's initial \$20 billion in funding, \$10 billion will come from public sector commitments and \$10 billion will be raised from a consortium of private sector. In addition to government funding, loans from international organizations such as the World Bank will account for a portion of public finance. Private sector funding will be coordinated by the Glasgow Financial Alliance for Net Zero, which includes Bank of America, Citi, Deutsche Bank, HSBC, Macquarie, MUFG and Standard Chartered.

The Indonesian Government has also proposed five investment focus areas have been identified to accelerate the energy transition:

I. Transmission lines and grid deployment

Development & enhancement of transmission grid (interconnection within and across power systems)

- Expansion of transmission lines within and between power systems;
- Advanced control center (ACC) to accommodate Variable Renewable Energy (VRE);
- Development and implementation of Smart Grid.

II. Early coal-fired power plant retirement

Phasing down of the coal-fired power plants to meet CO₂ emission target

- Early coal-fired power plant (CFPP) retirement by 2030

III. Baseload renewable energy deployment acceleration

Foundational renewable infrastructure and will be prioritized for the short term.

- Development projects of hydroelectric power plants;
- Development project of geothermal power plants;
- Development projects of other baseload energy power plants.

IV. Variable renewable energy deployment acceleration

Acceleration of variable renewables development considering the readiness of grid infrastructure

- Development projects of solar power plants;
- Development projects of wind power plants;
- Development projects of other sources of VRE.

V. Renewable Value

Enabling infrastructure and operations related to the transition

- Local manufacturing capability development;
- General capability and capacity building.

3. Vietnam Situation

An increase in carbon output is often part and parcel with economic development and Vietnam is not an exception. In 2009, Vietnam produced 1.5 metric tons of carbon per capita. Ten years later, that number had more than doubled to 3.5 metric tons, according to World Bank data. While Vietnam's carbon emissions are on a distinctly upward trajectory, curtailing economic development is well and truly off the table. The result is that a transition to green energy production will be key to bringing down the volume of greenhouse gases the country produces. To that end, Vietnam has already committed to becoming carbon-neutral by 2050. It has also put in place a number of key policies designed to get it there. The challenge now is funding this transition. In addition to the Government's efforts, the role of businesses in the private sector as well as international support is extremely important.

Vietnam Just Energy Transition Partnership (JETP) was adopted on 14 December 2022 in Brussel between the Government of Viet Nam and the European Union, the United Kingdom, France, Germany, the United States, Italy, Canada, Japan, Norway and Denmark (together the International Partners Group, or IPG). JETP is considered as a longterm, ambitious partnership to support Viet Nam's low-emission and climate resilient development, as well as to support Viet Nam to accelerate the just transition and decarbonisation of the electricity system and develop new economic opportunities to support Viet Nam's transition towards net-zero future. In 2023, in the plant of implementing JETP, Vietnam aims to:

- Establish a JETP Secretariat;
- Complete resource mobilization plan (RMP);
- Implement/identify pilot transition project(s)

JETP RMP will support Vietnam to:

- Develop an ambitious and reliable long-term legal framework for the green transition;
- Accelerate the decarbonisation of its electricity system;
- Reduce Viet Nam's project pipeline for coal-fired generation, ambitious emission reduction pathway to phasing out unabated coal-fired power generation;
- Create an enabling environment for businesses such as de-risking credit, facilitating equity and bank finance, auctioning of permits, speeding up licensing, enhancing competition;
- Create opportunities for technological innovation and private investment, design mechanisms to assist ensuring affordable electricity for low-income groups

JETPs bring together country-led energy transition ambition and planning, with catalytic donor capital, and private financing including from net zero committed financial institutions.

Viet Nam JETP sets very high ambition for peak emissions, net zero GHG emissions, renewables deployment, and addressing coal. In order to achieve these goals, the participation from private sector is very important and require new ways of deploying public/private capital across the system and in innovative financing structures for key country priorities. Private sector will support problem solving for innovative projects and financing structures, to support flow of transition finance on scale needed.

Besides, the green transition as well as implementing JETP also bring up new opportunities for private sector such as:

- Opportunity to participate in the Carbon credit market;
- Attracting many sources of FDI investment and opportunities to participate in global supply chains;
- The Government is also making significant efforts by completing the legal framework, developing strategies and supporting policies such as tax incentives, land providing preferential credit packages, develop human resource training, research and technology transfer. The Government also focuses on promoting and developing renewable energy through the introduction of electricity support tariffs, attractive policies for investors under the green growth model, funding packages from the state budget and international organizations are also deployed to support businesses in developing green, environmentally friendly projects.

Besides the opportunities mentioned above, the process of attracting private investment for the green economy also faces many challenges.

Figure 1. Difficulties to circular business development according to enterprises' assessment

Source: Central Institute for Economic Management (CIEM)

Firstly, according to a survey conducted by the Central Institute for Economic Management (CIEM), businesses are facing difficulties such as incomplete legal framework, lack of synchronization among agencies and sectors. Many national programs, although mentioning the participation of enterprises, lack the financial mechanism and the attractiveness of profit when investing, such as: the price of electricity is not attractive, so investment is not encouraged, there is no preferential policies on capital resources.

Secondly, the survey results of CIEM also show that enterprises also face a lack of large-scale investments, lack of financial resources and face many financial risks. To invest in climate change and green growth, businesses need large capital sources while the budget is limited. The current credit and loan packages do not have clear distinctions between traditional businesses and green businesses and make green businesses face many difficulties, because many businesses have to invest 3-5 years, even 7-10 years to start making profits.

Thirdly, the process of transforming production models is often accompanied by the application of new technologies in the production process, but many enterprises are not ready for the transformation process due to the lack of knowledge and capacity to operate the green business model. In Vietnam today, private sector does not have enough resources to implement training programs and courses to help their employees raise awareness about the impacts of climate change and improve their skills and abilities to be suitable with green production scale. The Government has not yet taken specific measures, introduced policies to develop training models and new industries at the scale of universities, colleges, and vocational training centers to attract more human resources for green growth.

Lastly, in the context that Vietnam is striving to be able to join the global value chain, the requirements of foreign investors become more and more stringent with environmental requirements being put on top, businesses are also aware of the importance of transitioning to a green development model. The scale and production technology of many enterprises in Vietnam are still outdated, and businesses need support from foreign experts during the transfer process.

4. Recommendation

Firstly, the government needs to establish strategic directions for the formation of green industries and sustainable growth. It is necessary to build an apparatus (in fact, there is no apparatus, but only a system, process, procedures and legal system) for a highly efficient and synchronous management plan. Having a centralised, high-level body which coordinates and manages the just transition is key to the success of developing the RMP. Full engagement by the highest level of government is critical. Maintaining high political agreement and consensus with the line ministries, local authorities and impacted groups is essential in the development and implementation of the RMP.

Secondly, develop a multi-stakeholder governance structure with the participation of key stakeholders from the government, civil society organizations, labour unions, and the private sector, working together to support a just and equitable transition to a low-carbon economy in Vietnam. Follow by that, we need to understand JETP is a new term and new initiative form of partnership. International finance comes from a broad mix of multilateral

development banks, bilateral, philanthropies, private sector... The challenge is to ensure that all these partners deliver, over a period of several years. This needs to be enshrined in robust agreements which cannot be “evaded” once the novelty of the JTP fades. Relabelling of existing finance sources needs to be avoided and an adequate portion of grants or soft financing needs to be negotiated in the RMP. Carbon markets need to be brought in.

JETP in Vietnam is currently designed as a high-level political commitment. The “just” term is not well researched and reflected in evidence-based strategies. Develop reliable data and evidence-based strategies for a just transition is essential for developing an effective roadmap and strategy for a just transition, measuring progress, and evaluating the effectiveness of transition policies and programmes. Commission more in-depth research, and scoping studies to provide evidence base and strategies with wide participation of experts in different fields (academia, business, labour, and associations) to support RMP development and implementation.

Lastly, there is a need for a formal platform to allow various stakeholders (and particularly society organisations) to be engaged, consulted, and share and receive information. This formal process is necessary for continuity throughout the actual implementation of RMP. Sharing experiences and strengthening the collaboration with South Africa and Indonesia should be made as early as possible to learn about the set up of the Secretariat, the governance systems and the draft of RMP. It can be done via organising workshops and conducting site visits of technical experts and high-level ranking officials...). In the longer run, the establishment of a platform for collaboration and frequent exchange of information among recipient countries may lead to combine actions and strengthen the voices and negotiation powers.

SOCIAL WORK ON ACCESS TO BASIC SOCIAL SERVICES FOR FEMALE MIGRANT WORKERS

Lu Thi Mai Oanh

oanhltm@vnu.edu.vn

Faculty of Education Sciences, VNU - University of Education, Hanoi, Vietnam

Abstract

Migration is an important factor and a driving force for economic and social development, contributing to population redistribution, labor market restructuring, job creation, and poverty alleviation. Therefore, migrant labor is considered a component of the sustainable economic and social development strategies of governments worldwide. The social work activities supporting female migrant workers indicate that a significant proportion of them have accessed basic social services, primarily in the context of working in factories and industrial zones. The evaluation of support services for female migrant workers indicates that they perceive the highest effectiveness in terms of providing information on education opportunities for their children, healthcare insurance coverage, and housing services. However, their evaluation of the effectiveness of accessing employment-related information is relatively lower. Furthermore, the research findings demonstrate a positive correlation ($r = 0.04$) between the evaluation of accessing basic social services and the educational attainment of female migrant workers.

Keywords: *social work, social work support for female migrant workers, basic social services*

1. Introduction

The rapid economic development, urbanization, industrialization, and structural transformation of the national economy have led to a surge in both internal and international migration. However, studies have recently emphasized the harsh living conditions faced by migrant workers in urban areas. These conditions include challenges in securing employment, unfair working conditions, inadequate healthcare coverage, and limited access to essential social services. Migrant workers often encounter substandard housing, restricted educational opportunities for their children, and discrimination from urban residents (Park & Wang, 2007; Solinger, 1999; Wong, Chang, & He, 2007). A notable consequence of this increasing social exclusion is a sharp rise in migrant worker unemployment rates, accompanied by a lack of access to unemployment benefits.

Accessing social services by migrant workers, including healthcare services, education and training services, information-sports-science services, employment services, community services, and social assistance, is generally not prohibited. However, certain barriers still exist, with employment services being a particularly crucial concern for migrant workers as it is their primary focus. Moreover, migrant

workers, especially the younger ones with lower levels of technical and vocational education, often do not meet the demands of the labor market. Therefore, the creation of employment opportunities for this group of migrant workers requires special attention. This article, titled "Social Work on Access to Basic Social Services for Female Migrant Workers," aims to explore the aforementioned issues.

2. Literature review

Basic social services play a vital role within the framework of social protection systems. Supporting activities aimed at facilitating the access of female migrant workers to these essential services not only improve their living conditions but also ensure the overall quality of labor within society. Nevertheless, multiple studies have highlighted the persistent challenges faced by migrant workers in attaining their fundamental rights, including social protection measures such as social insurance, healthcare, social assistance, and basic social services. These rights involve various aspects such as employment, the right to work, livelihood and income security, residence and housing, freedom of movement, education, entrepreneurial opportunities, access to information, and cultural participation. This article will specifically focus on the accessibility of fundamental social services, encompassing key areas such as employment information, housing, clean drinking water, environmental sanitation, education, and healthcare.

It can be observed that the activities of social work in supporting migrant workers in accessing basic social services involve enabling them to access and utilize fundamental social services such as housing, employment, clean water, education, and healthcare, among others, to integrate into the community and adapt well to the surrounding environment. One of the most important basic social services that migrant workers are particularly concerned about is employment. Finding a job, starting a new job, or following family relocation are the main reasons for migration. Currently, 43.0% of migrants are living in borrowed rental houses, nearly eight times higher than the proportion among non-migrants. Localities with many industrial zones attracting a large number of non-skilled workers have the highest rates of migrant workers living in rented or borrowed houses, such as Bac Ninh, Binh Duong, Dong Nai, and Can Tho. Among them, Binh Duong has the highest rate of migrant workers living in rented or borrowed houses in the country (74.5%). Furthermore, several other localities also have relatively high rates (40-50%), including Thai Nguyen, Hung Yen, Tay Ninh, Ba Ria - Vung Tau, Ho Chi Minh City, and Long An. (Population Census, 2019).

Moreover, some studies have addressed the housing services for female migrant workers. The research found no significant difference in living conditions between migrant and non-migrant populations regarding types of housing, household water sources, lighting fuel, cooking fuel, and toilet types. However, migrant workers face distinct disparities in terms of housing ownership rights and access to household amenities, presenting notable challenges. When comparing migrant workers to non-migrants, the proportions of

households owned by migrant workers that possess televisions (72.6%), washing machines (37.7%), refrigerators (58.5%), and motorcycles (88.4%) are noticeably lower. In contrast, non-migrant households exhibit higher proportions of these amenities, with corresponding figures of 97.2%, 61.1%, 82.3%, and 96.1%, respectively.

Until now, numerous studies have shown that migrant workers tend to live in crowded and unsanitary collective housing provided by employers or shared with others (Shen & Huang, 2003). Therefore, social work activities aimed at assisting migrant workers in accessing basic social services such as environmental sanitation services are essential. On the other hand, ensuring a livable environment is also a concern for migrant workers. Sèn Thị Hiền's (2013) study found that the majority of migrant workers, mainly engaged in informal occupations, such as street vending at wholesale markets like Dịch Vọng and Mỹ Đình bus station, selling balloons at Cầu Giấy intersection, or selling small items like CDs and cotton swabs. They only spend the night in these places, each person having their own mat. The next morning, they carry all their personal belongings to work. Such types of accommodations are often not provided with adequate security or living conditions. Particularly, the living spaces are heavily polluted, and the use of well water does not guarantee hygiene. However, many poor migrant workers choose this type of lodging because of its low cost and all-inclusive nature, without additional expenses for electricity or water (Sèn Thị Hiền, 2013).

In addition, Tan's (2000) study emphasizes that migrant workers often face excessive workloads, such as being required to work 10-12 hours a day. Moreover, migrant workers have to work seven days a week, which affects their health and does not allow sufficient rest for labor recovery. Furthermore, Tan's (2000) research also reveals that over half of the surveyed factories indicate that migrant workers are not provided with social insurance benefits as required by the government for immigrant workers; even some small factories refuse to reimburse medical expenses for workers. In particular, the study shows that over 80% of factories do not grant maternity leave to female workers. Additionally, some foreign-invested enterprises have no protective policies for workers in general and migrant workers in particular, neglecting their health. These businesses also require migrant workers to work in hazardous environments with dust, toxic substances, noise, and poor ventilation (Tan, 2000). Several studies in Vietnam also highlight the issue of migrant workers' health, particularly for female migrants who face more disadvantages due to the current rapid economic growth. Despite participating in the labor force (both formally and informally), many migrant workers do not enjoy the benefits provided by government social welfare policies, such as labor rights, employment, poverty reduction, social insurance, social welfare, and basic social services such as healthcare, education, housing, clean water, and access to information (Ministry of Labor, Invalids and Social Affairs, 2019).

Other studies also emphasize the financial difficulties and job challenges faced by female migrant workers (Nicassio, Solomon & McCullough, 1986; Thompson et al., 2002), language and cultural barriers (Vedder & Virta, 2005), poor living conditions (Papadopoulos

et al., 2004; Wong et al., 2004), and other issues such as poor mental health due to stress and pressure in life. Another study found that migrant workers experience losses in social networks, employment, social status, and living environment (Oropeza, Fitzgibbon & Baron, 1991), and these losses are related to the mental health of migrant workers, leading to frequent feelings of depression (Bhugra, 2004).

In addition to the aforementioned basic social services, education is also a crucial factor in migration decisions, thereby promoting the pursuit of a better life. De Brauw et al. (2013) found that educational attainment and age are particularly important determining factors for internal migration. Education influences the attitudes, aspirations, and beliefs of migrants, as well as their level of integration into the receiving community. Furthermore, children's education is also a significant concern and consideration in migration decisions. Many studies highlight the difficulties in accessing educational information for children, leading to challenges in their learning. This is primarily related to the cost of education. Similar to low-income families in urban areas, some migrant families have to withdraw one or more children from school to work and support other children's education (Nguyen Huu Minh & colleagues, 2005).

Through an overview of domestic and international research related to the basic social services of migrant workers in general and female migrants in particular, it is evident that they encounter difficulties and shortcomings in accessing basic social services. The Vietnam Family Development Strategy for 2020 and Vision 2030 emphasizes various indicators of Vietnam's family development to ensure warmth, progress, happiness, and to ensure that households have minimum access to basic social services such as education, healthcare, housing, clean water, and information. However, in reality, female migrant workers still face numerous challenges in accessing information services for employment, housing, clean water, environmental sanitation, education, and healthcare. Therefore, the Vietnam Family Development Strategy, especially for female migrant workers, requires specific targets, objectives, and supportive solutions to ensure the quality of life and the potential labor resources of this population.

2. Method

The article utilizes data from a survey on social work activities concerning female migrant workers titled "Social Work Activities for Female Migrant Workers in Binh Tan District, Ho Chi Minh City," conducted between April and August 2022. The effectiveness of accessing basic social services was assessed using the Likert 5-point scale (1=Ineffective, 5=Highly Effective). The evaluation of the effectiveness of supporting migrant workers in accessing basic social services includes (1) information access services (employment, legal procedures for female migrant workers, etc.); housing services; clean water; environmental sanitation information; education; and healthcare (insurance). Furthermore, the study simultaneously investigates the demographic characteristics of female migrant workers, as depicted in Table 2.1 below:

Table 2.1. General characteristics of the study sample

		Percentage %	Quantity
Age	Under 30 year old	17.3	51
	31 – 40 year old	48.0	141
	41 – 50 year old	24.5	72
	Above 51 year old	10.2	20
Education level	Elementary school	15.3	45
	Middle school	31.6	93
	High school	33.3	98
	Vocational school, college	10.5	31
	Graduate school and above	9.2	27
Marriage status	Married	69.0	203
	Divorced	14.6	43
	Single	16.3	48
Occupation	Restaurant employee	7	2,4
	Street vendor	26	8,8
	Taxi driver	9	3,1
	Laborer	144	49,0
	Scrap seller	7	2,4
	Freelance worker	58	19,7
	Unemployed	6	2,0
	Homemaker	11	3,7
	Other	26	8,8
N=294			

3. Results

3.1. Current conditions of access to basic social services for female migrant workers

Migrant workers currently account for approximately 70% of the labor force in cities and large industrial zones. These migrant workers are typically individuals from rural areas with low education levels and limited vocational skills. They often lack formal training in their respective fields and have limited knowledge of industrial practices and legal regulations. Moreover, their employment tends to be unstable and short-term. The

study also reveals that a majority of female migrant workers settle for an extended period of time. Specifically, 14.6% of them reside for one to three years, 13.3% for three to five years, and 4.3% for over five years. Only 7.8% stay for less than one year. These findings suggest that female migrant workers aspire to migrate for an extended period in order to escape the hardships in their hometowns, improve their income, or seek better employment opportunities.

Based on field surveys, the majority of female migrant workers rate their accommodation as average (62.9%), with some reporting satisfactory conditions (32.3%), while a small portion faces unsatisfactory conditions (4.8%). Some migrant families share a single room, while others rent rooms with two or three individuals from the same hometown or occupation. To save on rental costs, some families rent a single room together. Those who cannot afford proper accommodation often end up living in temporary or dilapidated houses, with cramped spaces measuring around 8 x 10m², equipped with only one bed, a shelf, and a kitchenette. Such living conditions fail to guarantee hygiene, and the surrounding environment is often unsatisfactory, with issues like flooding and a high presence of mosquitoes.

Notably, the difficulties faced by female migrant workers partially reflect the unsatisfied basic needs outlined in Maslow's hierarchy of needs. During their lives in Binh Tan District, female migrant workers encounter common challenges, including low income (61.9%) and inadequate living conditions and daily provisions (58.8%). These represent the most fundamental requirements for their daily lives. Additionally, they often experience fatigue, stress, and pressure (53.4%), lack access to counseling and support services (31.3%), face health problems and difficulties related to housing and employment (33.0% and 29.9%, respectively). Moreover, a small percentage of female migrant workers struggle to access basic social services, endure labor-intensive and exploitative work, face difficulties integrating into the local community, encounter challenges when dealing with local authorities, and have limited access to information, education for their children, healthcare services, and health insurance registration.

Apart from female migrant workers employed in industrial zones, the majority of other female workers experience unstable employment, leading to unemployment and financial difficulties while still needing to cover living expenses and monthly rent. This situation is partially reflected in the research findings for female migrant workers in Binh Tan District, where the predominant support received pertains to environmental sanitation services (waste disposal), accounting for 76.7% of the responses. Furthermore, 62.9% of workers in industrial zones receive assistance with healthcare insurance during hospital visits, 62.6% receive support for clean water access, and 58.5% receive information support regarding schools and education. However, the percentages for housing support and information services related to employment are significantly lower, at 43.5% and 39.1%, respectively.

Table 3.1. Activities to support female migrant workers to access basic social services for female migrant workers

Activities to support female migrant workers to access basic social services for female migrant workers	Percentage %
Healthcare services (insurance for hospital visits)	62.9
Education services (support for information on children's education)	58.5
Clean water services	62.6
Housing services:	43.5
Information services (jobs, etc.)	39.1
Environmental sanitation services (waste disposal, etc.)	67.7

It can be observed that despite constituting a large number, female migrant workers in general, and especially those in the informal sector, have not fully accessed basic social services. Therefore, providing support and access to social services for this group is crucial to improving their quality of life and ensuring equality, humanity, and a decent life for female migrant workers.

3.2. The effectiveness of social work on supporting female migrant workers to access basic social services

Supporting female migrant workers' access to basic social services is highly necessary. For instance, when declaring temporary residence, it is a mandatory requirement for all citizens when moving to a new place. Individuals are responsible for reporting to the local police station to ensure good local management. Typically, local police officers, in coordination with landlords, visit each household to guide and assist newly arrived workers in completing the temporary residence registration, including relevant documents such as household registration forms, change of household registration notice, identity cards, photographs, and proof of legal residence. As for providing advice and support for female migrant workers to access healthcare, education, housing services, etc., it is usually done by insurance sales officers at the Ward Women's Union (in charge of women's affairs) and cultural and justice officers. Migrant workers who need voluntary health insurance or want to enroll their children in schools seek guidance from these officers to complete the necessary procedures.

Migrant workers require initial support in terms of basic living conditions such as housing, clean water, electricity, etc. A survey on the living conditions reveals that a significant proportion of migrant workers in Binh Tan District are currently living in extremely challenging conditions. The survey also shows that the "Education Services (support for information on schools, children's education)" activity is considered "very effective" by 39.8% of respondents. The activities of "Healthcare Services (insurance for hospital visits)" and "Support for clean water services" are considered "very effective" by

43.9% and 42.9% of respondents, respectively. The remaining activities, namely "Support for housing services," "Support for information services," and "Support for environmental sanitation services," are also considered effective by female migrant workers. The effectiveness of activities supporting migrant workers' access to basic social services is demonstrated in the following table:

Table 3.2. The effectiveness of access to basic services

Access to services	Min	Max	Mean	SD
Healthcare services (insurance for hospital visits)	1	5	3.33	1.32
Education services (support for information on children's education)	1	5	3.41	1.27
Clean water services	1	5	3.30	1.26
Housing services:	1	5	3.33	1.17
Information services (jobs, etc.)	1	5	3.18	1.22
Environmental sanitation services (waste disposal, etc.)	1	5	3.79	1.18

The effectiveness of social work activities in supporting female migrant workers' access to basic social services is demonstrated through the support provided in terms of information on hospital visit insurance, information on schools and classes for their children, information on clean water, housing services, and employment information. The evaluation of the effectiveness of social work activities in supporting female migrant workers' access to basic social services shows that this group rates "support for information on schools and classes for their children" as having the highest average score ($M = 3.41$, $SD = 1.27$), followed by healthcare insurance for hospital visits ($M = 3.33$, $SD = 1.32$), housing services ($M = 3.33$, $SD = 1.17$), clean water ($M = 3.30$, $SD = 1.26$), and the lowest being employment information support ($M = 3.18$, $SD = 1.22$).

Comparing the differences in the evaluation of the effectiveness of social work activities supporting female migrant workers' access to basic social services based on age, educational level, and occupation only shows statistically significant differences in educational level, age group, and high evaluation of effectiveness in this activity. Specifically, female migrant workers aged 51 to 55 ($M = 3.58$, $SD = 1.09$) rated the effectiveness of social work activities supporting female migrant workers' access to basic social services with the highest and lowest average scores in the age group of 41 to 50 years ($M = 3.54$, $SD = 0.98$). On the other hand, female migrant workers with a college degree or higher rated the effectiveness of social work activities supporting access to basic social services ($M = 3.35$, $SD = 1.09$), followed by high school ($M = 3.37$, $SD = 0.98$), junior high school ($M = 3.32$, $SD = 1.01$), and the lowest being elementary school ($M = 3.23$, $SD = 0.85$). Additionally, the analysis also indicates a positive correlation between the evaluation of the effectiveness of activities supporting access to basic social services and the educational level of female migrant workers, with a correlation coefficient of $r = 0.04^{**}$.

Thus, in the group of female workers with higher educational levels, the effectiveness of activities supporting access to basic social services is rated higher, and vice versa.

4. Discussion and Conclusion

The provision of basic social services to female migrant workers is crucial. In practice, accessing essential social services such as housing, healthcare, education, employment, community support, and social assistance for female migrant workers is generally not prohibited but still faces numerous barriers and challenges. Evaluating the effectiveness of social support activities for female migrant workers in accessing basic social services reveals that they perceive the support in terms of information on schools and education for their children, health insurance when seeking medical treatment, housing services, clean water, and, to a lesser extent, job information assistance. Research also indicates a statistically significant correlation between educational level, age groups, and the effectiveness of these activities.

Abraham et al. (2021) estimated a logistic regression model predicting that female migrants are 7 times more likely to lose their jobs during high lockdown periods compared to males. Deshpande (2022) also estimated a 9% lower likelihood of employment for women compared to men. All these findings consistently highlight that women in the informal labor market are significantly affected by lockdown measures in the context of the Covid-19 pandemic. Jadhav (2020) further observed that women predominantly occupy precarious jobs in the informal sector, including manufacturing, informal services, construction, and agriculture. Several other studies have also found that migrant workers tend to live in overcrowded and unsanitary dormitories provided by employers or share accommodations with others (Shen & Huang, 2003), engage in physically demanding work such as manual labor, factory work, and services (Roberts, 2000), and receive low wages (Tan, 2000).

On the other hand, insurance plays a significant role in improving the human security of vulnerable migrant populations, helping them overcome hardships related to illness, disability, unemployment, or old age. In particular, migrant workers often have high mobility and engage in short-term employment. However, only migrant workers in industrial zones receive support related to healthcare services such as insurance or social insurance. Informal female migrant workers still face significant challenges in accessing healthcare services, especially health insurance. It is evident that accessing social services for migrants (healthcare services, education and training services, information on sports and science, employment services, community support, and social assistance) is generally not prohibited but still presents barriers and difficulties for migrant workers, particularly regarding employment services, which are their primary concern. Therefore, female migrant workers greatly benefit from organizations and employment service offices that provide labor supply, market information, and administrative management units in cities to support their access to employment.

Migrant workers not only make important contributions to the economic and social development of the country but also demonstrate the diversification of the local labor force structure. The migration of labor is an important factor in reducing labor pressure and

employment in rural areas, generating income, and contributing to social stability. However, this movement also reveals various pressing issues such as environmental concerns, employment, unemployment, social security, healthcare, education, legal assistance, disease control, etc., which affect the lives of migrants. Assessing the effectiveness of social support activities for female migrant workers in accessing basic social services, the majority of female migrant workers evaluate the effectiveness of support in terms of information on schools and education for their children, health insurance services during hospital visits, housing services, clean water, and, to a lesser extent, employment-related information support. Therefore, strengthening the role of employers and organizations employing female migrant workers, as well as support centers that provide necessary information and assistance, is essential to ensure the effectiveness of the social support system for female migrant workers and help them overcome initial difficulties at their destinations.

SPILLOVER VOLATILY INTER-CONNECTEDNESS WITHIN VIETNAM'S STOCK MARKET: NEW EVIDENCE FROM AN EXTENDED TVP-VAR MODEL

MSc. Nguyen Thi Nga

nguyennga@hvnh.edu.vn

Faculty of Finance, Banking Academy, Hanoi, Vietnam

Abstract

This study use an extended joint connectedness technique and the time-varying parameter vector autoregression (TVP-VAR) method to examine connections between the probability of default of three groups including Blue Chip stocks, Midcap stocks, and Risky stocks in on the Vietnamese stock market from January 3rd, 2017 to March 31st, 2023. The results demonstrate that these stocks exhibit significant default risk propagation, especially during crises such as COVID-19 and the Ukraine-Russia conflict. Specifically, the net total directional connectedness reveals a high level of default risk transmission among these stocks. For the Blue chip group, if VIC defaults, it will significantly increase the likelihood of default for the remaining stocks. In the Midcap group, if LCG defaults, it will notably increase the likelihood of default for the other stocks, particularly during crises like the Ukraine-Russia conflict. For the risky group, NVL's default risk has a strong potential for transmission to other stocks. However, during crises such as the Ukraine-Russia conflict, MCG's default would have a substantial impact on other stocks most of the time.

Keywords: *stock market volatility spillover; Vietnam; ETVP-VAR.*

1. Introduction

The linkages between financial markets have been a subject of heated debate among academics, policymakers, and investors, but some econometric and mathematical tools have recently confirmed this analysis. As a result, it gained significant significance by offering a thorough evaluation of market risk and credit risk that can be utilized to promote better decision-making (Gong et al., 2019; Kou et al., 2014). For investors, assessing and making appropriate decisions about international portfolio diversification also requires understanding the connection between financial assets, especially stocks.

Considering Vietnam's recent developments, it is perhaps even more crucial to explore these aspects. The Vietnamese economy has grown sustainably and rapidly since 1986 (Vo & Ho, 2021). A robust economy has been able to survive various crises, such as the pandemic, because of its solid foundations. In the year following COVID-19's outbreak, Vietnam is among the few countries to achieve positive GDP growth (2.91%), while growth is expected in 2022 to rebound to 5.5%. Vietnam's stock market rose approximately 36% in 2021, even as most Asian stock markets declined (Reuters, 2021). In 2021, the country was in terms of growth among the top seven global stock markets due to its impressive growth (VnExpress, 2022). Among Asia's stock markets, Vietnam's led the way, outperforming

Taiwan and India by 29% and 23%, respectively (Vietnam News, 2022). This makes Vietnam's stock market and its role in Asia increasingly significant, so it's worth examining.

The purpose of this study is to examine the dynamic relationship between stocks and indices in the case of developing countries like Vietnam. Moreover, we evaluated whether EPU affected this connectivity before and during the COVID-19 pandemic. Diebold and Yilmaz's (2014) popular VAR model and Antonakakis and Gabauer's (2017) dynamic connectedness method were combined to calculate dynamic connectedness. ATVP-VARs are an alternative method of extracting connectedness indices to rolling-window VARs. The first advantage is that arbitrary window sizes result in erratic or flattened parameters. By estimating its time-varying parameters using the Kalman filter method, instead of rolling-window VAR, TVP-VAR models prevent the loss of valuable observations. A final advantage of this model is that it does not exhibit high sensitivity to outliers (Antonakakis and Gabauer 2017; Gabauer and Gupta 2018; Antonakakis et al. 2018; Korobilis and Yilmaz 2018). By examining the interconnected between different types of Vietnamese stock, this study adds to the body of existing material. In

Following is a breakdown of the rest of the paper. A literature review is presented in the second section. A discussion of the data and methodology is presented in the third section. Results and discussion sections appear in the following sections. Lastly, the paper concludes with a section called "Conclusions and policy implications."

2. Literature review

A study by Wang et al. (2017) examined the global financial crisis among BRICs and G7s (except Japan) using multiscale correlation. During the financial crisis around the world, stock markets' contagion depended on both recipient countries and time periods. In order to determine the effect of the recent financial crisis on six major stock markets, we used VAR modeling and Granger causality tests (the US, UK, Germany, Japan, China, and Hong Kong), as stated in Jiang et al. (2017). Global stock markets' interdependence increased following the financial crisis. A long memory in the GARCH-copula model has been shown to increase dependency between major international stock markets following the European debt crisis and the global financial crisis, according to Mokni and Mansouri (2017). In this study, a generalized vector autoregressive (VAR) model is used to examine the dynamic interconnection of Asian emerging markets with other international markets. As a result of the Asian financial crisis and the global financial crisis, the integration of the world's stock markets, and there was a rising trend of increasing stock prices. In an analysis of regional, global, and GIPSI stock markets using static and rolling-window methods, Mensi et al. (2018) reported that the crisis caused the financial contagion effect to increase, according to Diebold and Yilmaz (2012, 2014). According to Zhou et al. (2018), shocks caused by extreme and erratic events could spread between Europe, Asia, and America via the CEEMDAN wavelet model. According to Gong et al. (2019), global stock markets are more connected during crises due to the use of the transfer entropy method. Using a dynamic spillover model, Kang et al. (2019) investigated how ASEAN stock markets interact with global markets. The authors found that during financial crises, there were increased returns

and volatility spillovers for each of the markets. Based on a spectral decomposition of variance decomposition, Su (2020) investigated the G7 stock markets' volatility spillover tendencies. Across the G7 stock markets, volatility spillovers were reported to be crisis sensitive. Stock market performance has been studied extensively in the wake of the virus outbreak. Taking into account an estimate of \$3 trillion in GDP and \$2 trillion in equity market valuations, Delisle (2003) estimates the losses due to SARS in 2003 were equal to the losses caused by Asia's financial crisis. Based on the findings of Nippani and Washer (2004), SARS had a negative effect on Thailand, Vietnam, Thailand, Hong Kong, Philippines, Singapore, and Indonesia. According to them, Vietnam's and China's stock markets were the only ones adversely affected by SARS. A global economic impact assessment of SARS was conducted by Lee and McKibbin (2004). Globalization and financial integration make it easy for any economic shock to spread from one nation to another, which made the SARS pandemic have a significant impact on human society worldwide. According to the data, the market indices of these three LCR countries—aside from Brazil—did not show considerably negative returns on the day following the Zika outbreak. Macciocchi et al. (2016) examined how the Zika virus outbreak impacted the short-term economies of Brazil, Argentina, and Mexico. As a result of the geographical proximity and widespread media coverage of the 2014 Ebola outbreak, Marinc (2016) examined whether US asset prices were affected by the information disseminated by the epidemic. Chen et al.'s (2018) study looked at how the SARS pandemic affects China's long-term interactions with four Asian financial markets. Stock price indices have varying cointegration relationships over time. The SARS pandemic also harmed China's long-term partnerships with the four markets. The COVID-19 effects have frequently been contrasted with those of the world financial crisis of 2008. Numerous theories have been used in recent studies to explain how the COVID-19 epidemic affected financial markets. Salisu and Vo (2020) used information from the top 20 impacted countries to assess health news found through Google searches in order to forecast stock returns. Stock valuations that include health-related information were found to be more accurate. It also improved forecast performance when macroeconomic factors were adjusted and the "asymmetry" effect was taken into consideration. Panel tests were applied to examine COVID-19's effects on the Chinese stock market by Al-Awadhi et al. (2020). Stock returns across all companies were significantly affected by COVID-19. According to Sharif et al. (2020), economic uncertainty, geopolitical risk, the oil price, COVID-19 outbreak, and the stock market are correlated using wavelet-based Granger causality testing. Geopolitical risk was significantly affected by COVID-19 more than economic uncertainty in the US. In a study conducted during COVID-19, Corbet et al. (2020a) tested the effect of the term "corona" on stock behavior. Youssef et al. Coronavirus pandemic-related names exhibited a negative effect.

Quantile regression was applied by Azimli (2020) to investigate risk-return dependence in the US after the COVID-19 pandemic, finding that the higher the quantile, the more dependent the market portfolio was on returns. It was found that COVID-19 affected both Shanghai and Shenzhen stock exchange volatility in a significant, significant and positive way during the COVID-19 pandemic by Corbet et al. (2020b). Additionally,

they found that WTI and Chinese stock markets had a strong positive correlation. Accordingly, Ashraf (2020) assessed how COVID-19 affected stocks. Based on a daily COVID-19 verified case count, financial markets responded negatively to COVID-19 confirmed cases. The short-term effects of Coronavirus outbreaks were examined using econometric models by Khan et al. (2020) and Liu et al. (2020). Following the viral spread, stock prices dropped sharply. Their findings showed that COVID-19 confirmed cases negatively impacted abnormal returns through an efficient channel, as well as detecting investors' gloomy opinion concerned with future returns and uncertain futures. A similar analysis was conducted by Zhang et al. (2020a, b, c) where country-specific risks associated with COVID-19 were examined. Moreover, they analyzed the potential effects of policy changes, including a zero percent interest rate policy implemented by the US and an unrestricted quantitative easing program initiated by the Federal Reserve. They discovered evidence of an upsurge in global stock market volatility following the pandemic declaration. The results show that policy interventions might have increased the uncertainty in the world's financial markets.

With data from the Hong Kong stock market, So et al. (2017) investigated how the COVID-19 pandemic affected stock market connectedness. When COVID-19 was in circulation, partial correlation networks exhibited higher clustering and network density, according to a correlation analysis of stock return networks based on dynamic financial networks. This indicates that when the outbreak occurred, systemic risks substantially increased, as well as a higher network connectedness in financial networks.

It has been established through a large body of literature that stock market dynamics and relationships are highly influenced by problems, including the public's health, stress, and rising ambiguity. This study investigated how the COVID-19 pandemic affects stock market linkages in the current study. The COVID-19 period was expected to see different market relationships from the previous typical period. Additionally, I expected that the impact of EPU on the stock market would be significantly diminished as a result of this health crisis.

3. Statistical analysis and methodology

3.1. Statistical analysis

According to the Merton model (Merton, 1976), the study use data from financial statements, including liabilities of companies listed on the Vietnam stock exchange and share prices, as well as daily trading volume to estimate the probability of default for each company. There are three groups of companies, including Blue Chip stocks, Midcap stocks, and Risky stocks. Blue Chip stocks include the Joint Stock Commercial Bank For Foreign Trade Of Vietnam (VCB), Vingroup Joint Stock Company (VIC), FPT Corporation (FPT), Vietnam Dairy Products Joint Stock Company (VNM), Mobile World Investment Corporation (MWG). Midcap stocks include LDG Investment Joint Stock Company (LDG), FECON Corporation (FCN), Petro Vietnam Drilling & Well Service Corporation (PVD), Lizen Joint Stock Company (LCG), and Hoa Sen Group (HSG). Risky stocks include

Vietnam Airlines JSC (HVN), Urban Development and Construction Corporation (UDC), MCG Energy And Real Estate Joint Stock Company (MGC), and No Va Land Investment Group Corporation (NVL). The period covered by my time series runs from January 3rd, 2017, to March 31st, 2023. The unit-root statistical tests (Elliott et al., 1996) serve as the foundation for these systems. Table 1 show the properties of these series.

3.2. Extended joint connectedness approach

The study aims to assess the $qd_{ij,t}$ a method of mutual connectedness that is equivalent, called $jd_{ij,t}$, these criteria are met by an organization:

$$G_{i \leftarrow \bullet, t}^{jnt, from} = \sum_{j=1, i \neq j}^p jd_{ij,t} \quad (1)$$

$$G_{\bullet \leftarrow i, t}^{jnt, to} = \sum_{j=1, i \neq j}^p jd_{ji,t} \quad (2)$$

$$jd_{ii} = \frac{1}{z} \sum_{i=1}^p G_{i \leftarrow \bullet, t}^{jnt, from} = \frac{1}{p} \sum_{i=1}^p G_{i \rightarrow \bullet}^{jnt, to}$$

In order to achieve this, I have to adopt the approach of Lastrapes & Wiesen (2021). As a result, equation 12's recommended computation must be correct. The table must also be the same in the diagonal components of the joint connectedness since the row totals must equal 1. Therefore, scaling factors vary per row, resulting in the following formula:

$$\eta_i = \frac{G_{i \leftarrow \bullet, t}^{jnt, from}}{G_{i \leftarrow \bullet, t}^{gen, from}} \quad (3)$$

$$\eta = \frac{1}{p} \sum_{i=1}^p \eta_i \quad (4)$$

Due to the soaring elements in each row, our soaring differs from the one that results based on the joint connectedness method. As a result, the following steps must be followed:

- $jd_{ij,t} = \eta_i qd_{ij,t}$
- $jd_{ii,t} = 1 - G_{i \leftarrow \bullet, t}^{jnt, from}$
- $G_{i \rightarrow \bullet, t}^{jnt, to} = \sum_{j=1, j \neq i}^p jd_{ij,t}$

It is also possible to calculate the metrics for directional connectedness based on net totals and pairwise distances on the soaring parameter for each row:

$$G_{i,t}^{jnt, net} = G_{i \rightarrow \bullet, t}^{jnt, to} - G_{i \leftarrow \bullet, t}^{jnt, from} \quad (5)$$

$$G_{ij,t}^{jnt, net} = qd_{ji,t} - qd_{ij,t} \quad (6)$$

My approach is expected to provide more precise findings than methods employed in previous studies because there is a similar explanation for the original connectivity methods proposed by Caloia et al. (2019). In general, this approach addresses several concerns associated with previously proposed connectedness strategies, such as: (i) it is not necessary to choose a rolling size at random; (ii) utilizing the Kalman gain of multivariate Kalman filtering, the predicted results are not influenced by outliers; (iii) The VAR coefficients can fluctuate over time; and (iv) Portfolio and risk administrators should take note of this to be able to observe the volatility of the energy market over time by allowing variances and covariances to fluctuate; (v) the solution of Lastrapes & Wiesen (2021) has been implemented a normalization problem involving row sums; and (iv) is similar to the directional joint connectedness study, the connectivity of joints is enlarged in a special way,

but it enables greater flexibility and multiple directional connectedness measures to be computed. This strategy emphasizes the comparative bilateral power of the indicators, which is one of its core features.

4. Results

Table 2 shows the average outcomes for the interlinkages of various indicators inside the network using the entire set of data from January 3rd, 2017 to March 31st, 2023. The diagonal part of this table describes the change of a single indicator, which is driven by shocks of its own. When the nondiagonal elements define how the instability of this indicator influences that of other indicators (FROM) and how other indicators impact the instability of this indicator (TO). The columns display the independent effects of each type of indicator on one another, whereas Table 2 specifically displays the influence of each individual indicator on the variance of forecast error of each other. In Panel A of Table 1, for Blue Chip stocks, the TCI average value for the entire set of data is 25.01%. It is proven that changes to this network might be responsible for 25.01% of the volatility in the network of indicators under investigation. This shows that about 75% of error variation of the system is caused by idiosyncratic causes. The contribution of each indicator is displayed in the last row of Table 2. The transmission of shocks and volatility to other system indicators is significantly influenced by VIC. It is worth noting that FPT, MWG, and VCB absorb our shock network in descending order. Furthermore, VIC plays a crucial role in the Blue chip group, and when this stock defaults, it will carry risks and increase the likelihood of defaults in the remaining part of the group.

Table 2. Averaged Joint Connectedness

Panel A: Blue chip stocks						
	VCB	VIC	VNM	MWG	FPT	FROM

PVD	1.74	2.26	73.42	15.50	7.08	26.58
LCG	2.63	5.76	3.72	80.54	7.34	19.46
HSG	2.60	8.49	2.29	15.68	70.95	29.05
TO	11.38	21.80	9.07	57.69	22.12	TCI
NET	-8.13	-5.67	-17.51	38.24	-6.93	24.41

Panel C: Risky stocks

	NVL	HVN	UDC	MCG	FROM
NVL	86.81	4.06	3.74	5.38	13.19
HVN	9.97	76.81	3.86	9.36	23.19
UDC	8.59	2.72	62.58	26.11	37.42
MCG	6.03	3.78	16.87	73.33	26.67
TO	24.59	10.56	24.48	40.84	TCI
NET	11.41	-12.64	-12.94	14.17	25.12

In Panel B of Table 2, for Midcap stocks, the TCI average value for the entire set of data is 24.41%. It is proven that changes to this network might be responsible for 24.41% of the volatility in the network of indicators under investigation. This shows that about 75% of error variation of the system is caused by idiosyncratic causes. The contribution of each indicator is displayed in the last row of Table 2. The transmission of shocks and volatility to other system indicators is significantly influenced by LCG. It is worth noting that PVD, LDG, HSG, and FCN absorb our shock network in descending order. Furthermore, LCG plays a crucial role in the Midcap group, and when this stock defaults, it will carry risks and increase the likelihood of defaults in the remaining part of the group. In Panel C of Table 2, for Risky stocks, the TCI average value for the entire set of data is 25.12%. It is proven that changes to this network might be responsible for 25.12% of the volatility in the network of indicators under investigation. This shows that about 75% of error variation of the system is caused by idiosyncratic causes. The contribution of each indicator is displayed in the last row of Table 2. The transmission of shocks and volatility to other system indicators is significantly influenced by NVL and MCG. It is worth noting that HVN and UDC, and VCB absorb our shock network. Furthermore, MCG and NVL play a crucial role in the Risky group, and when this stock defaults, it will carry risks and increase the likelihood of defaults in the remaining part of the group. Figure 2 displays the evolution of TCI over time.

Figure 2. Dynamic total connectedness

5. Conclusions and policy implications

This study employ a TVP-VAR model to measure the contagion risk transmission between three group from January 3rd, 2017, to March 31st, 2023. These stocks exhibit significant default risk propagation, especially during crises such as COVID-19 and the Ukraine-Russia conflict. Specifically, the net total directional connectedness reveals a high level of default risk transmission among these stocks. For the Blue chip group, if VIC defaults, it will significantly increase the likelihood of default for the remaining stocks. Additionally, the default risk transmission among large companies tends to increase during the 2022-2023 period due to the impact of macroeconomic policies. The risk contagion relationships among companies in the Blue chip and Midcap groups have significant implications for policymakers and investors. By understanding the risk contagion relationships among these companies, policymakers can develop the most effective policies to minimize market risks. The high level of default risk transmission among stocks highlights the gaps in financial market management. Moreover, market shocks such as the COVID-19 outbreak and the Ukraine-Russia crisis lead to risk contagion among stocks. The study's findings also recommend measures to improve the social welfare directly affected by investor sentiment and stock market volatility./.
